[redacted] – As far as this well maintenance program, we are really relying on existing information. Data collected to date. Mostly because it is a relatively small program. We are also helping Chance with the

large Executive Committee Project. That program would be where we gather much more detailed information, including oral knowledge.

[redacted] – The elders who lived off the land, Dagoo elders, from the area provide all the information. Plants and animals and cultural information. I know it's a small project. I would still like to see a review of oral history. There are still people that use the area. Normally using existing information, I understand. I get the footprint is small and small amount of caribou use the area. But it's a fairly long and large road coming right off the highway. Even though the footprint is small, there could be larger impacts to the caribou and maybe the moose. Take those considerations into account.

[redacted] – Certainly, we can take the road into consideration. On top of the road and the wells themselves – we considered a 4km buffer around the disturbed area.

[redacted] – Can we use more recent information? This information must be outdated (referencing dates on the Caribou handout). Using something from the technical committee. It's referencing work from 1993 – that's 20 years ago. Is there more recent data?

[redacted] – We have used much more recent data in the assessment. In the handout, I just referenced the technical committee when referring to summer ecology of the caribou. When I reference the portion of caribou that are in the project footprint – I'm using much more recent information. Data from 2017 in a report by [redacted] and [redacted].

[redacted] – [redacted] can you update us on the status of the Technical Working Group (referring to the NYLUP technical working group?)

[redacted] – The work from [redacted] and [redacted] is the first of two reports, the second report is being finalized.

[redacted] – In the future, I'm going to want to see more than that (using recent data). Moving forward when we're dealing with bigger things/projects we need to incorporate more Traditional Knowledge.

[redacted] –We had an archaeology study of the whole area in 2014. In that work, they have polygons that flag areas (points of interest). The reports were drafted by Matrix which was bought by Stantec. A full assessment of the project area was completed. We understand where the high potential areas are.

[redacted]

[redacted] – What does "points of interest" mean?

[redacted] – Mostly for archaeology sites. They look at the creeks and streams or the south side of hills for potential human use as well as paleo resources. Those reports helped us build the access routes. In this case (for the DO assessment), the routes are already existing, and the well sites are existing.

[redacted]

[redacted] – The lack of assessment on impact on VG harvesting rights is a major gap, this area has been extensively used in the past by Dagoo people and used currently. Also of interest is getting people back on the land to maintain the culture and traditional knowledge. In light of COVID, people are wanting to go

into those areas. There is a wealth of information to draw upon. Also there was no real assessment on vegetation, for example Tamarack, this is the only place it grows in the region.

[redacted] – People have nice snow machines. Now the trail has been marked out, we're going to want to make use of it. Use in this area and getting back to the Dagoo area. We want our people to know our entire traditional territory as they did in the old days. Would like to preserve this area for future use. Important for us to have the area used properly, for our people and our culture.

[redacted] – Thank you [redacted] and [redacted] You've brought up a lot of information, but also a gap. Future land use and planning is a gap. There is some internal work that needs to be done. I don't really see that being reflected yet, and something changing all the time.

[redacted] – During land claims selection, we had a committee all elders. Those elders would pinpoint important areas. [redacted] There was a whole mountain. Whole purpose of it, I think, the traditional area is very important even if we're not using it very much. It's really important for us, for the future generation. Development of today, I always look towards the future of our young generation, these unborns are our investment and I respect that very much. How are we going to protect the land and work safely on the land? Head waters. If there's a disturbance around the head waters, we'll probably get hit with it. Salmon, every year we get different salmon migrating, and water birds. I just hope that we come to some good solution

[redacted]

[redacted] – From the Chance perspective, under the new Lands Act for VG. It would be nice if we can work with lands technical staff. To get interests in the area. Trapping, that type of thing. Ran into Norma two weeks ago and got to see their camp. There are four families up there utilizing the area. Chance is adaptive to working with the technical group to help work on the gaps that are being referred to. This work is a two-way street. Almost like land use planning. Land use plan has some guidance, but it is very generic. The Lands Act by VG is very current. And working with land technical group will help.

[redacted] – That new act only applies to VG settlement parcels, are you going to follow VG law on crown land?

[redacted] – We want to make sure we do things right. It's about the YESAB process. We want to work with VG Government, and follow all the rules and regulations

[redacted] – Have you talked to Norma? Or others who use the area? What do they think?

[redacted] – That information would better inform Chance and their work. Something like the effects the assessment. In looking at the effects assessment, it really isn't clear how VG's values are reflected in that approach. How has that been accounted for in that process?

[redacted] – We are talking about some pretty important issues. Issues that spill over into the Executive Committee project. That project is not something we want to get into detail today. Thinking about some of the overlaps between the projects and VGs concerns. Engagement with VG is important to identify the valued components (VCs) and issues and to look at things in a detailed and meaningful way. We want to move forward with that. In terms of the project in front of us, a lot of thought around the VCs associated with this project were identified based on past knowledge and past experience in the area. All

this needs to reflect the scale of the project which is 8 existing wells. The wells are already there and in a disturbed area. The majority of the routes, following the old routes. That's what influenced the VCs. Input from past meetings with VG did inform the VC selection.

[redacted] – There are some pieces of this project, with respect to issues, that we have raised before and that haven't been addressed. E.g., disturbance to caribou. Referencing the 600m, where did that value come from. I would like to learn more about how you came to that number. We never know what the caribou are going to do year from year. What if the caribou are congregating in the area next year, what will you do?

[redacted] – With respect to safe operating distance, as you noted there are lots of different numbers out there. If we think about the logistics you can only often see 100-150 meters. And the detection distance is often smaller. That is a challenge for operations. In terms of minimizing the spatial overlap between where the project is and where the caribou may be, when the operations start, ground monitors go out and assess the area to look for caribou and signs of caribou. Then Chance can use any signs of caribou to help schedule which well site Chance will go to first/next. Looking at available telemetry data, from monitoring, one thing that stands out is that the caribou are mobile throughout the winter. Its rare that they would remain on one site for too long. Caribou typically move 2-5 kms a day. However, the number of collars are few. For every 1 collar there are 200 caribou.

[redacted] – In 2014 or 2015 a significant number of caribou went into the project area. Considering adaptive management, when things are happening, such as a large group of caribou in the area, do you have any plans on how you'd engage with VG. In the past, we've asked to see your monitoring protocol. Or the monitoring data Chance may be collecting. The bigger question is engaging with VG when there are a lot of caribou in the area.

[redacted] – Of course, all our wildlife monitors will be hired from here, and typically have been. Of course we want to work with VG. In the past, we have shared lots of our reports and information. During the packing for the base of the winter road we would have wildlife monitors going out ahead of the snow machines, assessing the areas. Again we have certain windows of opportunity, such as limited daylight. We are prepared to do formal reports. For example, we have a person from VG who completed certain training (William Linklater, with a University Degree in Environmental Science) and he wants to be the environmental technician and wants to provide the technical reporting. We want local monitors. We are already thinking about how we'd provide reports and our monitoring plans.

[redacted] – Are there any plans to involve VG on the adaptive management thresholds? For example if caribou are observed in the area or a certain number of caribou, then a certain management reaction is triggered. It would be highly valuable to determine what the thresholds are. E.g., 10 caribou or more. What are those triggers for when you need to consider other mitigation measures?

[redacted] – Those thresholds are weakly defined. Based on limited science. There is certainly no magic number. There would absolutely be a benefit to getting VG input. Based on VG knowledge.

[redacted] – The road will be gated?

[redacted] – Yes. That's clear from past discussions. It is also key for safety, as there is potential for sour gas at the site.

[redacted] – When you're done, what happens with the road? Is YG responsible?

[redacted] We'll just let it melt. The permits will have certain conditions. There are three different permits required, a highway access permit, a land use permit, and a well license. When we are done building the winter road the Natural Resource Officer looks at things. We will be monitoring the winter roads to ensure there is 6 inches of snow. Once we are done and the rigs and supplies come out, then we take a backhoe to the area where the winter road meets the Dempster Highway in order to fill in the start of the road again. April 15th is the last day to have a land use permit for a winter road.

[redacted] – What about wolves and predation? I worry about the yearlings. What if the winter roads concentrate the caribou and make them more susceptible to wolves?

[redacted] – When we use the winter roads, we are there all the time using the roads. We don't see wolves. They're there, but they are not on the road because we are using it 24 hours a day.

[redacted] – Wildlife monitors could be looking out. We could be taking part in those adaptive measures.

[redacted] – They will report any wildlife that they see.

[redacted] – Once we are on top of a well and activities are underway it would be impossible to shut down the work. It would be too hazardous to shut down. There will be some latitude to investigate different locations in the beginning as we have all wells that need to be maintained as options at the start, but once the well site work begins, there is less latitude to stop and move to a new location.

[redacted] – It is difficult to stop or pause. Hours isn't unheard of to pause, we could pause for say 12 hours, but pausing for days would cause issues.

[redacted] – Could we come up with other possible mitigations? For if the road does impact the herd. Other than shutting down?

[redacted] – We will have very limited traffic. The most traffic will be the wildlife monitors. Or the YG inspectors or other inspectors. Would VG be interested in doing their own inspection? We could maybe accommodate that.

[redacted] – In the past, we've hosted tours of our operations. We could make arrangements for appropriate times to facilitate tours.

[redacted] – You had asked, what would we do if predation was happening on the winter road? There is a small chance of predation happening, but it is very difficult to manage without knowing the specific details. Their likelihood is so small that it's difficult to plan for. Might not be able to have plans in place for every eventuality, but have a mechanism in place for dealing with issues if they arise. For example, a team above the monitors that they can report to, such as wildlife biologists, VG staff etc. Based on information and what's going on, then that team can discuss and provide advice and put together an effective site-specific mitigation measure.

[redacted] – That is awesome.

[redacted] – Yes, we've been wanting that. That would be welcome.

[redacted] – We are not trying to handcuff you. We would just like to be involved.

[redacted] – The plan for reclamation is remove it all and plan for regeneration? It will be important to think about end land use objectives. This has been an area excluded from use for a while, and there is

DRAFT

interest in bringing back use. Would natural regeneration bring us there? That should be taken into consideration.

[redacted] – Compared to a hard surface road. For these winter roads, the base layer (vegetation) is left intact. The trees and large shrubs are all that is removed. In terms of natural reclamation, the foundation is already there. Often there is not a lot that is done to reclaim those areas.

[redacted] You've been researching regeneration at EDI. Any findings worth sharing?

[redacted] – We looked at regeneration along types of linear feature specific to the larger exploration program, the Executive Committee Screening. This is building on work that YG already started. We are looking at successional pathways on different linear types of development. We used that as a base, understanding the year of disturbance and then tried to determine the stage of regeneration. We are in the final stages of writing that up and we can share that when it's done. What I said earlier about the base layer being maintained that's based on what we saw during this research. That's how we are getting a sense of how older linear features are regenerating.

[redacted] – Regeneration could go different ways. You could end up with difference species. It would be useful to look at other projects, and culturally important plants.

[redacted] – What we see more often in Alberta is that any resulting impact from linear features is due to snowpack that are the result of other uses such as snowmobile, and that results in additional packing and could result in a "highway" for wolves. If it stays unpacked, then it isn't used by wolves.

[redacted] – Why is the seismic line here near town with nothing growing on it?

[redacted] – This far north it tales a long time for things to regenerate.

[redacted] – Quick chat about process from here? What date do you want to submit? How much time do we have to engage?

[redacted] – That's up to Chance.

[redacted] - We would like to have our land use permits at the end of November and early December. In order to build the base and to commit the oil and gas equipment. We would like to be in YESAB soon. Very soon.

[redacted] – We need, at least, a logistical plan to get equipment into the area and get people under contract. We are cutting it close right now.

[redacted] – We look forward to getting VG's feedback and the input on the more technical pieces and work on integrating that into the proposal.

Action Items/Next Steps:

APPENDIX 2-C-67. October 31, 2020, Meeting Summary – document not available at time of submission.

APPENDIX 2-C68. November 3, 2020, Meeting Summary

VUNTUT GWITCHIN NATURAL RESOURCE COMMITTEE AND CHANCE OIL AND GAS MEETING

PROPOSED WELL MAINTENANCE AND WINTER ACTIVITIES

Date: November 03, 2020

Location: Conference Call

Attendees:

Vuntut Gwitchin:

[redacted], Director of Natural Resources, Vuntut Gwitchin Government
[redacted], Senior Researcher, Firelight
[redacted] Council, Vuntut Gwitchin Government
[redacted], Natural Resource Committee
[redacted], Natural Resource Committee
[redacted], Natural Resource Committee

Chance Oil and Gas Limited:

[redacted], President
[redacted], VP Government and Community Relations
[redacted], Regulatory, Environmental and Community Relations Coordinator

Vertex/Hemmera:

[redacted], Vertex
[redacted], Human Environment Business Leader, Hemmera
[redacted], Senior Environmental Specialist, Hemmera
[redacted], Human Environment Specialist, Hemmera

Purpose and Objectives

The purpose of this meeting was for Chance to provide the Vuntut Gwitchin (VG) Natural Resources Committee (NRC) with additional information pertaining to the withdrawal of its Project Proposal from the Dawson Designated Office.

Meeting Discussion:

[redacted] – Opened with a round table and reviewed the agenda.

[redacted] – Referred to an email that went out yesterday providing VG with notice of Chance withdrawing its DO submission. This approach was informed by advice from YESAB. Withdrawal would allow Chance to incorporate changes to the project that they have decided are worth pursuing. The changes relate to Chance's interest in undertaking extended flow testing of natural gas in three of the wells. Chance is interested in testing one gas bearing zone in M59, one gas bearing zone in M08, and two

DRAFT

gas bearing zones in J19. The same tests will be completed as described in the original project proposal. E.g., Pressure tests will be conducted to ascertain integrity of the well bore. Then Chance would proceed through the extended flow testing. Chance is unclear how long that test would take per gas bearing zone. However, estimates it to take 2 weeks. Extended flow testing at one site would be completed at the same time as the rest of the maintenance work. While conducting the flow test, a service rig would be elsewhere at another well site. Chance does not anticipate the duration of the project changing much. The zones of interest are the discovery intervals, or partial discovery intervals, that helped to define those sites as Significant Discovery Licences. The goal is to test the natural gas by measuring the pressure of the formation. A certain volume of natural gas would be produced over a two-week period. Information gathered at the outset would be compared against the end. Having measured what is withdrawn then it is possible to calculate an estimate of the resource in that accumulation. Chance has observed an obvious need in Yukon (e.g., by Yukon Energy). Yukon Energy is renting diesel generators and importing diesel generators. If Chance can demonstrate that a natural gas source is possible in the Yukon, then it could be an economic asset in northern Yukon. Assuming these wells go through flow testing, then they would be left in a suspended state pending an additional environmental assessment process that would be for the production and collection of the gas deposits. Rather than abandoning six wells, Chance is proposing to only abandon 3 wells and have 3 wells suspended as natural gas producing wells. The other 2 wells would be established wells for down hole disposal. Equipment on site for the extended flow testing would be similar to the equipment described in Chance's draft project proposal for its 30-well exploration project for Executive Committee Screening. Natural gas would be flared for the test period. If there are any liquids recovered, they could be trucked away for disposal in Alberta and/or down a disposal well. In M59, the natural gas is dry. In M08 and J19, the gas bearing intervals probably have more liquid. Perhaps some liquid propane and/or condensate. That would have to be trucked to Alberta or injected down hole. Tanks will be needed on site to contain what can't be flared. Chance will shortly be having engineering professional better defining/predicting what will occur. Chance's goal is to demonstrate to Yukon Government that there is a viable and locally available sources of energy. A resource that is more environmentally friendly being focused on natural gas and not diesel. Chance believes this will diversify the Yukon's economy, especially given the impacts of COVID on the Yukon's tourism industry. Chance also believes this resource could diversify the Yukon's supply train. Chance is revising its YESAB submission to include the changes mentioned regarding extended flow testing. Chance is hoping to get back in to YESAB as soon as possible, and hopefully still start this project this winter.

[redacted] – Expressed that these changes are quite a significant change from the previous project. VG will need some time, after having this in writing, in order for VG to formulate a response. In response to Chance's hopes of getting this new project into and through YESAB quickly, VG and Chance need to talk about timelines. First VG will need to talk internally to better understand what it will take for VG to review the new project proposal internally and provide comments to Chance.

[redacted] – At this time, only had one question pertaining to mechanics. Are there any anticipated changes in employment that would be associated with the additional changes?

[redacted] – Not for people hirable from the Yukon. It is a speciality service. Flow testing crew and equipment would have to come from Alberta. There may be some extra people involved in the flow testing maybe 2 per crew. Its possible we could have 6 more people depending on the flow testing.

[redacted] - No additional questions from the NRC members at this time.

[redacted] Indicated that Chance and Hemmera are updating the submission document. It can be shared when it is ready. Chance asked [redacted] and [redacted] to comment on timelines. Chance stated that they would be speaking with YG tomorrow. Though YG is aware of Chance's intention.

[redacted] Wanted to make it clear that changes will be incorporated into a new project proposal and those project changes will be tracked/carried throughout the document. Currently Chance and Hemmera are making those changes and adding in the new content. While we are fairly close, Hemmera hesitated to give a specific time for having the new project proposal (perhaps a week). Chance will have to review the draft. Then the draft will go to First Nations for review. The Dawson DO is pleased that Chance chose to revise the proposal and resubmit. Once the new project proposal is submitted, then the process restarts, i.e., proceed through the adequacy process again and forward as usual.

[redacted] Acknowledged that Hemmer and Chance are working on the specifics. However, broadly, inquired if Hemmera and Chance are systematically reviewing the interactions between the project components and the valued components, i.e., revising the effects assessment. Additionally, with respect to cumulative effects, if this project supports the development of a natural gas industry, has/will that be considered in the effects assessment.

[redacted]– Chance indicated that it needs the flow test to work that out and that it is not a certainty that the tests will go/be successful at this time. Looking at the future is too speculative

[redacted] – Responded that the new project components will be described/explained in the new project description and then be carried through the effects assessment to ensure that the whole document is updated. The effects assessment will include/consider the flow testing. Additionally, with respect to flow testing, if it is successful then those wells will be suspended for future use. Any future use is not being included in this proposal. The wells would simply remain suspended. Actually as they are now. Extended production will not take place on site. If Chance decides to do that in the future that would have to go through another assessment. At this times chance doesn't know what that looks like.

[redacted] – Understood, however questioned whether successful flow testing subsequent resource development can be seen as a reasonable in the foreseeable future.

[redacted] – Believed that the way the North Yukon Regional Plan, plan only looks at projects submitted/existing at that time. Chance did not think you can look at what might be foreseeable in the future. It will be difficult for Chance to consider / get into what would be there in the future.

[redacted] – Didn't have any additional content to add when asked by RW.

[redacted]– Stated that it sounded like Chance had had conversations with Yukon Government and inquired as to how long Chance has been talking with Yukon Government about this?

[redacted] – Only engagement with YG to date has been to notify Chioma (Izugbokwe) as to what Chance was looking to do. Chance has shared a draft program, but no comments from Chioma were received. Beyound that, no one else in YG is aware. Chance will be meeting with Yukon Government tomorrow.

[redacted] – A rough outline of the program was shared approximately 10 days ago, maybe 2 weeks. At that time Yukon Government was hesitant to provide any comments until the YESAB process had concluded. They did not want to be seen as influencing the process.

[redacted]– Stated that parties needed to map out the next steps. While NA was hesitant to give a date. I did hear him say a week to a week and half.

[redacted] – That depends on the back and forth with Chance in order to make sure we have all the details that we need.

[redacted] – What would the NRC like in terms of materials, in order to understand the changes. Do you just want the revised project proposal? An additional meeting? A summary of the changes?

[redacted] – VG would definitely expect the revised project proposal in full. And in terms of the committee's work, a summary of the changes would be helpful as well as a meeting. All three are likely needed. We should probably have another meeting before this gets submitted to YESAB. VG will have to revise its response.

[redacted] – Tentative date for 2 weeks from now for a meeting? With revised project description being provided in a week and a half.

[redacted] – Believes VG will need to talk internally as a committee. They have other files that they are working on. The NRC will discuss its schedule. Request that Hemmera/Chance provide an email so VG can follow-up once they have talked about their workload and timelines

[redacted] – For the next meeting scheduled between Chance and VG, Chance would like an agenda item to include discussing Section 68 benefits agreements.

[redacted] – Anything else the NRC would like a higher level of detail for?

[redacted] – Not at this time. Believed that the summary will be helpful for the NRC, then the draft when it is ready. It will be good to get that as soon as possible.

[redacted] – Responded that a one-pager could be put together and shared fairly quickly. Updated YESAB draft 12/13 of November, perhaps?

[redacted] – As Chance and Hemmera are progressing with the draft, they can give the NRC an update. To keep everyone in the loop.

[redacted] – Chance will share the summary before that week and half. That way VG has something to consider.

[redacted] – sign-off. Will follow-up with an email shortly.

DRAFT

APPENDIX 2-C-69. December 17, 2020, Meeting Summary

VUNTUT GWITCHIN GOVERNMENT AND CHANCE OIL AND GAS MEETING SUMMARY[DRAFT]

PROPOSED WELL MAINTENANCE AND WINTER ACTIVITIES

Date: December 17, 2020

Location: Conference Call

Attendees:

Vuntut Gwitchin Government:

[redacted], Director Intergovernmental Relations & Governance
[redacted], Director of Natural Resources
[redacted], Senior Researcher, Firelight

Chance Oil and Gas Limited:

[redacted], President
[redacted], VP Government and Community Relations
[redacted], Regulatory, Environmental and Community Relations Coordinator

Chance Consultants:

[redacted], Vertex
[redacted], Environmental Dynamics Inc.
[redacted], Human Environment Business Leader, Hemmera
[redacted], Senior Environmental Specialist, Hemmera
[redacted], Human Environment Specialist, Hemmera

Purpose and Objectives

The purpose of this meeting was for Chance Oil and Gas Limited (Chance) and Vuntut Gwitchin Government (VGG) to discuss the proposed Eagle Plain Well Maintenance and Winter Activities Project and previous questions submitted to Chance from VGG.

Meeting Discussion:

[Meeting began with introductions and parties reviewing agenda.]

[redacted] – This is an opportunity to discuss changes made to the proposal after the last comments we received from VGG. Received the four main questions from Jordan and incorporated additional text into the revised draft. The main summary table in the email shows where those items were addressed. With respect to concerns about putting wells back into suspended status, we clarified in the introduction the Oil and Gas Drilling and Production Regulations. Clarified the language and we removed the "3 years language" that is not in regulations. Pertaining to the question around potential affects between Extended Flow Testing (EFT) and permafrost, air quality, and wildlife. Added additional text to those sections in the

proposal. The analysis determined there were not many additional interactions between EFT and wildlife. Part of that was the design of the flare. The length, physical time of EFT, and the prediction of wildlife in the area at the time. Text was added to show those considerations. That is also why a value like air quality did not need a full-scale effects assessment. We revised the COVID health and safety procedures. Made a few changes based on the current COVID conditions. Main take home, Chance would follow and monitor Yukon policy. COVID policy/precautions is changing quickly. Once the project is permitted, what the health procedures are at that time, Chance will follow them. Overall, the document is essentially ready to go for submission.

[redacted] – Related to the regulations, can you provide more context, what those regulations are and how they relate to Chance's project? Title of regulation provided Oil and Gas Drilling and Production Regulations.

[redacted] – We have 8 wells in suspended status. When in a suspended state – not able to produce or inject anything. What we are planning to do is convert two of those wells into deep well injectors, so we have a means of disposing fluids that are used or produced during the project. Three wells will go through EFT and are natural gas bearing rock formations. Objectives, to get a better sense of the resource. When these wells were first drilled and tested, it was for a short duration and that info does not say much about the resource. EFT will help show what the resource base is behind the well. Important info that feeds into development strategies. Then three remaining wells will be abandoned. At the end, left with five wells, three will ultimately be gas producers, but they will be returned to a suspended state after the EFT. The disposal wells will be shut in, but capable of being used for injectors in the future. We have a water well at our camp and we might want to do an extended flow test at that well and we could inject saline water from the water well to the disposal well.

[redacted] – If the wells don't turn out to be suitable for commercial development, will they still remain suspended or will they be abandoned?

[redacted] – If the results are discouraging. Then we would abandon the wells.

[redacted] – Is there a number that leads to/triggers that decision?

[redacted] – Can you give us some insight into how you plan on measuring or bringing those wells into a suspended or abandonment. Threshold for making that decision.

[redacted] – When you do the flow test. Flowing natural gas to the surface and flaring that gas. Flaring the gas because there is no market to sell. When you do the flow test, you start with measuring the initial pressure. Then you produce a volume of natural gas for about two weeks. Then you measure pressure again. That final pressure measure can take some time. Maybe two weeks. Then that information, the change in pressure between the start and the end, can be used to determine the resource mass. Would need confidence that the resource mass is large enough before talking about production and talking to people about investment, markets, etc. Maybe Yukon Energy or mines as potential markets. Or similar to how Inuvik has used natural gas. In order to go ahead with that strategy, we need to know what the resource mass is.

[redacted] – For clarity Richard, nothing about working with Yukon Energy, etc. pertains to this project.

[redacted] – Correct. What I was just talking about is hypothetical. We need the data. Then would submit another proposal in the future.

DRAFT

[redacted] – What's that trigger? For it being marketable?

[redacted] – The flow test won't be the full/only defining measure. If we are going to get into contracts with Yukon Energy or a mine, we would be looking into an arrangement that would have to last up to 20 years in order to justify the investment of moving forward with development. Eagle Plains has zero infrastructure to deal with oil and gas development.

[redacted] – Is it fair to say that EFT for this project, the Designated Office project, will inform the Executive Committee multi-well exploration program.

[redacted] – No this project is not connected to the Executive Committee Project. It might have some benefits for it, for example, being able to use injector wells, that could provide value for the exploration program. What we get with respect to flow testing for the natural gas, may or may not be relevant to the Executive Committee. To get to a 20-year supply, we have to define 15 BCF of gas.

[redacted] – Any future work whether it's putting those wells into production would have to be a separate proposal.

[redacted] – Okay thank you, can we go back to my questions about regulations.

[redacted] – My interpretation of the regulations. Once we put these wells into EFT, they go into active status. Once that testing is complete and then they are returned to suspended status. If you have no additional activity for 3 years, then they have to be abandoned. As far as the injector wells. We plan on keeping them in an active status, by using them once or twice a year moving forward.

[redacted] – For how long?

[redacted] – Until the full Exploration Program [Executive Committee Project] begins.

[redacted] – Most of the wells are in a suspended state right now. Have been suspended for 60 years. Most "statuses" have certain time periods; however, regulators can extend timelines.

[redacted] – Are you speaking to the 2014 order?

[redacted] – In 2014, the regulator of the day, extended the suspended status for 5 years. Since then, have been in a back and forth with regulators to continue that status. We are still trying to do that. Regulators have the power to extend a suspended status. The status gets reviewed and that's where we are now.

[redacted] – In those regulations, it speaks to suspended wells in section 91. Speaks to the 3-year period as well as additional details.

[redacted] – The regulation provided was a federal regulation and not the territorial regulation. Are you aware of that? Make sure the right ones [regulations] are sent out to other parties.

[redacted] – That was an honest mistake. I pulled that table together. It should say the Yukon regulation. Yukon Oil and Gas Drilling Regulations OIC 2004/158.

[redacted] – Nathan can you describe how Chioma Izugbokwe (Yukon Government) would get involved?

[redacted] – I am expecting them to be full participants. I think they will feature prominently.

DRAFT

[redacted] – The regulator is responsible for administration of legislation. If they felt that there were inaccuracies in how legislation was being interpreted, or if something was going against the legislation, they will bring that up. Beyond that, they are free to participate in any way they want. That's generally been the case with assessments in Yukon.

[redacted] – For the regulator, Chioma, they would also facilitate, on behalf of YG, comments from Environment, Highways and Public Works, other YG Departments. As well as submitting their own comments in the assessment process. Those opportunities would help clarify the regulations as well.

[[redacted] joined the call.]

[redacted] – Welcome [redacted] to the call. We've really just gotten into substance of the first question. Hand things off to Justin.

[redacted] – We appreciate the responses provided and the changes to the proposal. Some issues still need clarification. For example, birds. Still no response pertaining to EFT effects on birds. That content in the proposal remains the same as previous version. The rationale for not bringing birds in is that the project has low potential to interact with birds because the majority of birds are migratory and should be at their winter grounds. However, we know flaring can adversely affect birds. The Proposal should identify which bird species are likely to be resident/over wintering and whether those species be affected.

[redacted] – Certainly, that content would be straight forward to add. Species that are present: Ravens, Canada Jays, Boreal chickadees, and a couple species of wood peckers. Potential for interaction is quite low. The main difference between EFT and other well maintenance activities is the flaring stack. Potential interactions with birds are accidental collisions. That's the primary concern, but very limited potential of that happening.

[redacted] – Thanks, adding that information would be nice. With respect to Permafrost and flaring. Literature shows there is evidence that substantiates a relationship between flaring and increased surface temperature. It stands to reason flare stack height could mediate increases in surface temperature. The Proposal should provide information about the relationship between flare stack height and permafrost impacts. Flipping things around and thinking forward to other projects, have you given any thought to changes in permafrost and melting conditions over time and how that might affect the integrity of project infrastructure.

[redacted] – We retained Palmer Environmental to do some permafrost studies. They've been in the field over the past couple years. Focusing on the area of interest [i.e., area associated with the multi well exploration project]. Those studies have not quite concluded. Hoping to finish up the end of this year. Couple points to make. In the Eagle plain area, on the higher ground and to a lesser extent in the valleys, bedrock is quite close to the surface. Potential for degradation of ground stability for operations is less of a concern where there is bedrock. Where that is different in the valleys, we would want to avoid work in the valleys. However, it is hard to know where the resource is.

[redacted] – This in an important issue. Need to have more discussion and workshops on this. In order for us to get into those topics we need a cooperation agreement.

[redacted] – Our understanding, this project has nothing to do with Executive Committee project. Not sure how those comments relate.

DRAFT

[redacted] – We are under Yukon orders to undertake maintenance on the wells. There is potential for wells to continue to exist after this program, they will have some application to the Exploration Program, but what that is, will be dependent on the outcomes of that program as it is carried out. Example, potential for disposal wells and fuel supply.

[redacted] – Pertaining to air quality, we appreciate the additional information. That was what we were looking for, previously there just wasn't enough info. Now, looking into caribou. We appreciate the response that the Project changes are accounted for by the conservative assessment that was already undertaken in the proposal. I.e., assuming 24 light and noise disturbance. However, that doesn't seem to account for increased intensity of disturbance. More people. More traffic. More machinery. In general. There may be no changes in frequency of disturbance, but there does seem to be changes in magnitude of disturbance.

[redacted] – I can speak to increased activity and flow tests. It is relatively low. There is a day shift and a night shift. One pick-up truck, back and forth twice a day with two testing personnel. Plus another pick-up truck for the supervisor. Other than that, there wouldn't be any other activity out there. Other than moving the test vessel in and out, that would be one tractor trailer load. A couple office trailers moved in and a little trailer for the 100-foot flare stack. The intensity of the activity is relatively low. It would be lower activity than what we would see on the abandonment and the disposal wells.

[redacted] – There would also be the wildlife monitor truck.

[redacted] – Your assessment is that this increase in disturbance is not sufficient to change the assessment valuation.

[redacted] – In the original assessment, we took precautionary large zones of influence. They would have accounted for louder and brighter disturbances than are really planned. They would have included the most extreme noises and activities levels. I'm confident that the zone of influence distances that we are using encompasses the potential effects of the extended flow testing.

[redacted] – What infrastructure would remain following closure of the project? In Section 2.5.8, it states reclamation activities will attempt to return the site to its previous conditions as much as possible. With several exceptions [listed the well sites]. However, no other info was included there. Curious to know what will remain at the sites. Will the flare stack remain?

[redacted] – As far as those sites, they would remain the same as they are now. A well will be at the site, but the flare stacks and the machinery would all be removed. They would go/return to the same physical status as they are now.

[redacted] – We know that flare stacks can leak. So there's potential for contamination, so wanted to know if they were going to be left behind. With respect to COVID and following YG guidelines, we would like to know if chance is developing its own policies in addition to those of YG?

[redacted] – Here at Vertex, we will be running the project for Chance. Vertex has developed a full comprehensive COVID 19 action plan that supplements or exceeds YG requirements.

[redacted] – Could that information make its way into the project proposal?

[redacted] – [redacted] and I can talk about that, and see what makes most sense.

DRAFT

[redacted] – Given, this hasn't gone through YESAB screening yet, this project is highly unlikely to be done this winter. Likely winter 2021/2022 and vaccinations may be available.

[redacted] – That runs through the questions on the proposal.

[redacted] – I think that's everything with the few questions we have so far. Hope to have some time for a discussion, pertaining to Chances' perspective on addressing the concerns of the other parties or First Nations. What discussions have happened with chief operations officer, and Chance needing to get this proposal in by December 31?

[redacted] – We have been back and forth with YG for almost two years. Received orders in 2019 to do the maintenance work. We also have OICs to engage with First Nations and implement engagement plans. In the case of moving this forward, YG is aware of our engagement plans. Trying to live to the spirit of the engagement plans. There's been back and forth with your colleagues Jordan to get this document prepared. YG is aware we are moving this project forward. Living in a setting with COVID – that is causing more issues. YG knows where we are and that we are moving forward with the program. The pace is the pace.

[redacted] – Have they said get it in by December 31st?

[redacted] – They have strongly encouraged us to get it in.

[redacted] – North Yukon Gas Forum, YG told us they had a conversation there. About the clear mandate for us to get this application to YESAB.

[redacted] – I will have to look at my notes to see if YG actually raised that point. It's been 6 years, plenty of conversations going around. We're interested in how you've addressed meaningful participation of First Nations over the past year.

[redacted] – Not actually six years. Review period in 2014 on status of the wells. Regulator renewed/gave suspended status until 2019. Have since been engaging with YG to continue that suspension. The orders we are dealing with now are maybe 18 months old. In 2014, we got approval to continue the suspended status. Between 2014 and today, we have developed and been implementing engagement plans with the affected First Nations. We have been doing our best to implement those plans. The past year has been focusing this project.

[redacted] – That direction 18 months ago? Is that available?

[redacted] – I'm sure YG would be happy to share it.

[redacted] – We are talking with YG ADMs tomorrow and we will be sure to have that conversation with them.

[redacted] – From the perspective of YG, the four older wells need to go into operation or abandonment by December 31st of this year. Obviously, that is not going to happen. Moving forward, with YESAB process, is there any concern that the project or that Chance is out of compliance with the direction of the YG?

[redacted] – We haven't heard of anything yet, no. COVID has the most potential to impact timing. We would not be able to do this by December 31st. COVID is one issue, but also the snow pack. There are other factors that influence what you can do and when you can do it.

DRAFT

[redacted] – The other thing to consider, we don't necessarily carry out many activities in December, except packing snow. We access well sites in Jan/Feb and when operating an under the land use permit. Operationally, the date/timeline that Chioma chose, it was/is a difficult time. Even without the hurdles we've had, the timeline still would have been hard to meet. The date we are going to focus on, get this into YESAB process, to get the clock ticking and get this in the public view phase. There is still an opportunity to work together. This is just the beginning. We can continue our conversation moving forward.

[redacted] – Nothing further from me.

[redacted] – Nothing further from me.

[redacted] – There might be some minor revisions to the proposal. However, for the most part, sounds like we are pretty much there.

[redacted] – I think that's accurate. Subject to the corrections/revisions mentioned today. Seems like we are there.

[redacted] – [redacted] and I will be a round to provide any additional information. Anyone on the Nature Resource Committee, if they need additional information, we are available to answer questions.

Action Items/Next Steps:

Action Item	Responsible Party	Date Required
None Identified	N/A	N/A

DRAFT

APPENDIX 2-C-70. February 17, 2021, Meeting Summary - document not available at time of submission.

APPENDIX 2-C-71. October 13, 2021, Meeting Summary

OLD CROW OPEN HOUSE SUMMARY

Date: October 13, 2021

Location: Chief Zzeh Gitlitt School Gym, Old Crow

Attendees:

[See Sign-in Sheet for attendees.]

Chance Oil and Gas Limited (Chance):
[redacted], VP Government and Community Relations
[redacted], Regulatory, Environmental and Community Relations Coordinator

Consultants:
[redacted], Hemmera:
[redacted], Hemmera
[redacted], Environmental Dynamics Inc. (EDI)
[redacted], EDI
[redacted], Peer Solutions
[redacted], Palmer

Purpose and Objectives:

The purpose of the open houses will be to share information about Chance's Eagle Plains Exploration Project (Project) and to collect feedback and concerns. More specifically, EDI, Peer Solutions, and Palmer presented information on baseline studies conducted for the Project.

Q&A Summary:

Note: The floor was open for questions throughout the presentation and afterwards.

[redacted] presented an overview of Project Components. Then [redacted] presented a high-level overview of the Yukon Environmental and Socio-economic Assessment Board (YESAB) process. Then EDI, Palmer, and Peer presented.]

Question/Comment: Clarify your role. You are from YESAB - what are you doing?

> [redacted]: We are not in YESAB and I'm not from YESAB. However, we are pulling together the application to YESAB and are in the early stages of developing the application.

Question/Comment: You've identified possible Valued Components (VC) based on past meetings. What has been heard from past meetings?

> [redacted]: Yes, we've shaped VCs from comments/concerns raised during past meetings, VCs from past assessments/projects, and using our professional expertise.

Question/Comment: When you did your baseline studies, what does that mean?

[redacted] The other consultants will provide those details in their presentations. The fieldwork for those studies was done in the project area on the map.

Question/Comment: Were those studies in that particular area [referenced outlined area on poster]?

[redacted]: Yes.

Question/Comment: In reference to the submission to YESAB, when is that due?

[redacted] Chance started this work [community engagement] a few years ago. We will be coming in November. Should be bringing Heritage in November. It is not “due”, but Chance is looking to submit at calendar year end.

Question/Comment: How could surface water be impacted. Are there going to be examples of things that will happen and what you will do?

[redacted] That is likely on our next trip, but there might be talk about that today because sometimes it’s about project design. Will touch on the project design portion today, but actual effects and mitigations will come at later meetings.

Question/Comment: My biggest concern is to let someone do what you are going to do [oil and gas development] while not protecting the area.

[redacted] We want to hear about your concerns. Discussion around that helps to frame the VCs and helps us to look at things.

Question/Comment: This is coming from an advocate for the protection of environment [land, animals, water] who was raised in the community and raised to protect lands [from oil and gas development, flaring]. People are scared and concerned, even more so today. They didn’t see the porcupine caribou herd this year. Water issues are important global issues too. There are issues with the salmon and vegetation. Land is eroding before our eyes. About our geology and terrain, how stable is that area, the project area? How stable are we today? We have people that come to our territory and do research and do research on our behalf. Informed decision making is critical for the Vuntut Gwitchin Government.

Question/Comment: Gwitchin people are fighting for calving grounds in Alaska, and your project is in the head waters and winter grounds. There is a trust issue that there could be fracking. But there is or was directional drilling? Or is it that only the moratorium on fracking that stopped Chance?

Question/Comment: Any updates on litigation?

[redacted] Not involved in legal matters. [redacted] Chance is focusing on conventional drilling, not fracking. Northern Cross wasn’t trying to hide anything, but describing all components of oil and gas. Northern Cross was owned by a Chinese company, but no longer.

Question/Comment: Does Vuntut Gwitchin Government (VGG) have veto powers? What you're saying is that, as a decision body, VGG has a final say?

[redacted]YESAB provides recommendations and YG makes decisions. However, YG consults with First Nations and that's when they can have their say and stop things.

Question/Comment: Concerns around oil in the area. There is oil in the Old Crow flats, it was always known that it is there, it has been identified.

Question/Comment: Historical context, with Northern Cross in particular. The blocks are in our traditional territory, but not R-blocks. You were under review by the Designated Office and were sent to Executive Committee because you did not have enough info. You are going to submit a new application. With respect to this, listen to elders, lots of work has been done already by Vuntut Gwitchin Government. You need to take this into account. That's why there is no trust. We have standards set in the community, standards that you are expected to meet. We need more analysis on what you found and your mitigations as well as the potential impacts to the environment. We know of the various boards that exist (caribou). This is not a standard application. There was a submission to the Designated Office, and it was sent back down to start from zero. The Yukon Oil and Gas Act requires benefits agreement which provides some decision-making power to the First Nation. There is a need to slow down because when you submit to YESAB the clock starts. There are 60-something days, and, at that time, the First Nation or community is reacting to what you've submitted or shared ahead of time. I'm concerned about the timeline. Request that you slow down and give us time to get info from you and then respond.

Question/Comment: Certainty and clarity about the future of the project. You say what your project is going to do and not do, but what certainty does the First Nation have for future events? Will there be a refinery in the Yukon? You say it will be small scale now, but nothing is holding you to that. That is where trust is an issue. What are the First Nation's tools?

Question/Comment: Who gave the permission to go there and do that work? I did not. Our elders said people would come and take things from us. We need to save the land and animals for our children.

Question/Comment: Concerning scale of the project. I've been to communities in Northern British Columbia that were told similar stories. They were smaller projects that were supposed to be small. Then they got bigger. Those areas also have seismic lines everywhere. They have no moose anymore. Old Crow is a small community, how does it/we stop this/that from happening?

Question/Comment: Is there salmon there in the area?

[redacted] salmon in the area.

Question/Comment: However, that the water flows all the way to where the salmon are.

Question/Comment: About the length of research, when did you do it and how much info was collected?

[redacted]Water was collected in summer and winters. We took a couple weeks long in both cases.

Question/Comment: About the presence of fish. Did you see fish in all the streams? Don't use 'probability' or 'predict the probability of fish', use language we understand.

[redacted] this [the language] should become clear as I walk through the slide, but this is good feedback.

Question/Comment: Do you know where the streams and rivers are? Could they be pointed out on the map?

[redacted] Yes, we have the project area and identified sample sites.

Question/Comment: Low temperatures and fish. Are there fish that can freeze and then re-animate in the spring or summer?

[redacted] No, but this is an interesting question, when you find slimy scalpin, you know there is overwintering areas nearby.

Question/Comment: Is the Chance Project Area in the caribou winter area?

[redacted] Yes, the 2016 winter area. There were years the caribou were not even in the Chance Project Area in the winter.

Question/Comment: Regarding the caribou: your caribou management plan was determined to be insufficient and impacts of the road on caribou was missing.

[redacted] Roads are an issue with any caribou. Project roads and their impacts to caribou.

Question/Comment: How will you show effects of roads on caribou and their migratory development? The communications and reporting about caribou are important.

[redacted] The environment work done is new. Understanding the effects of the road is the next step of analysis and we are working with the Porcupine Caribou Management Board. That way we can see where the road will be and effects on migrations. That will be key to the effects assessments. This has not been done yet.

Question/Comment: Will critical habitat be identified in the area? Are they are listed under Committee on the Status of Endangered Wildlife in Canada (COSEWIC)?

MS: They are not listed. Don't think that the critical habitat has been identified, or at least, nothing at this time. Calving grounds would definitely be considered critical habitat and, perhaps, some wintering grounds. If critical habitat was identified, it would be calving grounds.

Question/Comment: Are you seeing changes across the years with the caribou, water, fish, etc.?

[redacted] In the caribou over 30 years there has been some changes. Regarding fish, there is limited long-term data. Information on water goes back "a ways" with temperature - with an increase in temperature over time.

Question/Comment: It is going to take time to finish your studies. We rely on caribou as sole source of food. This is problematic with climate change and migratory changes. Hearing "little changes" form you for fish. I'm skeptical of you saying little or few changes when everything tells me there is more change. The caribou are not coming here, and we ate moose. I can't imagine 30 oil wells in the ground, and their impact on the

ground. The permafrost is melting. Concerned about the weight of the drills and wells, with the melting permafrost, causing them to sink into the ground. Glad people referenced the calving grounds in Arctic National Wildlife Refuge (ANWR), is a very real concern. We have to build a strong relationship to make good decisions. We have to build trust. We have to stand for all future generations. Caribou did not come to Old Crow this September. It scares me that there are caribou herds that are down to 3 animals. I do not want that to happen to my people or community.

Question/Comment: Question about how much wastewater would be produced by 30 wells. You're pumping wastewater underground?

> [redacted] In the reservoir, there is gas, oil, and water. That is what comes up and then that water mixture is what is put back down where it came from. Drilling chemicals are separated from the wastewater.

Question/Comment: You can fly over all the seismic sites and see the leftover damages from 50 years ago. It scarred the landscape. Predators. European Union just today have issued a banning oil and gas in the Arctic.

Question/Comment: The analysis and findings are not completed yet? So you will come back and educate us again?

> [redacted] The analysis and findings are not completed. If you have any information, it helps us. We don't want to come with complete reports.

Question/Comment: Every animal in this area we have a spiritual connection to, like a pet at home, and how much you grieve when it is gone. We live in untouched nature. We have committed to climate change (solar panels). It's not us impacting climate change versus India. Naturally connected to nature here. Those animals were who guided us, we are linked with them and had to speak to them. It's hard to articulate their importance. Talk to us and we'll tell you about that relationship.

Question/Comment: The Porcupine Caribou Technical Committee (PCTC) is made up of traditional users. It would be good to share the results of your work because the submission you are putting in will include information from all the communities.

> [redacted]We met with PCTC, and they want to see our methods section.

Question/Comment: Next, with respect to the submission process in advance of Yukon Environmental and Socio-economic Assessment Board (YESAB) submission and in advance of the clock starting. Give us time to review.

Question/Comment: Are there other ways that you are going to do consultation? There are people in the community that have traditional knowledge. How will you work with them? Mentioned a story of a family member talking about a river area, saying that what happens there, it will happen and come there, there is knowledge there to get from people.

> [redacted]COVID caused some hiccups. We had planned meetings all summer. Will share the reports. Had hoped to have a survey and go out to talk to people. We would like to do that. Chance would

like to bring people to the area/camp. We do want to do what the community wants. Everyone is on Facebook, so it is good for us to have a Facebook page or website. We want to start that.

Question/Comment: Specific question about wildlife, are you studying wolverines?

[redacted] No.

Question/Comment: Invasive species seen along the Dempster Highway are a concern. Thinking about seeds, fish, and animals, could that interfere with the food of these animals?

[redacted] Invasive species will be a component of this project, every project in the Yukon must have a plan for that. For example, vehicles get washed down. Actions like that can be done.

Question/Comment: About water sampling, is it possible to take people with you?

[redacted] Robin responded that in 2019, we did. But in 2021 it is not likely due to covid.

[redacted] We always reach out and let people know when we go.

Question/Comment: About the approach to water, how holistic is your approach, what other areas are you looking at? Caribou migrate across the landscape and water has movement, too.

[redacted] We definitely take a systems approach. For example, the designated office question about water movement, you need to look at the whole systems interaction with other disciplines.

Question/Comment: Developing oil and gas locally is better for climate change, but how is that reported and is the evidence for it quantified? Recommended that that argument be quantified with evidence and then present to the community.

Question/Comment: When you drill down into the permafrost, does it cause damage?

[redacted] The hole we drill is about 3 inches in diameter for seismic testing. Regarding wells we needed refrigerators around the well, there are aspects and ways to cool the ground around the well.

Question/Comment: Did/does the ground sink in around the drill?

[redacted] We visited older wells to look for slumping. Smaller drill holes can freeze up again. Larger well have more effects and impacts. Surface mitigation against this includes thick gravel layers under the well to provide insulation. Where we are proposing wells, very little soil on the bedrock, which reduces the subsidence. On rock, not soil and ice. Target environments are where bedrock is close to the surface.

[redacted]: Through Light Detection and Ranging (LiDAR) we are getting temperature readings which appeared consistent.

Question/Comment: Concerned about the permafrost melting. Stuff (items, animals, illnesses) previously caught and frozen in the permafrost comes to the surface.

Question/Comment: Concerned about forest fires. This is an isolated region, so forest fires are a major concern.

[redacted] Yukon Government doesn't stop fires. It monitors borders, but lets them burn. 40 to 60% of the landscape burned in that area.

Question/Comment: When drilling for the well, can shifts in the ground/permafrost break the pipe?

[redacted] The pipes are hundreds of meters in ground. Anything that happens in the surface environment is superficial and will not affect the pipe. The pipes are also supported by the gravel under the well. The pipes bend. We want to make sure that we are putting the wells where there isn't going to be movement.

Question/Comment: Suggests a two-day meeting.

[redacted] Suggested working groups.

Question/Comment: That approach doesn't work when everything is connected and if you want to or need to join all the groups.

APPENDIX 2-C-72. May 5, 2022, Meeting Summary

OLD CROW OPEN HOUSE SUMMARY

Date: May 5, 2022 – 10:00 AM - 7:00 PM

Location: New Community Hall, Old Crow

Attendees:

[See Sign-in Sheet for attendees.]

Chance Oil and Gas Limited (Chance):
Greg Charlie, VP Government and Community Relations
Cindy Dickson, Regulatory, Environmental and Community Relations Coordinator

Consultants:
Todd Mahon, Environmental Dynamics Inc.
Tim Bennett, Ecofor
Susan Eastman, Peer Solutions
Shirley McCuaig, Palmer
Jeffrey McLean, Hemmera

Purpose and Objectives:

The purpose of the open house was to share information about Chance's Eagle Plains Exploration Project (Project) and to collect feedback and concerns. More specifically, Greg Charlie opened the presentation session then Tim Bennett (TB) presented about heritage resources, Shirley McCuaig (SM) presented about permafrost, then Susan Eastman (SE) presented about seismic testing, and finally Todd Mahon (TM) presented about wildlife studies.

Q&A Summary:

The open house took place over the course of the day and posters were available for viewing and comment throughout. Below are questions from poster viewing and themes relating to those questions.

Question/Comment: How will some drilling affect the permafrost?

> SM: Drilling itself has a minimal impact on the permafrost because the drill components equilibrate to the temperature of the permafrost.

Question/Comment: Where is this project? Is the drilling on our traditional territory?

> JM: Referred the person asking the question to the poster on project location. The project area does overlap with Vuntut Gwitchin First Nation Traditional Territory.

Question/Comment: It is important to work the land and then break, then work again, and break. This is to let the land rest and keep it serene.

Question/Comment: Do you get both oil and gas?

GC: It depends on the composition of the deposit, but yes, there is potential for both oil and gas.

Question/Comment: Where and when are caribou around the project area?

TB: We have some data that I will present later in the day, and I'll go into more detail then. The short answer is that caribou ranges have a slight overlap with the project area in the late fall and winter.

Question/Comment: Concerns around outsiders interfering with caribou behaviour. Radio collaring, social media and technology in general are concerns because people are bothering the caribou.

Question/Comment: Opportunities and benefits like training and those sorts of things are important. The term of the jobs is important as well.

Question/Comment: Is this project on Vuntut Gwitchin land?

JM: Referred the person asking the question to the poster on project location. The project area does overlap with Vuntut Gwitchin First Nation Traditional Territory.

Question/Comment: Work opportunities are very important to the community, especially for the youth.

Question/Comment: Run-off water from the project operations is concerning.

Question/Comment: Air quality is important; it is important to know how the project will affect our air quality.

Question/Comment: A process flow chart that shows what stage in the process is this project at would be helpful.

Question/Comment: Would drilling cause the permafrost to thaw? A poster on the permafrost protection measures would be helpful. The casing is interesting to me too, a diagram would be helpful too.

SM: Drilling itself has a minimal impact on the permafrost because the drill components equilibrate to the temperature of the permafrost.

Beyond the questions and concerns captured above, other themes that arose during the poster session included the Project's progression through regulatory processes, training and job opportunities (location, duration of training, selection of employees), position of other affected First Nations, allocation and sale of products, and well closure.

Greg Charlie introduced the presentation sessions. The floor was open to questions during the presentation and afterwards. Tim Bennett presented about heritage resources

Question/Comment: Are the archaeology sites that have been found family sites?

TB: The sites are places where artefacts were found.

Question/Comment: What your job is to do is identify archaeology sites?

TB: Yes, that is right.

Question/Comment: Do you engage with First Nations? We have a heritage branch within the Vuntut Gwitchin Government (VGG).

TB: Yes, we submit to Yukon Heritage and they send this information along to First Nations. Then, there is a comment period. We try to bring First Nations crew along during fieldwork as well. There would be two Ecofor employees and a support role from the community as well.

Question/Comment: Have you worked with out heritage branch? Also, do you tell us when you find sites?

TB: Yes, I worked with Meghan, but we aren't at the point in the project where we are in the field scanning for heritage sites, not yet.

Question/Comment: Has the Natural Resource Committee been engaged?

Greg Charlie (GC): Last year we got a letter from Chief Dana saying to cease consultation and engagement with the VGG. But we are still needing to engage with the government, we have been sending letters with no response.

Question/Comment: Vuntut Gwitchin First Nation made it's own heritage department as we have our own regulations. Do you work under those regulations?

TB: I will try to work within that.

Question/Comment: When you identify an area, how strong is the ability to prevent disturbance?

TB: This is more difficult to follow up on, and it depends a lot on the proponent. In this case I think there is an understanding that heritage resources are important to the community and being respectful of that is important to my work.

Shirley McCuaig presented about permafrost

Question/Comment: The Dempster highway has some effects on permafrost. Will the roads that Chance uses damage permafrost?

SM: We are able to make roads that don't damage permafrost.

Question/Comment: Water is very important to the community. Keeping it safe and keeping it clean is important to the community. This area where you will do work is south of our areas. What effects are we looking at? What kind of aftermath could we expect?

SM: It is consistent heat that is damaging to permafrost. Vegetation and brush protect the permafrost by reducing some of the heat. If you remove vegetation, there is more of a chance to damage the permafrost. Mitigations are all about minimizing disturbance to the vegetation and revegetating. For example, we can re-seed damaged areas and this is very protective.

Susan Eastman presented about seismic testing

Question/Comment: Do you have the dates of the burns?

SE: Yes, we have the ones in the last fifteen years.

Question/Comment: What is in your seismic bags?

SE: Geophones that were placed by surveyors.

Question/Comment: You have the dates for seismic testing, do you have the dates for drilling?

SE: The seismic testing and drilling programs go hand in hand, but I do not have the dates for drilling. Drilling would typically happen a season after seismic testing.

Question/Comment: You mentioned something about 'hot rock.' What is that meaning?

SE: It detects multiple resources, hot rock is in reference to geothermal energy, energy within the earth.

Question/Comment: How much of the area has been seismic tested already?

SE: There is lots of 2-dimensional seismic testing data. Though I don't know exactly how much of the project area has seen seismic testing. 2-dimensional data isn't that representative in comparison the 3-dimensional data. 3D data gives you more information to work with. About 450km2 has been tested using 3D seismic.

Todd Mahon presented about wildlife

Question/Comment: How often do you see caribou in the permit area?

TM: It is difficult to tell because not many caribou in the porcupine herd have been radio collared. Of the caribou that are tagged, two out of 10 years they were tracked in the area. Incidental reports tell us that most years, if not all years, there are caribou in the area.

Question/Comment: There is project data here, and there is a porcupine caribou management plan. There is also lots of community knowledge. The correlation between the management board, the data that you have, and this community knowledge is very important.

TM: The information that I am presenting on is hot off the press. What is now important is how to use this information to maximize management of the herd. We have shared this information with the Porcupine Caribou Management Board and they are reviewing it now.

Question/Comment: How does this data relate to historical data?

TM: This data is new, although it shows similar findings to past studies.

Question/Comment: We are wondering about changing use in the last 10 years, in comparison to the previous 20 years. This caribou related data is very important to us.

Question/Comment: Thank you for the information today and please continue to keep us updated on this project and your studies.

Question/Comment: Has there been any interest in availability of jobs? And whose responsibility is it to decide who gets the jobs or which First Nations get the jobs?

> GC: Section 68 of the Yukon Oil and Gas Act requires a benefits agreements are discussed with First Nations and territorial government. In this case that includes Yukon Government, VGG and First Nation of Nacho Nyàk Dun. There has been no formal representation from VGG, since the Chief suspended communications with us. Last year we sent some letters, with no response. This open house doesn't count as consultation because VGG isn't here.

Question/Comment: Our members need work, and this work will take place for multiple years, but what will we have two years after this project is we don't become involved with the work?

Question/Comment: When our government doesn't take responsibility for showing up to meetings like this, the rules say that another government can fill in. Senior governments like the Yukon Government can fill in for Junior governments like VGG. You are on commissioners land. We agreed in our Final Agreement that there would be work on commissioners land and settlement land.

> GC: Yukon Government can sign off on some things, but we are trying to bring VGG back into discussions here.

Question/Comment: I would like to see information about how much oil and gas is down there.

Question/Comment: The project has been going for some time now, and I would like to know what the process is looking like from start to finish.

Question/Comment: All of us rely on fossil fuels in this community. We need it for the lifestyle we live and what we need is representation of members that want to work jobs.

Question/Comment: You need to share research on freshwater fish in the project areas.

Question/Comment: We have no investment; we have had no jobs either from Chance. We need to work with the opportunities that come across our territory when they do.

> GC: Chance will continue to advance with the project.

Question/Comment: Chance Oil and Gas proceeding means that caribou is critical. There has to be consultation and engagement about the caribou. It is critical that the community engage, not just VGG. It is critical because the VGG will decide on behalf of the people. It is critical that everyone is here, for example today we are missing some key knowledge keepers. This is a key part of the submission that Chance will make. Everyone has equal reason to share, if you don't share, the Minister of Environment will decide for us.

It is about co-management. We need to rally folks for the next meeting. We need to support democratic processes like this one.

Question/Comment: This project is very important for our livelihoods and our traditional territory. We can't forget that Chance will be there whether or not, so we should be there for consultation to get our voices heard. The agreement is a rolling plan and the socio-economic management plan needs lots of coordination. There could be a memorandum of understanding with the project as well, we need to see this as an opportunity.

Question/Comment: When John Eagle was chief, he followed the people. We need this now, no whispers behind closed doors. Everyone needs to be here so that we can get the shared benefits of projects on our traditional territory.

Question/Comment: This is a Yukon project, not just a Vuntut Gwitchin project. We will be competing for jobs with other First Nations, it is going to be hard. We need that training for the youth in our community and we need to be ready when the time comes.

APPENDIX 2-C-73. May 26, 2022, Meeting Summary

OLD CROW OPEN HOUSE SUMMARY

Date: May 26, 2022 – 10:00 AM - 8:00 PM

Location: New Community Hall, Old Crow

Attendees:

[See Sign-in Sheet for attendees.]

Chance Oil and Gas Limited (Chance):
[redacted], President
[redacted], Regulatory, Environmental and Community Relations Coordinator

Consultants:
[redacted], Environnemental Dynamics Inc.
[redacted], Environnemental Dynamics Inc.
[redacted], Vertex
[redacted], Hemmera
[redacted], Hemmera

Others:
[redacted] Yukon Government

Purpose and Objectives:

The purpose of the open house was to share information about Chance's Eagle Plains Exploration Project (Project) and to collect feedback and concerns. More specifically, Richard Wyman opened the session, Clive Mountford presented about drilling techniques and equipment, [redacted] (Hemmera) presented about YESAA and YESAB's new Pre-Submission Engagement Process, [redacted] (EDI) presented about linear features and disturbance, and finally [redacted] (EDI) presented about water bodies in the project area.

Q&A Summary:

The open house took place over the course of the day and posters were available for viewing and comment throughout. In the morning Chance and its consultants met with the Vuntut Gwitchin (VG) Renewable Resource Council (RRC). Below are questions from the RRC meeting, poster viewing, and evening presentations.

-----Start of RRC meeting----

RRC Attendees:
[redacted]

Question/Comment: Have you been consulting with the other First Nations like Tr'ondëk Hwëch'in (TH), Tetlit, Nacho Nyak Dun (NND) at a government level? Are they actively engaged with the company and what kind of engagement are they involved in?

[redacted] The TH and NND governments are mostly following VG's lead, meaning they are mostly unresponsive to engagement requests. There has been some communication with the TH Chief, although sporadic. There has been some limited communication with the Gwich'in Tribal Council (GTC), but ultimately limited due to Covid. The best chance of consultation seems to be with the GTC.

Question/Comment: Does the proposed project submission to YESAB include drilling in the summer?

[redacted] Yes, I believe so.

Question/Comment: As there are different concerns with drilling in the summer, I would like to know more. It would be nice to have posters up here in Old Crow, outlining where year-round access, drills, and where well locations will be so the community can look in their own time.

[redacted] We cannot say where these exact locations happen yet as it has not been determined, but we will be staying to higher land as much as possible to reduce permafrost troubles.

Question/Comment: How will the location of the first rig be determined?

[redacted] This will be determined using some historical data, but also information from seismic exploration.

Question/Comment: You mentioned high ground, but caribou go to high ground. Also, I am concerned about increased predation with increases in roads. How do mitigations work this through? I am also concerned about caribou at the headwaters and exploration activities.

Question/Comment: Will there be baseline water samples taken from all creeks before any exploration occurs to keep the company accountable in case any spills occur?

[redacted] I believe Yukon Government already holds this data.

[redacted] Yes, baseline data on water in the project area has been looked up and used while working on mitigations.

Question/Comment: A lot of concerns about this project are specifically about water and caribou. The community is concerned, and we are wondering who is going to manage everything? We don't feel that this has been outlined or shared enough with the community.

[redacted] We will work collaboratively to address these concerns.

Question/Comment: Can there be someone non-Chance to monitor. An independent non-Chance and non-government person. We would like someone completely separate to reduce any bias.

[redacted] We will have monitors on site throughout its entirety who will be contracted and paid by Chance but are a completely separate company. They will monitor wildlife sightings and would gather the data and information shared while on site with the affected First Nation(s).

Question/Comment: There is concern around companies not giving a full report on spills and concerns about projects in the area. Like what happened with the winter road. There is a high risk to water so the community concern is that all reports will be coming from Chance. It would be better to have some non-Chance reports about what is going on. There are big trust problems with the community and big companies. We need to know everything, not select information, but rather every little thing.

[redacted] We can make sure this will be done.

Question/Comment: How many spills has Chance had so far, on any project?

[redacted] If any, they have been very minor – less than one litre – none of consequence.

Question/Comment: Transparency is important, and it must be complete.

[redacted] The question you have, we don't have complete responses as it will require consultation with First Nations to create but it will come.

Question/Comment: There should already be reclamation plans outlining this (reclamation). We would like to see this in the plan. The more topics included in it, the better.

Question/Comment: This project must be worth the high cost of bringing all this equipment up here, there must be some sort of guarantee?

[redacted] There is no guarantee we will find anything; it is very high risk for us, and we are not certain of the outcome.

Question/Comment: What is the uncertainty of assessment, what kind of assessments will be done?

[redacted] Consultation with First Nations, YESAA (a federal Act), the Umbrella Final Agreement and land claims will guide the assessment. It will be Indigenous led. There might be a level of scrutiny through the Dawson Designated Office, or from Whitehorse with the Executive Committee.

Question/Comment: What happens if the consultation with VG doesn't or can't happen, will Chance bypass consultation and go ahead regardless of if the First Nation is happy and involved?

[redacted] Last March VG suspended consultation on this project. It is our duty to consult, but First Nations also have a duty to consult their citizens.

Question/Comment: Why did VG suspend consultation? I've been trying to get an answer from our Natural Resources Department, but they aren't responding to me.

[redacted] The Oil and Gas Policy initiated a VG led assessment process. The clock was ticking under Chance's exploration lands. We told VGFN this, but they said they wouldn't discuss with Chance anymore.

Question/Comment: You said you received a 10-year extension on the exploration lands, so why couldn't you finish within this timeline?

[redacted] The first bit expired in August 2021 and more will expire this August 2022. These extensions unfortunately still weren't sufficient.

Question/Comment: Policy, expiry, and dates? What happened?

Question/Comment: The NRC never came back after fully administering it, they didn't engage with the community and come back.

[redacted] It would have taken over four years to complete all of it (i.e., process under Oil and Gas Policy), so Chance asked to do it at the same time as everything else so it wouldn't expire, but VG said no.

[redacted] Explained some benefits of this project, specifically reducing dependence on imported diesel by using local natural gas.

Question/Comment: To use this oil and gas, don't you need to build a refinery for diesel before we could use it up here to reduce our carbon emissions?

[redacted] Diesel is pretty easy because you just need to heat it up and separate it.

Question/Comment: So how would we get it into that form? Something that would be a usable state for us?

[redacted] Something would need to be built, however it wouldn't be too difficult to build something to do this. A Yukon tailored refinery would not be that huge. Only creating about 12 truck loads a day or so.

Question/Comment: So fuel won't be exported anymore?

[redacted] Some might still be, but it depends on exploration and how much gas and oil is found.

Question/Comment: The main community concern is that they don't understand each process. Why is the location of the rigs not shared or not known yet. People want to be able to visualize and know how the risks will be mitigated.

Question/Comment: Last meeting someone brought up bringing community members out to site to see the project location. Where is this at, have you figured out when you will bring people? You need to engage more and get community members out on a plane to share concerns.

[redacted] With camp coming back into use, we could use this as a base camp for people and drive to 3 of the potential sites. It would be hard to see the location with a quick fly by as it would be missed in a blink of an eye.

Question/Comment: Will there be room in the chopper this summer to bring up some community members?

[redacted] Yes maybe, if someone wants to go work for a week slashing.

Question/Comment: Could you post it? It would be nice to make this available to community members.

[redacted] This information has already been shared with VG.

[redacted] Site visits are harder when the project location is not in operation and there are no trails yet.

Question/Comment: Why wouldn't the Executive Committee start in June as planned?

[redacted] The Pre-Submission Engagement Process is starting June 1st, which allows for more engagement and participation in developing the project proposal.

Question/Comment: How will VG communicate with YESAB if they shut down communication? How will it go ahead if not a lot of consultation?

[redacted] The Executive Committee will determine what happens, not Chance.

Question/Comment: Can Chance bypass First Nation consultation?

[redacted] Theoretically. In the past if the First Nations haven't been engaged, some projects have gone ahead. The Executive Committee may reach out to First Nations specifically, but this process includes locals and First Nation involvement.

Question/Comment: The community would like to see baseline data and to have this expertise on site. Would be nice to have a heritage person on site for the whole process. The biggest concerns with this project are water, reclamation, and heritage.

Question/Comment: It would be nice to have the full project description, not just the pre-description of the project.

[redacted] The pre-description is to be submitted in June

Question/Comment: It would be nice to have the full project description to have a meaningful conversation.

Question/Comment: What has Chance done for engagement so far? What sort of avenues have been pursued?

[redacted] We have mostly engaged with VG as the project has the biggest exposure to VG land. We have had Open House engagement with citizens, but the VG government decided not to engage. Also, important to note that the project description is only a draft because as comments are received, the project can be changed and edited.

[redacted] The project description is missing access roads information as they are still being explored right now. It is not complete yet.

Question/Comment: It would be nice to provide information at meetings as not everyone has internet or printers. It would be great if you could print off all the documents you are referring to. Bring it all for people.

[redacted] I will give you my card so that I can supply you with the studies. VG also was involved in these studies so they should have easy access to the information you are seeking.

Question/Comment: Will you engage the Yukon public, in Whitehorse with the YESAB process?

[redacted] Yes, we will specifically engage with Whitehorse, Dawson, Inuvik, and Fort McPherson.

Question/Comment: Tsiigehtchic?

[redacted] Yes, all over there we will engage.

Question/Comment: It would be nice to see exploration go way above industry standards for environmental concerns with oil and gas. Show how you are going above and beyond, and show the people because it will go a long way.

Question/Comment: Why is VG working with you for some departments like Heritage, but not all departments?

[redacted] I can't answer that I am not sure.

Question/Comment: Not everyone likes the public engagement forums. Over avenues of engagement and consultation would be good. Some ideas would be letting people know of online surveys, send a small package to mailboxes, allow for more private consultation, especially as it is hard for people to comment now with Covid issues and with leadership issues. Use local radio stations to involve people and do some interviews ([redacted] would be a good contact). Hire someone to interview people one on one in the community about this project. The youth could be hired to help with this.

[redacted] Thinks VG needs some approval to do this. Unclear, perhaps only if the interviews are being recorded. Regardless, the application is available online.

Question/Comment: [redacted] has a public computer and can send reports to her and help people access the site for comment submission. VG took away the public computer so there is only one at the RRC for the entire community now.

-----end of RRC meeting----

Beyond the questions and concerns captured above, other themes that arose during the poster session included the Project's progression through regulatory processes and consultation with VGFN, concerns about the project continuing without sufficient consultation, training and job opportunities, site visits for VGFN citizens), position of other affected First Nations, and specifics around rig location.

[redacted] *opened the presentation session describing the project at a very broad level while introducing the presentation sessions. Then* [redacted] *presented about drilling techniques and equipment,* [redacted] *(Hemmera) presented about YESAA and YESAB's new Pre-Submission Engagement Process, then* [redacted] *(EDI) presented about linear features and disturbance, and finally Mike Setterington (EDI) presented about water bodies in the project area. The floor was open to questions during the presentation and afterwards.* [redacted] *presented about heritage resources.*

Question/Comment: Has Chance run the numbers on how much this project will help reduce carbon emissions?

[redacted] No, however it will depend on many aspects. May lower the footprint more globally, but will reduce supply chain lines that are currently used for fuel and oil.

Question/Comment: Tapping gas is anticipated?

[redacted] Yes, we will capture any gas, fuel, oil, anything we possibly can.

Question/Comment: Should Old Crow comment submissions go through Chance or YESAB (*specifically asking for the comments with support for the project)*

[redacted] Chance is open to comments from residents of Old Crow and also a requirement to continue consultation and engagement with the First Nations and public. You can comment directly with Chance and/or through the YESAB public comment stage.

[redacted] We (Chance) need input from the community, so it (the Plan/Proposal) is developed with the local knowledge in the community. Feedback throughout all stages is important.

--[redacted] *presenting---*

Question/Comment: What type of training do I need to be a part of the emergency response team?

[redacted] There will be plenty of opportunities for employment, not necessarily emergency response stuff. Some of the key training areas are H2S Alive, WHMIS, First Aid, and some short Emergency Response course (like spill response/reclamation training).

[redacted] The Emergency Response Plan has many features to it and each area of activity would be responsible for addressing emergencies in their areas. Also, engagement and communication with other emergency personnel is involved. There will be a safety meeting on every shift, daily, or bi-daily with your crew.

[redacted] Blowout Preventer (BOP) drills are where we pretend there has been a release of gas or oil and act accordingly. Also, on my crews, I do a man down drill once a month. These types of drills and practice will likely be implemented.

[redacted] *presenting---*

Question/Comment: What's the density of proposed cut lines?

[redacted] I haven't calculated it yet, but likely twice the density that we see now.

Question/Comment: Will they be 2D lines or 3D?

[redacted] Both 3D and 2D will be used. It's a bit loose in the planning as we are still learning and figuring out stuff. It's a learning curve with each project going on and a lot of learning as we learn more about the geology in the area.

Question/Comment: If it goes into production, how would you monitor all impacts on the list and how often would these studies take place?

[redacted] Currently moving into creating monitoring plans. Hard to give specifics yet beyond these surveys in regards to environmental issues. Monitors will be on site to address the unknowns during project activities.

[redacted] This would be a good conversation to have with affected First Nations to determine the monitoring plans.

Question/Comment: It's important to have ongoing monitoring to determine if things need to stop or be changed.

Question/Comment: Monitoring of linear disturbance use was done in 2020 of March. Why wasn't it done at a different time, was there a reason for the March timing?

Question/Comment: This could have been a data gap if you only surveyed once. You didn't capture use during different times.

[redacted] We try to replicate exactly what's going on, but all studies are limited by logistics and budget. Every study is a snapshot in time.

[redacted] *presenting---*

Question/Comment: Is that [[redacted] *shared about how many little streams and pools there are in the study area.*] the same water you will be using for drilling operation?

[redacted]: No, the water for drilling needs to have flow. In the winter we will use the Eagle or Ogilvie Rivers because these other streams in the area will almost all freeze overwinter. Also drilling operations will have a very large setback from any waterbodies, flowing water as high ground is better from a permafrost point of view.

-----end of Presentations and Q&A----

2. Reintroduction Meeting Discussion

Chief [redacted] led a welcome prayer.

[redacted] provided a safety share and initiated introductions. [redacted] shared that he is based out of Yellowknife and looks forward to learning and listening from everyone during the meeting. Grand Chief [redacted] said he has been in his role for 2.5 years and noted he has been involved in the mining industry for many years. Grand Chief [redacted] shared how his ancestors followed caribou in the Eagle Plains area. He noted the importance of this area to his people today. Grand Chief [redacted] added that he is interested in understanding more about the Eagle Plains Exploration Project (the Project) and Chance Oil and Gas Limited's (Chance) next steps [redacted] was born and raised in Inuvik and often drives through the Eagle Plains area. She noted interest in learning more about the objectives of today's meeting. Richard said he was born in Treaty Seven Territory and is the founding shareholder of Chance (previously known as Northern Cross (Yukon) Limited) [redacted] shared that the name Chance is taken from the Chance sandstone in the Eagle Plain sedimentary basin where oil was first discovered in Yukon in 1959 [redacted] thanked everyone for joining the meeting and said he looked forward to establishing a collaborative, constructive, and respectful relationship with all the participating First Nations. Willard noted he is a Gwitchin citizen born in Tetlit Territory. [redacted] is currently an Advisor for the Lands and Resources Department at Gwitchin Tribal Council (GTC). [redacted] expressed interest in learning more about the Project and shared he had been in his role for 13 months [redacted] said she is a Yukon Gwitchin member who was raised by her grandfather. She has been with Chance for 10 years and is based in Whitehorse, Yukon. [redacted] shared that he is Red River Métis and the Executive Director of the Vuntut Gwitchin First Nation (VGFN). Chief [redacted] was born and raised in Old Crow and noted a background in oil and gas, self-government agreements, land protection and management, and early negotiations. Chief [redacted] said she was previously the Minister of Environment and had extensive experience dealing with oil and gas licensing and permitting. Chief [redacted] also shared that her intention at today's meeting was to listen and create an open dialogue around intentions [redacted] introduced herself and noted she is the Intergovernmental Relations Coordinator for VGFN. Chief [redacted] introduced himself. [redacted] introduced himself and welcomed everyone to the meeting.

[redacted] reviewed the agenda and asked everyone to share proposed changes or suggestions.

[redacted] noted [redacted] from Chance had joined the meeting via speaker phone.

Chief [redacted] said the proposed agenda topics are not where they need to be. Chief [redacted] shared that the Indigenous Nation attendees had intricate technical knowledge of the Project area. Chief [redacted] noted the Indigenous leaders at today's meeting had an internal briefing prior to this meeting. Chief [redacted] asked [redacted] what her role was during the meeting and if Two Worlds Consulting (TWC) was participating in the Project's Impact Benefit Agreement (IBA) process. [redacted] said TWC is not supporting the Project's IBA process and was recently hired to support the Project's engagement scope of work including meeting facilitation and notetaking. [redacted] added that TWC staff were happy to step out at any time if discussions related to the IBA process

were going to take place. Chief [redacted] noted that Grand Chief [redacted] opening comments highlighted the importance of the Project area to all northern Indigenous Nations. She added that the Project's existing IBAs are maturing, and further discussions related to IBAs will be required.

Chief [redacted] shared community concerns for wells that exist on the Project site and the Yukon's definition of employment and income opportunities in the *Yukon Oil and Gas Act*. Other Project-related concerns shared by Chief [redacted] included impacts to the environment, Treaty and Aboriginal Rights, extent of engagement, how Chance plans to engage going forward, permits with First Nation Na-Cho Nyäk Dun (NND), the vision to push north, the removal of 5 northern permits with respect to hydraulic and conventional methodologies, land, water, fish, and caribou protections, and the Executive Committee stage. Chief [redacted] also noted there are outstanding engagement protocols to establish to sustainably build integrity and trust with Elders and communities. She expressed interest in understanding potential request for land use permits to potentially develop or maintain existing lands including and involvement in related discussions. Chief [redacted] noted the importance of re-establishing relationships with all northern Indigenous Nations and acknowledged the history that exists between meeting attendees. Added that the Project area is used by all northern Indigenous Nations and looks forward to having collective conversations going forward to establish new opportunities and protect their inherent rights. Chief Frost [redacted] Chance to clarify their engagement approach going forward (e.g., when do they want to meet, what information is needed etc.). Chief [redacted] said ethical and responsible partnerships that respect people, and the environment are the foundation to how the northern Indigenous Nations govern themselves. They have lived off the land for generations and Chance will need to communicate differently with their people going forward. Acknowledged that trust and integrity is currently lacking at the community-level. Chief [redacted] said her role as Chief is the voice of the people, to deliver messages on behalf of the people to Chance and advance how Chance can move forward in a respectful manner. Chief [redacted] noted Chance had not signed previous agreements with the northern Indigenous Nations. Stated they are not closed for business but are interested in sustainable opportunities rooted in the laws of the land and that is the laws of the people. Chief [redacted] looked forward to identifying priorities to move this process forward.

[redacted] thanked Chief [redacted] for her comments and said Chance is exploring for natural gas and oil resources in the Project area using permits that have already been awarded. He said Chance is looking to understand how each northern Indigenous Nation wishes to be engaged and the best way to share information. [redacted] said Chance is open to economic and environmental stewardship partnerships. He shared that Chance is proposing to conduct smaller-scale exploration activities over a longer period of time to minimize potential environmental impacts and maximize potential Project-related benefits. [redacted] shared that Yukon Government has mandated Chance to conduct further investigations of existing suspended wells dating back to the 1950s/1960s. He said hydrocarbons have been discovered in some suspended wells. Richard noted Chance hired consultants such as EDI, Palmer, and Ausenco (previously Hemmera) to assess potential Project-related effects to the Eagle Plains Basin and support Chance's Environmental Assessment Application to the Yukon Environmental Socio-economic Assessment Board (YESAB). Richard noted Chance has a lot of information to share with the northern Indigenous Nations and would like to further engage each Indigenous Nation to better understand issues that should be addressed through mitigation and/or prevention measures. He added there are up to 30 new exploration wells to be drilled, up to 1,500 square kilometres of

new 3-D seismic data acquisition and up to 2,000 kms of new 2-D seismic data acquisition. Drilling results will determine long-term natural gas/oil extraction within the existing exploration permit areas. [redacted] added that the exploration activities would take place during the winter seasons over an 8–10-year period depending on results as the program unfolds. The exact drilling locations have not yet been determined. [redacted] noted that no hydraulic fracking would take place because the anticipated drilling will evaluate resource potential in geological formations that are not expected to need hydraulic fracturing. He said the camp is located at KM 325 on Dempster Highway and can accommodate around 75 people [redacted] added that the drilling program will occur sequentially rather than all at once. He also shared that natural gas/oil resources from the Project would support local energy security, economic independence, economic diversification, and a reduction of cumulative greenhouse gas (GHG) emissions by transporting fuel over shorter distances.

[redacted] added he had been involved in the Eagle Plains since 1959 and noted the landscape is unique compared to other northern landscapes because there are no lakes, the terrain supports exploration/extraction equipment, and it will be easier to build roads without significantly damaging the environment.

Grand Chief [redacted] noted that he was recording the meeting for GTC's internal minute keeping and requested permission from all meeting attendees. All meeting attendees agreed to the recording. Grand Chief [redacted] said he struggled with the open-ended agenda and thought it was paternalistic. Expressed interest in more structured agendas to avoid wasting anyone's time and to supporting things moving forward. Grand Chief [redacted] said meetings were had with Chance during the COVID-19 pandemic. He suggested a certain level of transparency, respect, and integrity was required to move forward. Grand Chief [redacted] noted he expects transparency, respect, and integrity from anyone working within their Traditional Territory and said there is water under the bridge in terms of this Project.

[redacted] asked Grand Chief [redacted] if the agenda felt vague. Grand Chief [redacted] responded that the agenda felt a bit vague and shared that GTC agendas included an opening prayer, introduction, meeting content, action items, and next steps. Noted members will quickly share if too much was included in the meeting agenda. Grand Chief [redacted] said he had previously heard what [redacted] shared and preferred meetings with a presentation / opportunity to review maps/leases to understand what is being discussed. Grand Chief [redacted] noted GTC represents four Gwitchin councils, and Chance maps reference one of these councils. Grand Chief [redacted] added that the GTC expects Chance to engage all Gwitchin communities/Indian Band Act councils. Noted GTC will support bringing together the right group of people and expressed interest in visiting the Project's camp. Grand Chief [redacted] shared that the Project is in an area where Gwitchin people harvest caribou. Noted compensation should be the last topic of discussion, and instead discussions should be focused on the management of the land, water, resources, environment, and air. Grand Chief [redacted] suggested Chance simplify future meeting agendas and appreciated the effort to move forward together.

[redacted] said she heard there is an interest in building trust and integrity as well as understanding of historic use in and around the Project. She summarized that historic wells and current and future permitting, involving Elders, inherent rights, employment and economic opportunities, respectful and collaborative relationships, community level engagement timelines, and the

protection of land, water, and air resources are important topics to be discussed at future meetings. Erin asked meeting attendees if she heard them correctly. Grand Chief [redacted] added that the key values mentioned were respect, transparency, accountability, and integrity.

Chief [redacted] shared that it is unfortunate how things have gotten to this point and acknowledged the historical relationship between Chance and northern Indigenous Nations. He noted that he was one of four NND Chiefs to go through this process and felt like little had been accomplished to date. He suggested the northern Indigenous Nations wanted to get to work for their children and future generations. Noted the importance of getting right down to the basic facts. Chief [redacted] added that they need to keep a sharp eye on the issue from a political point of view and bring in politicians as needed and move quickly back to the technical folks. He said it is time to put the politics to the side. Shared the politicians are like the star at the top of a Christmas tree and will let information filter down. Chief [redacted] noted the discussions with Chance had been ongoing over the past 12 years. Emphasized the importance of straightening the politics and focusing on arrangements. Chief [redacted] suggested everyone move forward without going back over the past 12 years of deliberations. Noted NND has not had a large role in the Project to date and that the northern Indigenous Nations will charge hell with a snowball together. Thanked everyone for the opportunity to speak.

[redacted] asked if there was anything else that anyone wanted to add to the discussion. Chief [redacted] reflected on the process and the Project. Noted [redacted] had been involved in the region for a long time. Chief [redacted] said her people are fighting for refuge and noted pristine areas and it's significant to use as the refuges. Chief [redacted] said the previous Project application triggered an Executive Committee review and could not determine if there were any adverse effects to the Porcupine caribou herd because of proposed development in the region. She shared the importance of being more confident in numbers and determinations in the YESAB consultation and engagement process. Chief [redacted] expressed concern for the YESAB process. Specifically, caribou, environment, climate change, assessment planning, monitoring and evaluation, triggers for stopping and advancing work, inherent rights, and the full scope/development of the Project. Expressed interest in a broader agreement with Chance to set the bar higher than the *Yukon Oil and Gas Act* and influence Project triggers and remedies to consider environmental vulnerabilities (e.g., halting project operations). Chief [redacted] acknowledged how fragile the environment is currently, especially around climate change and the pressure of resource development. Added that the northern Indigenous Nations want to participate collaboratively in the Project to ensure it is well managed and not going to create long-term environmental degradation. Suggested this approach will create a degree of control for the Gwitchin people which is important for quantifying significant adverse impacts. Noted the significance of assessment, data, management, and planning work. Chief [redacted] said the northern Indigenous Nations will share their interests/concerns with Chance and will stop the process from advancing if it does consider local Indigenous Knowledge. Noted the importance of listening to Elders and their teachings to inform Project management, planning, and decision-making. Chief [redacted] added the importance of upholding sustainability objectives and expects Chance to work more responsibly.

[redacted] shared interest in having a full dialogue on issues, concerns, and values with the northern Indigenous Nations. Noted the Project's intention is to minimize impacts and hopefully create benefits too. Acknowledged that this exchange is required. [redacted] said he felt like Chance was previously delivering information in a one-way direction and hopes to have more of

[redacted] TWC kindly requests Chief [redacted] review and clarify this sentence to make sure it adequately captures what was being shared.

an exchange. Noted Chance is unable to react without feedback and looks forward to doing whatever it takes to address the concerns identified by the northern Indigenous Nations.

Grand Chief [redacted] acknowledged Gwitchin Treaty rights to harvest, including the rights to access to support their harvesting. Noted these rights come with the responsibility to legally and spiritually be stewards of their Traditional Territory. Shared a story about the late Elder [redacted], who travelled by dogsled in the 1960s in and around the Peel River area. Grand Chief [redacted] said the late Elder [redacted] saw smoke and assumed it was a camp. As he approached the smoke, he realized it was a drill rig. This was a troubling experience because late Elder [redacted] did not know who these people were or what they were doing on the land. This experience laid the groundwork for Gwitchin people to form the Gwitchin Comprehensive Land Claim Agreement (GCLCA) to prevent future incidents like this in their Traditional Territory. Grand Chief [redacted] explained the GCLCA was signed in 1991 and this agreement set a principle that non-Indigenous people, businesses, government, or elected agencies were not able to do anything in our Traditional Territory without speaking with the original inhabitants of the land. Noted this includes having the right to say no and share standards around what they are willing to allow. Grand Chief [redacted] shared porcupine caribou is the main concern for GTC as well as impacts to water, air, and the overall ecosystem (which is very fragile). Grand Chief [redacted] said he was not a fan of the term 'traditional knowledge' because it refers to the past, and Gwitchin Knowledge is current. He noted Gwitchin Knowledge Studies help Gwitchin people develop a record of their knowledge for community use purposes and stated the importance of respecting the intellectual property of such information. Expressed interest in advancing discussions around historic and current use of the land and impacts to Treaty rights and access. Grand Chief [redacted] shared that the Gwitchin standard is high for a good a reason.

[redacted] asked Chief [redacted] what collaboration looks like to her community. Chief [redacted] responded that she is at today's meeting to share the perspectives of her community and the standards they are trying to uphold. Noted these standards were established through their laws and agreements. Chief [redacted] said Chance had heard community feedback for over 20 years. Noted the northern Indigenous Nations are not interested in discussing only monetary compensation or relationships. They want to protect the land, water, air, and caribou. Chief [redacted] said there are outstanding questions to be answered around water, hydrology, and the assessment of oil and gas. These conversations will also include the Yukon Government. Chief [redacted] confirmed she had shared how her community would like to see this process move forward and preferred not to speak to her personal feelings. Chief [redacted] asked [redacted] to clarify what he meant by one-way conversation and lacking information. She said this comment was unclear because there is an established process through YESAB to obtain information. Requested further clarification from Chance. [redacted] said Chance has hired consultants to support their assessment and the Project has an interest from learning from the First Nations. [redacted] said he hears about Section 35 rights and mentioned he is looking to understand what those rights are and how the Project could potentially infringe on those rights. [redacted] added that the Chance had conducted baseline studies and offered to provide this information with the First Nations. Expressed interest in receiving First Nation feedback on what Chance has learned to help guide how they develop and manage the Project until conclusion. [redacted] said Chance is trying to develop a pathway to support conversations that will take place under a cooperation agreement including a terms-of-reference. He noted that previously this process did not go far and explained Chance is following this process because it was how mining companies in the Yukon

had moved forward their proposed projects. [redacted] asked the group to confirm if there is a different way of doing it.

Grand Chief [redacted] said he was surprised by the comment [redacted] made about not understanding legal rights. He said the courts look at collaborative agreements and IBAs to clarify the muddy waters. Grand Chief [redacted] said their rights have evolved over the last 30 years. Stated each Indigenous Nation has the inherent right to self-government in their Traditional Territories. Grand Chief [redacted] said if they seem sensitive it is because Chance is looking to occupy a part of their Traditional Territory and as a sovereign nation, they must review that. Noted it would take another 20 years to get an idea of rights. Grand Chief [redacted] expressed interest in clearly understanding timelines to convey this information back to the community level. Noted the Chiefs are spokespeople that have a responsibility to explain to their people what is being proposed. He said the support of Gwitchin will not be possible if he is unable to explain the Project to his people. Grand Chief [redacted] said he used to this type of back-and-forth dialogue. Noted there is often a desire to hold your cards close to your chest for fear of liability. He suggested Chance create frank and open discussions because that is what matters to the Gwitchin people. Shared that some people in the community may be upset around work being conducted in this area. Grand Chief [redacted] asked Chance if they will stop operations if the caribou migrate to the Project area. He explained that is the baseline of what Gwitchin people will expect and the community will also be interested in understanding what Chance is doing in the area to protect caribou and other species. Grand Chief [redacted] acknowledged some effort had been made to protect caribou. As a leader, Grand Chief [redacted] said he needs to be able to answer these questions from the community.

[redacted] said Chance loves feedback and had information to share. Noted Chance is looking to better understand how the northern Indigenous Nations would like to be engaged and how Chance should proceed after today.

Meeting attendees took a break between 3:50 pm – 4:05 pm.

[redacted] said Chief [redacted] wants the whole life cycle of Eagle Plains examined, and it is difficult for Chance because the Project is currently exploratory and does not go beyond that. Shared that the Project will determine if there is anything worth pursuing. If there something worth pursuing is found, then that is a better time to establish economic partnerships since the nature of the resource to be developed will be better understood [redacted] noted that Chief [redacted] understands this process because of the Victoria Gold project. [redacted] reiterated that the proposed Project is the first stage involving 30 wells to get an idea around what resources are available in the Eagle Plains for everyone. He added that pipelines and other works required after exploration will be considered later. [redacted] said Chance is willing to risk their money and assume that it might not work out, but they really hope that it will. Suggested the northern Indigenous Nations may regret getting into something now if it turns out differently because at this stage there is not enough information to move on. [redacted] said the northern Indigenous Nations can evaluate how the Project goes including how the terrain is treated and improvements needed to protect the environment better. [redacted] said Chance is focused on this first stage (exploration). He said that is hoping the northern Indigenous Nations will help Chance with that. Noted exploration is high risk in terms of very uncertain outcomes related to resource determination and they will not want to participate in that. Suggested involvement beyond exploration will be different, including a payoff for all the northern Indigenous Nations.

[redacted] said the exploration phase will create opportunities for businesses and these opportunities will continue even expand into development if the project proceeds beyond exploration.

Grand Chief [redacted] respectfully said they are not interested in any kind of payoff and said that [redacted] comment about payoff was offensive. [redacted] responded that he meant there would be an opportunity to be a full partner in the Project. Grand Chief [redacted] said they have different expectations and are interested in being full partners now. Expressed interest in understanding the nature of the operation and how and understood the long period of time between initial investment. Grand Chief [redacted] shared GTC experienced the false prospect of the Mackenzie Valley Pipeline. Shared that he felt the discussion was not getting anywhere productive and suggested Yukon Government attend the next meeting. Grand Chief [redacted] requested the meeting conclude. Chief [redacted] and Chief [redacted] agreed with Grand Chief [redacted] request to stop the meeting. Chief [redacted] added that they had addressed the major points and want further deliberation with Yukon Government present. Chief [redacted] added that the northern Indigenous Nations have an obligation to the Yukon Environmental and Socioeconomic Assessment Board (YESAB) as well and will take this time to reflect. Noted the importance of fully understanding what is involved in exploration, including the end product. Chief [redacted] said they want to know they did everything possible to protect the environment. Stated the Charter is intrinsic to everything they do. It is founded on Gwitchin ways. Chief [redacted] thanked everyone for making space for this conversation to happen and shared her appreciation.

[redacted] thanked everyone and said Chance would work on pulling together a summary of engagement topics and associated timelines. Noted the clock is ticking on land tenures. Chief [redacted] confirmed their awareness of the clock ticking and suggested the northern Indigenous Nations will get back to Chance with their perspectives [redacted] added that [redacted] booked accommodation in Old Crow in March at Porcupine Camp. Expressed that finding accommodation in Old Crow is a challenge.

DRAFT

3. Reintroduction Meeting Action Items & Next Steps

Table 2 below details action items and next steps identified during the Reintroduction Meeting.

Table 2: Reintroduction Meeting Action Items & Next Steps

Topic	Action Description	Responsible	Estimated Date
Meeting Minutes	• Review and provide comment on Draft Reintroduction Meeting Minutes with Two Worlds Consulting.	All	February 20, 2023
Meeting Minutes	• Incorporate meeting attendees' feedback on the Draft Reintroduction Meeting Minutes and share a finalized version of the minutes with all attendees for their records.	Two Worlds Consulting	March 1, 2023 (or approximately 2 weeks after receiving feedback from meeting participants)
Meeting Agendas	• Create simplified agendas for future meetings.	Chance	Ongoing
Meeting Format	• Utilize visual aids such as presentation slides and maps during future meetings.	Chance	Ongoing
Next Steps	• Share perspectives with Chance.	GTC, NND, VGFN	TBC

APPENDIX 2-C-75. August 4, 2023, Meeting Summary

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

Meeting Minutes

Subject	Project Overview Meeting
Prepared By	Two Worlds Consulting (TWC)
Groups Involved	Chance Oil and Gas Limited (Chance) Environmental Dynamics Inc. (EDI) TWC Vuntut Gwitchin First Nation (VGFN)
Participants	[redacted] Regulatory, Environmental and Community Relations Coordinator (Chance) [redacted], VP Government and Communication Relations (Chance) [redacted], Regulatory Lead (EDI) [redacted], Senior Fisheries Biologist (EDI) [redacted], Engagement Facilitator (TWC) [redacted], Technical Advisor (VGFN)
Date/Time	August 4, 2023 8:30 AM – 9:30 AM PST
Copies to	Chance and VGFN

Purpose of Meeting

- Chance provided an Eagle Plains Exploration Project (Project) overview to John.

Topics Discussed

- Chance overview
- Project overview including information on exploration, design changes, baseline studies, regulatory process, schedule, engagement, proposed next steps

Key Issues Raised / Chance Responses to Issues

- Interested in which consultants completed Chance's caribou work to support VGFN determine who they engage as a consultant to review Project information related to caribou.
    - [redacted] confirmed [redacted] at EDI led the caribou work.
- Expressed permafrost, caribou, and water are key issues.
    - Chance confirmed these topics would be included in the draft Project Proposal and Chance is open to discussing these topics with VGFN.
- Expressed interest in YESAB, Yukon Government, and Chance meeting to make sure that there is a common understanding of consultation next steps.
    - Chance confirmed interest in understanding YESAB and Yukon Government consultation next steps. Noted they would continue to try and meet YESAB and Yukon Government to confirm the common understanding of consultation next steps with First Nations.
- Inquired about the Eagle Plains Exploration Project's (Project) approach to cumulative effects.
    - [redacted] said they did a linear features assessment to assess regrowth of linear features. Staff walked seismic lines to assess line of sight and monitored wildlife. This

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

information will feed into cumulative effects for the Project. Pat added there is no other development in the area except the Dempster Highway.

Actions and Responsible Party

- Chance to send meeting actions and requested information to [redacted] – complete.
- Chance to send a plain language definition of 2D and 3D seismic to [redacted] – complete.
- Chance to inquire about well abandonment service providers (i.e., future availability and anticipated service fees in the future) – in progress.
- EDI to forward August 23, 2023 virtual meeting invite with YESAB to [redacted] – complete.
- [redacted] to discuss information requests detailed in the email from [redacted] on September 5, 2023 with leadership and share feedback with Chance – in progress.

Details of Discussion

- [redacted] led a round of introductions.
- [redacted] said he is working for VGFN on energy files.
- [redacted] introduced the Project and reviewed background information. [redacted] said Chance wants to be part of the Yukon energy strategy by providing oil and natural gas to Yukoners and businesses in the territory. [redacted] said he spoke with [redacted] regarding royalty opportunities.
- [redacted] discussed the First Nation Traditional Territories that overlap with the Project area. He said Chance wants to make sure all potentially affected First Nations are informed of the proposed Project.
- [redacted] noted the Project overlaps with the North Yukon Planning Region (NYPR) and Peel Watershed Planning Region (PWPR). Specifically, land use management zone 4 (LMU 4).
- [redacted] shared Chance has been undergoing a Yukon Environmental Socio-economic Assessment Board (YESAB) assessment since 2014. He has been working with Chance for over nine years. Greg said the Dawson City Designated Office referred the Project to the Executive Committee of YESAB in 2016.
- [redacted] said some VGFN Citizens are very familiar with the Project and ask why Chance continues to keep talking about the Project. He added that these VGFN Citizens have said to [redacted] and [redacted] that a decision on the Project should be made. [redacted] said some VGFN Citizens have expressed interest in understanding the end-use products if the oil and gas resources from Eagle Plains are eventually extracted.
- [redacted] expressed Chance's interest in building a new path forward with First Nations. He noted the importance of reclamation and closure.
- Chance played the draft Project video.
- [redacted] shared that Chance is hoping to build a longer airstrip to accommodate crew change, movement of supplies, and medical evacuation (if required). He added that a smaller remote camp that can accommodate up to 25 people will be utilized for drilling and seismic activities.

DRAFT

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

- [redacted] reviewed how the current Project is different than the previously proposed project. Specifically, how Chance is looking to rebuild relationships and collaborate with First Nations, use low impact seismic, complete drilling activities only during the winter season, utilize the existing Project footprint and networks, spread activities across 10 years to minimize annual impacts and support steady employment, and use winter ice roads versus all season roads.
- [redacted] asked if Chance is talking to the territorial government.
- [redacted] said Chance is talking to Yukon Energy. He said Yukon Energy recognizes that they are putting in more diesel generated electric power in the Faro area (approximately 24 megawatts of diesel this winter). [redacted] said Chance has also had meetings with proponents for the Casino and Coffee Gold projects. He said these projects will require more energy than what is available in the Yukon. [redacted] said Yukon has an isolated grid and potential end-use products from the Project could create royalties to support energy development.
- [redacted] asked [redacted] if Chance had retained Keith Halliday.
- [redacted] confirmed Chance had not retained [redacted]. He shared that [redacted] suggested Chance conduct economic analysis to understand mining royalties and how end-use products from the Project could penetrate the Yukon market. Greg said 70% of hydrocarbons in the Yukon are from the United States, mostly diesel for heating purposes.
- [redacted] said he is looking for folks to review Project documents on behalf of VGFN and wanted to know who Chance had engaged.
- [redacted] expressed interest in meeting with potentially affected First Nations on topics of most interested (e.g., porcupine caribou herd, fish, permafrost, etc.).
- [redacted] said that Chance hired consultants to do baseline studies in 2018/2019 and these studies were updated in 2022/2023. Jennifer shared that Chance had conducted baseline studies on terrain/surficial geology, permafrost, water quality and surface flows, fish and fish habitat, vegetation, porcupine caribou herd, moose, American marten, grizzly bear, birds, heritage resources, and linear features.
- [redacted] asked which consultants completed Chance's caribou work. [redacted] confirmed [redacted] at Environmental Dynamics Inc. led the caribou work and that it relied on existing data and habitat analysis.
- [redacted] shared Chance is aiming to submit their Project Proposal to the Executive Committee of YESAB in mid-December.
- [redacted] asked if Chance had progressed engagement with First Nation of the Na-Cho Nyäk Dun (NND) and Tr'ondëk Hwëch'in (TH).
- [redacted] confirmed Chance had met with [redacted], technical advisor on behalf of NND and TH, the day prior. He said [redacted] was going to discuss engagement preferences with each Nation's leadership. [redacted] said Chance was planning to go to Old Crow and Fort McPherson at the end of August to conduct open house events.
- [redacted] said he would follow up with VGFN leadership while he was in Old Crow with Chance at the end of August.

DRAFT

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

- [redacted] said Chance is hoping to get feedback on the draft Table of Contents for the Project Proposal from YESAB and the First Nations.
- [redacted] asked if Chance is discussing the consultation process after the Project Proposal is submitted with the Yukon Government and YESAB. Greg said he did talk to [redacted] and [redacted] from Yukon Government about it.
- [redacted] said the Yukon Government and YESAB have to consult on their decision document. If the Project is approved, First Nations will be consulted on authorizations (i.e., the permits). He noted there are a lot of layers of consultation.
- [redacted] said he met with the former chair of YESAB. He added that YESAB is sorting out who is doing what. [redacted] suggested YESAB, Yukon Government, and Chance meet to make sure that there is a common understanding of steps.
- [redacted] asked if [redacted] was aware of any key areas of interest to VGFN. [redacted] said permafrost and water are key issues. Historically, caribou has been a huge issue for all northern First Nations.
- [redacted] provided an overview of the discussion on linear impact thresholds from a meeting with Yukon Government staff the day prior. [redacted] noted further discussions with YESAB on this topic are required.
- [redacted] asked about cumulative effects.
- [redacted] confirmed that cumulative effects is something that needs to be clarified with the Yukon Government and YESAB. Specifically, cumulative effects of seismic.
- [redacted] asked what approach Environmental Dynamics Inc. is using for cumulative effects. [redacted] said they did a linear features assessment to assess regrowth of linear features. Staff walked seismic lines to assess line of sight and monitored wildlife. This information will feed into cumulative effects for the Project. [redacted] added there is no other development in the area except the Dempster Highway.
- [redacted] asked when Chance will be in Old Crow later in August.
- [redacted] confirmed travel dates and noted the Project Team is interested in meeting with leadership at 2:00 pm in advance of the open house at 4:00 pm. [redacted] confirmed he would ask VGFN leadership if they were available to meet with Chance during their trip to Old Crow.
- [redacted] asked for the August 23, 2023 YESAB meeting details.
- [redacted] shared [redacted] is the Yukon Government point of contact for the Project.

Subject	Project Overview Meeting
Prepared By	Two Worlds Consulting (TWC)
Groups Involved	Bluescape Group of Companies (Bluescape) Chance Oil and Gas (Chance) Environmental Dynamics Inc. (EDI) Palmer Peer Solutions TWC Vuntut Gwitchin First Nation (VGFN)
Participants	[redacted], Senior Vice President Engineering and Operations (Bluescape) [redacted] Regulatory, Environmental and Community Relations Coordinator (Chance) [redacted], Deputy CEO and Senior Biologist (EDI) [redacted] Senior Geoscientist and Project Manager (Palmer) [redacted] VP Operations (Peer Solutions) [redacted] Engagement Support (TWC) [redacted] Socioeconomic Support (TWC) Deputy Chief [redacted] (VGFN) [redacted] Executive Director (VGFN) [redacted] Acting Executive Assistant (Virtual) (VGFN) [redacted] Technical Advisor (VGFN)
Date/Time	September 13, 2023 2:00 PM – 3:00 PM PST
Copies to	Chance and VGFN

Purpose of Meeting

- Chance provided an Eagle Plains Exploration Project (Project) update to VGFN.

Topics Discussed

- Chance overview
- Project overview including information on exploration, design changes, baseline studies, regulatory process, schedule, engagement, proposed next steps

Key Issues Raised / Chance Responses to Issues

- Expressed interest in understanding how community feedback shared to date has been used by Chance.
    - TWC confirmed a slide in the presentation documents how Chance has incorporated past feedback to the current Draft Project Description.
- Noted the importance of listening to the people that grew up and live in Old Crow.
- Suggested Chance consider additional engagement methods to reach a broader audience.
- Asked how Chance is in Phase 6: Submission of Project Proposal.
    - TWC committed to sharing the language from YESAB's User Guide: Pre-Submission Engagement for Executive Committee Screenings with meeting

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

attendees which outlines that referred Projects move to Phase 6: Submission of Project Proposal. Noted where Chance stood in the Pre-Submission Engagement process was confirmed by Yukon Environmental Socioeconomic Assessment Board (YESAB) staff.

Actions and Responsible Party

- Chance to send meeting minutes including actions to VGFN – complete.
- Chance to share language from YESAB's User Guide: Pre-Submission Engagement for Executive Committee Screenings describing why the Project is in Phase 6: Submission of Project Proposal with meeting attendees – complete.
- Chance to consider conducting an open house event in Whitehorse with VGFN Citizens that do not live in Old Crow – in progress.
- Chance to consider conducting door-to-door engagement in Old Crow and a digital survey to engage a broader range of VGFN Citizens – in progress.
- Chance to contact [redacted] with requests to share information via the VGFN newsletter – as needed.
- Chance to provide Major Projects Yukon and Chance September meeting details with [redacted] – complete.
- Chance to contact [redacted] and cc [redacted] to confirm community-based research protocols and process – complete.
- VGFN to confirm if there are specific Citizens or businesses that should be invited to participate in socioeconomic interviews – in progress.
- VGFN to confirm if Chance can support coordination logistics for the meeting with all potentially affected First Nations – complete.
- VGFN to confirm if there are any existing documents containing VGFN socioeconomic data and/or Traditional Knowledge that Chance should review to inform the Project Proposal – in progress.

Discussion

- [redacted] led a round of introductions.
- Deputy Chief [redacted] asked what happens to the feedback shared at open house events and noted the importance of listening to the people that grew up and live in Old Crow. She expressed interest in understanding how the feedback shared to date has been used by Chance. [redacted] confirmed a slide in the presentation documents how Chance has incorporated past feedback in the current Draft Project Description.
- [redacted] reviewed the agenda and asked if anyone had any revisions. No revisions were shared.
- [redacted] provided a background on Chance. She shared that Chance is a small company with offices in Calgary and Whitehorse.
- [redacted] provided an overview of the proposed Project including information on the:

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

- Project location (overlap with First Nation traditional territories, North Yukon Planning Region, and the Peel Watershed Planning Region).
- Proposed Project activities including seismic, drilling, extended flow testing, and progressive reclamation and closure.
- Proposed supporting Project activities including the use of the existing Chance camp and airstrip, construction of winter access roads, use of a remote fly-in camp, construction of a winter airstrip, mix-bury cover sumps, and a central processing facility.

- [redacted] shared how the Project approach and design had changed since it was last proposed. Daryl added a deeper explanation of the difference between past and current seismic technology (i.e., how seismic lines today have a relatively minimal impact to the land). Deputy Chief [redacted] said this information was a good point to share at the community open house event later that day.
- Deputy Chief [redacted] noted at previous open house events Chance proposed to drill 20 wells and then two years ago proposed 50 wells. She said she was surprised by that. [redacted] confirmed Chance is proposing up to 30 wells and did not recall previously proposing 50 wells.
- [redacted] added that the Project is also proposing to use winter access roads instead of all-weather roads. [redacted] confirmed what [redacted] shared and said the use of winter access roads only was in response to concerns shared by First Nations at past engagement events. She said winter access roads are expected to have less impact on permafrost. [redacted] added that this is one of the changes that they hope to share with the community at the open house later that day. She added that community members are likely not aware that the latest iteration of the Project is different, in some respects, than what they had previously heard.
- [redacted] reviewed baseline studies that were conducted in 2018/19 and updated in 2022/2023.
- [redacted] shared the Project would be assessed by the Executive Committee of YESAB. She explained the Project was referred by the Dawson City Designated Office of YESAB to the Executive Committee in 2014. She noted Chance received confirmation from YESAB that they were in Phase 6: Submission of Project Proposal of YESAB's Pre-Submission Engagement process since they were referred. Deputy Chief [redacted] asked how Chance was able to jump to Phase 6: Submission of Project Proposal. Eliza committed to sharing the language from YESAB's User Guide: Pre-Submission Engagement for Executive Committee Screenings with meeting attendees.
- [redacted] reviewed completed 2023 engagement activities with all potentially affected First Nations as well as proposed engagement and regulatory next steps for the Project.
- [redacted] shared that TWC, on behalf of Chance, is proposing to conduct socioeconomic interviews to understand Project-related socioeconomic effects to inform the Project Proposal (e.g., information on community health and wellbeing, infrastructure services, education, and employment). She noted information publicly available is often not specific or detailed enough to capture this information for northern communities. [redacted] asked VGFN to confirm if they have any community-based research protocols Chance should be aware of (e.g., forms to be completed in advance of fieldwork) and if there are specific VGFN Citizens or businesses

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

that should be interviewed [redacted] added that she believed VGFN had a research approval process for Old Crow and said [redacted] in Whitehorse is responsible for reviewing research requests.

- Deputy Chief [redacted] said it is important to highlight Project changes. She noted northern communities have not been consulted on many things and it is important for the people to hear that Chance has heard and incorporated their feedback to their YESAB submission. She said this may encourage people to speak up more. She said some people may not say anything at open house events, but they have thoughts to share.
- [redacted] asked if VGFN has a suggestions board. Deputy Chief [redacted] said VGFN does not have a suggestions board. She said some folks will attend meetings and prefer to use sticky notes to share feedback rather than speaking aloud to the group.
- [redacted] asked Deputy Chief [redacted] if she was aware of any individuals that should be contacted about socioeconomic interviews. She noted they are hoping to interview a diverse group of individuals representing different genders, ages, people that live in community versus outside the community, land users, etc.
- Deputy Chief [redacted] recommend folks that live along the Dempster Highway are interviewed.
- [redacted] suggested a VGFN Citizen support with interview coordination. [redacted] responded and said VGFN will see how things roll out and requested he be included on communications to [redacted] (VGFN staff member responsible for managing community-based research requests). [redacted] said Chance is hoping VGFN will confirm if there are existing socioeconomic studies that should be relied on to inform the Socioeconomic Effects Assessment as well as leadership and community engagement preferences (virtual versus in person, frequency, topics of interest, preferred method for sharing information (e.g., verbal and/or written), etc.).
- [redacted] said Chance is also looking for feedback on the draft Valued Environmental Socioeconomic Components (VESECs).
- [redacted] asked VGFN to confirm if there are any sources of Traditional Knowledge that Chance should rely on for their Project Proposal. She confirmed that TWC, on behalf of Chance, is
- pulling together a list of publicly available secondary sources of Traditional Knowledge for VGFN's review and approval prior to being relied on in the Draft Project Proposal.
- Deputy Chief [redacted] shared that the same people attend the open houses and suggested Chance engage other subsets of the community. She asked if Chance is planning to conduct an open house in Whitehorse for VGFN Citizens that do not live in Old Crow and suggested they go door-to-door in Old Crow to share Project information and/or send out a digital survey.
- [redacted] confirmed Chance is hoping to conduct an open house in Whitehorse and asked if they should also direct the request for door-to-door engagement to [redacted]. [redacted] asked Chance to send this request to him and he can try and sort out logistics that take holidays and seasonal considerations into account.
- Deputy Chief [redacted] said people can make informed choice if they hear from Chance and VGFN leadership.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

- [redacted] asked if there is anywhere to post information. James confirmed community communications should be sent to him. He added survey and newsletter requests should also be sent to him.
- [redacted] asked if Chance is meeting with the Porcupine Caribou Herd Management Board (PCMB). [redacted] confirmed they had met with the PCMB committee a few times. He shared that EDI presented their analysis and plans for the Environmental Assessment (EA). [redacted] said they were planning to send the EA written analysis to the PCMB committee.
- [redacted] raised the proposed joint meeting with VGFN and Gwich'in Tribal Council (GTC). She asked if there was any update on this meeting. [redacted] said Greg had introduced him to the new GTC Acting Director and would introduce the GTC team at an already established meeting with VGFN, Tr'ondëk Hwëch'in, and First Nation of Nacho Nyäk Dun. [redacted] said this group would add the Project to the discussion list. [redacted] asked John to let Chance know if they needed any support coordinating logistics for that meeting.
- [redacted] shared Chance is looking to set up more meetings with YESAB.
- [redacted] asked if Chance is dealing with Major Projects Yukon.
- [redacted] said that she and [redacted] had met with them a few months ago. [redacted] shared Chance had a meeting scheduled with Major Projects Yukon mid-September and would confirm the meeting date and time with [redacted].
- Deputy Chief [redacted] thanked everyone and wished the Chance Project Team well at the community open house.
- [redacted] asked for community open house details.
- [redacted] shared the community open house was scheduled for 4:00 pm – 8:00 pm and noted dinner will start at 5:00 pm. She said the Chance Project Team will stay until needed. [redacted] added that the Chance Project Team would share a Project video during dinner and then provide a presentation including a question-and-answer period.
- [redacted] added that permafrost and jobs tend to be a main discussion point and that the Chance Project Team is looking for direction from leadership to have deeper discussions with community members on topics of interest.
- [redacted] thanked VGFN for their time.

APPENDIX 2-C-77. September 13, 2023, Open House Summary Report

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

Meeting Minutes

Subject	Project Overview Meeting
Prepared By	Two Worlds Consulting (TWC)
Groups Involved	Bluescape Group of Companies (Bluescape) Chance Oil and Gas (Chance) Environmental Dynamics Inc. (EDI) Palmer Peer Solutions TWC Vuntut Gwitchin First Nation (VGFN)
Participants	[redacted], Senior Vice President Engineering and Operations (Bluescape) [redacted] Regulatory, Environmental and Community Relations Coordinator (Chance) [redacted], Deputy CEO and Senior Biologist (EDI) [redacted] Senior Geoscientist and Project Manager (Palmer) [redacted] VP Operations (Peer Solutions) [redacted] Engagement Support (TWC) [redacted] Socioeconomic Support (TWC) Deputy Chief [redacted] (VGFN) [redacted] Executive Director (VGFN) [redacted] Acting Executive Assistant (Virtual) (VGFN) [redacted] Technical Advisor (VGFN)
Date/Time	September 13, 2023 2:00 PM – 3:00 PM PST
Copies to	Chance and VGFN

Purpose of Meeting

- Chance provided an Eagle Plains Exploration Project (Project) update to VGFN.

Topics Discussed

- Chance overview
- Project overview including information on exploration, design changes, baseline studies, regulatory process, schedule, engagement, proposed next steps

Key Issues Raised / Chance Responses to Issues

- Expressed interest in understanding how community feedback shared to date has been used by Chance.
    - TWC confirmed a slide in the presentation documents how Chance has incorporated past feedback to the current Draft Project Description.
- Noted the importance of listening to the people that grew up and live in Old Crow.
- Suggested Chance consider additional engagement methods to reach a broader audience.
- Asked how Chance is in Phase 6: Submission of Project Proposal.
    - TWC committed to sharing the language from YESAB's User Guide: Pre-Submission Engagement for Executive Committee Screenings with meeting

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

attendees which outlines that referred Projects move to Phase 6: Submission of Project Proposal. Noted where Chance stood in the Pre-Submission Engagement process was confirmed by Yukon Environmental Socioeconomic Assessment Board (YESAB) staff.

Actions and Responsible Party

- Chance to send meeting minutes including actions to VGFN – complete.
- Chance to share language from YESAB's User Guide: Pre-Submission Engagement for Executive Committee Screenings describing why the Project is in Phase 6: Submission of Project Proposal with meeting attendees – complete.
- Chance to consider conducting an open house event in Whitehorse with VGFN Citizens that do not live in Old Crow – in progress.
- Chance to consider conducting door-to-door engagement in Old Crow and a digital survey to engage a broader range of VGFN Citizens – in progress.
- Chance to contact [redacted] with requests to share information via the VGFN newsletter – as needed.
- Chance to provide Major Projects Yukon and Chance September meeting details with [redacted] – complete.
- Chance to contact [redacted] and cc [redacted] to confirm community-based research protocols and process – complete.
- VGFN to confirm if there are specific Citizens or businesses that should be invited to participate in socioeconomic interviews – in progress.
- VGFN to confirm if Chance can support coordination logistics for the meeting with all potentially affected First Nations – complete.
- VGFN to confirm if there are any existing documents containing VGFN socioeconomic data and/or Traditional Knowledge that Chance should review to inform the Project Proposal – in progress.

Discussion

- [redacted] led a round of introductions.
- Deputy Chief [redacted] asked what happens to the feedback shared at open house events and noted the importance of listening to the people that grew up and live in Old Crow. She expressed interest in understanding how the feedback shared to date has been used by Chance. [redacted] confirmed a slide in the presentation documents how Chance has incorporated past feedback in the current Draft Project Description.
- [redacted] reviewed the agenda and asked if anyone had any revisions. No revisions were shared.
- [redacted] provided a background on Chance. She shared that Chance is a small company with offices in Calgary and Whitehorse.
- [redacted] provided an overview of the proposed Project including information on the:

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

- Project location (overlap with First Nation traditional territories, North Yukon Planning Region, and the Peel Watershed Planning Region).
- Proposed Project activities including seismic, drilling, extended flow testing, and progressive reclamation and closure.
- Proposed supporting Project activities including the use of the existing Chance camp and airstrip, construction of winter access roads, use of a remote fly-in camp, construction of a winter airstrip, mix-bury cover sumps, and a central processing facility.

- [redacted] shared how the Project approach and design had changed since it was last proposed. Daryl added a deeper explanation of the difference between past and current seismic technology (i.e., how seismic lines today have a relatively minimal impact to the land). Deputy Chief [redacted] said this information was a good point to share at the community open house event later that day.
- Deputy Chief [redacted] noted at previous open house events Chance proposed to drill 20 wells and then two years ago proposed 50 wells. She said she was surprised by that. [redacted] confirmed Chance is proposing up to 30 wells and did not recall previously proposing 50 wells.
- [redacted] added that the Project is also proposing to use winter access roads instead of all-weather roads. [redacted] confirmed what [redacted] shared and said the use of winter access roads only was in response to concerns shared by First Nations at past engagement events. She said winter access roads are expected to have less impact on permafrost. [redacted] added that this is one of the changes that they hope to share with the community at the open house later that day. She added that community members are likely not aware that the latest iteration of the Project is different, in some respects, than what they had previously heard.
- [redacted] reviewed baseline studies that were conducted in 2018/19 and updated in 2022/2023.
- [redacted] shared the Project would be assessed by the Executive Committee of YESAB. She explained the Project was referred by the Dawson City Designated Office of YESAB to the Executive Committee in 2014. She noted Chance received confirmation from YESAB that they were in Phase 6: Submission of Project Proposal of YESAB's Pre-Submission Engagement process since they were referred. Deputy Chief [redacted] asked how Chance was able to jump to Phase 6: Submission of Project Proposal. Eliza committed to sharing the language from YESAB's User Guide: Pre-Submission Engagement for Executive Committee Screenings with meeting attendees.
- [redacted] reviewed completed 2023 engagement activities with all potentially affected First Nations as well as proposed engagement and regulatory next steps for the Project.
- [redacted] shared that TWC, on behalf of Chance, is proposing to conduct socioeconomic interviews to understand Project-related socioeconomic effects to inform the Project Proposal (e.g., information on community health and wellbeing, infrastructure services, education, and employment). She noted information publicly available is often not specific or detailed enough to capture this information for northern communities. [redacted] asked VGFN to confirm if they have any community-based research protocols Chance should be aware of (e.g., forms to be completed in advance of fieldwork) and if there are specific VGFN Citizens or businesses

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

that should be interviewed [redacted] added that she believed VGFN had a research approval process for Old Crow and said [redacted] in Whitehorse is responsible for reviewing research requests.

- Deputy Chief [redacted] said it is important to highlight Project changes. She noted northern communities have not been consulted on many things and it is important for the people to hear that Chance has heard and incorporated their feedback to their YESAB submission. She said this may encourage people to speak up more. She said some people may not say anything at open house events, but they have thoughts to share.
- [redacted] asked if VGFN has a suggestions board. Deputy Chief [redacted] said VGFN does not have a suggestions board. She said some folks will attend meetings and prefer to use sticky notes to share feedback rather than speaking aloud to the group.
- [redacted] asked Deputy Chief [redacted] if she was aware of any individuals that should be contacted about socioeconomic interviews. She noted they are hoping to interview a diverse group of individuals representing different genders, ages, people that live in community versus outside the community, land users, etc.
- Deputy Chief [redacted] recommend folks that live along the Dempster Highway are interviewed.
- [redacted] suggested a VGFN Citizen support with interview coordination. [redacted] responded and said VGFN will see how things roll out and requested he be included on communications to [redacted] (VGFN staff member responsible for managing community-based research requests). [redacted] said Chance is hoping VGFN will confirm if there are existing socioeconomic studies that should be relied on to inform the Socioeconomic Effects Assessment as well as leadership and community engagement preferences (virtual versus in person, frequency, topics of interest, preferred method for sharing information (e.g., verbal and/or written), etc.).
- [redacted] said Chance is also looking for feedback on the draft Valued Environmental Socioeconomic Components (VESECs).
- [redacted] asked VGFN to confirm if there are any sources of Traditional Knowledge that Chance should rely on for their Project Proposal. She confirmed that TWC, on behalf of Chance, is
- pulling together a list of publicly available secondary sources of Traditional Knowledge for VGFN's review and approval prior to being relied on in the Draft Project Proposal.
- Deputy Chief [redacted] shared that the same people attend the open houses and suggested Chance engage other subsets of the community. She asked if Chance is planning to conduct an open house in Whitehorse for VGFN Citizens that do not live in Old Crow and suggested they go door-to-door in Old Crow to share Project information and/or send out a digital survey.
- [redacted] confirmed Chance is hoping to conduct an open house in Whitehorse and asked if they should also direct the request for door-to-door engagement to [redacted]. [redacted] asked Chance to send this request to him and he can try and sort out logistics that take holidays and seasonal considerations into account.
- Deputy Chief [redacted] said people can make informed choice if they hear from Chance and VGFN leadership.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

- [redacted] asked if there is anywhere to post information. James confirmed community communications should be sent to him. He added survey and newsletter requests should also be sent to him.
- [redacted] asked if Chance is meeting with the Porcupine Caribou Herd Management Board (PCMB). [redacted] confirmed they had met with the PCMB committee a few times. He shared that EDI presented their analysis and plans for the Environmental Assessment (EA). [redacted] said they were planning to send the EA written analysis to the PCMB committee.
- [redacted] raised the proposed joint meeting with VGFN and Gwich'in Tribal Council (GTC). She asked if there was any update on this meeting. [redacted] said Greg had introduced him to the new GTC Acting Director and would introduce the GTC team at an already established meeting with VGFN, Tr'ondëk Hwëch'in, and First Nation of Nacho Nyäk Dun. [redacted] said this group would add the Project to the discussion list. [redacted] asked John to let Chance know if they needed any support coordinating logistics for that meeting.
- [redacted] shared Chance is looking to set up more meetings with YESAB.
- [redacted] asked if Chance is dealing with Major Projects Yukon.
- [redacted] said that she and [redacted] had met with them a few months ago. [redacted] shared Chance had a meeting scheduled with Major Projects Yukon mid-September and would confirm the meeting date and time with [redacted].
- Deputy Chief [redacted] thanked everyone and wished the Chance Project Team well at the community open house.
- [redacted] asked for community open house details.
- [redacted] shared the community open house was scheduled for 4:00 pm – 8:00 pm and noted dinner will start at 5:00 pm. She said the Chance Project Team will stay until needed. [redacted] added that the Chance Project Team would share a Project video during dinner and then provide a presentation including a question-and-answer period.
- [redacted] added that permafrost and jobs tend to be a main discussion point and that the Chance Project Team is looking for direction from leadership to have deeper discussions with community members on topics of interest.
- [redacted] thanked VGFN for their time.

APPENDIX 2-C-78. October 13, 2023, Meeting Summary

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

Meeting Minutes

Subject	Consultation and Capacity
Prepared By	Two Worlds Consulting (TWC)
Groups Involved	Chance Oil & Gas (Chance) TWC The Yukon Government (YG) Canadian Northern Economic Development Agency (CanNor) Crown-Indigenous Relations and Northern Affairs Canada (CIRNAC) First Nation of Na-Cho Nyak Dun (FNNND) Tr'ondëk Hwëch'in First Nation (TH) Gwich'in Tribal Council (GTC) Vuntut Gwitchin Government (VGG) Yukon Environmental and Socio-economic Assessment Board (YESAB)
Participants	• [redacted] Executive Committee Manager (YESAB) • [redacted] Aboriginal Relations (YG) • [redacted] Major Projects Director (YG) • [redacted] Major Projects Manager (YG) • [redacted] Geothermal & Petroleum Resources Manager (YG) • [redacted] Regional Environment Manager (CIRNAC) • [redacted] Manager (CIRNAC) • [redacted] Project Officer (CanNor) • [redacted] Project Manager (CanNor) • [redacted], Resources & Governance Consultant (FNNND and TH) • [redacted], Lands & resources coordinator (GTC) • [redacted], Technical Advisor (VGG) • [redacted], Caribou Coordinator (VGG) • [redacted] (Chance) • [redacted] (Chance) • [redacted], Regulatory Lead (Chance) • [redacted], Transboundary Specialist (GTC) • [redacted], [redacted], and [redacted] (TWC)
Date/Time	October 13, 2023 from 10:30am – 12:00pm PST
Copies to	[redacted]

Purpose of Meeting

- Discuss Consultation and Capacity

Topics Discussed

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

- YESAB Screening Process
- Consultation Plan
- Transboundary Territory

Key Issues Raised / Chance Responses to Issues

- Inquired about international transboundary lands and if there is a plan to address that.
    - Chance stated they are following the YESAB regulations and there is nothing explicitly about international transboundary consultation requirements.
- Noted the need for Nations to receive capacity funding prior to the submission of proposals.
    - CIRNAC stated that NPFP is flexible and can be arranged to support this

Actions and Responsible Party

- VGG to set up all Nations meeting.
- YG to set up meeting with VGG, TH, FNNND, GTC to discuss Consultation Plan after all Nations meeting.
- VGG, TH, FNNND, GTC to follow up with CIRNAC about capacity funding.
- CIRNAC to follow up about Transboundary with US consultation protocol

Details of Discussion

- [redacted] talked about Chance's project proposal. [redacted] discussed Engagement with Chance and the somewhat revised project description. He clarified that this meeting is about the process moving forward and not the project details, as well as to better understand the Nations feelings. John introduced the idea of making a joint consultation plan process to ultimately look at capacity funding for all Nations to meaningfully participate in further engagement. [redacted] clarified that this meeting is to hear the party's perspectives on consultation and capacity and not to talk about the project or project details.
- [redacted] reiterated that this meeting is for consultation discussions. [redacted] described the screening process for YESAB. He stated that YESAB through the screening process checks to see if the proponent has fulfilled consultation duties with communities and First Nations using the four-point test. He clarified YESAB doesn't need consultation records during the screening period, as this is separate from the records of past consultation leading up to the screening period. [redacted] said he is here to answer any further questions about the screening process as the meeting progresses.
- [redacted] asked for clarification about the project history and new regulatory screening process since the project went from Dawson City Designated Office to the Executive Committee. [redacted] continued that with the newer consultation under the Executive Committee how will this change the screening process since the project is referred from the DO?
- [redacted] clarified this is a referred project and now must update under new regulation. He stated Chance is not submitting a new project rather a revised proposal and consultation record to meet new standards.
- [redacted] asked whose regime Chance was under before compared to now and how that has changed the process.
- [redacted] added that Nations are dealing with a proposal that has not been submitted yet and the consultation record only covers what has happened during the DO days.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

- [redacted] stated that First Nations are providing comments but asked [redacted] if Nations should expect face to face discussions to provide input moving forward.
- [redacted] answered yes, this is a possibility. He said YESAB could include Nations in the screening process if needed and desired.
- [redacted] redirected the conversation onto Aboriginal Relations with Yukon Governments
- [redacted] proposed adding to the meeting agenda more discussions regarding the Yukon government. He stated the Yukon Government is a regulator on this project and decision maker on this project and will make recommendation based on the Department of Economic Developments input. [redacted] further explained that the Yukon will lead a consultation under major projects Yukon, with affected Nations and YG will be relying on the screening process which means Nations need to participate in the screening process to inform how treaty rights are affected and how YESAB are taking those impacts and converting to values ultimately to inform decision making. [redacted] continued that the YESAB approach is to engage early in addition to the ongoing screening. He said this meeting is a good time to understand what the consultation process looks like moving forward. He informed that YESAB will be leaning on the Aboriginal Relations to inform and set up that consultation approach. He clarified the assessment itself will be informed by regulators providing technical expertise.
- [redacted] agreed with [redacted] and explained the process further.
- [redacted] explained that YESAB has a less defined consultation process to let it be led more by participants. She explained that YG has been working on multiyear consultation efforts. She invited a discussion of the components that need to be improved in the engagement process. [redacted] stated that she looks forwards to using consultation tools to better inform a process moving forward.
- [redacted] asked if YG is aware of the transboundary areas and how consultation works with Alaskan transboundary lands. He also asked how YG feels about transboundary lands with America.
- [redacted] answered that YG takes transboundary issues seriously but can't confirm if there is a case to reference where an organized Indigenous group in America had transboundary lands with Canada. [redacted] explained that YG has dealt with transboundary within Canada and Provinces more frequently than National transboundary lands.
- [redacted] asked to hear from other Federal representatives on International transboundary protocol.
- [redacted] answered speaking to the federal approach to consultation and the federal participation in these major projects. [redacted] stated that this project may not require federal decision bodies. She clarified that Canada's engagement and duty to consult relies on what is determined through the YESAB screening process.
- [redacted] stated that the Northern Participant Funding Program (NPFP) is designed to assist First Nations in participating in big projects but is limited to 150,000 dollars per fiscal year. He further explained that NPFP is limited to projects that are for sure to go through the assessment process.
- [redacted] asked [redacted] if Nations can't trigger NPFP funding until the proposal is submitted how can Nations get ready for the assessment, as Nations don't want to be left behind. [redacted] asked, if there was a possibility for capacity funding about 2 months before the proposal is submitted.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

- [redacted] answered that CIRNAC tries to be very flexible with this and are open to discussions before submission if things are moving quickly. Shane continued that CIRNAC is looking to maximize participation and readiness.
- [redacted] asked [redacted] if he would be open to assisting in creating a consultation plan
- [redacted] answered that he would be very open to help with a consultation plan. He clarified that Provincial limiting doesn't limit federal funding.
- [redacted] asked If Canada is not a decision body how are transboundary lands addressed with the US for Federal consultation.
- [redacted] asked, for the federal money that is available, is there any documents on the responsibility of proponents to provide capacity funding or is there federal linkage to proponent obligation.
- [redacted] answered, no, federal funding is not linked to proponent responsibility, rather federal funding is supplementary.
- [redacted] asked what Transboundary lands are in question.
- [redacted] clarified that Gwich'in territory extends into Alaskan transboundary lands. [redacted] asked if there is a plan around addressing this.
- [redacted] asked if this is referencing Porcupine Caribou Herd. [redacted] continued that Chance follows YEASB regulations and is concerned over the international regulations being brought into the equation as Chance is following all required regulations that are known.
- [redacted] answered that there are international transboundary Porcupine Caribou Herd relations that he wants clarification on about if there is existing federal protocol for but he just wanted to raise question not to raise concern.
- [redacted] echoed [redacted] and thanked John for clarifying on importance of concern raised.
- [redacted] reiterated that there is no question about FNNND desire to be very involved but the form that will take on how that participation will look he is not sure on. He stated that FNNND is overlapping with TG and that both First Nations want to be involved but have to sort out the details.
- [redacted] stated that Chance has been working with FNNND for a while now and Chance needs to know what level of consultation is required as previous meetings have been postponed and there is not a clear understanding of what FNNND wants consultation wise. [redacted] wanted to get confirmation about level of consultation desired by FNNND. He stated porcupine caribou is common priority amongst all Nations involved and that is known. [redacted] said that Chance would like to schedule meetings with FNNND and asked if [redacted] could help Chance in a timely matter to get some direction on how and when to consult with FNNND as it has been hard in the past. [redacted] recognized that the type and degree of consultation needs to be sorted out on direction that further consultation will take.
- [redacted] answered that there has been some difficulty lately with new governments in both Nations and all new staff causing delays. [redacted] stated that he is working on trying to facilitate more understanding on needs.
- [redacted] stated that he had a few meetings with Chance regarding the proposal and GTC and Chance have a good working relationship, but this relationship doesn't replace the federal duty to consult, and GTC looks forward to discussing that further when the time comes.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

- [redacted] talked about the how the Old Crow meetings back in May discussing the revised project description were delayed due to floods but the but the Mid September meetings in Old Crow were very productive. [redacted] thought it was a good session. [redacted] shared that the VGG perspective is to get ahead of this and have regular meetings with Greg, to keep in touch. John shared that VGG are in support about the proposal being submitted. [redacted] shared that VGG would like to know what the consultation process looks like so VGG can prepare. [redacted] proposed that VGG works together with the other Nations to be more efficient and share resources and to be coordinated in the consultation process. John asked for a First Nations reps only meeting to get organized and so Nations can be active and not passive in the consultation process.
- [redacted] asked if the current project proposal is the final version of the proposal. [redacted] said that the last timeline heard was mid December for probable submission to YESAB. [redacted] asked if FNNND and TH are currently being consulted on the final or work in progress proposal.
- [redacted] answered that Chance has a description of the project in draft from. [redacted] said that the Nations consultation on the project so far has not just been about ticking off a box about rather what people think about the project. [redacted] said that all Nations are going to see the final proposal when it is submitted. [redacted] stated that Chance is looking at a submission in January and said [redacted] can talk to that more.
- [redacted] said that Nations are currently dealing with the draft proposal currently, but the final will be the one that is focused on moving forward.
- [redacted] asked if it can be confirmed that the proposal can be adjusted.
- [redacted] answered that the proposal can be adjusted until submission.
- [redacted] Presented Chance project updates: [redacted] showed slides. [redacted] thanked everyone for attending. He stated Chance is working to meet all four points under YESAB screening. [redacted] stated nothing has really changed from 2014 to the new project. He continued that minor changes were made to First Nations engagement, like seasonal road. [redacted] informed that between now and January 2024 the goal is to submit proposal early to mid February. He stated Chance is happy to do virtual meetings. [redacted] said Chance doesn't want to be throwing big packages at you, Chance wants to make sure that it can be a meaningful conversation. He stated Chance will be doing a document review and that Two Worlds Consulting was hired to support in this endeavour. He finished by saying the meeting held with YESAB about traditional knowledge was critical and Chance wants to capture that Knowledge and use it to influence the submission.
- [redacted] closed the meeting by discussing possible next steps like an all Nation only meeting and a consultation plan with help of YG. [redacted] stated that it was good to hear about support for consultation and about capacity funding as needs are there. He finished by sharing that it might be a good idea to collapse all nations together to save money.

APPENDIX 2-C-79. December 6, 2023, World Café Summary Report

VUNTUT GWITCHIN FIRST NATION AND CHANCE OIL AND GAS LIMITED: OLD CROW WORLD CAFÉ COMMUNITY EVENT SUMMARY REPORT DECEMBER 6, 2023

Figure 1: Old Crow (December 2023)

Introduction

Chance Oil and Gas Limited (Chance) is proposing the Eagle Plains Exploration Project (Project) to gain a better understanding of the commercial feasibility of oil and natural gas resources in the Eagle Plains Basin. Proposed Project activities are scheduled to occur over a period of up to 10 years, and include:

- Constructing approximately up to 1,500 square kilometers of new 3D seismic lines.
- Constructing approximately up to 2,000 square kilometers of 2D seismic lines.
- Drilling up to 30 wells (5 -8 wells per year) during the winter to evaluate the presence of oil and natural gas resources.

Chance is in the process of preparing a Project Proposal for submission to the Yukon Environmental Socio-economic Assessment Board (YESAB) Executive Committee in February 2024.

Chance invited Vuntut Gwitchin First Nation (VGFN) Citizens and residents of Old Crow to a World Café Community Event (World Café) in Old Crow on Wednesday, December 6, 2023. The objectives of the Community Event were to:

- Strengthen the relationship and enhance communications between VGFN Citizens, residents of Old Crow, and Chance.
- Share information on potential Project-related effects and proposed mitigation measures to support VGFN Citizens and residents of Old Crow to prepare views on the Project.
- Receive feedback from VGFN Citizens and residents of Old Crow on consultation and engagement, potential Project-related effects, general Project-related concerns, and proposed mitigation measures.

This report summarizes the World Café event including the location, invitation, details, and feedback received.

Event Location

The World Café event was hosted at the Darius Elias Community Centre in Old Crow.

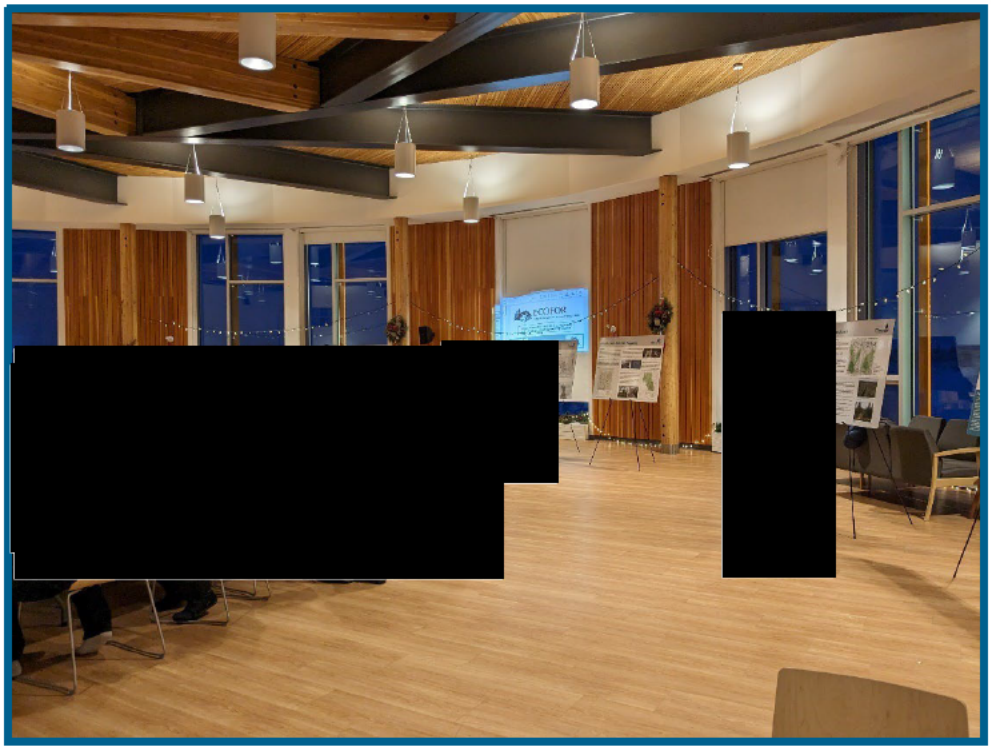

Figure 2: World Café attendees at the Darius Elias Community Centre.

World Café Event Invitation

On November 29, 2023, an invitation was provided to VGFN staff to print and display around Old Crow (Appendix A). The invitation was also shared virtually on Chance's Facebook page. The invitation provided key information such as purpose, location and time, and Chance contact information to share questions and/or feedback about the World Café event or Project.

World Café Event Participation

World Café event participants included:

- Chance Project Team[1]:
  - Chance.
  - Environmental Dynamics Inc. (EDI).
  - Ecofor.
  - Palmer.
  - Two Worlds Consulting.

[1] The Chance Project Team wore name tags to identify their names and the organization they represented.

- VGFN Citizens.
- VGFN Government and Staff; and
- Residents of Old Crow.

World Café Event Details

The World Café event was held on December 6, 2023, from 4:00 pm to 8:00 pm MDT. World Café event attendees[2] were asked to sign-in[3] upon arrival and were provided a Project handout (Appendix B). The Project handout included Project information, a description of the YESAB regulatory process, studies completed by Chance, Project regulatory process timeline, and key First Nation Project feedback and Chance's responses to shared feedback. World Café attendees were included in a raffle for a chance to win various door prizes (see page 6). Coloring sheets and medical masks were also provided for World Café attendees, if interested. In total, there were 42 World Café attendees.

Figure 3: Children's drawing from the World Café event.

[2] World Café event attendees refers to VGFN Citizens, VGFN Government and Staff, and residents of Old Crow.
[3] Completed sign-in sheets from the World Café event are available in Appendix C.

Chance placed Photo Permission Posters (Appendix D) around the Darius Elias Community Centre. These posters indicated that Chance would be taking photos at the World Café and that these images would be utilized by Chance in materials intended for the public. The posters encouraged attendees to advise facilitators from Two Worlds Consulting if they preferred that they and/or their children not be photographed. No World Café attendees requested not to be photographed.

Posterboards (Appendix E) were also placed around the Darius Elias Community Centre to share Project information with attendees. Representatives from the Chance Project Team were available to respond to comments and questions while World Café attendees reviewed the posterboards. Posterboards included:

- Eagle Plains Exploration Project
    - Including a high-level Project description, Project benefits to the Yukon, a Project map (depicting First Nation Traditional Territories and Settlement Lands, permit zones, Peel Watershed Planning Region, North Yukon Planning Region, and Dawson Planning Region), and a summary of the YESAB process.
- Heritage Resource Management Program
    - Including a description of the Project's Heritage Resource Overview Assessment, Heritage Resource Impact Assessment, Systematic Data Recovery Excavation, and current heritage resources management work within the Project area.
- Permafrost and Terrain Mapping
    - Including background information on permafrost in the Project area, how terrain and permafrost information informs the Project design, surficial geology mapping, and next steps for permafrost data gathering.
- Porcupine Caribou Herd
    - Including information on habitat mapping, seasonal ranges based on historic use of the area, caribou distribution and movement, key existing information, and the Project's *Linear Features Study*.
- Wildlife and Habitat Mapping
    - Included an ecological land classification plot location map, and information on wildlife such as birds, moose, and American Marten in the Project area.
- Fish and Water
    - Identified key findings from fish and aquatic studies, and information on fish sampling locations, water quality and hydrology.
- Information about Chance, Jobs, and Training.
    - Including a Chance company profile, examples of Project-related jobs, and related training requirements.

- Chance's Seismic Exploration Program
    - Including information on seismic technology, seismic programs, the difference between 2D and 3D seismic, and how Chance is planning to reduce potential seismic-related impacts.

Chance contracted a VGFN Citizen to prepare dinner for attendees. Dinner was served at 5:00 pm MDT. After dinner, attendees were divided into two focus groups. Technical experts from EDI, Ecofor, and Palmer were divided amongst the groups. Focus group #1 had a presentation from EDI on Wildlife and Fish and Fish Habitat. Focus group #2 had presentations from Ecofor and Palmer on Archaeology/Heritage Resources and Permafrost. Once presentations and comments/concerns were addressed, the technical experts switched tables and presented on their respective areas of expertise to the opposite focus group. The focus groups were designed to provide attendees with a forum for open conversation to learn about potential Project-related effects, offer feedback, express concerns, and propose mitigation measures in a more intimate setting. Attendees were encouraged to pose questions and share comments on the Project both during and after the presentations. Chance staff drew prize winners[4] periodically throughout the event. Door prizes included:

- Two Air North gift cards (eligible for freight and flight).
- Three Co-op grocery gift cards.
- One Bingo card.
- Five Ecofor packages (calendar, tote bag, hat).
- One mug from Indigo.

[4] World Café event prize winners had to be present at the time their name was drawn. If an individual was not present at the time their name was drawn, a new name was drawn.

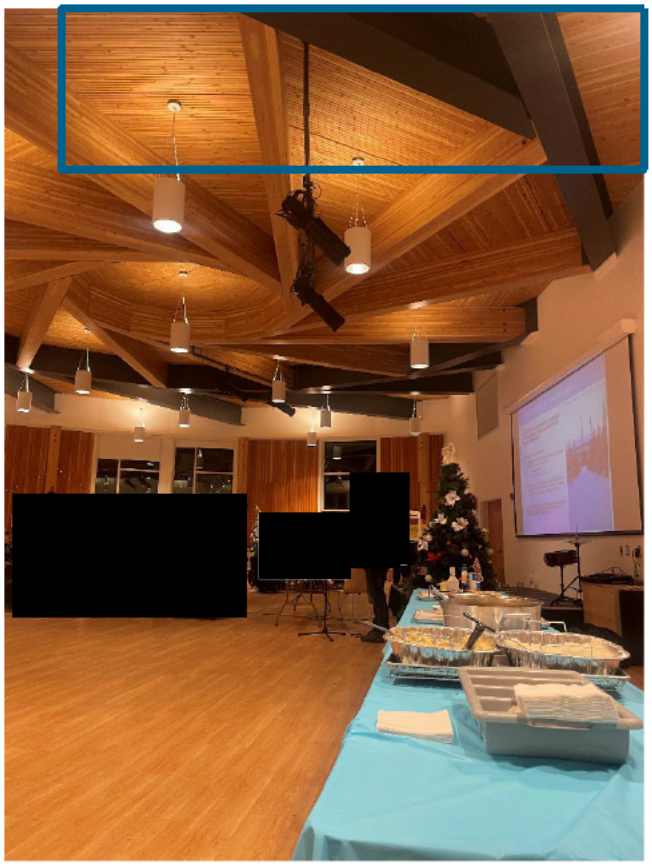

Figure 4: Community dinner provided by Chance.

Figure 5: Attendees split into two focus groups at the event.

Chance asked World Café attendees to complete a Project Feedback Form (Appendix F) prior to leaving the event. This form requested the following information from attendees:

- How they heard about the event.
- How they would rate the event.
- Whether they were able to share their thoughts, ideas, and knowledge during the event in a comfortable manner.
- Whether the event contributed to their understanding about Chance and the Project.
- Event highlights and areas for improvement for future events.
- Additional comments or questions about Chance, the Project, and/or the event.
- Whether they wished to receive Project updates including details on future engagement events.

World Café event Feedback Form results are summarized in the World Café Event Feedback Section. Four feedback forms were submitted at the World Café event.

World Café Event Feedback

Table 1 summarizes feedback shared at the World Café event by VGFN Citizens and residents of Old Crow.

Table 1: World Café Feedback

Feedback Topic	Feedback Shared	Chance's Response to Feedback Shared
Heritage Resources	Inquired if a heritage resource is the same as an unmarked grave.	The Chance Project Team stated that the two are distinct and impacts to burial sites are taken very seriously. If uncovered, work would stop and the RCMP and First Nations are contacted immediately. Once the area is cleared from Project activities, it is designated an archaeological site. Confirmed Chance would engage the First Nations and rely on and follow their guidance. The Chance Project Team added that burial sites can be marked off for avoidance and Drill sites are movable and would not impact known burial sites. The Chance Project Team does not anticipate encountering burial sites because of the acidic soil conditions in the Project area.
	Asked what Chance has found at known heritage resource sites and what is done with the artifacts. Asked what employees will do if they find a heritage and archaeological site.	The Chance Project Team has found stone tools and small stone chips that are the byproduct of their production. Discovered archeological and heritage resources are taken back to Ecofor's office in Whitehorse to examine and weigh them. These archeological and heritage resource materials are then turned over to Yukon Government Heritage Department. If an archaeological and heritage resource is discovered, Chance employees would be required to create a 30-meter buffer around the site(s) to protect and avoid the areas. The Project will implement measures to mitigate impacts to archaeological and heritage resources on site if they overlap with a planned drilling area. These mitigations will likely take the form if systematic data recovery excavations. Any removal of archaeological and heritage resources will be conducted in compliance with federal, provincial, First Nation, and industry best practices and standards.
	Encouraged Chance to work with the Vuntut Gwitchin Government Natural Resource department. VGFN noted that they have a lot of information that can inform Chance's work.	Chance thanked the attendee for their comment and noted they would continue to engage Vuntut Gwitchin Government on the Project including sharing heritage resources information. Chance planned a technical working group with government and technical advisor representatives from all potentially affected First Nations and Yukon Government to discuss the Project's

		archaeological and heritage resource studies on January 16, 2024.
	Stated they would like to see a copy of the Chance Find Procedure.	The Chance Project Team confirmed a *Chance Find Procedure* for the Project is being developed and stated potentially affected First Nations will be notified when the *Chance Find Procedure* is implemented. The Chance Project Team also shared that Chance is available to address any questions that VGFN Citizens may have about the Project via phone or email. The Chance Project Team committed to sharing Ecofor's contact information with VGFN Citizens who have questions related to archaeological and heritage resource studies completed for the Project, if requested.
Consultation and Engagement	Asked why Chance is consulting with Gwich'in Tribal Council (GTC).	The Chance Project Team responded that Chance is consulting Gwich'in Tribal Council because the Project overlaps with Gwich'in Tribal Council primary and secondary use areas.
	Expressed that Chance has provided clear and valuable information at the event. Added that the Project will be a significant project for Vuntut Gwitchin Government.	Chance appreciated the feedback.
	Expressed that having two focus groups made it conducive for open communication.	Chance appreciated the feedback.
	Expressed Chance explained the topics well.	Chance appreciated the feedback.
	Shared that they were satisfied or very satisfied with the World Café.	Chance appreciated the feedback.
Fish and Fish Habitat	Inquired as to how long water and fish studies had occurred.	The Chance Project Team shared that water quality and fish studies were conducted in 2019, 2020, and 2022. These studies were completed in the summer over a 3-month period.
	Inquired about Chance's fish guidelines for the Project and expressed interest in seeing clear guidelines to protect fish.	The Chance Project Team confirmed fish guidelines for the Project will follow guidelines set by the Department of Fisheries and Oceans (DFO) Canada. Measures will be outlined in the Project Proposal.

	Inquired about fish monitoring.	The Chance Project Team responded that water quality monitoring will take place during drilling. Added that Project activities occur in the winter and fish monitoring is not required at that time because fish overwinter outside of the Project area.
	Inquired about differences in monitoring outcomes between lake fish and river fish. Identified that different species are found in each.	The Chance Project Team said monitoring efforts have identified arctic grayling but did not detect any salmon species. Added that the Chance Project Team is only monitoring river systems and not lakes because lakes are not present in the Project area.
	Asked if the Chance Project Team has a best practice for protecting fish and fish habitat or where the answers go from their studies.	The Chance Project Team stated that Chance is required to follow fish guidelines set by DFO. Other guidelines for fish and fish habitat protection could come from YESAB or suggestions made by Vuntut Gwitchin First Nation and other potentially affected First Nations. Shared that there will be a public comment period once Chance submits the Project Proposal to YESAB in 2024. Added that anyone can download and submit comments on the Project Proposal directly to YESAB and/or Chance. The Chance Project Team noted that suggestions to protect fish and fish habitat shared today are helpful and could change the Project design. The Chance Project Team confirmed suggestions shared would be reflected in the Project Proposal. The Chance Project Team reminded attendees that the World Café event is one of multiple opportunities to ask questions about and shared feedback on the Project.
	Inquired about the Project's strategies for safeguarding riparian areas within the designated Project zone.	The Chance Project Team shared that studies completed for the Project identified high value riparian areas in the Project area and said these areas will be avoided as much as possible.
Drilling	Inquired about previous drilling activity in the Eagle Plains Area.	The Chance Project Team conducted drilling activities in 2012 and 2013. Added that drill holes were to up 3.4 kilometres deep. The Chance Project Team said the Project will utilize shallow drilling, involving drilling between 1,500 and 2,400 meters. The Chance Project Team confirmed that fracking will not be utilized for the Project and that Drill Stem Testing (DST) and flow tests to understand the amount and quality of natural gas reserves will be used.
	Asked who granted Chance the authority to drill in the Project area.	The Chance Project Team said the Project is located off First Nation settlement land, and the Yukon Government is the regulator that grants authority to drill.

	Asked why information around who has the authority to drill in the Project area is not known to the public.	The Chance Project Team responded that they want this information to get out. The Chance Project Team said there was a seven-year process to develop the *North Yukon Land Use Plan* including public meetings. The *North Yukon Land Use Plan* outlines designated high development areas. Chance shared that the *North Yukon Land Use Plan* was approved by Vuntut Gwitchin Government. The Chance Project Team also said that the YESAB process will dictate what the Project will be and stated YESAB is required to review all Project information and feedback from First Nations.
Monitoring	Shared that they had observed no progressive reclamation in the last three years and thought an environmental firm typically completes this work. Added there is an economic opportunity for Vuntut Gwitchin Government to be involved in progressive reclamation and expressed concern for Project-related waste after exploration concludes.	The Chance Project Team responded that monitoring programs will be in place during and after reclamation. Added Chance will conduct community meetings to share reclamation progress and status. The Chance Project Team also stated that money is put aside for reclamation and for any Project-related accidents that may occur.
Traditional Knowledge	Asked if traditional knowledge was considered in the Project design.	The Chance Project Team shared that Traditional Knowledge has been considered throughout the process and was provided information by citizens of Old Crow on the winter range of the PCH. The Chance Project Team noted that Porcupine Caribou Herd baseline studies captured both traditional knowledge and western science. The Chance Project Team engaged VGFN Heritage on Traditional Knowledge confidentiality and use protocols. The Chance Project Team also shared existing secondary sources of Traditional Knowledge for VGFN Heritage's review, comment, and permission for use. The Chance Project Team added that Traditional Knowledge is reflected in the Land and Resources section of the Project Proposal and has influenced the Project design (e.g., focusing on winter access roads versus all season access roads). The Chance Project Team added that a request was brought in for the Project Team to halt building an all-season road until resources have been identified. It was requested that hunters were not allowed on the access road.

	Expressed concerns about the Project impacting Vuntut Gwitchin lands and the Porcupine Caribou Herd. Added that Vuntut Gwitchin rely heavily on traditional food because of their remote location.	The Chance Project Team acknowledged the significance of Porcupine Caribou Herd to Vuntut Gwitchin people. Added that Project-related effects to the Porcupine Caribou Herd and land and resource use are described in the Project Proposal. Proposed mitigation measures for Project-related effects will also be described in the Project Proposal.
Accidents and Malfunctions	Asked how spills in rivers will be cleaned up.	The Chance Project Team shared that Chance has spill plans and an emergency response plan, which is required by law for all oil and gas companies in Canada. Added that as part of the regulations, the well location needs to be a minimum of 100 meters away from any water source. Added that the Chance Project Team must be aware of all spill incidents. Added that releases to the environment are expected to be highly unlikely.
Water Resources	Asked what measures the Project is taking to protect creeks.	The Chance Project Team said studies completed for the Project have helped to identify potential low impact drilling locations away from creeks and other water bodies. Added that the Project will avoid works near creeks as much as possible and that mitigation measures will be in place in case working near creeks becomes unavoidable.
	Asked how the Project will avoid creek crossings and erosion.	
	Encouraged Chance to conduct drilling away from water resources.	
Vegetation	Asked if Chance could give examples of lichen protection.	The Chance Project Team shared that conducting Project activities in the winter will reduce potential Project-related effects to lichen. The Chance Project Team added that lichen is also protected because newer seismic technology will not require that vegetation be cut all the way to the ground. Added that lichen is also protected when winter access roads are reused.
Wildlife	Inquired about a wildlife monitoring program.	The Chance Project Team said there will be a wildlife monitoring program throughout the Project that prioritizes hiring First Nation Citizens.
	Inquired about the decline of the northern caribou species.	The Chance Team acknowledge the concern about reported declines in caribou numbers, and that several herds are showing signs of recovery, and noted that the Porcupine Caribou Herd is at the largest numbers ever recorded.

	Requested that meat from a caribou killed by a predator be brought to Vuntut Gwitchin First Nation.	The Chance Project Team said typically the Yukon Government and Environment and Climate Change Canada want to inspect the carcass. The Chance Project Team confirmed looking into the viability of sharing caribou meat with Vuntut Gwitchin First Nation. Added that while drilling, employees are to let the caribou move through the Project site unimpeded. The Chance Project Team explained that caribou are expected to adapt to the drills if they are not seen as predators.
	Asked if proposed caribou mitigations to limit disturbance been successfully used elsewhere.	The Chance Project Team said Chance would need to implement and monitor the proposed mitigations to understand their effectiveness. Technically, effectiveness is impossible to determine unless we have an experimental design that allows effects to occur.
	Noted that a lot of caribou like to stay along the winter roads.	The Chance Project Team agreed and noted this behaviour may attract wolves and other predators. The Chance Project Team agreed based on observations from the 2013/2014 seismic work and noted this behaviour.
	Asked what information the Chance Project Team had received from the Porcupine Caribou Management Board (PCMB).	The Chance Project Team confirmed that a lot of information had been received from the PCMB. Added that the PCMB provided Chance/EDI with collared data and that Chance shared Project information and wildlife studies with the PCMB technical committee per the PCMB's direction. The Chance Project Team shared that Chance met with the PCMB on December 1st to discuss the Project and conducted a technical working group meeting with the PCBM on the Porcupine Caribou Herd on December 20th.
Land and Resource Use	Asked about subsistence hunting access in the Project area.	The Chance Project Team acknowledged land and resource use in the Project area will change during exploration. Added that no long-term effects to land and resource use are expected.
Employment and Economy	Inquired whether Vuntut Gwitchin First Nation employees have been involved in recent Project studies.	The Chance Project Team confirmed Project studies are shared with Vuntut Gwitchin First Nation and that VGFN Citizens will be involved in future monitoring work for the Project. In the past, consultants have contacted Vuntut Gwitchin Government to inquire about Citizen availability to participate in monitoring.
	Recommended wildlife monitors should be from Old Crow.	The Chance Project Team said wildlife monitoring opportunities will be prioritized for Vuntut Gwitchin First Nation Citizens.

Studies	Asked if other governments are involved in studies completed for the Project.	The Chance Project Team said Chance is responsible for conducting the studies and uses available government data to support their studies. Added that Chance is required to conduct specific studies to meet requirements under the *Yukon Environmental Socio-economic Assessment Act*.
	Inquired about EDI's involvement with other governments.	The Chance Project Team shared that EDI supports the sonar project on the Porcupine River and works with the Vuntut Gwitchin First Nation on the winter road which involves DFO.
Geology, Soils, and Permafrost	Asked if permafrost is under the whole Project area.	The Chance Project Team stated that the Project footprint is assumed to be continuous permafrost but are aiming to avoid ice-rich areas. Added that areas containing silts and clays will thaw the permafrost more quickly than areas without silts and clays. The Chance Project Team noted that Chance will utilize the suitability map prepared by Palmer to design winter access road and drilling locations.
	Asked if the temperature of the ground has been warmer due to climate change.	. The Chance Project Team stated that data has only been collected over the past few years and that changes in climate are measures over a longer time scale.
	Asked if the Project area has been hit by wildfires.	The Chance Project Team responded that wildfires have hit the Project area which can cause permafrost to reduce and increase the active layer. Added that wildfires damage permafrost, but vegetation helps to insulate in areas not damaged by wildfire.
	Asked how the Project will impact permafrost.	The Chance Project Team stated that a heat island (area with a higher temperature than surrounding areas) will have a thicker active layer of permafrost that is more susceptible to thawing. Explained that since the Project activities will occur in the winter, less impacts to permafrost are anticipated because snow helps to protect the permafrost active layer. Areas with more silts and clays are more susceptible to thawing the active layer of permafrost. These types of areas will be avoided for Project activities, where possible.
	Asked what was identified in the permafrost study.	The Chance Project Team said the studies identified areas and thickness of permafrost. Added that this data will help create a baseline to understand potential future impacts to permafrost in the area.

	Asked the depth of the permafrost.	The Chance Project Team said the depth of permafrost varies across the Project area. Palmer's drilling work shows that the active layer is 0.45 to 0.9 metres (m) thick in fine-grained soils, below wetlands, and in valley bottoms. In coarse-grained soils, it is more than 0.9 m thick. Areas recently burned by wildfire have active layers that are more than 1 m thick, possibly much more.
	Asked what the Project will do to avoid drilling in discontinuous permafrost areas.	The Chance Project Team noted that the Project will take action to prevent drilling in discontinuous permafrost areas.
	Noted that some people in Old Crow have noticed changes in soil/permafrost conditions.	The Chance Project Team said that happens when the permafrost starts to unfreeze.
	Inquired about mitigation measures to protect permafrost.	The Chance Project Team stated there are three approaches to protect permafrost (avoidance, monitoring, and protective approaches). Avoidance involves identifying and avoiding areas that are more susceptible to changes in permafrost conditions due to drilling or other Project-related activities. The Project is also anticipating implementing monitoring programs. Protective measures include using snowpack in the areas where the Project is anticipating conducting drilling and on winter roads. The Chance Project Team explained that stated the Project will use a solution/system to refrigerate the area around the drill to reduce heat from friction to protect the permafrost. This will ensure the integrity of the permafrost.
	Asked if the *Surficial Geology Mapping* and *Road and Wellpad Suitability for Exploration* maps shared on the permafrost posterboard were accurate.	The Chance Project Team clarified that the maps have been verified to a level consistent with professional standards and adjusted using data collected in field i.e. temperature sensors and surface drilling.
	Asked if Palmer was a private company or a government office.	The Chance Project Team confirmed that Palmer is a privately owned company. Shared that Palmer hires registered professional geologists and geo-scientists who are bound by ethical standards to present accurate terrain and permafrost information.
Other	Asked if Chance had mapped out traditional camps in the area.	The Chance Project Team stated that Ecofor and the VGG Heritage Department can assist if there is any traditional hunting camp. Added that to date, there are no specific camps in the area aside from a cabin from the 1960 to 1970s exploration. The Chance Project Team is assessing potential Project-related effects to land and resource use. This information will be

		described in the Project Proposal and will identify potential Project-related effects to known traditional camps.
	Asked if the Project is going to be conducted throughout the year.	The Chance Project Team confirmed exploration activities are planned for the winter months over a 10-year period.
	Inquired about who would lead the reclamation.	The Chance Project Team confirmed Chance is responsible for conducting reclamation work. Added that the Project will not require extensive reclamation. The Chance Project Team shared that reclamation activities will occur throughout exploration activities and natural regeneration is expected to occur. The Chance Project Team also said that the main reclamation activity is dismantling the camp.
	Inquired about Old Crow transitioning to cleaner energy sources.	The Chance Project Team said royalties from a future extraction project could be used by Vuntut Gwitchin Government to support the transition to more sustainable energy sources.

World Café Event Closing

Chance is grateful for the opportunity to conduct the World Café event. They valued discussing, Project-related interests, concerns, and feedback of VGFN Citizens and Old Crow residents.

EAGLE PLAINS EXPLORATION PROJECT: NOVEMBER 2023 UPDATE

Contact Chance Oil and Gas Limited (Chance) with questions or comments about the Project:

[redacted]

[redacted]

Where is the Eagle Plains Exploration Project (Project)?

The Project is located in the Eagle Plains Basin area in the Yukon, centred approximately 605 km north of Whitehorse and 40 km south and west of the Eagle Plains Hotel, along the Dempster Highway.

What is the Project?

The Project proposes to use seismic and drilling techniques to better understand oil and natural gas resources in the Eagle Plains Basin. If sufficient oil and/or natural gas resources are discovered, Chance may propose to conduct a future extraction project. Any future extraction project would undergo an environmental assessment.

What is the regulatory process for the Project?

Chance is preparing a document called a Project Proposal for submission to the Yukon Environmental and Socio-economic Assessment Board (YESAB) in February 2024. This will begin the assessment process for the Project. The Project Proposal will summarize the Project, including potential Project-related environmental and socio-economic impacts to affected First Nations and residents of communities. Once submitted, the Project Proposal will be available for download on YESAB's website.

The Project is being assessed by the YESAB Executive Committee (EC). The EC will review the Project Proposal and recommend for the Project to proceed, proceed with terms and conditions, or be rejected. First Nations, the public, and Decision Bodies (i.e., Government of Yukon and Government of Canada) will review and provide feedback. The EC will consider feedback and post a final recommendation. Decision Bodies are responsible for issuing authorizations and permits for the Project to proceed to construction.

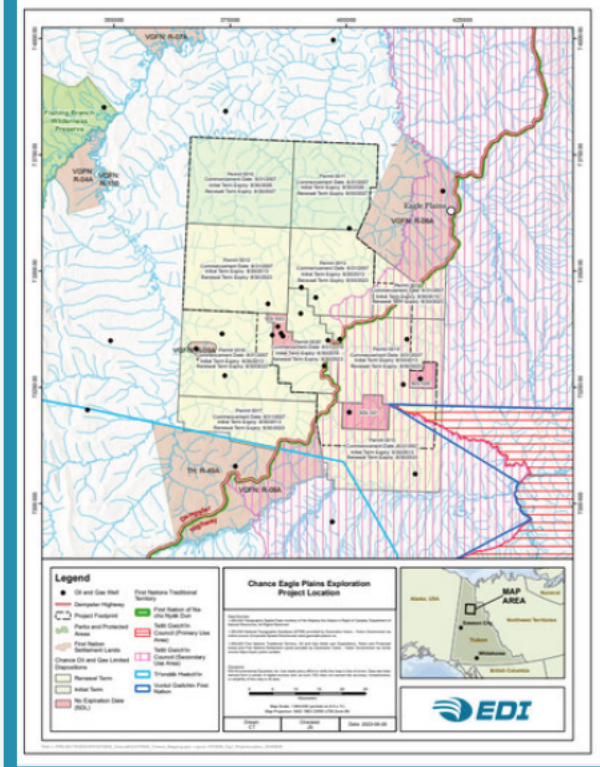

Figure: Project Location

Chance is committed to continued consultation and engagement with affected First Nations, residents of communities, and the Porcupine Caribou Management Board before and after submitting the Project Proposal.

What studies have been completed ?

- Permafrost Studies
- Fish and Fish Habitat Studies
- Vegetation Studies
- Water Quality and Surface Flow Studies
- Terrain and Surficial Geology
- Wildlife Studies
  - Porcupine Caribou Herd
  - Moose
  - American Marten
  - Grizzly Bear
  - Birds
- Linear Features Study
- Heritage Resources Studies

Chance OIL AND GAS LIMITED

Project Regulatory Process Timeline

2014
Chance started Project Planning

2016
YESAB Dawson City Designated Office referred the Project to be assessed by the YESAB EC

2018 - 2023
Chance conducted studies on permafrost, heritage resources, wildlife, water, vegetation etc.

June 2023
Chance developed the Draft Project Description

July 2023 - January 2024
Chance is currently developing the Project Proposal

February 2024
Chance will submit the Project Proposal to the YESAB EC to start the assessment process for the Project

Key First Nation and Residents of Communities' Project Feedback (2014 - Present)

- Shared the importance of land, water, and resources to First Nations culture and way of life
- Expressed concern for conventional seismic impacts to wildlife (e.g., predator-prey relationships), vegetation, and land and resource use (e.g., hunting)
- Expressed concern for year-round drilling impacts and increased Project footprint to the Porcupine Caribou Herd
- Shared interest in contributing to Project heritage studies and being notified of the discovery of any heritage resources
- Expressed concern for the use of temporary and all-season roads to permafrost and vegetation
- Had perceptions that the Project included fracking
- Expressed interest in developing mitigation measures for the Project (i.e., ways to reduce Project impacts to people and the environment)
- Shared interest in Project-related training, employment, and procurement opportunitites
- Noted concern for Project-related effects to wildlife such as the Porcupine Caribou Herd and land and resource use activities

How Chance Has Responded to Feedback Shared

- Spread activities across 10 years to reduce annual environmental impacts
- Focused on newer, low impact seismic technology
- Switched from year-round to winter-only drilling activities. Focused on using the existing Chance footprint and networks rather than increasing the Project footprint
- Shared heritage studies with affected First Nations and committed to notifying affected First Nations immediately if heritage resources are discovered
- Switched from year-round roads to winter ice roads
- Confirmed no fracking is anticipated, now or later
- Confirmed willingness to continue to have discussions on Project mitigation measures with affected First Nations and residents of communities
- Spread activities across 10 years to create longer/steady employment opportunities and hosted career fairs
- Completed constraints mapping to avoid sensitive or high-quality environmental and heritage areas, and focused on an area that allows the highest level of development based on the North Yukon Regional Land Use Plan and the Peer Watershed Regional Land Use Plan

Appendix E. Project Information Posterboards

Eagle Plains Exploration Project

Chance Oil and Gas Limited Overview

Chance Oil and Gas Limited (Chance) is an exploration company focused on assessing oil and natural gas potential in Yukon. Chance was incorporated on September 19, 1994 and has offices in Whitehorse and Calgary.

What is the proposed Eagle Plains Exploration Project?

Chance is proposing a drilling and seismic exploration project ("Eagle Plains Exploration Project" or "Project") to better understand oil and natural gas resources in the Eagle Plain Basin. Chance will conduct the following activities over a period of up to 10 years:

- Construct 1,500 square kilometers (km²) of new 3D seismic lines (i.e., pathways created by removing vegetation to support Project activities)
  - Seismic lines will be constructed over multiple programs (i.e., not all at once)
- Construct 2,000 km² of 2D seismic lines
  - Seismic lines to be constructed during one or multiple of the 3D seismic programs
- Drill up to 30 wells to evaluate the presence of oil and natural and gas resources
  - Drilling to be conducted during the winter
  - Drilling approximately 5-8 wells per year
- Conduct extended flow testing on up to 20 wells to understand how much oil and/or natural gas each well can produce over time
  - This information will help Chance understand if it is economical to propose a new project focused on extracting available oil and natural gas resources in the Project area.

What are the benefits of oil and natural gas to the Yukon?

If the Project finds it is economical and feasible to extract, the proposed Project will:

- Provide less carbon intensive oil and natural gas supply to Yukon, parts of Canada, and other regions across the world
- Create employment and procurement opportunities for First Nations and local/regional businesses
- Reduce local and regional reliance on oil and natural gas resources from other areas in Canada and across the world
- Improve local and regional energy security
- Offset the use of carbon-intensive diesel in Yukon using natural gas for power generation.

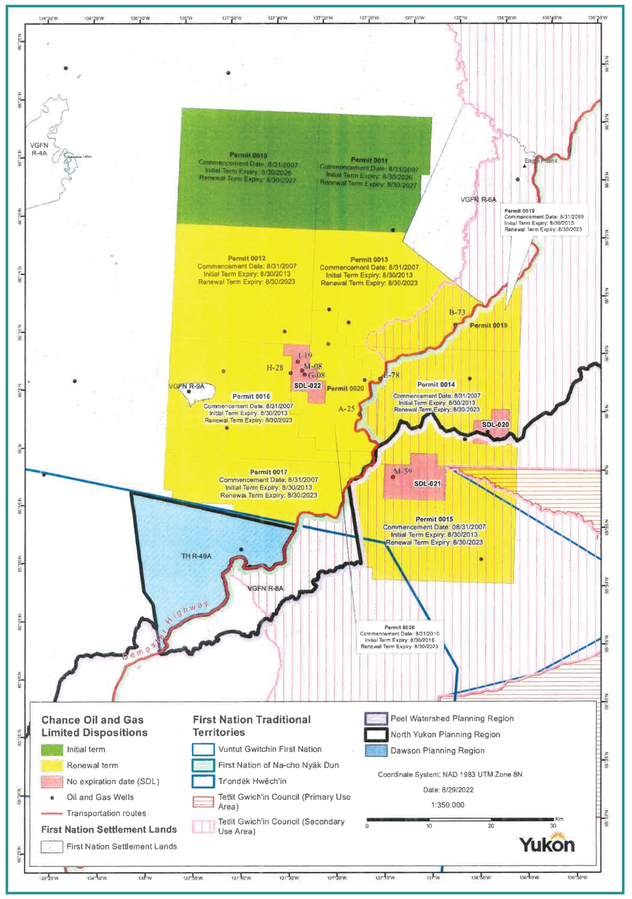
Chance Rig

Where is the Project?

The proposed Project is approximately 2,400 km² located in the territories of:

- First Nation of Na-Cho Nyäk Dun
- Tetlit Gwich'in Council Secondary Use Area
- Vuntut Gwitchin First Nation.

Chance Oil and Gas Limited Dispositions and Wells

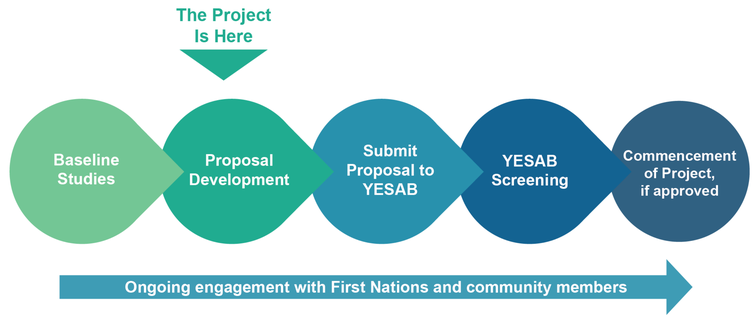


Chance Rig and Camp

What regulatory process does the Project fall under?

The proposed Project will be assessed by the Executive Committee of the Yukon Environmental and Socioeconomic Assessment Board (YESAB), under the *Yukon Environmental and Socioeconomic Assessment Act (YESAA)*. Chance is planning to submit a Project Proposal to YESAB in late 2023. The Project Proposal will reflect feedback from First Nations and community members as well as baseline research conducted by Chance between 2019 – 2023. First Nations and community members will have an opportunity to comment on the Project Proposal in engagement processes and during the YESAB assessment process. Chance will engage First Nations and community members during all stages of the YESAB assessment process.

YESAB Process



First Nation Engagement

Chance appreciates the opportunity to engage and learn from potentially affected First Nations. Chance will incorporate feedback shared during ongoing engagement with First Nations to the Project Proposal and other plans. Chance will provide ongoing Project updates with interested First Nations throughout the life of the Project.

Eagle Plain Basin

Heritage Resource Management Program

Introduction

On behalf of Chance Oil and Gas Ltd. (Chance), Ecofor Consulting Ltd. (Ecofor) has been developing a Heritage Resource Management Program for the Eagle Plains Exploration Project (Project) since 2021. The goals of the Heritage Resource Management Program are to assess the heritage resource potential and sensitivity within the Project Area and make recommendations for the ongoing management of heritage resources. The Heritage Resource Management Program includes three main types of assessments:

1. Heritage Resource Overview Assessment (HROA)

- An HROA involves a desktop review (no fieldwork) including reading through past documents, databases, and maps of the physical/environmental and cultural/historical setting within the Project Area. Information gathered during the desktop review is used to identify known heritage resource sites and predict areas of high potential for undocumented heritage resource sites. The HROA considers landscape features (e.g. mountains, hills, valleys), visible surroundings, closeness to natural resources (e.g. water and food gathering areas), and distance to previously recorded heritage resource sites to determine high potential for undocumented heritage resource sites. Indigenous Knowledge and Traditional Land Use data are also used to enhance the HROA, when available.

2. Heritage Resource Impact Assessment (HRIA)

- An HRIA is the first phase of field study within a Heritage Resource Management Program. It involves visits to any known heritage resource sites that may be affected by exploration activities and the areas of elevated potential identified in the HROA. Specific HRIA tasks include:
  - Pedestrian survey to identify surficial heritage resources and areas with potential for underground heritage resources
  - Shovel testing in areas with confirmed potential for underground heritage resources
  - Documentation of all shovel test locations and heritage resource sites encountered during the HRIA
  - Reporting of all documented heritage resource sites encountered during the HRIA to First Nations, Chance, and the Yukon Government Heritage Resource Unit.

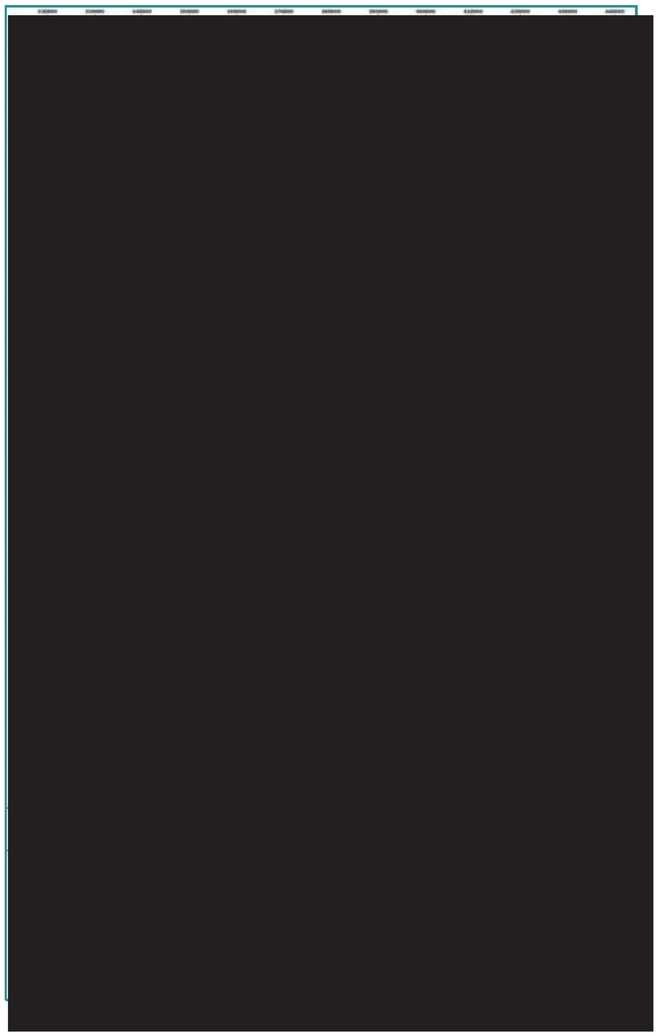
3. Systematic Data Recovery Excavation (SDR)

- An SDR program is used when the Project cannot avoid affecting a heritage resource site. The goal of the SDR program is to mitigate impacts to the site area by collecting detailed site data to develop a strong understanding of the site. Specific SDR tasks include:
  - Shovel testing within the known site area to determine the site boundaries and identify underground heritage resources
  - Excavation of 1 m x 1 m excavation units, arranged as blocks, trenches, or individual units, to recover heritage resource materials
  - Detailed documentation of all heritage resources encountered during the SDR program
  - Reporting of all documented heritage resource sites encountered during the SDR program to First Nations, Chance, and the Yukon Government Heritage Resource Unit.

Heritage Resource Management Program Details

Previous Heritage Resource Management Work Within the Project Area

The Project Area has not been extensively explored for heritage resources, but a few studies have assessed portions of the current footprint. These studies include three permitted HRIAs related to previous oil and gas exploration and one HRIA related to a fibre optic cable project along the Dempster Highway. Three non-permitted studies have also been completed in association with the fibre optic project along the Dempster Highway, including a HROA, an Indigenous Knowledge/Traditional Land Use study, and an update to the original HROA. These studies have identified seven archaeological sites and one Yukon Historic Sites Inventory site.



Current Heritage Resource Management Work Within the Project Area

The Project's Heritage Resource Management Program work began in 2021. An HROA was completed in early 2022. This review identified several thousand areas of high potential for surface and underground heritage resource sites within the 2,400 km^2 area Ecofor archaeologists studied.

In 2022, Ecofor conducted an HRIA program within a 625 km^2 subsection of the Project Area where a new seismic and drilling program has been proposed. A Vuntut Gwitchin First Nation member participated in this HRIA. Work included a helicopter survey throughout this area, a survey on foot, and shovel testing at 12 locations. In total, 228 shovel tests were completed. Shovel tests at location E10 led to the recording of archaeological site [redacted] This site has been flagged as a no-work area. If future phases of the Project are unable to avoid the site area, an SDR program may be considered. No heritage resources were discovered at the other shovel test locations.

Chance and Ecofor will continue to develop the Heritage Resource Management Program. Further HRIA studies are planned for summer 2023. This work will help inform heritage resources management needs of proposed Project activities.

Heritage Resource Management Program

Introduction

On behalf of Chance Oil and Gas Ltd. (Chance), Ecofor Consulting Ltd. (Ecofor) has been developing a Heritage Resource Management Program for the Eagle Plains Exploration Project (Project) since 2021. The goals of the Heritage Resource Management Program are to assess the heritage resource potential and sensitivity within the Project Area and make recommendations for the ongoing management of heritage resources. The Heritage Resource Management Program includes three main types of assessments:

1. Heritage Resource Overview Assessment (HROA)

- An HROA involves a desktop review (no fieldwork) including reading through past documents, databases, and maps of the physical/environmental and cultural/historical setting within the Project Area. Information gathered during the desktop review is used to identify known heritage resource sites and predict areas of high potential for undocumented heritage resource sites. The HROA considers landscape features (e.g. mountains, hills, valleys), visible surroundings, closeness to natural resources (e.g. water and food gathering areas), and distance to previously recorded heritage resource sites to determine high potential for undocumented heritage resource sites. Indigenous Knowledge and Traditional Land Use data are also used to enhance the HROA, when available.

2. Heritage Resource Impact Assessment (HRIA)

- An HRIA is the first phase of field study within a Heritage Resource Management Program. It involves visits to any known heritage resource sites that may be affected by exploration activities and the areas of elevated potential identified in the HROA. Specific HRIA tasks include:
  - Pedestrian survey to identify surficial heritage resources and areas with potential for underground heritage resources
  - Shovel testing in areas with confirmed potential for underground heritage resources
  - Documentation of all shovel test locations and heritage resource sites encountered during the HRIA
  - Reporting of all documented heritage resource sites encountered during the HRIA to First Nations, Chance, and the Yukon Government Heritage Resource Unit.

3. Systematic Data Recovery Excavation (SDR)

- An SDR program is used when the Project cannot avoid affecting a heritage resource site. The goal of the SDR program is to mitigate impacts to the site area by collecting detailed site data to develop a strong understanding of the site. Specific SDR tasks include:
  - Shovel testing within the known site area to determine the site boundaries and identify underground heritage resources
  - Excavation of 1 m x 1 m excavation units, arranged as blocks, trenches, or individual units, to recover heritage resource materials
  - Detailed documentation of all heritage resources encountered during the SDR program
  - Reporting of all documented heritage resource sites encountered during the SDR program to First Nations, Chance, and the Yukon Government Heritage Resource Unit.

Permafrost and Terrain Mapping

Chance OIL AND GAS LIMITED

Background Information on Permafrost

Continuous permafrost is frozen ground that remains below 0°C for more than 2 years. Chance Oil and Gas Ltd's (Chance) proposed Eagle Plains Exploration Project (Project) is entirely within a zone of continuous permafrost. The depth of permafrost below the ground surface varies across the Eagle Plains landscape and throughout the year. Permafrost can be more or less sensitive to disturbances (e.g., drilling), depending on a number of factors, such as ground temperature, ice content, and soil type. Permafrost warmer than -2°C is more likely to thaw as a result of local, minor disturbances to the ground surface, whereas cooler permafrost will likely not thaw from minor disturbances.

Chance needs to understand the terrain and permafrost conditions of the Project Area to design the Project. This information is key for identifying the best areas for the Project's access roads and well pads, for locating gravel for road construction, and for the in-ground placement of drill cuttings. Palmer has mapped the geology of the top layer of ground (what is above the bedrock, also called the surficial geology), determined the state of permafrost throughout the Project Area, and created maps identifying suitable locations for Chance's proposed oil and natural gas exploration activities.

Palmer installed sensors, using a drill that can be carried in a helicopter, to measure ground temperature and frozen/thawed state in the top 1 m of the ground in suitable locations.

Helicopter slinging drill

Drilling with lightweight Talon drill

How Terrain and Permafrost Information Informs the Project

The active layer is the part of the ground that thaws in the summer and refreezes in the winter. Palmer's drilling work shows that the active layer is 0.45 to 0.9 m thick in fine-grained soils, below wetlands, and in valley bottoms. In coarse-grained soils, it is more than 0.9 m thick. Areas recently burned by wildfire have active layers that are more than 1 m thick, possibly much more.

Field Testpit

Ice content information is important, as ground containing lots of ice is more sensitive to disturbances (e.g., drilling) and recovers less quickly than ground containing less ice. Areas with high to moderate amounts of ice were found within wetlands and fine-grained soils. The ice content in these areas makes up more than 20% of the soil, but ice amounts vary a lot and are not the same throughout the soil. Ground with low amounts of ice, (less than 10% of the soil) were found within weathered sandstone bedrock near the surface and within coarse-grained layers of material that can be found alongside fine-grained layers of material containing more ice. Palmer concludes that ground ice content in the Project Area is highly variable (i.e., the amount of ice underground is not the same everywhere). Palmer upgraded the oil and natural gas exploration suitability maps to account for different permafrost conditions.

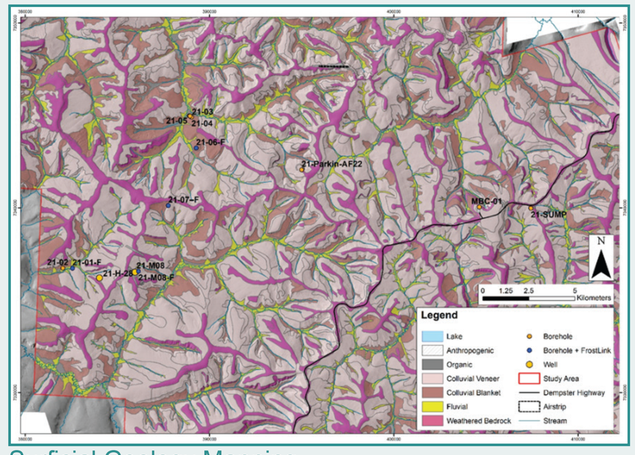
Palmer first collected data from the ground temperature sensors in summer 2022. Cold, stable permafrost was identified in areas with lots of ice on the valley bottom and in a few other areas. One site on a northeast slope within the Project Area has a ground temperature of 3.8°C at 1 m depth, and temperatures are likely similar at locations on similar slopes. Palmer was unable to measure the ground temperatures at 1 m depths at two locations because the equipment malfunctioned.

In places where the shrubs and trees were burned by wildfire 18 years ago, the active layer is more than 1 m thick (and may have thawed down to bedrock) and the 1 m ground temperature is -0.2°C. Permafrost is unlikely to return to its former possible shallower depths due to the site conditions (a lack of vegetation), so permafrost is considered to be naturally disappearing at this site.

Cold, stable permafrost is preferred for proposed Project activities. Areas with large amounts of ice can either be avoided or protected through appropriate actions. Areas where permafrost is naturally becoming deeper because trees and brush were lost to wildfire should be left to naturally recover (i.e., allow permafrost to slowly re-establish itself) or actions can be taken to help keep the ground cold (e.g., adding an insulating cover to perform the same function as vegetation or installing a thermal management device). Such mitigation would likely result in faster permafrost recovery of these areas.

FrostLink Sensor with Plastic Housing

FrostLink Sensor with Steel Housing



Surficial Geology Mapping

Road and Wellpad Suitability for Exploration

Suitability is determined based on surficial geology, permafrost conditions, and drainage. Very high and high suitability are favourable for establishing access roads and wellpads, low and very low suitability are unfavourable for establishing access roads and wellpads. The exploration suitability map assumes no mitigation. Exploration activity that needs to cross less suitable areas can be done responsibly through appropriate mitigation.

Next Steps

Next steps include gathering data from two sensors installed in 2022, replacement of malfunctioning sensors, and installation of six new sensors in summer 2023. The new sensor design is more durable and waterproof and is expected to perform better in the harsh climate.

Porcupine Caribou Herd

Overview

The Porcupine Caribou Herd's annual range extends over large portions of northern Yukon and northeast Alaska. Environmental Dynamics Inc. (EDI) conducted habitat, movement, and linear features studies to:

- Better understand the Eagle Plains Exploration Project (Project) Area with regards to Porcupine Caribou
- Support the assessment of potential Project-related effects to Porcupine Caribou
- Identify ways for the Project to reduce potential Project-related effects to Porcupine Caribou.

Key Existing Information

- The Project overlaps a small proportion of the Porcupine Caribou Herd's late fall and winter ranges
- Based on the past 30 years of data collected from collars placed on caribou to track their movement using GPS, less than 3% of the Porcupine Caribou Herd typically occurs within the Project Area
- Late-fall and winter are less-sensitive periods for Porcupine Caribou
  - During these seasons, Porcupine Caribou are typically in good body condition and are free of insects and other stressors
  - Late-fall and winter are not associated with critical life stages, such as breeding or calving.

Example caribou habitat in Eagle Plains with lots of terrestrial lichen

Habitat Mapping

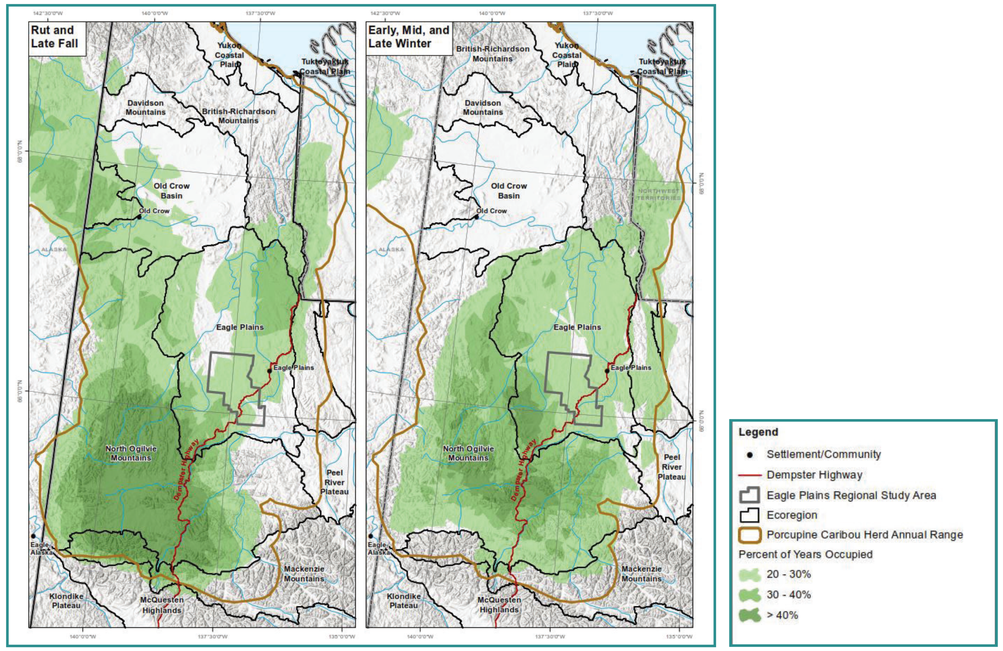
EDI modeled Porcupine Caribou habitat using collar data from the Porcupine Caribou Management Board and vegetation mapping. These models describe the amount, quality, and distribution of important late-fall and winter Porcupine Caribou habitat across the Project Area. Lichen cover was the primary driver of habitat selection by caribou.

Caribou Distribution and Movement

EDI used collar data and studies conducted by the Porcupine Caribou Technical Committee to better understand how much of the Project Area overlaps with the late-fall and winter ranges and movement routes of the Porcupine Caribou Herd.

- Caribou tend to move an average of 8.7 km per day in late-fall and 4.4 km per day in the winter.
- Porcupine Caribou spent half as much time in the Project Area during the late-fall and winter than other parts of their late-fall and winter ranges.

Seasonal Ranges Based on Historic Use



Linear Features Study

Linear features (e.g., roads, powerlines, and trails) can affect how people and wildlife move across the landscape as well as predator-prey relationships. EDI studied existing linear features in the Project Area to evaluate vegetation recovery on linear features and how those lines are used by people and wildlife.

- There are three main types of linear features associated with past oil and gas exploration activities in the Eagle Plains: winter roads, 2D seismic lines (i.e., pathways created by removing vegetation to support oil and gas exploration activities) (5-8 m wide), and 3D seismic lines (1.5-3 m wide)
- Most 2D seismic lines are from oil and gas exploration activities that took place between the 1950s to 1990s
  - 75% of these seismic lines have vegetation growing back with similar species and densities as the nearby vegetation that wasn't disturbed
  - 22% of these seismic lines have vegetation growing back at a faster rate, and are now larger than nearby vegetation that wasn't disturbed
- All 3D lines were created in the winter of 2014, and showed signs of normal regrowth
  - Line of sight down 3D lines was not expected to offer substantial advantage to hunters and/or predators compared to line of sight through areas that were undisturbed
- Signs of caribou or moose use were observed on all types of linear features
- Other than the Dempster Highway, no human use was observed on linear features in winter.

Line of sight down a seismic line in the Eagle Plains

Aerial view of a seismic line in the Eagle Plains

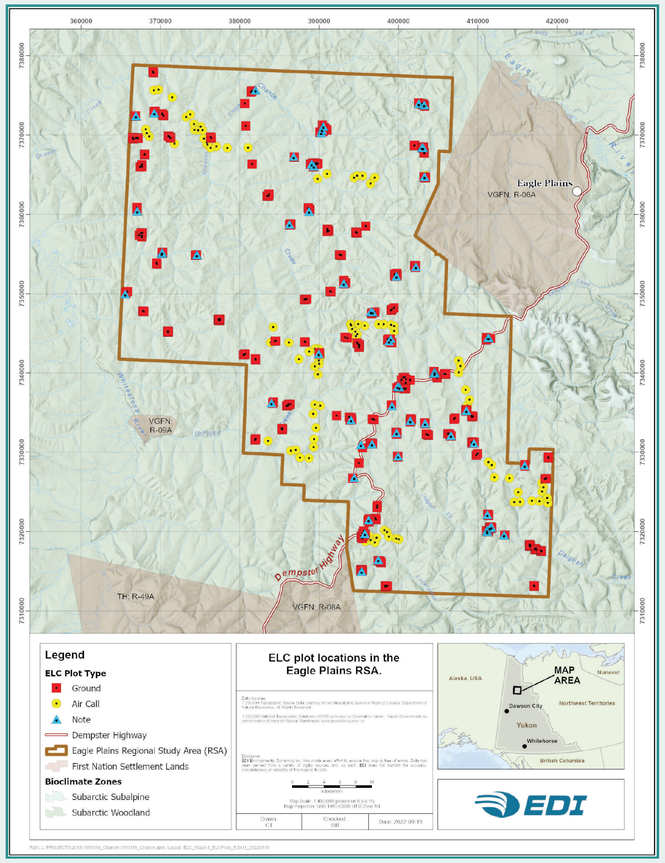
Wildlife and Habitat Mapping

Overview

Chance Oil and Gas Limited (Chance) is committed to protecting wildlife and habitat during the proposed Eagle Plains Exploration Project (Project). Many types of wildlife occur in the Project Area at different times of year. Environmental Dynamics Inc. (EDI) has been gathering information on a number of key species in the Project Area. Field studies, best management practices, working with Indigenous land users and Traditional Knowledge holders, and consultation with communities will help make informed decisions about protecting the environment and wildlife throughout the life of the Project.

Ecological Land Classification - Habitat Mapping

The Yukon Environmental Socio-economic Assessment Board requires that a project proposal have an area-wide ecosystem map. This mapping identifies any rare or sensitive ecosystems in the Project Area and can be used for wildlife habitat mapping. Both ecosystem and habitat mapping can be tools to measure potential Project-related impacts and disturbances to habitat types. They can also be used to reduce potential Project-related effects. EDI completed ecosystem mapping across the Project Area following Yukon standards for Ecological Landscape Classification.



Ecological Landscape Classification Plot Locations

Birds

Due to the remote location of the Project Area, existing knowledge on bird presence was limited. EDI conducted point count surveys and wetland bird surveys in the Project Area in June 2019. A total of 52 species of birds were detected, including four species at risk: Red-necked Phalarope, Common Nighthawk, Olive-sided Flycatcher, and Rusty Blackbird. The number of species and total bird abundance were both well-distributed across the habitats of the Project Area. Most birds are expected to be absent from the Project Area during winter months.

Lincolns Sparrow

Rock Ptarmigan

Spotted Sandpiper

Red-necked Phalarope

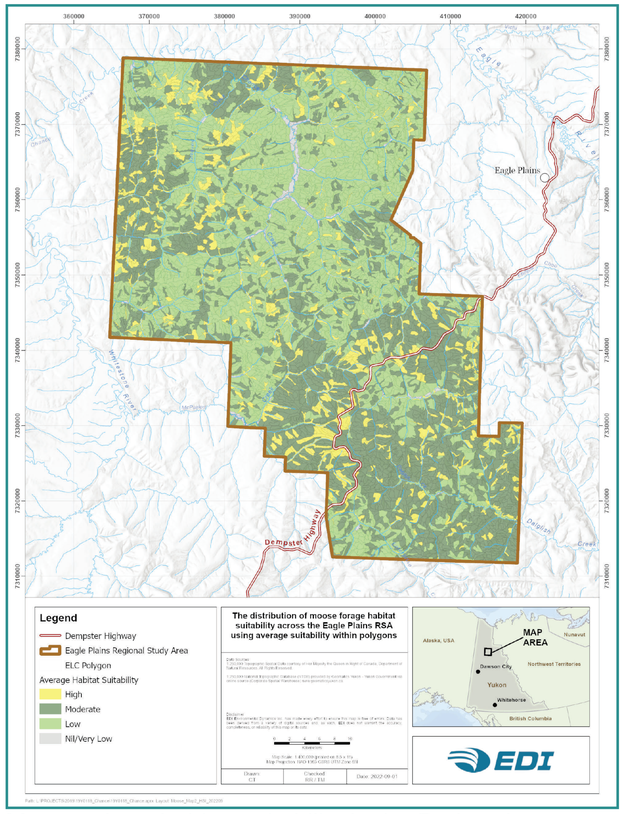
American Marten

Marten is an indicator species for mature and old forest values and is important to local communities as a furbearer. EDI developed a habitat model to understand the amount, quality, and distribution of habitat for this species. The majority (60%) of the Project Area is made up of low-quality habitat. High-quality habitat, found in 16% of the Project Area, is associated with mesic, spruce-dominant ecosites in mature to old forests.

Moose

Formal population surveys of moose have not been conducted in the Project Area but local knowledge suggests that, while moose densities in Eagle Plains are relatively low compared to areas in southern Yukon, they are relatively high compared to other areas in northern Yukon. Winter is the most limiting season for moose due to reduced food availability and greater energy demands from cold temperatures and the extra effort to travel through snow. EDI developed a habitat model to understand winter moose habitat amount, quality, and distribution in the Project Area. The model identified widespread moderate- and low-quality habitat, with only a small amount of high-quality habitat present.

Willow shrubs browsed by moose in the Project Area



Moose winter habitat suitability in the Project Area

Fisheries and Water

Fish and Aquatic Studies

Overview

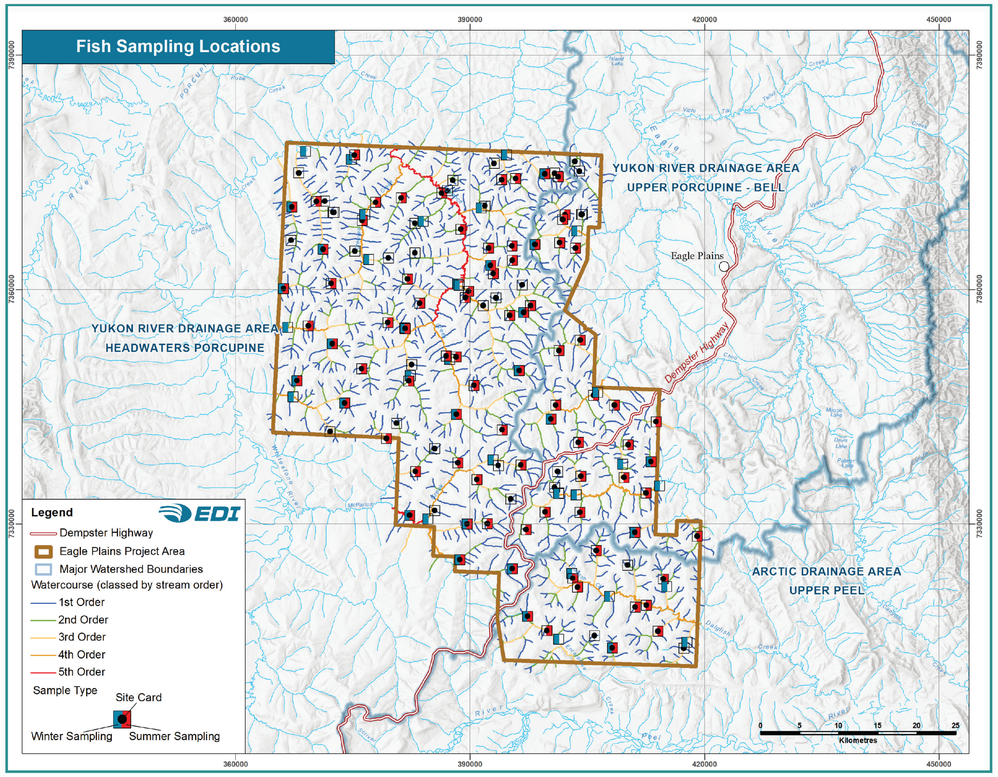
There is very little information available on fish populations in the Eagle Plains Area. In order to gain a better understanding of where and when fish are there, EDI conducted studies in 2019 and 2020. These studies included compiling historic info, assembling available spatial data on streams, conducting field studies in 2019-2020, and developing a model that could be used to tell the chances of fish being present in streams in the Project Area. Field studies occurred in July/August 2019, when the presence of fish was expected to be its highest, and again in March 2020, when the availability of overwintering fish habitat was expected to be at its lowest.

Key Findings

- Six species of fish were observed within or immediately next to the Project Area. This included Arctic grayling, slimy sculpin, longnose sucker, burbot, round whitefish, and lake whitefish. All of these species, with the exception of lake whitefish, were observed during the summer 2019 fish surveys.
  - During the summer, Arctic grayling were around the most. They were the only species found in all types of streams.
- Larger streams generally had better habitat for fish such as higher water volume and better water quality (e.g., dissolved oxygen levels). EDI found that the bigger the stream, the more likely the fish were there.
- During winter, fish habitat becomes very limited due to reduced water flow and reduced water quality. Smaller streams had no water in the winter. In bigger streams, water was limited to deeper pools and dissolved oxygen levels were too low to support overwintering fish.

Arctic Grayling caught during fish sampling

Electrofishing sampling during summer 2019



The 'order' is the type of stream, 1 is the smallest and 5 is the biggest. Clear sitecards mean that no sampling was done in 2019/2020, but there is historic information that was used in the study.

Water Quality and Hydrology

Overview

The project area contains 1,467 streams, many of which are smaller headwater streams. During summer 2019 and winter 2020, EDI collected water samples from five locations within the Project Area and five locations downstream. Eight of these sites match regional sites previously sampled by Yukon Government Water Resources Branch. EDI then combined the water quality data they collected with historic data available from Environment and Climate Change Canada, Yukon Government Water Resources Branch, and Water Survey of Canada.

Example of brown-stained water that is common in streams within the Project Area

Example of a stream in the Project Area

Key Information and Findings

- Surface water quality was similar across the Project Area. Surface water was generally neutral to slightly acidic, typical for boggy northern landscapes. Turbidity (concentration of suspended sediments) changed from stream to stream, likely as a result of melting permafrost causing slumping of stream banks.
- Some metal concentrations, including aluminum, cadmium, copper, iron, and manganese, were present throughout the Project Area at levels higher than Environment Guidelines. Select metals like arsenic and selenium also exceeded guidelines in isolated samples. Given the lack of development near sampling locations, these high levels of metals are likely naturally occurring.
- Dissolved oxygen is consistently low in all streams surveyed in the Project Area during the winter. It is suspected that most fish migrate out of the Project Area in the winter, to areas where the water conditions better support their survival.

Information about Chance, Jobs, and Training

Chance's Company Profile

Chance Oil and Gas Ltd. (Chance) is a Canadian-owned private company incorporated in the Yukon. Chance's head office is located in Calgary, but its team members are based in both Calgary and Whitehorse.

Key Members of Chance's Team:

- Mike Chernoff, Chairman and CEO
- Richard Wyman, President
- Greg Charlie, VP Government and Community Relations
- Cindy Dickson, Regulatory, Environmental and Community Relations Director
- Lynn O'Neil, Corporate Secretary

Chance's Exploration Objectives

The business plan of the company is to explore for, and in the future potentially develop, oil and natural gas resources in Eagle Plains to help meet the energy needs of the Yukon and/or other markets.

Chance's exploration objectives includes:

- Drill up to 30 wells to evaluate resource potential
- Undertake the exploration program on a small scale over a long period of time (i.e., up to 10 years) in order to minimize environmental and social impacts
- Operate as continuously as possible to provide steady employment, to become more efficient over time, and to reduce costs and disruptions associated with starting up and shutting down
- Involve local and regional businesses
- Discover sufficient oil and natural gas resources to support future development of oil and gas.

Worker at camp

Operator

Annual inspection of bottom suspended wells

Some Examples of Jobs

Drilling Program

- Wellsite Supervisor
- Service Rig
- Security
- Wireline Crew
- Slickline Crew
- Truck drivers/operators (Water Tank, Vacuum Truck, Picker / Bed Truck, Fuel Truck)
- Flow Test Crews
- Tool hand
- Cementing Crew
- Wildlife Monitor
- Heritage Monitor
- Road/Trail Construction and Maintenance

Seismic Program

- Line Preparation Supervisor
- Equipment Operators
- Survey Coordinator
- Surveyor
- Source Preparation Supervisor
- Equipment Helpers
- Cruisers
- Slashers
- Packers
- Water Truck Driver
- Line Crew
- Wildlife Monitor
- Heritage Monitor
- Road/Trail Construction and Maintenance

General Camp Operations

- Nurse Practitioner/Medic
- Camp Cooks
- Office Staff
- Camp attendants
- Maintenance and Cleaning Staff

Project Workforce

Chance's workforce is limited by the size of its camp. The Chance Camp can hold a maximum of 75 - 80 people. It's also possible that additional workers could stay at Eagle Plains Hotel.

Chance will work with First Nations to maximize their involvement. One of Chance's main objectives is to provide as much work and contracts to First Nation / Yukon partners as possible.

Training Requirements

Basic training required by all project workers:

- Workplace Hazardous Materials Information System (WHMIS)
- Hydrogen Sulphide Alive
- Wildlife Awareness
- Emergency First Aid/Wilderness First Aid Training
- Common Safety Orientation

Additional and advanced training (varies by job position):

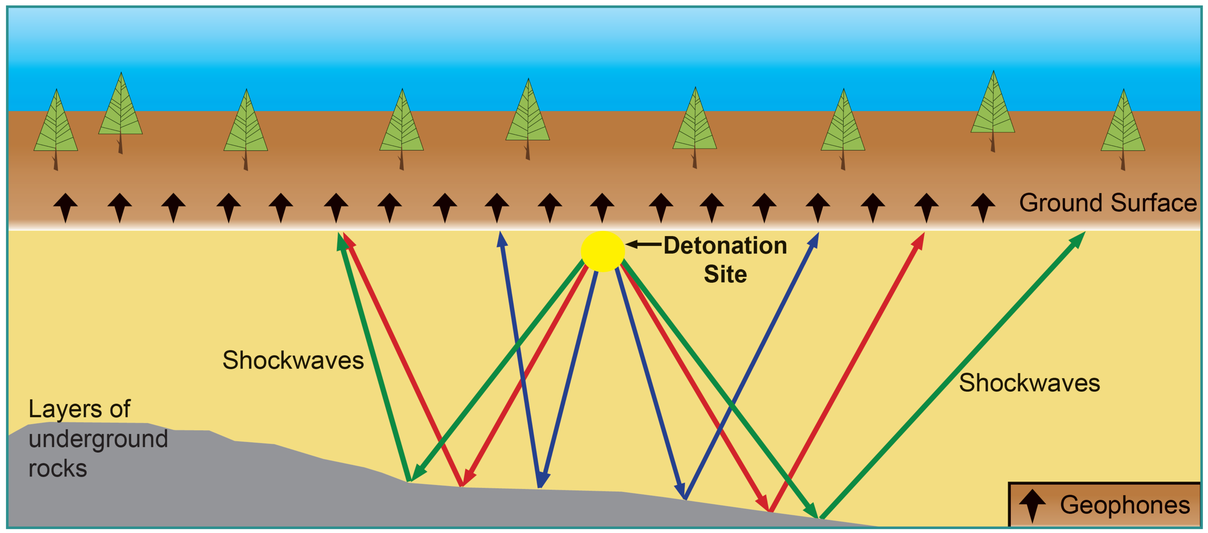
- Food Safe
- ATV
- Chainsaw (Level 1)
- Transportation of Dangerous Goods
- Wildlife/Environmental monitoring training
- Driving licenses (Class 1 and 3)
- Well Service Blowout Prevention
- Confined Space Entry and Monitor
- Fall Protection from Rig Work
- Oilfield Driver Awareness

Annual inspection of bottom suspended wells

Chance's Seismic Exploration Program

What is Seismic?

Seismic technology is used to record and study the earth's layers. Explosives are put in a hole underground (approximately 6m deep) and then that hole is sealed. When the explosives go off, the only sound heard above ground is a dull thud. That sound is similar to that of a passing diesel truck and only lasts about one second. The explosion sends shocks waves down into the ground. Those shock waves bounce back in a variety of different ways off the layers of underground rock. They are then recorded on the surface using equipment called geophones. Information recorded by geophones allows experts to create images of the layers of rock underground and find areas in the earth that may have oil or gas.



How seismic technology works. In this example it is 2D seismic because it is a single line.

Seismic Programs

Chance's seismic programs will help identify the general depths and locations of oil and gas reserves below the surface. Having this information will help decide the best locations for wells and help reduce the number of wells needed for exploration. The seismic programs propose up to 1500 km² of 3D seismic and 2000km of 2D seismic. The programs will take up to 5 to 10 years.

What is the difference between 2D and 3D?

2D seismic data is gathered by putting the geophones and shooting holes with dynamite in one line. 2D seismic is less expensive and needs less lines. They are measured by certain lengths (e.g., 2000 km of 2D seismic).

3D seismic data is gathered by spreading out the geophones in a grid pattern. The source lines (where dynamite is used) will run north/south direction while the receiver lines (geophones) will run east/west director. This is why 3D seismic is measured in area (e.g., 1500 km^2). 3D seismic provides a 3D understanding of the earth's layers. This provides better information on where the oil and gas are located.

2D lines and 3D lines can overlap each other and take place in the same area.

Reducing Disturbances

In order to reduce the impact of the seismic lines on the environment, Chance will:

- Use old lines, previously burnt areas, and natural open areas, instead of clearing vegetation
- Prepare lines in winter to protect ground cover and vegetation.
- Use zigzags and curves in the lines to make them harder to see and reduce predator line-of-sight.
- Using rough mulching, which only takes off branches of trees. The trunk and roots are left intact to preserve the forest.
- Doglegs will be used where lines meet roads so they can't easily be seen by drivers.
- Remote detonate in summer to avoid times when caribou are present and to maximize hours worked.

Purpose of Meeting

- To provide a Project summary and updates; and share results of Environmental Baseline Studies including preliminary potential effects and mitigation to Fish, Wildlife, Porcupine Caribou Herd, Linear Features, and North Yukon Land Use Planning Conformity.
- A question and answer period followed the information sharing.

Topics Discussed

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

- Project summary and updates
- Baseline Studies
- Effects Assessments
- Fish and Fish Habitat
- Wildlife and Wildlife Habitat
- Porcupine Caribou Herd

Key Issues Raised / Chance Responses to Issues

- Participants would like more detail about the Project Proposal and requested Chance to include all activities in the Project proposal. / Chance to review.
- Participant inquired about meandering seismic lines and how operators are informed about the design. / Chance confirmed that there is a design in place and that scouting will occur prior to the work, to understand the density of the forest and to optimize line locations.
- Asked if the Project videos are online. / Chance is developing a webpage.
- Requested more information on Chance's interpretation of disturbance. / Chance responded that key disturbance factors include noise, smells, and human movement/presence, and consider how far away caribou are from the well sites. Chance stated that disturbance is dependent on how the caribou are responding. Studies on Zone of influence are mixed, with various analytical methods, and depending on interpretation can range from no avoidance up to 40 kilometres of avoidance. There are many issues with analytical approaches that are scale dependent, and not often considered by those authors.
- The priority is to not disturb the caribou, but further work is needed to determine what is too much disturbance. Participants inquired about mitigations and if there is anything other than seasonality. / Chance responded that there will be mitigations in place, and there will be direct and indirect effects.
- A participant cautioned about using a 1-kilometrer Zone of Influence (ZOI), and believes the literature will reflect larger zones. Shared that he thinks Chance will have a difficulty finding that in the literature. / Chance responded that the primary reason for the buffer was because of sensory disturbance and that in larger ZOI assessments there is not a clear mechanism that is associated with the level of disturbance. Chance is focused on addressing local scale sensory disturbance within the work area, and that linear avoidance is assumed within the literature on ZOI's. The assessment applies a uniform 75% reduction across the 1-kilometre zone, which is a conservative (i.e., likely over-estimate) of the effect throughout the zone.
- PCTC (Porcupine Caribou Technical Committee) advised against doing the ZOI analysis based on low sample size (few caribou interacting with 3D seismic across the range). / Chance said that they could not ignore existing data and conducted the analysis regardless, and in the end did not rely on a 3D ZOI analysis as it was not conclusive.
- Participants expressed concerns about the ability of the Land Use Planning Council to review the Project for a conformity check, compared to the capacity of the North Yukon Commission. / Chance said that there are knowledgeable people on the council who have been there for a while. Shared that the North Yukon Commission no longer exists.
- Inquired about how Chance will be able to privatize a road. / Chance responded that the Chief Operating Officer can make it a private road. Said that that it is more of a safety concern, and that people are not interested in hunting around the drilling area. The company could grant access to subsistence harvesters, but this may create a safety concern for staff on site.
- Expressed concerns about the lack of communication between Chance and the Executive Committee. These conversations are important.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

- A participant shared concerns that their experience on drill projects, drill sites needed a 24-hour supply of water, which was trucked into the site. Unless technology has changed, that is one example of essential road traffic even if there are caribou in the area. Participant asked if the reduction would be sufficient or not. / Chance does not have the details on what is considered essential road traffic right now, but will include that in the Project Description.
- Participant requested an end of season report, to understand if caribou mitigation efforts worked and is concerned that this is not being considered. / Chance is interested in learning how the caribou are impacted, and that Chance will learn over the project lifecycle (10-year program).
- Participants encouraged ongoing in-person discussion outside of the YESAB review, which, through written format, can become hostile.

Actions and Responsible Party

- No actions.

Details of Discussion

[redacted] (Chance) gave a brief Project summary and added that [redacted] (EDI) would lead the presentation. [redacted] emphasized that the Project is a proposed exploration program and reiterated that the proposed submission of their Project Proposal is February 2024. Chance has been conducting virtual and in person engagement meetings. He mentioned First Nation of Na-Cho Nyäk Dun leadership currently does not want to participate in community engagement. Chance will continue to provide Project information and that engagement will continue with the First Nations and residents of communities. Chance will also share technical reports with First Nations. Chance is proposing a 10-year program.

The group shared a round of introductions.

[redacted] (EDI) stated the exploration area is around 2400 square kilometres, with clearing occurring during the winter and that it will be approximately 1500 square kilometres total of 3D seismic spread over 10 years. He added that there will be 2000 square kilometres of 2D seismic. [redacted] (EDI) noted that the Project is looking at up to 5 wells per year, equivalent to 2 hectares, and a maximum of 30 wells total. He stated that winter operations will last about 1 to 3 years in each area. He added that there will be three Project work areas and winter access roads will be created. He noted that there will be spring and summer seismic activities with helicopter support and extended flow testing. He stated that the seismic work is different than what was done in the 1950s.

[redacted] (Chance) added that extended flow testing occurs during the winter months and a well of interest will be flowed for natural gas and oil to a service rig. He shared that Chance will be abandoning 3 or up to 5 wells next winter.

[redacted] (PCMB) asked if the seismic testing will include installing and retrieving geophones, which was done previously.

[redacted] (Chance) said that it is new to Chance and that they use the same equipment from the seismic program in 2013.

[redacted] (PCMB) mentioned that he knew Chance was working on site.

[redacted] (Chance) stated that the geophones will be flown out when the snow and wildlife are gone in the spring. He added that if the caribou are hanging out, they can employ mitigation measures and hold off detonation and data collection until the caribou migrate north.

[redacted] (NND/TH) asked if this includes surface drilling.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

[redacted] (Chance) said that it would involves drilling a 3-to-5-meter hole, and the charge will be put down and repacked.

[redacted] (NND/TH) inquired if it was helicopter access and if Chance would be setting up a portable drill.

[redacted] (Chance) mentioned that the site is accessible by vehicle and that Chance would transport the drilling equipment. He added that Chance can hold off until late spring to detonate and take samples.

[redacted] (NND/TH) inquired if it was restricted access.

[redacted] (Chance) confirmed that it will be restricted access.

[redacted] (PCMB) stated that in 2013 there were caribou around. If caribou are around when Chance conducts work, will they hold off on the seismic activity?

[redacted] Chance) said Chance would hold off on detonation activities, but this needs to be discussed further. Chance will make these decisions as they occur and depending on how many caribou are in the area. [redacted] does not understand what the criteria is for this. In the baseline data being gathered for the technical review, there is the understanding that the caribou will migrate. He noted that Chance will go back to that location after the caribou move through. He stated that it depends on the number of caribou that are migrating in the winter range. Chance won't know until they do the field work and determine caribou movement through wildlife monitoring.

[redacted] PCMB) said that if there are caribou moving through the area, it won't be just one hundred in the Eagle Plains Basin. It will be a lot more caribou than that. This is what the collared data suggests.

[redacted] (EDI) noted that the Project team wants to have a good understanding of caribou movement. He added that protecting the lichen protects the herd. He noted that this is why activities are occurring in the winter to minimize the impacts. Seismic lines don't have to be straight anymore, and it is not the Project that was proposed in the past. This is a different seismic operation and that the key thing is that it will be spread out over 10 years.

[redacted] (EDI) presented the Baseline Studies Completed slide.

[redacted] (EDI) shared that the Project was bumped up to Executive Committee screening, which required Chance to do several studies.

[redacted] (PCMB) inquired about information on the Executive Committee.

[redacted] (EDI) said that it is a higher level of consultation and requirements. The Executive Committee reviews the Project.

[redacted] (Chance) said that they require additional data and baseline studies. The original Project went to the Yukon Environmental and Socioeconomic Assessment Board (YESAB) Dawson office and four out of six concerns came from it. These concerns put the Chance Project into a higher level of screening.

[redacted] (EDI) stated that field studies from 2019 to 2021 included: ecological mapping, linear features, fish, water, birds, and desktop studies that includes Porcupine Caribou Herd (PCH), moose, and martens. Chance wanted to do a linear features study to feed into the Land Use Plan (LUP) conformity check. He noted that the PCH are in the desktop studies because there is so much information available on them. He added that there were concerns about grizzly bears, but Chance doesn't have information on them.

[redacted] (EDI) presented the Effects Assessment Approach slide.

[redacted] (EDI) said there will be an impact on caribou, and we are assessing the significance of the effects. He added that Chance put the Environmental Assessment in the context of the LUP. He noted that there is more disturbance which is included in the Linear Features Study. The constraint maps help to develop scenarios to figure out future impacts. He noted that the spatial

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

scale is relevant to the species. He said that exploration programs typically do not trigger an Executive Committee review. He added that this Project is going through the same review as the Casino mine project. He said that there is enough concern that it triggered an Executive Committee screening. There are always questions about the Project. He stated that Chance can't do an impact assessment without confirmed sites, which is why the Project team is using scenarios.

[redacted] (Chance) stated that Chance is taking an ecological perspective. Chance is trying to do the Project in a sustainable way by using constraints mapping and studies. Chance knows where the Project would like to drill. Chance needs to design winter access that considers constraints and previous disturbances. The Project team has described this to the Executive Committee and to communities to understand that Chance is listening and modifying the Project Proposal. They are not drilling year-round, and Chance's approach is unique and hasn't been done in the Arctic.

[redacted] (PCMB) asked for clarification whether the Project team was talking about next steps in the permitting process and if they had stopped talking about drilling.

[redacted] (EDI) said seismic comes first to identify the drill targets.

[redacted] (PCMB) said drilling is part of the exploration program, but we are talking about seismic right now.

[redacted] (Chance) said that Chance will still have to drill but initially they must get the targets and do the seismic. He added that this is what will help us understand what kind of resources are out there.

[redacted] (PCMB) inquired as to whether seismic would give Chance that information.

[redacted] (Chance) responded that no, it won't. He added that once it is put in a controlled environment, seismic will be used to understand of the layers of rock formation, depth of it, and any anomalies. He noted that drill site locations will be determined in the seismic studies.

[redacted] (PCMB) questioned whether Greg believed seismic and drilling to be one and the same. [redacted] (Chance) stated they are indeed different, and that identifying drill targets requires the seismic work.

[redacted] (PCMB) said [redacted] (EDI) said the drill on the slide was unconventional.

[redacted] (VGFN) asked if the last step in the process is flow testing.

[redacted] (Chance) said that that is correct. Geologists have said there is a 10 to 20% success rate, which means that 3 of 30 wells or 6 of 30 wells may be successful. Currently they do not know how successful they will be, but that there is opportunity. He noted that the business plan is focused on local consumption and that the Yukon needs additional energy. He said that Chance needs to understand what kind of gas there is and flow it. He noted that the flow time is up to six weeks. Chance would like to understand what kind of gas there is.

[redacted]NND/TH) mentioned that even if heating oil is locally sourced, it would need to be refined down south and then shipped back up. To be a local supplier, Chance would still have to ship oil south.

[redacted] (Chance) said that oil would need to be shipped south during the flow tests, but that there is technology to be refined at the site, but that's not a part of this Project.

[redacted] (YG) said that natural gas flow testing would occur for 6 weeks to prove the resource and asked Greg how long it would be with oil.

[redacted] (Chance) said it would require two years for flow testing and that Chance would be awaiting recommendations from YESAB. He added that it is longer for oil than gas. He noted that when the pressure comes up, the oil is a heavier liquid. He said that it takes time to understand it.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

[redacted] (YG) inquired about how long it would need to flow for.

[redacted] (Chance) said that the Project is not able to flow test summer months as Chance does not have all season roads. If there are successful wells, then Chance will need to seek a permit for an all-season road.

[redacted]YG) said that he's trying to understand the level of disturbance and if Chance would have to turn off the tap and begin flow tests in the following year.

[redacted](EDI) stated that that is something that Chance will have to include in the Project description.

[redacted](Chance) said that winter activities will only be 4 to 5 months.

[redacted] (VGG) asked if flaring would occur during flow testing.

[redacted](Chance) said that yes that is why flow testing is shorter because it would include a minimum of 3 weeks of flaring.

[redacted] (YG) expressed concern about how the trucks would be staged up to get the oil.

[redacted](Chance) said that Chance could get him the information. There will be heated storage, and will include 400-barrel trucks to keep the crude oil in. He said that the oil will come into a station area and before it gets taken away, there will be separators. He stated that Chance will probably have to reinject produced water back down into the wells.

[redacted] (VGG) stated that there needs to be more details about the Project Proposal and what activities Chance is proposing. For example, what are the activities associated with flow testing so that it can be evaluated. He noted that if the detail is in the Project Proposal to start with it saves everyone time. Chance will review.

[redacted] (EDI) presented the Land Use Plan Context slide.

[redacted] (EDI) said there are differences between how it works. There is the Integrated Management Area Zone 4 and that this is where it is expected that development will occur in the area. This zone has a higher level of protection than other areas. Even though Chance is looking at development in this area, Chance is looking at a high level of environmental protection. He added that it is likely one of the highest levels of protection with protection covering 37% of late winter and 31% of the fall range.

[redacted] (EDI) presented the Low Impact Seismic slide.

[redacted] (EDI) said Chance will use meandering lines to avoid large trees and to make the lines of sight to be less than 70 meters. There will be small narrow mulchers used for the seismic lines (2.5 m), which will help to protect vegetation. There is low ground pressure equipment over at least 20 cm of packed snow/ice. The vegetation will be pushed over, not cut, which means a faster recovery.

[redacted] (YG) asked if that is 20 centimetres of snowpack.

[redacted] (EDI) confirmed that it is 20 centimetres of snowpack.

[redacted] (Chance) Chance wants 20 centimeters of snowpack for winter roads, and in Chance's mitigation section, it says Chance will strive to get 20 centimeters.

[redacted] (VGG) asked if there is a design in place for meandering seismic lines and how Chance will communicate this to the operator.

[redacted] (EDI) said that that is an excellent question and [redacted] is the expert.

[redacted](Chance) said that scouting will be done in advance to understand the density of the forest, determine the location, and design it based on that information. If there are dense trees on the south side, Chance will design it to go around.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

[redacted] (VGG) asked if Chance would design it.

[redacted] (Chance) responded yes, they go out and walk it before they design it. There was helicopter support in the past to scout areas, to avoid mulching and to decide where to mulch. He noted that Chance will get more information about the criteria.

[redacted]. (YG) said they are trying to avoid site lines from certain lengths.

[redacted](VGG) said that it is up to Chance to design meandering seismic lines.

[redacted] (EDI) said that is how it works operationally.

[redacted](YG) said aerial photos could be helpful.

[redacted] (EDI) noted that Chance does not have any high-definition photos.

[redacted] (YG) said that the Yukon Government has some photos.

[redacted] (EDI) presented the Linear Feature Disturbance slide.

[redacted] (EDI) said that there are indicator levels of linear disturbance. He added that cautionary is 0.75 kilometres/square kilometer and the Regional Study Area (RSA) is 1.79 kilometres/square kilometre (unadjusted), and 0.52 kilometres/square kilometres(adjusted). He said that if the 3D lines are removed, it could be down to 0.48 square kilometers. He added that the background isn't presented too much in the LUP. He noted that Chance is utilizing the cautionary level.

[redacted](YG) said this is all the discussion from the LUP process.

[redacted] (EDI) said that there is a lot of theory around it, and that is why Chance did a linear effects study.

[redacted](YG) said that the numbers came from the caribou work. He said that he was not at the table but talked to people, such as [redacted], after the plan was done.

[redacted] EDI) said that information came out of Alberta, for example, different land uses and species in the area such as wolves preying on moose rather than caribou.

[redacted] (YG) asked what Chance meant by vegetation recovery.

[redacted] (EDI) said that they used the tall shrub stage, which was 2 metres instead of 1.5 metres from the LUP.

[redacted] (EDI) added that the old seismic approach was to cut the vegetation down.

[redacted] (EDI) presented the Environmental Constraints Mapping slide.

[redacted] (EDI) said Chance intends to avoid heritage sites, permafrost/terrain sensitive areas, riparian management areas, priority ELC units, caribou habitat, and moose habitat. He added that directional drilling is good to avoid high quality habitat, another mitigation measure.

[redacted] (Chance) said that Chance needs to get surface distance between 1.5 to 2.0 kilometres. He said that the Project team could stay on top of the hill and still drill in the valley.

[redacted] (VGG) asked if the Project videos are online.

[redacted] (Chance) said that Chance is in the process of developing a webpage.

[redacted] (Chance) said that Chance wants to launch the website before the new year and the February 2024 submission.

[redacted] (EDI) presented the Well Site Scenarios slide.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

[redacted] (EDI) said that the well site locations are unknown. He added that Chance develops scenarios within constraints to the range of potential habitat effects. Chance develops scenarios based on Scenario 1 which is developed by the seismic team.

[redacted] EDI) presented the Project Interactions slide.

[redacted] (EDI) said that there will be direct and indirect habitat interactions. Direct being vegetation clearing and indirect such as sensory disturbance. He added that there are areas where the Project team will avoid human activity. He said that there will be an indirect and direct mortality risk, direct being vehicle collisions and indirect will be due to increased predator access. This is what YESAB brought up in the first review. Chance is trying to reach a balance in the assessment.

[redacted] (PCMB) inquired about Chance's interpretation of disturbance.

[redacted] (EDI) responded that key disturbing factors are noise, smells, and human movement/presence. He added that this depends how far away caribou are from the well sites. He noted, based on mixed results in literature using various analytical methods, some possibly erroneously, that disturbances could result in no avoidance and up to ~40 kilometres of avoidance. He said that it is dependent on how the caribou are responding to the disturbance.

[redacted] (NND/TH) asked if there would be something on the ground at whatever distance it is. He asked what mitigation is there. He added that the concern is not to disturb the caribou, but how much is too much disturbance. He asked if there were other mitigations other than seasonality.

[redacted] (EDI) responded that there is a mitigation. He added that Chance calls them direct and indirect effects.

[redacted] (EDI) presented the Porcupine Caribou slide.

[redacted] (EDI) said that the key resource in the LUP is the caribou. He added that the information that Chance presents on the caribou is far more descriptive than in 2013. He noted that it was important to characterize the caribou. He added that Chance must understand the caribou enough to understand interactions with the Project. He said that Chance can't avoid all locations, and that Chance has looked at potential effects on PCH habitat and movement. He said that when looking at mortality it is challenging to quantify. He added that Chance has looked at residual effects, which are effects that are left over after mitigation is applied and that cannot be addressed.

[redacted] (EDI) presented the Porcupine Caribou – Distribution slide.

[redacted] (EDI) identified the PCH-identified life cycle periods or seasons. He added that there are patterns of occurrence from 1970 to 2016, supplied by PCTC. He said that Chance is looking at rut and winter overlap. He added that there is no doubt that Chance will see the caribou and that they will likely show up some time during the 10 year operation, and when they do, they will show up in large numbers.

[redacted] (EDI) shared movement of the PCH after the 2013/2014 seismic program. He said that the PCH moved through the Project area in 2015. He added that there were 13,000 to 14,000 observations through the cameras. He said that it was evident that they had moved through there. He noted that this has not happened ever since. He said that he is unsure where the PCH are now in the winter.

[redacted] (YG) said that the time where it does split, they used winter ranges in Alaska recently. He added that the challenge is that the PCH may go to the same area for two decades and then never go there again. He noted that he has not seen them in the uplands for two decades but that is where they used to be. He said that it is common to see them overlap with the December range.

[redacted] (EDI) said that there could be richer detail to describe. He said that when the PCH do show up it will be a lot.

[redacted] (YG) said that they do not have detailed GPS data prior to 2015. He added that collared data did not start until 2012.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

[redacted] (EDI) added that before, there were different collars.

[redacted] (YG) confirmed that previously, the location was tracked every day versus now, where you can track every minute of their movement. He added that most survey work occurs during the summer periods. He said that they had late winter data to look at distribution.

[redacted] (EDI) presented the Porcupine Caribou – Movement slide.

[redacted] (EDI) stated that in 2015, caribou travelled through a network of 2D seismic lines, winter roads, and a large 3D seismic grid. He said that the PCH will probably show up in abundance based on the work Chance has done.

[redacted] (YG) said this is late winter data. He added that that is when distribution would be done.

[redacted] (EDI) said that this is why the Project went to the Executive Committee. He added that Chance doesn't know enough about the PCH in the winter. He said that in the baseline effects, the Project can compile that data. He shared that a lot of the information was not available to the Chance team. He noted that if Chance misses anything, that this is what Chance is looking for.

[redacted] (EDI) said that caribou occupy the RSA in less than 20% of previous years. He added that rut/late fall and winter seasons are considered the least biologically sensitive periods for the herd. He said that that doesn't mean that the Project team isn't treating them sensitively, caribou are just less sensitive during these times. Winter is the least sensitive period relative to all seasons. He said that protecting calving grounds is key. He added that this herd keeps going back and other caribou herds are quite different. He noted that, the PCH are in good health this time of year and less sensitive than other times of the year. He shared that this information came from the PCTC report.

[redacted] (EDI) said that they are looking at the movement rate of PCH and what will they be exposed to. He said that based on the PCH collared data, it is evident that they move through the area. He added that it is roughly 4 to 5 days in the rut and late fall or 15 to 16 days in the winter.

[redacted] (EDI) said that the analysis consisted of quantifying daily travel times. He added that Chance characterized the seasonal ranges by dividing the seasonal range into around 2500 square kilometres of cells. He said that after that, they compared the different travel rates and residency times. He noted that the Project can say that the RSA is around half in the late fall and there are about ten days less spent in the winter. He shared that overall, caribou are spending less time in the RSA when they are there.

[redacted] (EDI) said that this is why it is important to characterize what the caribou are doing in the area. He added that they seem to be moving through the area quickly.

[redacted] (YG) asked if Chance is characterizing that their residency will be half of when they are going into the area.

[redacted] (EDI) said that we calculated residency times as an average, and that we are making a relative comparison of residency in the RSA versus the broader seasonal ranges using the collar data. He said that when the Project team is making a comparison of residency times, they are seeing this much of a difference.

[redacted] (YG) said that he is unsure if he would base the data on the limited set of examples, but it does give a sense. He added he would be leaning more on to the seasonal range data (SRD). He shared that the residency of SRD is useful. He said that he would be careful saying that about collared data.

[redacted] (EDI) said that there will be a list of uncertainties in the Environmental Assessment.

[redacted] (EDI) said that the standard error is associated with the ranges. He shared that the seasonal range average is not directly comparable to the RSA and that he is not sure if the seasonal range residency time is the best average to use. He said

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

that the composition of the eco ranges is different. He added that they wouldn't expect the same amount of residency time in the RSA.

[redacted] (YG) said that there is a lot of data, around 50 years of movement data for the herd. He added that there is only GPS data for a decade, which isn't that much.

[redacted] (EDI) said that the Project team must move through with some level of confidence. He said that the Project talks about reversibility of effects and if it is reversible.

[redacted] (EDI) presented the Porcupine Caribou – Habitat Selection slide.

[redacted] (EDI) shared a recap of the methods and results for PCH. He said that they used a standard approach to developing these models and used a generalized linear mixed model. He added that it was a 1:10 used-available design. He shared that they are looking at interactions with lichens, and plant functional type layers (e.g., light microlichens, conifer, forbs, deciduous shrubs, graminoids, and evergreen shrubs). He said that it included elevation, slops, aspect, and distance to waterbodies. He added that they did random effects on the caribou year and did a 5-fold cross variation of model predictions. He added that they mapped RSF predictions across seasonal ranges.

[redacted] (EDI) said that they used selection ratios to identify the RSF prediction threshold where the proportion of used locations is greater than available. He added that this corresponds to selected habitat by caribou; these predictions considers the partial effects of all habitat covariates (rather than single covariate coefficients). He shared that they were able to identify four habitat ratings: high, moderate, low, and very low. He said that the selection threshold identified the split between high/moderate and low/very low and that the split between high and moderate was based on midpoint value, the same for low and very low.

A participant asked if this is describing the quality of the habitat or the ratio of use.

[redacted] (EDI) said that it is quantifying selection. He added that when Chance maps that, it has been classified as a habitat with high or moderate rating. He shared that it is selection, not use.

[redacted] (EDI) said that the moderate and high ratings are the areas associated with selected habitat. He shared that that corresponds to caribou using the areas more frequently than what would be expected by random chance. He added that the Project team chose the term 'selected' habitat and didn't want to use 'suitable' habitat because all habitats can potentially be suitable and used by caribou. He said that the habitat ratings are associated with higher macrolichen cover.

[redacted] (YG) asked what the Y-axis on the top graph said.

[redacted] (EDI) responded that it is the proportion of locations. He said that both figures show the same information in a different type of way.

[redacted] (EDI) presented the Caribou / Project Interaction – Review slide.

[redacted] (EDI) shared that the RSA overlaps with the PCH seasonal ranges. He added that the caribou occupy the RSA in less than 20% of years (or approximately 1 in 5 years). He shared that rut/late fall and winter seasons are considered the least sensitive periods for the herd. He added that the exposure period of individual caribou is expected to be 1 to 2 weeks. He said that Chance is looking at the assessment of criteria of seasonal habitats and that they were built into the LUP.

[redacted] (EDI) presented the Potential Habitat Effects slide.

[redacted] (EDI) shared that direct habitat effects refers to areas cleared of vegetation. He said that this affects 2% of selected rut/late fall and winter habitats within the RSA. He added that it affects 0.2% of selected rut/late fall and winter habitats at the Eagle Plains ecoregion scale. He said that the 3D seismic may not create a functional loss if lichen persists. He shared that it should not affect the lichen.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

[redacted] (EDI) shared that the indirect habitat effects refer to sensory disturbance. He added that they did a ZOI study that was applied around all disturbances. He said that they assumed a 75% reduced habitat effectiveness within a 1-kilometer ZOI. He shared that it is hard to quantify the area. He said that it means that there is a 75% chance that caribou are less likely to select the area. He added that annually, about 32% of the RSA experiences sensory disturbance and affects 23% of the selected rut/late fall and winter habitats within the RSA. He said that it affects 5% of selected rut/late fall and winter habitats at the Eagle Plains ecoregion scale. He added that it is a temporary effect which is reversed once activity stops.

[redacted] (YG) asked where 1 kilometre came from.

[redacted] (EDI) said that it is based on the permanent disturbance, which was their own zone of disturbance. He added that they looked to find a balance of something that was reasonable. He said that 1 kilometer seemed like a reasonable measure.

[redacted] (YG) said that activities like helicopter work and safety checks, cause greater disturbance than the mulcher. He added that he cautions using the 1-kilometer buffer. He shared that he thinks Chance will have a hard time supporting that in the literature.

[redacted] (EDI) said that the primary reason was to associate the ZOI with sensory disturbance. He said that in assessments where ZOIs were found to be large, there hasn't been a test or link to a clear mechanism that could lead to such large areas of avoidance. He argues that studies with large ZOIs often capture broad changes in a herd's range distribution rather than local effects of a Project. He added that this assessment is focused on local-scale sensory disturbance which covers the work area. He said that, in the literature, ZOIs are most often quantified as linear avoidance up to the ZOI threshold. This causes the average avoidance effect to be about halfway up the sloped line. He shared that, for this assessment, they applied a uniform 75% reduction across the 1-kilometer buffer.

[redacted] (YG) said there is a potential effect for the whole area. He asked how they could get this into more detail. He said they will be looking at it very closely.

[redacted] (EDI) said that they identified a 2- or 4-kilometre ZOI associated with the 2D seismic lines (including winter roads and trails). However, he stated that they identified attraction (rather than avoidance) to the 3D seismic grid. He added that the 2–4-kilometre ZOIs for historical 2D seismic are small in magnitude. Habitat effectiveness is reduced by 20–40% on the footprint itself, but the average reduction across the ZOI is much smaller.

[redacted] (EDI) asked what the sample size for the 3D seismic sample size analysis was.

[redacted] (EDI) said that he will have to circle back.

[redacted] (YG) said that the PCTC advised against doing that analysis.

[redacted] (EDI) said that Chance did not rely on a 3D ZOI analysis.

[redacted] (YG) said that it was raised. He added that it may or may not be the case, but they don't have the data.

[redacted] (EDI) added that it is not conclusive.

[redacted] (YG) said that's perfect.

[redacted] (EDI) said that Chance expects those comments to come up too and that's why the analysis is there.

[redacted] said that when you talk about all this data, so next year when you are doing the seismic, there is no additional effects to the PCH at that location.

[redacted] (EDI) said that there will be a leftover footprint. He added that there is a linear disturbance that brings in predators.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

A participant said that it seems reasonable for seismic activity, but then there is a well being drilled. They said that the ZOI would be much bigger based on that. They said that there is going to be less of an impact.

[redacted]. (EDI) said that the impact could be up to 1 kilometer, but Chance could revisit that and rethink the details of that too.

[redacted] (EDI) shared that it was 1 kilometer impact for everything sticking to sensory disturbance.

[redacted] (NND/TH) said that if the caribou are discouraged from using the ZOI and activity stops, that they came back through. He added that he doesn't know if there is any information on prolonged activity. He said that they are talking about several winters. He said that if there is a prolonged period of disturbance, he hasn't come across the information. He asked if there is any information on permanent discouragement of using the area, even after the mulching disturbance stops.

[redacted] (EDI) said that he would look at caribou near mine sites and the Central Arctic Herd and how they responded. He said that they looked it on a herd basis, but he is unsure if they respond well. He shared that work has been done on caribou response to roads, and other development. He said he cannot think of whether they responded to any well site. He said thinking about the development in Prudhoe Bay, there was work on the caribou's response to the road and pipeline. He added that they had deemed a 300-meter zone. He said that if it is not fenced off, the caribou will move through.

[redacted] (YG) said Heather did the most recent analysis on that, and their role is to do objective PCTC science. He said it is the calving and post calving information that has not been developed in the last 30 years. He added that it was around 5 or 6 kilometers. He said that it was a tundra environment and oil field, in the summer. He shared that there were many differences.

[redacted] (EDI) said that it is hard to make that comparison of linear disturbance in Alberta to Eagle Plains. He shared that a caribou response to a single well site would need a wealth of data. He said that there are forty well sites out there.

[redacted] YG) said a camera on the well site would be good.

[redacted] (EDI) said that if you look at an oil rig and the caribou herd are going through, there is a clear answer to that.

[redacted] (VGG) asked if the linear thresholds Chance talks about, are based on the proposed linear disturbance.

[redacted] (EDI) said that that is why the planning commission did their own effects strategy.

[redacted](VGG) asked if Chance has talked to anyone at the Yukon Government about cumulative effects or linear features.

[redacted] (YG) said one of the linear things that was discussed was that the threshold is 1.5 meters of wooded vegetation. He added that they just don't know.

[redacted] (Chance) said that the last direction that Chance got was from [redacted] office when she was Deputy Minister and that the challenge is that the environmental groups are challenging the Yukon Government because the proponent is responsible to go to First Nations to work with them to get their permission on conformity checks. He asked if the proponents are responsible for making communities understand the effects.

[redacted] EDI) said that at the community level during our meetings, it has not been a topic of discussion.

[redacted] (VGG) said that it's coming up in another process around cumulative effects. He added that he is curious as it sounds like a lot of that work was based on studies from Alberta. He asked what the underpinning of the analysis is and if there is other information that is new to him.

[redacted] (EDI) said that Chance looked at the line of sight, travel speeds, visibility, and different levels of regeneration. He added that the Project team wanted to inform the planning commission.

[redacted](Chance) said that when Chance made the original submission, their understanding was that the Land Use Planning Council was working with them. He stated that they were told that Chance must figure that out and convince any other affected

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

parties. He asked how Chance does that work. Chance completed what it was required to do based on what was agreed to. He said that it is basically an EMR (Energy, Mines, and Resources) office that is just trying to figure it out. He shared that Chance is confused on who will oversee the old studies and disturbance that didn't occur from Chance/Northern Cross.

[redacted] (EDI) added that Chance did their own studies of effects. He added that that is how Chance came up with adjusted numbers.

[redacted] (NND/TH) said that he's come across concerns about the Land Use Planning Council not having the background that the commission has. He added that this is a compounding factor. He said that the council doesn't have a knowledge of history that the commission developed under the treaty, and that the council doesn't have the background to consider a project. He said that there are concerns about the council being capable of having a reliable opinion.

[redacted] (Chance) said that Sam is at the council and has a lot of knowledge and has been there for a while. He shared that there is no North Yukon Commission now.

[redacted] (YG) said that he is interested in talking about mitigations. By focusing on if the herd is coming through, it minimizes the issue. What happens when they do come through. It may be important to get information from the PCTC or Mike Suitor from the Yukon Government. If you hear caribou are coming your way and will be there in 3 days, what will the response be to that data.

[redacted] (EDI) said that they will get into that. He added that the monitoring part is an important part of the assessment.

[redacted] (EDI) presented the Potential Movement Effects slide.

[redacted] (EDI) said that there will be local movement effects such as reduced crossing if there is traffic on roads and seismic lines. Effects to seasonal movements or migrations are unlikely. Long distance movements will mostly be in fall and do not overlap with the bulk of Project activities. Short residency times and fast movement rates through the RSA and caribou travel through network of linear features in the RSA.

[redacted] (YG) said that pertaining to the effect of harvesting activities, there are areas where similar work has been done. A similar migrating effect can be seen and that it is possible that it may change a migration pattern. He said that he doesn't want to discount it.

[redacted] (Chance) asked what the probability is of that occurring.

[redacted] (YG) said that he is unsure exactly. He added that in 2015 it almost happened.

[redacted] (Chance) said that it is easy to tell that they go along the Dempster Highway.

[redacted] (YG) said that humans are travelling the same way the PCH like to because it is the easier travel. He added that it is a scenario that could occur, and it shouldn't be discounted.

[redacted] (PCMB) said that if looking at the probability, what's going to be in place with the PCTC, the people, and what is the plan to respond.

[redacted] (EDI) said that Chance will note it. He asked if it is going to stop them from entering the work area. He stated that Chance is assuming a 75% probability. He said that he is not trying to downplay the potential effects, but it is only an exploration project.

[redacted] (YG) said that YG has programs that shut down for 2 to 3 weeks when the herd hits.

[redacted] (EDI) said that that will certainly happen. He said that the Project team can't operate with thousand caribou around us. He added that it will affect their localized movement.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

[redacted] (EDI) presented the Potential Mortality Effects slide.

[redacted] (EDI) said that direct effects are vehicle collisions, but this is low risk on access roads and seismic lines. He said that by restricting the road, it won't be public access. He stated that the indirect effects are predation and hunting. He added that linear features might give more access to humans.

[redacted] (NND/TH) said that the resource road regulation on the Territorial Roads Land Act should give Chance permission to make the road private. He asked how Chance can use it as a private road. He asked if under the Oil and Gas Act they would be able to say it is a private road. He asked if Chance has had that discussion.

[redacted] (Chance) said that the Chief Operating Officer (COO) can make it a private road. He said that it is more of a safety concern, and no one wants to hunt around the drilling area. He added that it is one thing to give the access to an Indigenous harvester, from a safety point of view there is an issue around the work area buffer.

[redacted] (NND/TH) asked if the COO has the capability to give Chance a private road.

[redacted] Chance) confirmed yes and that they have had a COO do it before.

[redacted] (EDI) said that any predator wants easier access. He shared that it would have a temporary effect, limited to annual work areas where activities pack the snow on linear feature. He added that there aren't resident caribou in the Project area compared to other herds. He said that it is hard to conceptualize.

[redacted] (YG) said that he has seen people using the seismic lines. He said that there is no real monitoring of it. He stated that on predation, it is a different scenario. He shared that it is complicated because there are migratory wolves. He added that the question is if the herd has a major decline. He said that it is being anticipated sooner or later but they don't know.

[redacted] (EDI) said that there is uncertainty around mortality effects. He shared that it is more around Indigenous access, but Chance doesn't know how to move around that.

[redacted] (YG) said that the affected harvest on ZOI basically has a double effect.

[redacted] (EDI) said that as soon as the Project increases predation risk, there will be an increased effect. He added that it is important to increase local awareness there.

[redacted] (YG) said that this can be dealt with in the Project Effects Assessment.

[redacted]. (EDI) said that there is no harvest policy other than the Indigenous Rights to Harvest.

[redacted]. (EDI) presented the General Protection Measures slide.

[redacted] (EDI) said there is environmental constraints mapping to reduce habitat loss. Chance will stay out of this area when caribou are coming. There will be a limited annual footprint, reducing sensory disturbance. There will be access management to reduce mortality risk. People will probably use the winter access. He shared that he doubts that individuals will use the 3D seismic access.

[redacted] (YG) agreed that people likely won't use it as well.

[redacted] (EDI) shared that low impact seismic will help to reduce habitat loss and has been developed over the years. He added that there will be a maximum width of 2.5 meters that will retain ground vegetation. There will be speed limits in place to reduce mortality risk. He emphasized the importance of worker awareness, including reporting any sightings. There will be a caribou interaction response plan. He asked if there is an information database that Chance can use to understand weekly migration patterns.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

[redacted] (YG) said that the YG is trying to get a database in place. He shared that the PCTC updates their website and YG does the updates as they can. He said that the YG has a regulatory meeting that often changes things.

[redacted] (EDI) asked if YG will tell them when the caribou are coming.

[redacted] (YG) said that some companies are required to contact YG on a schedule. The other more likely scenario is just paying attention to the herd. He said the Chief of Mine and Land Use provides emails and the YG provides weekly updates after that. He shared that YG has been doing it for 5 years and it is working well.

[redacted] (EDI) said that there is flexibility with the seismic operation and that it will be Chance's bad luck. He added that Chance can't move the seismic and once a drill is spinning, the Project team can't stop.

[redacted] (NND/TH) said that it is possible to stop the drill.

[redacted] Chance) said that when driving, risks of potential impacts are increased. He added that there are speed controls, traffic controls, and the only traffic would be wildlife monitors.

[redacted] (EDI) said anything that is necessary.

[redacted] (NND/TH) said there was a constant of bringing water in with big trucks when he worked at the mine sites.

[redacted] (EDI) said that once the drill is going, it is not stopping.

[redacted] (PCMB) said that a caribou action response plan has potential, and he knows PCMB would be interested. He said it would be great if Chance could get their caribou information from PCMB and PCTC. He added that it would be good to see something established. If Chance is responding to caribou interactions, it would be nice to have a plan established. It would make sense if there was official communication linkage to be notified. These communications could establish a cooperative protocol. He added that this could help PCMB study the herd.

[redacted] (EDI) said that he wouldn't be able to develop that independently.

[redacted] (Chance) said that he agrees with getting the real data.

[redacted] (YG) said there will always be redundancy on this, and YG is trying to figure that out. He added that there are ways to do it. He said that the challenge for using satellites to track is that there could be several thousand caribou that don't have collars.

[redacted] (EDI) said that he agrees that it is only a small portion.

[redacted] (YG) said that there are 110 collars on the caribou.

[redacted] (EDI) said there is a level of warning from local monitors. He added that there will be a balance of reported observations, onsite. He shared that Chance would have to do aerial surveys.

[redacted] (YG) said there is no need for aerial surveys. He added that it can give you a sense of what you are dealing with and that they did that in 2013.

[redacted] (PCMB) said that it makes her think about how PCMB could help. If there are wildlife monitors around, it would be great to get regular updates on what they are observing. She added that if there is a situation where several caribou are coming to the Project area, the PCMB has connections to the Porcupine Caribou communities to get the word out. PCMB can help communicate things to bring show that we are engaged and that communities can be confident that Chance and PMCB are working together and sharing accurate information. PCMB wants the communities to be comfortable with what is happening. She added that there is the opportunity to look at the PCMB and Chance engagement as a very positive thing.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

[redacted] (EDI) said that this could be something to work on. He said that he agrees on collaboration and that aerial surveys during operation will be good. He shared that he thinks that the project can operate safely. He said that a lot of this relies on the observers being there.

[redacted] (NND/TH) said that with an existing drill site, and caribou in the area, Chance won't be able to shut down the drill. He said that the idea being that traffic could be reduced. He doesn't know where the water is coming from for the drill. He said that in past projects, there was a 24-hour supply of water from the water source to the drill site. He said that unless technology has changed, that is one example of traffic that can't be stopped if there are caribou in the area. He asked if the reduction would be sufficient or not.

[redacted] (EDI) shared that Chance doesn't have the details on what is considered essential road traffic right now. He shared that 5 vehicles a day sounds manageable.

[redacted] (YG) said that his issue is that there are no communications occurring with the Executive Committee. He said that it is important to have these conversations. These conversations will greatly increase Indigenous relations.

[redacted] (PCMB) said that the PCMB represents PCMB from the PCMB Agreement parties. She said that the PCMB isn't a decision-making board, but they can provide input to regulatory processes and review processes. She added that the PCMB knows trust is important with communities and when working with groups that are willing to go over and above what is specified in regulatory decisions. When the PCMB knows that there is an interest in building that trust, if anyone is looking at building positive relationships, it must be a collaborative process. There needs to be transparency and a willingness to work together no matter what the information may be. It is important for PCMB to do that and that the PCMB wants to work together. It is reasonable to say Chance can't shut down a well in production if there is a conversation ahead of time. If they know about these concerns in advance, there could be something in place that incorporates Traditional Knowledge that would address the communities' concerns. She shared that when caribou come and you can't shut down the well, the PCMB knows that that is reasonable, and they can support that. The PCMB can help with mitigation around that. She said not to underestimate the trust with PCMB and that the PCMB wants to work with Chance to do a good job of this. She shared that what happens with the Project will last in people's minds.

[redacted] (NND/TH) said that even if the PCMB aren't a decision maker, they are important.

[redacted] (EDI) said that the next step is mitigation. He said that he has seen a change in the approach by Chance. It comes down to the communication aspect and the seismic program is flexible.

[redacted] (YG) said regarding the effects monitoring piece, that looking at developing a couple of well-focused designs would be helpful. He said that if the exploration project is successful, Chance will get towards a development stage and there won't be any data.

[redacted] (EDI) said that to determine if mitigation is successful, Chance will have to do an experimental approach.

[redacted] (NND/TH) said that they do a report at the end of the season, to understand if it worked. He is amazed that this is not being considered.

[redacted] (EDI) said that this is a 10-year program, and it is Chance's opportunity to learn. He added that Chance wants to understand what the caribou do.

[redacted] (YG) said that the collared data is one scale.

[redacted] (EDI) said that it makes sense to put in effects monitoring.

[redacted] (YG) said that he is happy to work with Chance and discuss with PCTC to provide input. It is going to have to be a collaborative approach somehow.

Vuntut Gwitchin First Nation0009	22-Feb-18	Meeting	Outgoing	Vuntut Gwitchin First Nation	Kelly Constable (Hemmera)	Greg Charlie (Chance), Mike Chernoff, Richard Wyman (Chance)	Chief Bruce Charlie (Vuntut Gwitchin First Nation), Chief Dana Tizya-Tramm (Vuntut Gwitchin First Nation) Joe Linklater (Vuntut Gwitchin First Nation), Joe Peter, Martin Frost Jr., Paul Josie (Vuntut Gwitchin First Nation), Rosa Brown (Vuntut Gwitchin First Nation) (Vuntut Gwitchin First Nation), Shena Shaw (Hemmera)	Engagement	The purpose of this meeting was to re-set the relationship between Chance and Vuntut Gwitchin First Nation. In the meeting, it was discussed that Vuntut Gwitchin First Nation sees an opportunity with Chance. Vuntut Gwitchin First Nation is new to oil and gas and therefore Vuntut Gwitchin First Nation is taking slower steps and the process may be slower with Vuntut Gwitchin First Nation than elsewhere. Chance has a Community Relations Committee of the Board that focuses on identifying initiatives that Chance can pursue to promote collaborative community engagement. Vuntut Gwitchin First Nation leads for the Communications and Engagement Plan were discussed. Chance provided Vuntut Gwitchin First Nation with feedback on their draft Vuntut Gwitchin First Nation Oil and Gas Engagement Policy and the difference in purpose between this policy and the Communications and Engagement Plan. Vuntut Gwitchin First Nation described how the Vuntut Gwitchin First Nation Citizens will want to be part of engagement activities with Chance and will want to help set priorities for engagement.	Vuntut Gwitchin First Nation asked for Vuntut Gwitchin First Nation representation on the Community Relations Committee of the Chance Board of Directors.	N/A
Vuntut Gwitchin First Nation0010	20-Mar-18	Email	Outgoing	Vuntut Gwitchin First Nation	Shena Shaw (Hemmera)	N/A	Emily Mann (Hemmera), Rosa Brown (Vuntut Gwitchin First Nation) (Vuntut Gwitchin First Nation)	Engagement	Chance asked Vuntut Gwitchin First Nation to let them know when they have an alternate date for the September 28, 2018 meeting.	N/A	N/A
Vuntut Gwitchin First Nation0011	22-Mar-18	Phone Call	Outgoing	Vuntut Gwitchin First Nation	Kelly Constable (Hemmera)	Cindy Dickson (Chance)	Chief Dana Tizya-Tramm (Vuntut Gwitchin First Nation) Darius Elias (Vuntut Gwitchin First Nation), Emily Mann (Hemmera), Kris Statnyk (Vuntut Gwitchin First Nation), Marvin Frost Jr. (Vuntut Gwitchin First Nation), Megan Williams (Vuntut Gwitchin First Nation), Shena Shaw (Hemmera), Rebecca Shrubb (Vuntut Gwitchin First Nation)	Engagement	The purpose of this meeting was to review the draft Schedule of Engagement, Chance Community Relations Committee Terms of Reference, Vuntut Gwitchin First Nation and Chance Engagement and Communication Plan, and the minutes of the February 22, 2018 meeting in Old Crow.	A Vuntut Gwitchin First Nation representative noted that the parties are in general agreement on the front heavy approach of the Oil and Gas Policy. They wondered if this commitment had been recorded in the meeting minutes. A Chance representative suggested that the topic be parked to a time when the Chance President was in attendance so that both parties can have a detailed discussion on the front-heavy approach. The Chance representative added that they had not received comments on the meeting minutes by either Chance or Vuntut Gwitchin and that the process for giving feedback on the minutes should be discussed in this current meeting.	N/A
Vuntut Gwitchin First Nation0012	27-Mar-18	Email	Outgoing	Vuntut Gwitchin First Nation	Kelly Constable (Hemmera)	Cindy Dickson (Chance), Greg Charlie (Chance), Richard Wyman (Chance)	Chief Dana Tizya-Tramm (Vuntut Gwitchin First Nation) Emily Mann (Hemmera), Rosa Brown (Vuntut Gwitchin First Nation) (Vuntut Gwitchin First Nation), Shena Shaw (Hemmera), Josie William (Vuntut Gwitchin First Nation) Josie (Vuntut Gwitchin First Nation)	Engagement	Hemmera sent the first of four updated documents to Vuntut Gwitchin First Nation - The February 22, 2018 Old Crow Meeting Minutes for Vuntut Gwitchin First Nation's review and input.	N/A	N/A
Vuntut Gwitchin First Nation0013	27-Mar-18	Email	Outgoing	Vuntut Gwitchin First Nation	Kelly Constable (Hemmera)	Cindy Dickson (Chance), Greg Charlie (Chance), Richard Wyman (Chance)	Chief Dana Tizya-Tramm (Vuntut Gwitchin First Nation) Emily Mann (Hemmera), Rosa Brown (Vuntut Gwitchin First Nation) (Vuntut Gwitchin First Nation), Shena Shaw (Hemmera), Josie William (Vuntut Gwitchin First Nation) Josie (Vuntut Gwitchin First Nation)	Engagement	Hemmera sent the second of four updated documents to Vuntut Gwitchin First Nation - the Community Relations Terms Of Reference.	N/A	N/A
Vuntut Gwitchin First Nation0014	28-Mar-18	Email	Outgoing	Vuntut Gwitchin First Nation	Kelly Constable (Hemmera)	Cindy Dickson (Chance), Greg Charlie (Chance), Richard Wyman (Chance)	Chief Dana Tizya-Tramm (Vuntut Gwitchin First Nation) Emily Mann (Hemmera), Rosa Brown (Vuntut Gwitchin First Nation) (Vuntut Gwitchin First Nation), Shena Shaw (Hemmera), Josie William (Vuntut Gwitchin First Nation) Josie (Vuntut Gwitchin First Nation)	Engagement	Hemmera sent the 3rd and 4th updated documents: the draft Communications and Engagement Plan, and the updated draft Schedule of Engagement. Hemmera noted that this draft incorporates some general feedback from Vuntut Gwitchin First Nation that was received during the March 22, 2018 teleconference and was aware both Vuntut Gwitchin First Nation and Chance were still reviewing and providing edits to these notes.	N/A	N/A
Vuntut Gwitchin First Nation0015	16-Apr-18	Email	Outgoing	Vuntut Gwitchin First Nation	Kelly Constable (Hemmera)	Cindy Dickson (Chance), Greg Charlie (Chance), Richard Wyman (Chance)	Chief Dana Tizya-Tramm (Vuntut Gwitchin First Nation) Emily Mann (Hemmera), Rosa Brown (Vuntut Gwitchin First Nation) (Vuntut Gwitchin First Nation), Shena Shaw (Hemmera), Josie William (Vuntut Gwitchin First Nation) Josie (Vuntut Gwitchin First Nation)	Engagement	Hemmera sent the draft meeting minutes from the March 22, 2018 teleconference for review and comment by Vuntut Gwitchin First Nation.	N/A	N/A

Vuntut Gwitchin First Nation0016	23-Apr-18	Phone Call	Outgoing	Vuntut Gwitchin First Nation	Kelly Constable (Hemmera)	N/A	Chief Dana Tizya-Tramm (Vuntut Gwitchin First Nation)	Engagement	Hemmera called Vuntut Gwitchin First Nation and spoke with a Councillor. The following items were discussed: Vuntut Gwitchin First Nation had completed their review of the draft documents provided to them (Engagement and Communication Plan, meeting minutes, draft TOR for the Community Relations Committee) and will email those to Hemmera today; Vuntut Gwitchin First Nation had requested a teleconference with Hemmera to review Vuntut Gwitchin First Nation's comments on the above-noted documents; Hemmera updated Vuntut Gwitchin First Nation on meetings had with other First Nations; Vuntut Gwitchin First Nation asked if the meetings went well; Vuntut Gwitchin First Nation asked if there are any obvious roadblocks to move forward with the Communications and Engagement Plans with all five First Nations, Hemmera said that there wasn't anything urgent at this moment and noted that having Vuntut Gwitchin First Nation so actively engaged is much appreciated and is important for generating buy-in when engaging the other First Nations. Vuntut Gwitchin First Nation thought that a meeting with other potentially affected First Nations was a good idea and suggested that this would be most successfully planned and executed if Vuntut Gwitchin First Nation were to lead the event with support from Chance and Hemmera. Vuntut Gwitchin First Nation agreed. Vuntut Gwitchin First Nation asked Hemmera if the multi-party meeting would be a full day. Discussed details around an all-party meeting. Vuntut Gwitchin First Nation has met multiple times internally about the Chance documents and that Vuntut Gwitchin First Nation as a whole has had really positive conversations, is very much looking forward to a new relationship with Chance, and there is noteworthy buy-in from Vuntut Gwitchin First Nation on Chance's plans and engagement efforts – Hemmera thanked Vuntut Gwitchin First Nation for this comment. Vuntut Gwitchin First Nation informed Hemmera that moving forward, should anything require their immediate attention, to text over cell phone and they would prioritize the matter.	N/A	N/A
Vuntut Gwitchin First Nation0017	27-Apr-18	Email	Outgoing	Vuntut Gwitchin First Nation	Kelly Constable (Hemmera)	Cindy Dickson (Chance), Greg Charlie (Chance), Richard Wyman (Chance)	Chief Dana Tizya-Tramm (Vuntut Gwitchin First Nation) Rosa Brown (Vuntut Gwitchin First Nation) (Vuntut Gwitchin First Nation), Shena Shaw (Hemmera), Josie William (Vuntut Gwitchin First Nation) Josie (Vuntut Gwitchin First Nation)	Engagement	Hemmera sent to Vuntut Gwitchin First Nation and Chance the most recent version of the Vuntut Gwitchin and Chance Communication and Engagement Plan (Plan) as provided by Vuntut Gwitchin First Nation to Hemmera via email on April 25. Hemmera discussed this most recent version with Vuntut Gwitchin First Nation representatives that day a teleconference, and conveyed the following key points of Vuntut Gwitchin First Nation's revisions to the document: • This version discusses clearly the distinction between engagement and communication with Vuntut Gwitchin First Nation and engagement and communication with Vuntut Gwitchin First Nation Citizens; • The relationship between the Communications and Engagement Plan and Vuntut Gwitchin First Nation's Oil and Gas Engagement Policy (Policy) is more distinct; • The role of the Committee (as described in the Policy) in engagement and communication with Chance; and • Once Vuntut Gwitchin First Nation and Chance reach a point where the Plan is mostly agreed to by both parties, the Plan can likely be ratified by Vuntut Gwitchin Chief and Council in mid-May.	N/A	N/A
Vuntut Gwitchin First Nation0018	01-May-18	Email	Outgoing	Vuntut Gwitchin First Nation	Greg Charlie (Chance)	Cindy Dickson (Chance), Richard Wyman (Chance)	Chief Dana Tizya-Tramm (Vuntut Gwitchin First Nation) Emily Mann (Hemmera), Rosa Brown (Vuntut Gwitchin First Nation) (Vuntut Gwitchin First Nation), Shena Shaw (Hemmera), Josie William (Vuntut Gwitchin First Nation) Josie (Vuntut Gwitchin First Nation)	Engagement	Chance sent revisions to the Communication and Engagement Plan provided to Hemmera by Vuntut Gwitchin via email on April 26. Chance provided the following suggestions and updates: Communication and Engagement Plan, Section 3: Chance had updated the Plan to reference the Policy and has removed the Policy as an attachment, noting that Chance would comply with this Policy and all other Vuntut Gwitchin First Nation policies applicable to Chance's activities. Chance was hesitant to sign off on the Policy as part of the Plan, as it did not seem appropriate for a proponent to be approving or signing off on a self-governing First Nation's internal Policy. However, Chance would like to strongly note that they were fully committed to complying with this, and all of Vuntut Gwitchin First Nations internal Policies and Procedures. Vuntut Gwitchin Oil and Gas Engagement Policy, "Conflict of Law and Policy": This section of the Policy describes conflict between the Policy and Vuntut Gwitchin First Nation Law; Vuntut Gwitchin First Nation may want to consider the instance of conflict between the Policy and the Yukon Oil and Gas Act as well. Policy, general comment: There are some legislated processes regarding engagement and oil and gas dispositions in the Yukon Oil and Gas Act that Vuntut Gwitchin First Nation may wish to engage Yukon Government about for consisteNorthern Cross Yukon with the Policy. Chance suggested a brief call to walk through all their edits in detail and discuss next steps; asks Vuntut Gwitchin First Nation for the best for time/date to set up a conference call.	N/A	N/A
Vuntut Gwitchin First Nation0019	03-May-18	Phone Call	Incoming	Vuntut Gwitchin First Nation	Richard Wyman (Chance)	Cindy Dickson (Chance), Greg Charlie (Chance)	Chief Dana Tizya-Tramm (Vuntut Gwitchin First Nation) Shena Shaw (Hemmera)	Engagement	Chance and Vuntut Gwitchin First Nation had a teleconference to discuss a round of revisions to the Communications and Engagement Plan.	N/A	N/A
Vuntut Gwitchin First Nation0020	10-May-18	Phone Call	Incoming	Vuntut Gwitchin First Nation	Josie William (Vuntut Gwitchin First Nation) Josie (Vuntut Gwitchin First Nation)	Greg Charlie (Chance)	Josie William (Vuntut Gwitchin First Nation) Josie (Vuntut Gwitchin First Nation)	Engagement	The Natural Resources Director for Vuntut Gwitchin First Nation called Chance to provide an update that the Vuntut Gwitchin First Nation team is meeting this week on the re-draft of the engagement plan and will provide the next draft by end of this week.	N/A	N/A
Vuntut Gwitchin First Nation0021	15-May-18	Email	Outgoing	Vuntut Gwitchin First Nation	Josie William (Vuntut Gwitchin First Nation) Josie (Vuntut Gwitchin First Nation)	Cindy Dickson (Chance), Greg Charlie (Chance), Richard Wyman (Chance), Rick Nielsen (Chance)	Chief Dana Tizya-Tramm (Vuntut Gwitchin First Nation) Darius Elias (Vuntut Gwitchin First Nation), Emily Mann (Hemmera), Kris Statnyk (Vuntut Gwitchin First Nation), Megan Williams (Vuntut Gwitchin First Nation), Rosa Brown (Vuntut Gwitchin First Nation) (Vuntut Gwitchin First Nation), Shena Shaw (Hemmera)	Engagement	Vuntut Gwitchin First Nation thanked Hemmera for the email and said they would mention it again, to please include Vuntut Gwitchin First Nation, their Intergovernmental Affairs Coordinator in all emails. Vuntut Gwitchin First Nation also confirmed that Chance would receive the final version of the VVuntut Gwitchin First Nation/Chance Communication & Engagement Plan shortly. Hemmera sent back an email to Josie William (Vuntut Gwitchin First Nation) (Vuntut Gwitchin First Nation), and thanked them for the note. Hemmera confirmed they would add Kris to the distribution list for Vuntut Gwitchin First Nation. Hemmera also sent apologies to a Vuntut Gwitchin First Nation representative for erroneously excluding him from the correspondence.	N/A	N/A

Vuntut Gwitchin First Nation0022	15-May-18	Email	Incoming	Vuntut Gwitchin First Nation	Kris Statnyk (Vuntut Gwitchin First Nation)	Cindy Dickson (Chance), Greg Charlie (Chance), Richard Wyman (Chance), Rick Nielsen (Chance)	Chief Dana Tizya-Tramm (Vuntut Gwitchin First Nation) Darius Elias (Vuntut Gwitchin First Nation), Emily Mann (Hemmera), Kris Statnyk (Vuntut Gwitchin First Nation), Megan Williams (Vuntut Gwitchin First Nation), Rosa Brown (Vuntut Gwitchin First Nation) (Vuntut Gwitchin First Nation), Shena Shaw (Hemmera)	Engagement	Vuntut Gwitchin First Nation sent a revised copy of the Communication and Engagement Plan, dated May 7, 2018. This version of the Plan incorporated the changes most recently suggested by Chance with the only exception being Vuntut Gwitchin First Nation's desire to keep the Policy attached as an appendix. From the perspective of Vuntut Gwitchin First Nation, they considered this version of the Plan to be completed and final and subject to amendment by the parties over time as contemplated under Section 6 of the plan. Vuntut Gwitchin First Nation0033	06-Jun-18	Email	Outgoing	Vuntut Gwitchin First Nation	Kelly Constable (Hemmera)	N/A	Chief Dana Tizya-Tramm (Vuntut Gwitchin First Nation)	Engagement	A representative from Hemmera sent an email to Vuntut Gwitchin First Nation saying that they were hoping to connect with them via telephone the previous day and left a voice mail regarding their note and memo provided on May 31, 2018. Hemmera asked Vuntut Gwitchin First Nation to call them back at their earliest convenience.	N/A	N/A
Vuntut Gwitchin First Nation0034	12-Jun-18	Email	Outgoing	Vuntut Gwitchin First Nation	Kelly Constable (Hemmera)	Cindy Dickson (Chance), Greg Charlie (Chance), Richard Wyman (Chance)	Emily Mann (Hemmera), Megan Williams (Vuntut Gwitchin First Nation), Shena Shaw (Hemmera)	Engagement	A representative of Hemmera sent the newly appointed Acting Director for Lands and Resources an update about the newly completed Communications and Engagement Plan. Hemmera wanted to touch base with this representative about moving forward on implementing the finalized Plan (which was attached to the email). Hemmera also attached an outline with some suggested next steps for communications and engagement. Hemmera asked the representative if they could give them a call tomorrow or to have a touch-base chat. They asked if there was a time that worked best.	A representative from Vuntut Gwitchin First Nation answered the email that Hemmera sent to Vuntut Gwitchin First Nation on June 13th, 2018. Vuntut Gwitchin First Nation has prepared a response to the Hemmera memo and they expects it will be sent out today. Vuntut Gwitchin First Nation apologized for the delay but said with everyone's busy schedules they needed a bit more time. Vuntut Gwitchin First Nation also said that if Hemmera wanted to touch base they would be available the next day for a phone call.	N/A
Vuntut Gwitchin First Nation0035	19-Jun-18	Meeting	Outgoing	Vuntut Gwitchin First Nation	Greg Charlie (Chance)	N/A	Chief Dana Tizya-Tramm (Vuntut Gwitchin First Nation)	Engagement	A representative from Chance met with a representative from Vuntut Gwitchin First Nation in Whitehorse, Yukon, to discuss a meeting in Old Crow the week of July 9-13, 2018. The precise dates were not yet confirmed. Vuntut Gwitchin First Nation indicated they were also good with having Hemmera continue to participate as they moved into implementation of the Plan.	N/A	N/A
Vuntut Gwitchin First Nation0036	27-Jun-18	Email	Outgoing	Vuntut Gwitchin First Nation	Greg Charlie (Chance)	Cindy Dickson (Chance), Richard Wyman (Chance)	Emily Mann (Hemmera)	Engagment	Chance sent Vuntut Gwitchin First Nation a draft agenda to assist with the discussion on July 10, 2018. Chance also said to add or make changes if they would like.	N/A	N/A
Vuntut Gwitchin First Nation0037	10-Jul-18	Meeting	Outgoing	Vuntut Gwitchin First Nation	Richard Wyman (Chance)	N/A	Chief Bruce Charlie (Vuntut Gwitchin First Nation), Chief Dana Tizya-Tramm (Vuntut Gwitchin First Nation) Josie William (Vuntut Gwitchin First Nation) Josie (Vuntut Gwitchin First Nation), Esau Schafer (Vuntut Gwitchin First Nation), Marvin Frost Jr. (Vuntut Gwitchin First Nation), Paul Josie (Vuntut Gwitchin First Nation), Rosa Brown (Vuntut Gwitchin First Nation) (Vuntut Gwitchin First Nation), Kris Statnyk (Vuntut Gwitchin First Nation)	Engagement	The purpose of this meeting was to establish a general understanding of Chance's project plans going forward and communication pathways for oil and gas related matters, as well as to collaboratively decide on next steps in engagement. Meeting Objectives: • Provide an overview of Chance's land tenure status and general exploration project plans • Learn the status of the standing committee Key outcomes for Chance: • Establish formal contact representatives for both Chance and Vuntut Gwitchin First Nation going forward • Decide on short term and medium term next steps. Vuntut Gwitchin First Nation0062	03-Oct-18	Letter	Outgoing	Vuntut Gwitchin First Nation	Richard Wyman (Chance)	N/A	Chief Bruce Charlie (Vuntut Gwitchin First Nation)	Engagement	Chance wrote to Vuntut Gwitchin First Nation to advise that Chance intends to relinquish its exploration rights to the entire Exploration Permit 0005 (EP). This EP partially overlaps with the Ch'ihilii Chik Habitat Protection Area (HPA). Chance recognizes the importance of protected areas and wishes to support the Vuntut Gwitchin First Nation by surrendering this EP to facilitate the creation of the HPA with no encumberance of outside oil and gas rights. As a courtesy, Chance was giving notice prior to informing the Yukon Government of the relinquishment.	Vuntut Gwitchin First Nation had previously mentioned that the Ch'ihilii Chik Habitat Protection Area (HPA) was of concern if oil and gas activity were to occur in permit 0005.	N/A
Vuntut Gwitchin First Nation0063	04-Oct-18	Email	Incoming	Vuntut Gwitchin First Nation	Chief Dana Tizya-Tramm (Vuntut Gwitchin First Nation)	Cindy Dickson (Chance), Greg Charlie (Chance), Mike Chernoff, Richard Wyman (Chance)	Emily Mann (Hemmera), Chief Dana Tizya-Tramm (Vuntut Gwitchin First Nation) Megan Williams (Vuntut Gwitchin First Nation), Rosa Brown (Vuntut Gwitchin First Nation) (Vuntut Gwitchin First Nation), Rick Nielsen (Chance), George Meadows (Hemmera), Shena Shaw (Hemmera), Josie William (Vuntut Gwitchin First Nation) Josie (Vuntut Gwitchin First Nation), Kris Statnyk (Vuntut Gwitchin First Nation)	Engagement	A Vuntut Gwitchin First Nation representative let Chance know that they would be arriving in Vancouver on October 15, 2018, and in Whitehorse on October 16, 2018, at 6PM, and available to meet in Whitehorse on October 17 or 18, 2018.	N/A	N/A

Vuntut Gwitchin First Nation0064	04-Oct-18	Meeting	Outgoing	Vuntut Gwitchin First Nation	Richard Wyman (Chance)	N/A	Chief Dana Tizya-Tramm (Vuntut Gwitchin First Nation) Rosa Brown (Vuntut Gwitchin First Nation) (Vuntut Gwitchin First Nation), Kris Statnyk (Vuntut Gwitchin First Nation)	Engagement	Vuntut Gwitchin First Nation opened the meeting by discussing the timeline for finalizing the Agreement. Originally, Chance and Vuntut Gwitchin First Nation were striving for a timeline that would allow for the Agreement to be completed before October 19, when it is expected the Vuntut Gwitchin First Nation election will be called. However, this timeline would not afford time for community engagement. There were benefits to waiting for the incoming council in that they would be the ones to sign off on the Agreement and then be responsible for implementing the agreement. Vuntut Gwitchin First Nation suggested moving forward with the discussion of the Agreement keeping a new longer timeline in mind. Chance and Vuntut Gwitchin First Nation were looking at February 2019 as the earliest date on which an Agreement could be signed off. Chance responded that Chance did not have problems with this timeline as long as February 2019 remained the target end date for finalizing the Agreement, as this seemed to be a realistic deadline. Vuntut Gwitchin First Nation started the conversation by saying that Vuntut Gwitchin First Nation has issues with Chance's amendments and comments to Section 4.3, specifically Chance's reluctance to attach the Policy, and wish to have the freedom to submit a Yukon Environmental Socio-economic Assessment Board Proposal prior to the end of this Agreement and therefore prior to signing a Benefits Agreement. Chance asked if Chance and Vuntut Gwitchin First Nation could potentially complete some aspects of the Policy at the same time rather than sequentially. Due to the fact that Yukon Environmental Socio-economic Assessment Board had public components and Chance could not do anything without permits, they raised that it may be time inefficient to advance things sequentially. Vuntut Gwitchin First Nation asked for an example of items that Chance would want to develop in paralleled sequences. Chance elaborated that Chance and Vuntut Gwitchin First Nation could develop a YESAA application at the same time as a Benefits Agreement. Vuntut Gwitchin First Nation reminded the group that a fundamental aspect of the policy was to have a front-end process.	Timeline of Agreement - this should be extended from October 19, 2018 to February 2019. This allows for community engagement and for the newly elected officials to be in office.	N/A
Vuntut Gwitchin First Nation0065	05-Oct-18	Email	Outgoing	Vuntut Gwitchin First Nation	Shena Shaw (Hemmera)	N/A	Emily Mann (Hemmera), Rosa Brown (Vuntut Gwitchin First Nation) (Vuntut Gwitchin First Nation)	Engagement	Chance contacted Vuntut Gwitchin First Nation to discuss the agenda for the next meeting. Specifically, Chance wanted to discuss walking through the policy in more detail with the exploration development scenario document and also more detail on specific items in the NYRLUP.	N/A	N/A

Vuntut Gwitchin First Nation0074	19-Oct-18	Email	Outgoing	Vuntut Gwitchin First Nation	Shena Shaw (Hemmera)	N/A	Shena Shaw (Hemmera), Emily Mann (Hemmera)	Engagement	In response to a Vuntut Gwitchin First Nation representative's email, a Chance representative suggested meeting on October 24, 2018.	N/A	N/A
Vuntut Gwitchin First Nation0075	19-Oct-18	Email	Outgoing	Vuntut Gwitchin First Nation	Shena Shaw (Hemmera)	N/A	Shena Shaw (Hemmera), Emily Mann (Hemmera)	Engagement	A Vuntut Gwitchin First Nation representative said that their afternoon was open and suggested meeting at 1:00PM. A representative from Chance then sent a meeting scheduler.	N/A	N/A

Vuntut Gwitchin First Nation0076	31-Oct-18	Letter	Incoming	Vuntut Gwitchin First Nation	Chief Dana Tizya-Tramm (Vuntut Gwitchin First Nation)	Richard Wyman (Chance)	Chief Dana Tizya-Tramm (Vuntut Gwitchin First Nation)	RE: Relinquishment of Exploration Permit 5	Dana T. sent a letter to Vuntut Gwitchin First Nation thanking Chance for surrendering their oil and gas Exploration Rights to their permit #0005 ("EP5") so that the Ch'ihilli Chik working group may submit a clean Ch'ihilli Chik Habitat Protection Area Management Plan without any third party land interests to YYukon Government and the Minister of Environment. Dana T. stated stated this was viewed as a 'good will gesture' of cooperation and respect.	N/A	20181031-Vuntut Gwitchin First Nation0076
Vuntut Gwitchin First Nation0077	19-Nov-18	Email	Outgoing	Vuntut Gwitchin First Nation	Emily Mann (Hemmera)	N/A	Kris Statnyk (Vuntut Gwitchin First Nation), Rosa Brown (Vuntut Gwitchin First Nation) (Vuntut Gwitchin First Nation), Chief Dana Tizya-Tramm (Vuntut Gwitchin First Nation) Darius Elias (Vuntut Gwitchin First Nation), Megan Williams (Vuntut Gwitchin First Nation)	Engagement	Hemmera sent out an email on behalf of Chance and stated that they hoped their email found all at Vuntut Gwitchin First Nation well. Hemmera explained that Chance acknowledged that there had been a small break since the last Vuntut Gwitchin First Nation-Chance meeting, Chance was proposing to meet again before the new year to maintain the positive momentum established with meetings. Chance and Vuntut Gwitchin First Nation had both expressed a need to meet regarding the Oil and Gas Policy and spend some time developing a further understanding of the Policy and its application to stages of the exploration project. Chance and GTC think this is an important step to be done before moving forward with the Cooperation Agreement. A common and improved understanding of the policy, and discussion of any issues with its implementation would aid in moving forward with the Cooperation Agreement and future engagement once the new Chief and Council was formed. Chance was proposing to spend half a day on this meeting and host it in Whitehorse on one of the following dates: • December 12 • December 13 • December 17 • December 18 Chance asked Vuntut Gwitchin First Nation representatives to please respond to Chance with tjtheir availability as soon as possible and Chance stated they would send out a scheduler by the end of that week.	N/A	N/A
Vuntut Gwitchin First Nation0078	21-Nov-18	Email	Outgoing	Vuntut Gwitchin First Nation	Greg Charlie (Chance)	Cindy Dickson (Chance), Richard Wyman (Chance)	Kris Statnyk (Vuntut Gwitchin First Nation), Rosa Brown (Vuntut Gwitchin First Nation) (Vuntut Gwitchin First Nation), Chief Dana Tizya-Tramm (Vuntut Gwitchin First Nation) Darius Elias (Vuntut Gwitchin First Nation), Megan Williams (Vuntut Gwitchin First Nation), Shena Shaw (Hemmera)	Engagement	Greg (Chance) said they were available on meeting dates suggested by Hemmera.	N/A	N/A
Vuntut Gwitchin First Nation0079	21-Nov-18	Email	Outgoing	Vuntut Gwitchin First Nation	Richard Wyman (Chance)	Cindy Dickson (Chance), Richard Wyman (Chance)	Shena Shaw (Hemmera), Kris Statnyk (Vuntut Gwitchin First Nation), Rosa Brown (Vuntut Gwitchin First Nation) (Vuntut Gwitchin First Nation), Chief Dana Tizya-Tramm (Vuntut Gwitchin First Nation) Darius Elias (Vuntut Gwitchin First Nation), Megan Williams (Vuntut Gwitchin First Nation)	Engagement	Richard (Chance) informed the group that they would be unlikely to meet in person on the suggested dates, but could join by conference call. Richard agreed that there were some foundational conversations needed before the group gets back to crafting the Cooperation Agreement.	N/A	N/A
Vuntut Gwitchin First Nation0080	21-Nov-18	Email	Outgoing	Vuntut Gwitchin First Nation	Emily Mann (Hemmera)	N/A	Kris Statnyk (Vuntut Gwitchin First Nation), Rosa Brown (Vuntut Gwitchin First Nation) (Vuntut Gwitchin First Nation), Chief Dana Tizya-Tramm (Vuntut Gwitchin First Nation) Darius Elias (Vuntut Gwitchin First Nation), Megan Williams (Vuntut Gwitchin First Nation), Shena Shaw (Hemmera)	Engagement	Hemmera sent a small update regarding the previous request for a meeting in December. Of the dates listed, December 17 and 18, 2018, are best for them. Hemmera asked if either of these days work for Vuntut Gwitchin First Nation to meet, and to please let them know.	N/A	N/A
Vuntut Gwitchin First Nation0082	27-Nov-18	Email	Outgoing	Vuntut Gwitchin First Nation	Emily Mann (Hemmera)	Cindy Dickson (Chance), Greg Charlie (Chance), Richard Wyman (Chance)	Chief Dana Tizya-Tramm (Vuntut Gwitchin First Nation) Rosa Brown (Vuntut Gwitchin First Nation) (Vuntut Gwitchin First Nation), Kris Statnyk (Vuntut Gwitchin First Nation), Darius Elias (Vuntut Gwitchin First Nation), Megan Williams (Vuntut Gwitchin First Nation), Shena Shaw (Hemmera), Calista Morrison (Hemmera)	Engagement	Hemmera sent some information about the All-Party Meeting that Chance was planning for February 1, 2019. Hemmera understood that Vuntut Gwitchin First Nation had been briefed about the meeting, but thought they would share what had been shared with the other First Nations. The All-Party Meeting was meant to bring together potentially affected First Nations and Yukon Government to discuss matters related to Chance's upcoming exploration project. Shared the proposed agenda. Hemmera stated that Chance would like to host the meeting in Vancouver on February 1, 2019, the day after AME Roundup Conference. They were hoping that scheduling this meeting immediately after this widely attended conference would allow for maximum participation. Details around capacity funding were discussed. Hemmera noted that they were happy to have further conversations regarding Vuntut Gwitchin First Nation's attendance and meeting logistics. Hemmera stated Vuntut Gwitchin First Nation could give them a call at any time if they have questions using the contact information provided below. Hemmera stated if Vuntut Gwitchin First Nation representatives knew the names of other Vuntut Gwitchin First Nation attendees who would attend to please let them know as well.	N/A	N/A
Vuntut Gwitchin First Nation0083	06-Dec-18	Email	Outgoing	Vuntut Gwitchin First Nation	Emily Mann (Hemmera)	Cindy Dickson (Chance), Greg Charlie (Chance), Richard Wyman (Chance)	Chief Dana Tizya-Tramm (Vuntut Gwitchin First Nation) Darius Elias (Vuntut Gwitchin First Nation), Megan Williams (Vuntut Gwitchin First Nation), Rosa Brown (Vuntut Gwitchin First Nation) (Vuntut Gwitchin First Nation), Kris Statnyk (Vuntut Gwitchin First Nation), Shena Shaw (Hemmera), Calista Morrison (Hemmera)	Engagement	Hemmera sent Vuntut Gwitchin First Nation the draft agenda for the December 12, 2018, meeting between Vuntut Gwitchin First Nation and Chance. If Vuntut Gwitchin First Nation had additions to the agenda, or changes, they were asked to let Hemmera know.	N/A	N/A

Vuntut Gwitchin First Nation0084	06-Dec-18	Email	Outgoing	Vuntut Gwitchin First Nation	Emily Mann (Hemmera)	N/A	Darius Elias (Vuntut Gwitchin First Nation)	Engagement	Emily (Hemmera) tried to call Darius (Vuntut Gwitchin First Nation) about their attendance to the All-Party meeting in response to their voicemail. Emily apologized for the delayed reply as they were out of the office for a few days the week prior. Emily stated they were happy to hear that Darius could attend, and explained that Hemmera had secured the meeting room. Hemmera explained they were starting to confirm the attendance of representatives from each First Nation. Hemmera explained that Yukon Government was also looking into bringing the Minister or Deputy Minister to the event, but would have to confirm closer to the date. Emily explained that if Darius would like to arrive a few days before to attend AME Roundup, that would be fine with them. Emily said that logistically, they were thinking each person who would attend would book their travel and accommodation and submit receipts to Chance for reimbursement. Hemmera stated that Chance would cover their round-trip airfare and 2-nights accommodation, and that any other nights in Vancouver would not be covered. Emily stated to please let them know if they had any other questions, as they were generally in the office (with the exception of tomorrow, Dec. 7, afternoon).	N/A	N/A
Vuntut Gwitchin First Nation0085	11-Dec-18	Email	Incoming	Vuntut Gwitchin First Nation	Kris Statnyk (Vuntut Gwitchin First Nation)	Cindy Dickson (Chance), Greg Charlie (Chance), Richard Wyman (Chance)	Chief Dana Tizya-Tramm (Vuntut Gwitchin First Nation) Rosa Brown (Vuntut Gwitchin First Nation) (Vuntut Gwitchin First Nation), Darius Elias (Vuntut Gwitchin First Nation), Megan Williams (Vuntut Gwitchin First Nation), Calista Morrison (Hemmera), Shena Shaw (Hemmera)	Engagement	Vuntut Gwitchin First Nation sent a presentation on the Vuntut Gwitchin First Nation Oil and Gas Engagement Policy that they will be using in discussions in the December 12, 2018, meeting.	N/A	N/A
Vuntut Gwitchin First Nation0086	11-Dec-18	Email	Outgoing	Vuntut Gwitchin First Nation	Emily Mann (Hemmera)	Cindy Dickson (Chance), Greg Charlie (Chance), Richard Wyman (Chance)	Chief Dana Tizya-Tramm (Vuntut Gwitchin First Nation) Rosa Brown (Vuntut Gwitchin First Nation) (Vuntut Gwitchin First Nation), Darius Elias (Vuntut Gwitchin First Nation), Megan Williams (Vuntut Gwitchin First Nation), Kris Statnyk (Vuntut Gwitchin First Nation)	Engagement	Hemmera sent Vuntut Gwitchin First Nation meeting material in preparation for the December 12, 2018, meeting. Hemmera sent a copy of the Engagement and Communication Plan with the appended Vuntut Gwitchin First Nation Oil and Gas Engagement Policy and Chance's most recent permit map. Hemmera also included a copy of the meeting agenda.	N/A	N/A
Vuntut Gwitchin First Nation0087	11-Dec-18	Email	Outgoing	Vuntut Gwitchin First Nation	Emily Mann (Hemmera)	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance)	Shena Shaw (Hemmera), Calista Morrison (Hemmera), Kris Statnyk (Vuntut Gwitchin First Nation), Chief Dana Tizya-Tramm (Vuntut Gwitchin First Nation) Rosa Brown (Vuntut Gwitchin First Nation) (Vuntut Gwitchin First Nation), Darius Elias (Vuntut Gwitchin First Nation), Megan Williams (Vuntut Gwitchin First Nation)	Engagement	Hemmera thanked Vuntut Gwitchin First Nation for sending a PowerPoint presentation for the December 12, 2018, meeting. Hemmera said they would get this set-up before the meeting starts tomorrow. The presentation was added to the start of the meeting Agenda and discussion on the Policy would come after the presentation.	N/A	N/A
Vuntut Gwitchin First Nation0088	11-Dec-18	Email	Outgoing	Vuntut Gwitchin First Nation	Emily Mann (Hemmera)	N/A	Josie William (Vuntut Gwitchin First Nation) Josie (Vuntut Gwitchin First Nation)	Engagement	Emily (Hemmera) sent a note to Josie William (Vuntut Gwitchin First Nation) (Vuntut Gwitchin First Nation) that they understood they may be joining Chance and Vuntut Gwitchin First Nation meeting tomorrow via teleconference. Emily wanted to pass along the meeting material that was sent to the group earlier today. The attachments included: • A Vuntut Gwitchin First Nation representative's Presentation on the Oil and Gas Engagement Policy • The Meeting Agenda (the Vuntut Gwitchin First Nation representative's presentation would be first, and then the rest of the meeting would proceed after that) • Chance's permit map which had been updated as of October 2018 Emily noted that to view the presentation the next day, the Vuntut Gwitchin First Nation representative would be indicating which slide they were on so Josie William (Vuntut Gwitchin First Nation) could follow along with the presentation on their own computer. The dial-in information was also included below, and Emily indicated they had just sent the meeting invite to Josie William (Vuntut Gwitchin First Nation) as well.	N/A	N/A
Vuntut Gwitchin First Nation0089	12-Dec-18	Meeting	Outgoing	Vuntut Gwitchin First Nation	Richard Wyman (Chance)	N/A	Dana Tizya Tramm, Rosa Brown (Vuntut Gwitchin First Nation) (Vuntut Gwitchin First Nation), Darius Elias (Vuntut Gwitchin First Nation), Kris Statnyk (Vuntut Gwitchin First Nation)	Engagement	The purpose of this meeting was to have an in-depth discussion on the Vuntut Gwitchin First Nation Oil and Gas Engagement Policy (Policy). This meeting sought to increase understanding of the stages of the Policy and the action required by each party to comply with each stage. This included pinpointing which stage of the Policy Chance and Vuntut Gwitchin First Nation are at currently and understanding how the stages of the Policy align with project design and environmental assessment in practice. Meeting objectives included: • Provide a forum in which discussion can be held around the Policy before beginning to move forward again with the Cooperation Agreement and other Policy action items • Increase understanding of the Policy, the reasons behind the Policy, and each stage of the Policy • Increase understanding of how the Policy will be executed in practice	N/A	N/A
Vuntut Gwitchin First Nation0090	13-Dec-18	Email	Outgoing	Vuntut Gwitchin First Nation	Emily Mann (Hemmera)	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance)	Shena Shaw (Hemmera), Calista Morrison (Hemmera), Kris Statnyk (Vuntut Gwitchin First Nation), Megan Williams (Vuntut Gwitchin First Nation)	Engagement	Hemmera contacted a Vuntut Gwitchin First Nation representative explaining that Chance was considering going to Old Crow on January 17, 2019, and they wanted to let Vuntut Gwitchin First Nation know to see if Chance could align their meeting with anything the Natural Resources Committee has planned re: oil and gas activity and to follow protocol established in the Communications and Engagement Plan and the Vuntut Gwitchin First Nation Oil and Gas Engagement Policy. Hemmera noted that Chance's objective with the trip was to meet with the new Chief and Council and the Natural Resources Committee to provide background information on Eagle Plains basin, the past year of engagement, and Chance's plans for 2019. Hemmera asked if this Vuntut Gwitchin First Nation representative was able to help arrange a meeting with the Natural Resources Committee or provide a contact.	N/A	N/A

Vuntut Gwitchin First Nation0091	14-Dec-18	Email	Incoming	Vuntut Gwitchin First Nation	Megan Josie William (Vuntut Gwitchin First Nation)s	N/A	Emily Mann (Hemmera)	Engagement	A Vuntut Gwitchin First Nation representative responsible for connecting Chance to the Natural Resources Committee through the Communications and Engagement Plan told Hemmera to arrange the proposed January 17, 2019, meeting in Old Crow with another Vuntut Gwitchin First Nation representative.	N/A	N/A
Vuntut Gwitchin First Nation0092	14-Dec-18	Email	Outgoing	Vuntut Gwitchin First Nation	Greg Charlie (Chance)	Richard Wyman (Chance), Cindy Dickson (Chance)	Rosa Brown (Vuntut Gwitchin First Nation) (Vuntut Gwitchin First Nation), Megan Williams (Vuntut Gwitchin First Nation), Kris Statnyk (Vuntut Gwitchin First Nation), Chief Dana Tizya-Tramm (Vuntut Gwitchin First Nation) Shena Shaw (Hemmera), Calista Morrison (Hemmera)	Engagement	Greg (Chance) representative added to an email to a Vuntut Gwitchin First Nation representative that the Chief-elect said it is important that Chance and Vuntut Gwitchin First Nation meeting in Old Crow. This meeting will be an introduction going forward.	N/A	N/A
Vuntut Gwitchin First Nation0093	14-Dec-18	Email	Outgoing	Vuntut Gwitchin First Nation	Emily Mann (Hemmera)	Richard Wyman (Chance), Greg Charlie (Chance)	Megan Williams (Vuntut Gwitchin First Nation), Kris Statnyk (Vuntut Gwitchin First Nation), Chief Dana Tizya-Tramm (Vuntut Gwitchin First Nation) Shena Shaw (Hemmera), Calista Morrison (Hemmera)	Engagement	Hemmera sent an email after a Vuntut Gwitchin First Nation representative recommended that they got touch to arrange the January 17, 2019, meeting in Old Crow. Hemmera stated that some of Chance's objectives for the trip were to meet with the new Chief and Council and the Natural Resources Committee (Committee) to provide background information on the Eagle Plains basin, the past year of engagement, and Chance's plans for 2019. Hemmera explained that they would need to coordinate with the Committee to pick a time to meet and provide some background material for that conversation. Hemmera asked if they would be able to help coordinate with the Committee or provide a contact for them. Hemmera explained they realized that people's vacations might prohibit some of the planning in the next few weeks, but they were hoping to tentatively set a date before the holidays.	N/A	N/A
Vuntut Gwitchin First Nation0094	19-Dec-18	Email	Outgoing	Vuntut Gwitchin First Nation	Emily Mann (Hemmera)	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance)	Megan Williams (Vuntut Gwitchin First Nation), Kris Statnyk (Vuntut Gwitchin First Nation), Chief Dana Tizya-Tramm (Vuntut Gwitchin First Nation) Shena Shaw (Hemmera), Calista Morrison (Hemmera), Rosa Brown (Vuntut Gwitchin First Nation) (Vuntut Gwitchin First Nation)	Engagement	Chance thanks the Vuntut Gwitchin First Nation representative for being a liaison with the Natural Resource Committee and for communicating that the committee has not yet been formally formed. As soon as you can confirm the availability of the Committee members, even tentatively, it would be great to know. Chance understands that because of varying holiday schedules, it can be hard to schedule stuff at this time of year. Looking forward to hearing an update about the January 17, 2019, meeting when you can provide one.	N/A	N/A

Hemmera noted that they were still finalizing dates and logistics. Hemmera also noted that role profiles were in the attachment, and that they were aiming to have dates finalized by the following week. Hemmera asked that Vuntut Gwitchin First Nation give thought to potential participants in the fieldwork.	N/A	E00250_Vuntut Gwitchin First Nation Participation in Chance Fieldwork
E00262	17-Jun-19	Email	Outgoing	Vuntut Gwitchin First Nation	Hemmera	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance), Todd Mahon	Rosa Brown (Vuntut Gwitchin First Nation) (Vuntut Gwitchin First Nation)	Site Visit/Field Work Engagement/Consultation	Hemmera shared that Chance had set dates for participation in Field Surveys. Chance was proposing following logistics for First Nation participation: 1) Each First Nation with territory overlapping Project area could have up to two members participate 2) Important to note that the work would be physically demanding, requiring the ability to hike steep, rugged terrain and thick bush, and requiring average or above-average fitness to participate 3) There were limited spots for participants due to helicopter constraints and availability at Eagle Plains Hotel, and because of this it was important to respond as soon as possible to Emily or Calista (Hemmera) to confirm availability 4) Participants should arrive on start date, but not mandatory to stay for duration of field study 5) all travel, including flights, vehicle travel to Eagle Plains Hotel, ad stay in Hotel must be booked by the First Nation and billed to Chance. A Table of Opportunities by date was included in the correspondence. Hemmera noted that the purpose of participation would be to observe fieldwork and gain first hand understanding of the research. Hemmera noted that the deadline for Vegetation Survey # 1 was June 19.	N/A	E00262_Chance Field Surveys-Vuntut Gwitchin First Nation Chance FN Participant Information

N/A	E00392_Chance Field Surveys_3
E00394	09-Jul-19	Email	Incoming	Vuntut Gwitchin First Nation	Cheryl Charlie (Vuntut Gwitchin First Nation)	N/A	Cheryl Charlie (Vuntut Gwitchin First Nation), Rosa Brown (Vuntut Gwitchin First Nation), Tammy Josie	Site Visit/Field Work	Cheryl (Vuntut Gwitchin First Nation) indicated that Tyrel and Teryn Cassi of Old Crow were interested in this type of field work. Cheryl asked Tammy (Vuntut Gwitchin First Nation) to please provide their contact information to Emily (Hemmera).	N/A	E00394_RE_ Chance Field Surveys_2

E00391	10-Jul-19	Email	Incoming	Vuntut Gwitchin First Nation	Megan Josie William (Vuntut Gwitchin First Nation)s	N/A	Megan Williams (Vuntut Gwitchin First Nation)	Site Visit/Field Work Jobs/Contracts	Megan asked Hemmera questions about Chance Field Surveys. Megan indicated that Tyrel Cassi may be available and a good choice. Megan asked if they could hire 3 people for 5 days since the dates were the same for vegetation/seismic/fish and fish surveys, and also noticed that 2 of those people may also be able to work August 1-6. Megan asked if Chance was covering wages as well as travel, and also asked if there would be someone available to pick up the research assistant when they arrive/depart Dawson. Megan also asked if there were any other First Nations participants already signed up.	N/A	E00391_RE_ Chance Field Surveys_4
E00395	10-Jul-19	Email	Outgoing	Vuntut Gwitchin First Nation	Hemmera	N/A	Megan Williams (Vuntut Gwitchin First Nation)	Site Visit/Field Work Jobs/Contracts	Hemmera responded to Megan's (Vuntut Gwitchin First Nation) questions about field surveys. Hemmera said they would call Ty Cassi to ask about availability, and asked Megan to let them know if anyone else may be interested to attend as soon as possible. Answers to questions were included as follows: Yes, they could also hire 5 individuals for the 5 different time segments. Yes, Hemmera would talk to Chance about the daily rate. Picking up at Dawson would be logistically challenging as there was not room in the researcher's vehicles. Participants would have to rent a vehicle in Inuvik or Dawson and drive themselves to Eagle Plains. Spots were offered to Gwich'in Tribal Council and NND as well and they were taking people on field surveys on a first come first serve basis. Hemmera followed up with First Nations this week and did not hear back. For participants to be covered by Yukon Workers' Compensation Board, they would have to be contracted by Vuntut Gwitchin First Nation or by another other First Nation. Therefore, Hemmera stated that they needed lead up time to figure out contracts and payments.	N/A	N/A
E00436	10-Jul-19	Letter	Incoming	Vuntut Gwitchin First Nation	Cheryl Charlie	Greg Charlie (Chance)	Cheryl Charlie	Engagement/Consultation Meeting Coordination/Planning	Cheryl sent an email on behalf of Vuntut Gwitchin First Nation Natural Resources Committee, which included a letter in response to the following notices submitted by chance in accordance with the Vuntut Gwitchin First Nation Oil and Gas Engagement Policy: 1. Notice of Chance's application to extend the term of oil and gas permits 0006-0011 and 0019 submitted March 15, 2019 pursuant to section 23 of the Policy; 2. Notice of Chance's proposed oil and gas activities in Eagle Plains basin submitted on June 6, 2019 pursuant to section 24 of the Policy. The Committee has reviewed both notices including Chance's confidential financial statements. The Committee had questions regarding the financial circumstances of the company and potential risks. The Committee determined by consensus that they were not in a position to recommend Vuntut Gwitchin First Nation proceed to any further stage of engagement with Chance unless the potential risks they were concerned about could be addressed. The Committee requested a meeting with Chance to discuss these matters further and proposed a meeting in Old Crow in August 2019 for this purpose.	N/A	E00435_Meeting acceptance letter to Cheryl Charlie dated July 15 2019.pdf
E00396	11-Jul-19	Email	Incoming	Vuntut Gwitchin First Nation	Megan Josie William (Vuntut Gwitchin First Nation)s	N/A	Megan Williams (Vuntut Gwitchin First Nation)	Site Visit/Field Work	Megan confirmed that the wage for field assistants is $250 per day. They also stated they would only be able to hire someone with a driver's license, and said they weren't sure if Ty had one. They would also have to get the driver's abstract in order to add the person to their insurance so they can use the Natural Resources truck in Dawson. Megan said they would keep in touch, and to please confirm the wage with Chance.	N/A	E00396_RE_Chance Field Surveys_1
E00341	12-Jul-19	Email	Outgoing	Vuntut Gwitchin First Nation	Richard Wyman (Chance)	Richard Wyman (Chance), Todd Mahon, Lynn O'Neil, Greg Charlie (Chance), Cindy Dickson (Chance), Hemmera	Megan Williams (Vuntut Gwitchin First Nation), Ty Kassi	Site Visit/Field Work	Richard (Chance) spoke with Ty and confirmed their interest in participating in several environmental studies planned at Eagle Plains. The dates were a bit different than originally quoted, but they seemed to work ok for Ty. There were three studies happening between July 24 and August 8: fish and aquatics, seismic lines and broad area vegetation and habitat assessments. Richard stated that Ty would be welcome to join in for all of these studies. Richard noted that if Ty had chest waders, they should bring those, and if not to please advise so that they could make arrangements to get some. Richard said they would arrange for Ty to travel to Whitehorse on July 23, so they could join the EDI crew that is mobilizing to Eagle Plains on July 24. Ty would return with the crew on August 3, so he could get to Old Crow to participate in the GA activities starting August 8.	N/A	E00341_Ty Kassi
E00323	15-Jul-19	Email	Outgoing	Vuntut Gwitchin First Nation	Richard Wyman (Chance)	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance), Mike Chernoff	Cheryl Charlie, Rosa Brown (Vuntut Gwitchin First Nation) (Vuntut Gwitchin First Nation), Chief Dana Tizya-Tramm (Vuntut Gwitchin First Nation) Brandon Kyikavichik, Megan Williams (Vuntut Gwitchin First Nation), Sandra Charlie, Brandy Charlie	Engagement/Consultation	Richard (Chance) thanked the Vuntut Gwitchin First Nation Natural Resources Committee for their letter dated July 10. Richard stated to please file Chance's response accepting their invitation to meet and suggested it would be convenient to meet in Old Crow while there for the GA. Richard asked if Vuntut Gwitchin First Nation could arrange to get copies of this letter to the members of the Natural Resources Committee (Roger) since Richard did not have addresses for very many of them. E00325	15-Jul-19	Email	Outgoing	Vuntut Gwitchin First Nation	Hemmera	Richard Wyman (Chance), Cindy Dickson (Chance), Greg Charlie (Chance)	Megan Williams (Vuntut Gwitchin First Nation), Rosa Brown (Vuntut Gwitchin First Nation) (Vuntut Gwitchin First Nation)	Engagement Reports/OIC Requirements	Hemmera sent draft reports on the Implementation of the Communications and Engagement Plan for both Vuntut Gwitchin First Nation and Chance to review. This report summarized the meetings the parties had since completing the plan. Hemmera asked recipients to please make any desired revisions to the document in tracked changes and send back once finalized. Once Hemmera has incorporated the changes, they indicated they would send final versions to both parties to sign. Hemmera asked parties to please have revisions in by July 26, after which Hemmera would finalize, get them signed and submit to Yukon Government for July 31.	N/A	E00325_Re_ Draft Plan Implementation Report to Review

E00435	15-Jul-19	Letter	Outgoing	Vuntut Gwitchin First Nation	Richard Wyman (Chance)	Richard Wyman (Chance)	Cheryl Charlie, Vuntut Gwitchin First Nation Natural Resources Committee	Engagement/Consultation	Richard (Chance) provided a response to July 10 letter from the Vuntut Gwitchin First Nation Natural Resources Committee. Chance would be pleased to meet with the Natural Resources Committee in August to discuss financial circumstances raised in letter and other matters related to ongoing engagement. Chance representatives including Greg (Chance), Cindy (Chance) and Richard (themself) would be in Old Crow during GA from August 8-10. Emily Mann (Hemmera) and Calista Morrison (Hemmera) of Hemmera would also be in Old Crow the entire week doing some engagement work with the community as part of the pre-submission consultation required by Yukon Environmental Socio-economic Assessment Board. In order for Chance and Hemmera to try to meet with Committee, Richard asked to please let them know what they were are able to arrange. A few points to consider 1. Chance has a 25 year corporate history in Yukon; 2. Chance has very supportive stakeholder base to finance Company's business plan; 3. Chance has successfully raised almost $150 million to undertake a variety of exploration Projects during past 25 years; 4. Fund the Company on "needs only basis" given unknown time frame and manage uncertainties inherent with oil and gas exploration; 5. The Eagle Plains area is under explored and understanding of oil and natural gas resources potential is relatively immature, but improving; 6. The knowledge gains Chance has made in the past 25 years, there is still uncertainty of outcomes from exploration activities, so there is not yet a basis for ay sustainable development in area; 7. Successful exploration work will attract future investment, but timeframe unpredictable; 8. Yukon Government policies and Yukon Environmental Socio-economic Assessment Board processes have shown to be unpredictable and variable. It is most convenient for Chance to meet with the Committee while in Old Crow for the GA, to the extent that this meeting relates to Chance's outstanding application to Yukon Government seeking extension in tenure to exploration permits 0006-0011 and 0019, prior to August 30 deadline for the permits to be continued or expire. Application will be for maximum allowable under the Oil and Gas Act of 5 years. This permit has one suspended well at McPartlon A-25 which we hope to use for fluid disposal of any produced water associated with the proposed exploration Project. We are at an intermediate stage of discussions with the Manager of Oil and Gas Operations with Yukon to extend the suspended well status on the suspended wells at Eagle Plain. Manager has indicated hat Chance will need to do some physical assessments of the legacy wells to confirm the integrity of the wells before granting an extension. Assessments will require access to 3 suspended wells at SDL M-08, G-08, and J-19 and well as M-59 in order to do the work. A service rig, cement pumping equipment, and wireline services are expected to be used to conduct the assessments. Anticipate taking temperature measurements in wells to evaluate permafrost depth. The program is expended to take 1-2 months. This is a winter operation and will be done during the winter of 2020-2021 and may require Designated Office screening by Yukon Environmental Socio-economic Assessment Board. We will provide more information as soon as we can.	N/A	E00600_FW_ Suspended wells and Exploration Permit 20_1

E00633	13-Feb-20	Email	Outgoing	Vuntut Gwitchin First Nation	Richard Wyman (Chance)	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance), Robert Froehlich, Katrijn Thys	Erika Tizya-Tramm (Vuntut Gwitchin First Nation), Cheryl Charlie, Brandon Kyikavichik, Katherine Peter, Sandra Charlie, Rosa Brown (Vuntut Gwitchin First Nation) (Vuntut Gwitchin First Nation), Kris Statnyk (Vuntut Gwitchin First Nation), Chief Dana Tizya-Tramm (Vuntut Gwitchin First Nation) Darius Elias (Vuntut Gwitchin First Nation), Marvin Frost	Project Description/Activities Cooperation Agreement	Explained Chance's need to submit to the Yukon Environmental Socio-economic Assessment Board the multi-well exploration drilling and seismic data acquisition Project ("Activities") in June, 2020, whether or not a Benefits and Stewardship Agreement ("BSA") is in place despite provisions in the Vuntut Gwitchin First Nation Oil and Gas Engagement Policy ("Policy").The intention here is driven by external factors that affect our future. We fully intend to negotiate a BSA prior to undertaking the Activities in parallel to the Yukon Environmental Socio-economic Assessment Board prices. I have obtained Board Approval for the first phase of Capacity Funding as described in recent discussions of the Cooperation Agreement. The 2 fundamental reasons for Chance to move forward on a June submission: 1. The land tenure clock is ticking down 2. The Yukon Environmental Socio-economic Assessment Board process will involve external bodies which could significantly influence the character of the proposed Activities and the various management plans in ways that my render any prior BSA obsolete or unworkable. Discusses Permits and Significant Discovery Licenses, their numbers, expirations, and applications for tenure extensions. Remaining tenure is very short to be able to get through ExComm, coincidently negotiate and execute a BSA, complete any training, negotiate contracts for services, obtain necessary permissions, plan and ultimately start to execute the proposed Activities. We cannot rely on past success related to tenure extensions going forward. Submitting to ExComm a comprehensive Project Description will be an important step to change that mindset and we are hopeful that the Vuntut Gwitchin First Nation will collaborate in a constructive way in the development of this submission. ExComm has significant consultation requirements of proponents and First Nations in the development of these submissions. I would like to request a Meeting with the Natural Resources Committee and arrange a public Meeting to update the community with progress being made on either March 5 or March 10 in Old Crow. We can continue the Cooperation Agreement discussions as needed, or if we can resolve the outstanding issues before then, have a signing ceremony of the Cooperation Agreement. N/A	E00636_FW_ Letter to COGL re Intention to Submit Proposal Letter to R.Wyman re COGL Intention to Submit Proposal signed
E00637	27-Feb-20	Letter	Incoming	Vuntut Gwitchin First Nation	Erika Tizya-Tramm (Vuntut Gwitchin First Nation)	Richard Wyman (Chance), Mike Chernoff	Erika Tizya-Tramm (Vuntut Gwitchin First Nation)	Engagement/Consultation	Letter in response to discussions with Chance on February 10, 2020 and subsequent correspondence received from Chance regarding the intention to submit a Proposal in June 2020. The Committee considered Chance's request for a waiver of the requirement under the Vuntut Gwitchin First Nation's Oil and Gas Engagement Policy for the negotiation and ratification of a Benefits and Stewardship Agreement with the Vuntut Gwitchin First Nation prior to submission of the Proposal to Yukon Environmental Socio-economic Assessment Board. Based on feedback and input received by the Committee, Chance's request for a waiver cannot be granted. The engagement process set out under the Policy must be respected and adhered to by Chance. Chance has been aware of the Policy since its development in fall 2017, and that the Policy would be the framework for engagement with Vuntut Gwitchin First Nation. In May 2018, following approval of Policy, Chance agreed in the Communication and Engagement Plan that it would comply with the Policy in relation to any oil and gas activities within the Vuntut Gwitchin First Nation Traditional Territory. On numerous occasions Vuntut Gwitchin First Nation met with Chance to discuss in good faith the Policy, including the staged requirements for a Cooperation Agreement and a Benefits and Stewardship Agreement. After two years of good faith engagement with Chance, the notice that it is prepared to submit the Proposal to Yukon Environmental Socio-economic Assessment Board in less than three months and in non-compliance with the Policy is deeply disappointing to the Committee. It is contrary to the guiding purposes of the Policy which we are mandated to fulfill. We acknowledge receipt of the Cooperation Agreement delivered by Chance on February 22, 2020, however, in absence of terms that ensure compliance with the Policy in relation to the Proposal, the Committee cannot recommend it to Council for approval under section 27 of the Policy. In the event that Chance chooses to proceed with its intention to submit the Proposal in non-compliance with the Policy, Vuntut Gwitchin First Nation will not be in a position to support the Proposal. To advance the Proposal contrary to the Policy undermines the fundamental objective of sustainable development enshrined under the Final Agreement and North Yukon Regional Land Use Plan. A lack of support for the Proposal will arise in the event of non-compliance with the Policy, the Committee will continue to fulfill its mandate to inform and seek the views of Citizens in relation to the Proposal. Nothing in the Policy prevents Chance from carrying out consultation activities with Citizens in relation to the Proposal; however, it is expected Chance will adhere to the notice requirement under section 21 of the Policy.The Committee has considered Chance's notice to meet in Old Crow on March 5, 2020, to consult with Citizens.The Elders Council recommended that Chance schedule its consultation after the community meeting with the Yukon Environmental Socio-economic Assessment Board Executive Committee on March 24, 2020 in Old Crow. The Committee supports this recommendation. Asked that further communication be directed to Erika.	N/A	E00636_FW_ Letter to COGL re Intention to Submit Proposal
E00638	10-Mar-20	Email	Outgoing	Vuntut Gwitchin First Nation	Richard Wyman (Chance)	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance), Rick Nielson	Erika Tizya-Tramm (Vuntut Gwitchin First Nation), Cheryl Charlie, Brandon Kyikavichik, Katherine Peter, Sandra Charlie, Rosa Brown (Vuntut Gwitchin First Nation) (Vuntut Gwitchin First Nation)	Information Sharing	Please find attached our response to your letter of February 27, which includes a request for a Meeting or a series of Meetings as needed to continue the dialogue regarding the Cooperation Agreement and other topics of importance. A community presentation is also requested. The request for a Meeting complies with your request to defer getting together until after you have met with Yukon Environmental Socio-economic Assessment Board Executive Committee on March 24.	N/A	E00638_Meeting request March 10 Letter to Vuntut Gwitchin First Nation NRC

E00639	10-Mar-20	Letter	Outgoing	Vuntut Gwitchin First Nation	Richard Wyman (Chance)	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance), Rick Nielsen (Chance)	Erika Tizya-Tramm (Vuntut Gwitchin First Nation), Cheryl Charlie, Brandon Kyikavichik, Katherine Peter, Sandra Charlie, Rosa Brown (Vuntut Gwitchin First Nation) (Vuntut Gwitchin First Nation)	Meeting Coordination/Planning Engagement Reports/OIC Requirements Cooperation Agreement	I am responding to your correspondence dated February 27, 2020. Chance is disappointed that the Natural Resources Committee was not able to provide the waiver requested by Chance to accommodate a parallel process of the undertaking the Yukon Environmental Socio-economic Assessment Board process and negotiating the Benefits and Stewardship Agreement in place of the sequence processes described in the Oil and Gas Engagement policy. Chance is interested in continuing discussions related to the Cooperation Agreement and wishes to meet the Natural Resources Committee, possibly the Chief and Council and the community at large. Chance requests a Meeting or series of Meetings between April 1 and April 8 in Old Crow. Meeting topic suggestions: 1. Continuation of Cooperation Agreement negotiations 2. Tenure management and application to extend the tenure of Exploration Permit 0020 beyond August 30, 2020 expiry 3. Upcoming Yukon Environmental Socio-economic Assessment Board Designated Office application for well maintenance work 4. Discussions related to information gathering processes needed to support a submission to Yukon Environmental Socio-economic Assessment Board Executive Committee 5. Other consultation related to anticipated Yukon Environmental Socio-economic Assessment Board Exec. Committee assessment of proposed exploration drilling and seismic data gathering Project 6. Initiating discussions related to the Benefits and Stewardship Agreement connected to the Project including discussions about timeline needed to reach agreement. Chance interested in hosting a community dinner to provide an update about the Project while in Old Crow for Meetings with Natural Resources Committee. Depending on topic, Chance would like representatives of Hemmera to attend some of the discussions given its expertise in Yukon Environmental Socio-economic Assessment Board submissions for both Executive Committee and the Designated Office in Dawson. Chance is interested in working in a constructive, cooperative and collaborative way with the Natural Resources Committee, the Chief and Council and the Citizens of Vuntut Gwitchin First Nation. E00650	16-Apr-20	Email	Outgoing	Vuntut Gwitchin First Nation	Greg Charlie (Chance)	Greg Charlie (Chance)	Erika Tizya-Tramm (Vuntut Gwitchin First Nation)	Meeting Coordination/Planning	I hope all is well with family and home in Old Crow! I want to follow up from our last correspondence to see if we can continue our conversation on the Cooperation Agreement. Please let me know if I can help organize a conference call or virtual Meeting over the internet, like Microsoft Team Meeting program or Zoom? However I heard Zoom is not that secure.	N/A	E00650_FW_Follow up_1
E00651	16-Apr-20	Email	Incoming	Vuntut Gwitchin First Nation	Erika Tizya-Tramm	Greg Charlie (Chance)	Erika Tizya-Tramm (Vuntut Gwitchin First Nation)	Meeting Coordination/Planning	Thank you for Chance's letter. I have had time to review the letter and I am glad to see a shift back to due process under Vuntut Gwitchin First Nation's Oil and Gas Engagement Policy, albeit now under these new and unprecedented times. NR is in discussions and given Vuntut Gwitchin First Nation Council's implementation of EmergeNorthern Cross Yukon Response Measures for COVID-19 and these unprecedented times, my superiors are requiring Council engagement on this matter, hopefully early next week. After then Vuntut Gwitchin First Nation will be better able to respond about next steps.	N/A	E00650_FW_Follow up_1

E00654	20-Apr-20	Letter	Outgoing	Vuntut Gwitchin First Nation	Richard Wyman (Chance)	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance)	Erika Tizya-Tramm (Vuntut Gwitchin First Nation), Brandon Kyikavichik, Roger Kyikavichik, Rosa Brown (Vuntut Gwitchin First Nation) (Vuntut Gwitchin First Nation), Katherine Peter, Cheryl Charlie, Sandra Charlie	Project Description/Activities Engagement/Consultation	As previewed in my letter of April 9, 2020, this letter confirms what had already been mentioned in emails, correspondence and conversations of the past several months regarding tenure extension of Exploration Permit 0020 ("Permit"). On March 12, 2020, Chance ("Chance") applied to the Yukon Government to extend tenure of the Permit that will otherwise expire on August 30, 2020, unless extended. Chance requested the maximum permissible tenure extension of five years to allow sufficient time to continue engagement with affected First Nation Governments and communities, undergo Yukon Environmental and Socio-Economic Assessment Board Executive Committee impact assessment of proposed exploration activities as described in the Project description ("Project Description") delivered to the Vuntut Gwitchin First Nation ("Vuntut Gwitchin First Nation") on June 5, 2019, and ultimately to undertake exploration activities. In the interest of transpareNorthern Cross Yukon, this letter highlights the importance of this Permit to Chance and the reasons for the tenure extension request. The application sets tin motion a consultation process between the Vuntut Gwitchin First Nation, other affected First Nation Governments, and the Yukon Government in accordance with the *Yukon Oil and Gas Act* and associated disposition regulations. This letter is simply a courtesy to both alert you to the pending consultation and also share with you the rationale for the tenure extension request. It is important to Chance that this Permit be continued for several reasons. First of all, there is a suspended well, McParlon A-25, that has significant value either as a potential producing well, a potential disposal well for water and other by products that may be produced in association with oil or natural gas, or as an observation well to periodically monitor permafrost changes. Secondly, part of a significant shale oil discovery made in 2012 is located throughout this Permit. Under the moratorium preventing hydraulic fracturing, this resource is stranded, and forms part of the claim made by Chance against Yukon for compensation for the damages caused by the moratorium. Thirdly, the Permit has significant conventional oil and natural gas resource potential (i.e. hydraulic fracturing is NOT required to produce any discovered resources) that could be evaluated as part of the program described in the Project Description. Fourthly, Chance has good 3D seismic data covering most of the permit to support future exploration work to define prospects to drill. In closing, Chance would like the support of the Vuntut Gwitchin First Nation so Chance can get the requested tenure extension and continue exploring. If you have any questions or comments about this letter, please feel free to contact any of Greg (Chance), Cindy (Chance) or me. Please forward this letter and the attachments to Roger Kyikavichik for review.	N/A	E00654_April 20 Letter concerning EP 0020

Enclosed with this letter is a copy of the Audited Financial Statements of Chance for the year ended December 31, 2019. This information is marked "Confidential". Also enclosed with this letter is a cheque in the amount of $1000.00 as payment for the administration fee. We look forward to collaborating with you on this Yukon Government mandated Project as soon as possible. In order to be able to ensure that the necessary oil field services are contracted to be able to do the work during the winter of 2020-2021, a submission to the Yukon Environmental Socio-economic Assessment Board Designated Office in Dawson will need to be submitted in the first part of June. A benefits agreement will be needed since the Project is likely going to exceed $1 million in expenditures. Please contact Greg (Chance) to set up a virtual Meeting to address any questions or comments you may have regarding the Project. I hope you and your family are well and looking forward to summer in Old Crow.	N/A	E00662_FW_Well Maintenance Project follow up Email with Letter attached
E00668	01-Jun-20	Email	Outgoing	Vuntut Gwitchin First Nation	Greg Charlie (Chance)	Greg Charlie (Chance)	Erika Tizya-Tramm (Vuntut Gwitchin First Nation)	Engagement/Consultation DO Project Meeting Coordination/Planning	I left you voice message this morning and trying to follow up with you from last week. Sorry it didn't work out to meet in person and was hoping to meet in person. I hope we can continue on with our work and because we have sensitive timeframe, we need to understand what is our schedule. I spoke to Dana and Darius at Council office separately about moving forward with negotiation and engagement and they both informed me that they gave you direction already and it was to proceed. I didn't see Cheryl in the office during my time up there so I couldn't follow up with her. We would like to know where we are going with NR and Natural Resources Committee with this file. Thanks and please give me a call soon.	N/A	E00668_ FW_Stage 1 Project Description - NRC (14)
E00698	09-Jun-20	Email	Incoming	Vuntut Gwitchin First Nation	Erika Tizya-Tramm	Greg Charlie (Chance)	Erika Tizya-Tramm (Vuntut Gwitchin First Nation)	DO Project Meeting Coordination/Planning	Due to new Vuntut Gwitchin First Nation COVID policies at Vuntut Gwitchin First Nation and the community's day care closure, I have had to work from home full-time and manage my time as such, so I apologize I could not meet with you directly as was planned. Being the direct contact on this file, I was not aware you had Meetings planned with Vuntut Gwitchin First Nation Council during your recent visit to Old Crow. It sounds like those Meetings reaffirmed my email to you May 26 notifying you of the direction from Council to recommence negotiations of a cooperation agreement. The NR committee is scheduled to discuss this direction at their next Meeting. Since officially notifying the Natural Resources Committee of Chance's multi-year, multi-well Project under Vuntut Gwitchin First Nation's Engagement Policy in July 2019, which was subsequently deemed adequate in August 2019, the Natural Resources Committee has worked with Chance regarding their various issues with the process. Vuntut Gwitchin First Nation and the NR committee have a demonstrated commitment to our work on this file and will continue to do so under the current COVID circumstances, Vuntut Gwitchin First Nation's Policy, and Yukon Environmental Socio-economic Assessment Board. We look forward to the recommencement and timely conclusion of a cooperation agreement. We will have our revisions to Chance's version as soon as practicable after our committee meets this week. E00800	08-Jul-20	Email	Incoming	Vuntut Gwitchin First Nation	Erika Tizya-Tramm	Greg Charlie (Chance)	Erika Tizya-Tramm (Vuntut Gwitchin First Nation)	DO Project Engagement/Consultation Meeting Coordination/Planning	In regards to your proposed Chance community Meeting date in your email below, unfortunately all of the Vuntut Gwitchin First Nation reps on this file are unavailable the week of July 13. We did discuss the next best dates and we'd like to propose the week of July 20. July 20 and July 24 would be travel days, which leaves the other days free for our full participation at your community Meeting. If agreeable, we can raise this with the Natural Resources Committee at our Meeting next week. I would also recommend Chance provide the NR committee with an agenda, a description of how this Meeting will be conducted given COVID restrictions, and any other information that needs to be shared in preparation for this event. We would be happy to share any feedback to make your Meeting successful. I suggested to Greg that our Heritage centre, the John Tizya Centre, would be a better venue as it is right by the river, it has a great indoor and outdoor space, and it is very central in our community. We are looking forward to some deep and meaningful engagement on your Project.	N/A	E00800_Re_ DO Workover Letter - Vuntut Gwitchin First Nation NR (18)
E00801	08-Jul-20	Email	Outgoing	Vuntut Gwitchin First Nation	Hemmera	Greg Charlie (Chance)	Erika Tizya-Tramm (Vuntut Gwitchin First Nation)	DO Project Engagement/Consultation Meeting Coordination/Planning	Thanks very much for the feedback Erika. That is helpful. I will loop back with Chance to see if they are available those dates. Do you happen to know if the John Tizya Centre is available to book those dates? The other materials will be along shortly, including a draft agenda, outline of the Meeting materials and a COVID Health and safety plan. In anticipation of developing the COVID plan any ideas you have for the communities expectations from us with respect to items such as mask wearing, etc. would be helpful. We have a draft template that we have started developing but it is for work we are doing in more urban centres in other parts of the country and it would be good to get a sense of what would be considered appropriate from Vuntut Gwitchin First Nation perspective.	N/A	E00801_RE_ DO Workover Letter - Vuntut Gwitchin First Nation NR (17)
E00802	08-Jul-20	Email	Incoming	Vuntut Gwitchin First Nation	Erika Tizya-Tramm	Greg Charlie (Chance)	Erika Tizya-Tramm (Vuntut Gwitchin First Nation)	DO Project Engagement/Consultation Meeting Coordination/Planning	I will call Megan who oversees John Tizya Centre about its availability for that week. The main practices exercised in the community at this point have been to keep to outdoor gatherings as much as possible, social distancing, and any food should be handled with gloves, pre-plated and handed out individually. Vuntut Gwitchin First Nation has a mic and speaker system they can set up if need be, but would need a heads up for our tech people to set up. Any other equipment needed such as Projector, screens, etc would also need advanced notice	N/A	E0802_Re_ DO Workover Letter - Vuntut Gwitchin First Nation NR (16)
E00803	08-Jul-20	Email	Outgoing	Vuntut Gwitchin First Nation	Hemmera	Greg Charlie (Chance)	Erika Tizya-Tramm (Vuntut Gwitchin First Nation)	DO Project	Okay that all sounds great. And thanks for checking on the Centre's availability.	N/A	E00799_RE_ DO Workover Letter - Vuntut Gwitchin First Nation NR (15)

E00810	08-Jul-20	Email	Incoming	Vuntut Gwitchin First Nation	Erika Tizya-Tramm	Greg Charlie (Chance)	Erika Tizya-Tramm (Vuntut Gwitchin First Nation), Rosa Brown (Vuntut Gwitchin First Nation) (Vuntut Gwitchin First Nation), Justin Page, Tania Salerno	Engagement/Consultation Meeting Coordination/Planning DO Project	Meeting Invitation Vuntut Gwitchin First Nation has requested this Meeting to get clarity on a few outstanding questions regarding Chance's well maintenance program. I realize the short notice, but it would be really helpful to our group if we had a brief power point presentation to follow along with Chance's walk through of their program and well-by-well plans. Below are some questions to assist Chance in preparing this material: Is the well being prepared to maintain suspended status or abandonment? If it is being prepared for suspended status, what is the new timeframe before the well will be brought into production or abandoned? If abandoned, are the plans for downhole abandonment or surface abandonment? If plans are for downhole abandonment, could the well be brought into production at a later date? Describe the different activities pertaining to maintaining suspended status, downhole abandonment, and surface abandonment. What is the deadline for the 4 newer wells to be brought into production or abandoned (the deadline for the four older wells is Dec 31 2020)? Are any of the wells being prepared for deep well injection? We are also seeking additional information about Blackie Road and if any new construction is planned or the re-establishing of previously used winter roads. Based on this, our agenda looks like: 1.Introductions 2.Walk though of Chance well maintenance program 3.Plans for each well (with map) 4.Plans for Blackie Road 5.Next steps	N/A	E00810_RE_ Vuntut Gwitchin First Nation questions re COGL well maintenance program (10)
E00812	08-Jul-20	Email	Outgoing	Vuntut Gwitchin First Nation	Hemmera	N/A	Erika Tizya-Tramm (Vuntut Gwitchin First Nation)	Engagement/Consultation DO Project Meeting Coordination/Planning	I just wanted to let you know that I will be forwarding the invite to Calista and Nathan at Hemmera, and a fellow by the name of Clive who is the well engineer from Vertex designing the program. Also to Richard and Cindy for their participation.	N/A	E00812_RE_ Vuntut Gwitchin First Nation questions re COGL well maintenance program (14)
E00811	09-Jul-20	Email	Outgoing	Vuntut Gwitchin First Nation	Hemmera	Greg Charlie (Chance)	Erika Tizya-Tramm (Vuntut Gwitchin First Nation), Rosa Brown (Vuntut Gwitchin First Nation) (Vuntut Gwitchin First Nation), Justin Page, Tania Salerno	Engagement/Consultation DO Project Meeting Coordination/Planning	We were able to quickly pull together a ppt for presentation at our 1:00PM Meeting today. Clive from Vertex will be on the phone to speak to the specific technical aspects of well suspension and abandonment. Erika if there is time it would also be helpful if we could take five min to discuss logistics for the Old Crow Meeting the week of July 20th so we can confirm date etc.	N/A	E00810_RE_ Vuntut Gwitchin First Nation questions re COGL well maintenance program (10) 200709_Chance_DO_Project_Vuntut Gwitchin First NationMeeting_July2020_v0.1.pptx

E00779	16-Jul-20	Email	Incoming	Vuntut Gwitchin First Nation	Erika Tizya-Tramm	Greg Charlie (Chance)	Erika Tizya-Tramm (Vuntut Gwitchin First Nation)	Engagement/Consultation DO Project	NR staff have been working to find accommodations for our reps to attend Chance's proposed community Meeting July 23 in Old Crow, but there is absolutely nothing available for those dates.Vuntut Gwitchin First Nation requested at our phone call regarding the well maintenance work that Vuntut Gwitchin First Nation's questions addressed prior to a community Meeting. With the Meeting only a week away, would you be able to provide a response on the community Meeting date and the timeline for Chance's response to Vuntut Gwitchin First Nation's questions on the well maintenance program by the end of today so Vuntut Gwitchin First Nation can plan accordingly?	N/A	E00779_Fwd_ Well Maintenance questions and community Meeting
E00768	17-Jul-20	Email	Outgoing	Vuntut Gwitchin First Nation	Richard Wyman (Chance)	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance)	Erika Tizya-Tramm (Vuntut Gwitchin First Nation)	DO Project Engagement/Consultation Meeting Coordination	Thanks for your efforts to find accommodation for your reps to attend the planned community Meeting in Old Crow on July 23. We are eager to be able to come to the community and share information about the Well Maintenance Project planned for the winter of 2020-2021. To that end, Chance has been able to make adjustments to its accommodation needs which has freed up accommodation space for your representatives. Greg or Cindy have the details about the accommodation so please contact them to firm up the arrangements. From what I have been told, there are now two beds available to your committee representatives. Either later today or early next week, Hemmera will send copies of the communication materials that we plan on using. Greg and Cindy have booked the John Tizya Centre for an outdoor Meeting, but as contingeNorthern Cross Yukon if the weather is poor, the Community Hall is also booked. It is an open house which hopefully meets the protocols of COVID gatherings and the time is from 2:00PM to 6:00PM PDT. With respect to your request on July 10 to have the responses to your questions submitted prior to the open house - yes those answers are in development and we will send them for your review early next week. we definitely fully intend on complying with your request that the Natural Resources Committee has Chance's response prior to the Open House. Importantly, we do need to submit the application for the well maintenance program to the Dawson Yukon Environmental Socio-economic Assessment Board DO as soon as possible in order to have sufficient time to negotiate a Benefits Agreement, obtain a variety of permits and operating licenses, and contract the services and suppliers needed to do the required work. As such we will need to submit the application to the Dawson DO very shortly after you receive our responses. I have copied Shena and Calista at Hemmera so they are aware of this communication. Shena is likely travelling to Old Crow for the Open House with Greg and Cindy. We are also expecting that a biologist working on this file with EDI will be attending as well since we expect interest and questions to several valued components, notably caribou, from the community members. Please let me know if this approach works for you and I hope you have a good weekend.	N/A	E00768_Community Meeting in Old Crow July 23.msg

E00911	28-Aug-20	Email	Outgoing	Vuntut Gwitchin First Nation	Hemmera	Richard Wyman (Chance), Cindy Dickson (Chance), Greg Charlie (Chance)	Erika Tizya-Tramm (Vuntut Gwitchin First Nation)	DO Project Project Description/Activities	Further to Richard's email dated August 7th (attached), Chance (Chance) has made a few revisions to their Project Description for the Designated Office Evaluation of their proposed Well Maintenance Program. As a result of those changes, Hemmera has also revised the effects assessment sections of the Project Proposal . Below are the reasons for the revision that have been provided to us by Chance and a brief summary of the amendment itself: 1. Ongoing conversations between Chance and Yukon Government, Oil and Gas Branch (Yukon Government) have necessitated changes. While Chance was previously of the impression wells could continue to be suspended, Yukon Government is now directing Chance to conduct inspection and maintenance activities for all eight suspended wells and then abandon those wells or bring them into active status (i.e., end the period of well suspension). Chance is now proposing to abandon six wells (i.e., M-59, M-08, J-19, G-08, B-73, and H, 28) and to bring the remaining two wells (i.e., A-25 and E-78) into active status as deep-injection wells. Waste fluid produced during the abandonment of the six wells can then be disposed of via injection into the deep-injection wells. No oil or gas is expected to be produced from the two wells proposed to be activated; they would specifically be used for disposal of waste fluid from activities associated with these maintenance activities. (See sections 2.1.4 and 2.1.5 for further description) 2. At this time, Chance cannot confirm whether it will use the Eagle Plains Hotel or the existing Chance Camp for housing workers over the duration of the Project. The decision to utilize the Eagle Plains Hotel or the Chance Camp will be made when the Project schedule is finalized. It will also have to take into consideration the Hotel's ability to accommodate Chance workers over the full duration of the Project as well as COVID-19 related self-isolation requirements at that time. As a result both options are considered in the effects assessment for the housing of the Project workforce. (See sections 2.2 and 2.3 for further description) 3. When the Chance field team were at Eagle Plain early August, they observed that the route used to access M-59 would require realignment of the final portion of Blackie Winter Road. The section of the original route that proceeds north for the final kilometer is not ideal for traffic due to steeper terrain. The steeper route would result in a significant risk to the trucks bearing heavy loads, fuel supply, and other fluid handling shipments. Chance is proposing shifting the final portion of Blackie Winter Road east of the original route in order to attain a much gentler gradient. E00904	15-Sep-20	Email	Outgoing	Vuntut Gwitchin First Nation	Hemmera	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance)	Erika Tizya-Tramm (Vuntut Gwitchin First Nation)	DO Project Engagement/Consultation Project Description/Activities	We appreciated the time and feedback of the Natural Resources Committee while in Old Crow on September 3rd and did our best to incorporate what we heard during that trip. As you know, Chance's timeline for completing this work was tied to compliance with regulations, so in an effort to ensure that the maintenance activities could occur this winter Chance needed to submit the application last week. It was submitted late evening and today Hemmera received confirmation that the Project was on the Yukon Environmental Socio-economic Assessment Board registry. We acknowledge that you will have future comments on the Project as it progresses through the Yukon Environmental Socio-economic Assessment Board process. We continue to look forward to hearing your views and are happy to hold additional Meetings to discuss and answer any questions you may have. Please see the link to the registry here: Project 2020-0151 Eagle Plains Well Maintenance and Winter Activities	N/A	E00904_Chance DO Project (Well Maintenance) - Yukon Environmental Socio-economic Assessment Board Registry Information

E00908	02-Nov-20	Email	Outgoing	Vuntut Gwitchin First Nation	Hemmera	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance)	Erika Tizya-Tramm (Vuntut Gwitchin First Nation)	DO Project Engagement/Consultation	After further consideration of the proposed Project (Eagle Plains Well Maintenance and Winter Activities) activities and the requirements of the Yukon Oil and Gas Act, Chance (Chance) has determined that changes are required to the Project submitted to the Dawson Designated Office on September 11, 2020 (Project #2020-0151). As such, Chance has decided to withdraw its Project Proposal and will be informing the Yukon Environment and Socio-Economic Assessment Board today, November 2, 2020. Chance intends to incorporate changes into a revised Project Proposal . Once the revised Proposal has been drafted, Chance will notify you by sharing a draft and requesting a Meeting to discuss the changes further. After Chance has discussed those changes with the Vuntut Gwitchin, the Project Proposal will be finalized and resubmitted to the Dawson Designated Office. Chance understands and appreciates that making changes to this Project a second time is requesting additional effort and capacity of the Vuntut Gwitchin. Chance looks forward to continuing to work with the Vuntut Gwitchin and will do its best to ease this process.	N/A	E00908_Chance DO Proposal Withdrawal - Vuntut Gwitchin Notification

E00900	19-Nov-20	Email	Outgoing	Vuntut Gwitchin First Nation	Hemmera	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance)	Erika Tizya-Tramm (Vuntut Gwitchin First Nation)	DO Project Engagement/Consultation Project Description/Activities	Further to my email dated November 2nd (attached) and our Meeting November 3rd, Chance (Chance) has revised its Project Proposal (including updated Project Description and Effects Assessment) for Designated Office Evaluation. Below is the key Project component that has changed: •Extended Flow Testing: After maintenance activities are complete and depending on wellbore integrity (as confirmed through maintenance activities), Chance proposes to conduct Extended Flow Testing (EFT) on up to three of the wells which have the highest potential for natural gas reserve. The reason for this change is to allow Chance to gather important information about the nature of the natural gas resource accumulation and its productive capability. a.Wells proposed for EFT are M-59, M-08, and J-19 (see PDF attached for Figure 2-1). Please note, Figure 2-1 is currently being updated to reflect this change. b.Revert up to three wells to suspended status (if the EFT results prove to have sufficient resource). c.Abandon three to six wells (the three remaining wells (G-08, B-73, and H-28) will be abandoned and up to additional three wells may be abandoned if wellbore integrity is not confirmed or if EFT results prove insufficient resources). •Timelines: If work cannot be completed this winter season (due to low snow pack, COVID considerations, or permitting delays), Chance will complete the Project during the winter of December 2021 to March 2022. Additional detail is within the attached revised Draft Project Proposal . While revisions were made throughout the document, Section 2.1.3 is the substantive addition with respect to EFT. We've attached both a clean version and a version with tracked changes to facilitate your review. Given the very short time frame for winter work, Chance will be submitting the application to Yukon Environmental Socio-economic Assessment Board on , November 20th. Hemmera anticipates the Vuntut Gwitchin Natural Resource Committee requiring additional discussions with Chance to review these changes and look forward to scheduling a Meeting where we can discuss these matters further to support your future submissions to the YESAA process. E00889	25-Nov-20	Email	Incoming	Vuntut Gwitchin First Nation	Jordan Peterson	Greg Charlie (Chance), Richard Wyman (Chance), Cindy Dickson (Chance)	Jordan Peterson, Erika Tizya-Tramm (Vuntut Gwitchin First Nation), Justin Page, Kris Statnyk (Vuntut Gwitchin First Nation), Rebecca Shrubb (Vuntut Gwitchin First Nation)	DO Project Engagement/Consultation DO Project Engagement/Consultation Project Description/Activities	Vuntut Gwitchin First Nation ("Vuntut Gwitchin First Nation") acknowledges receipt of Chance's ("Chance") revised Project Proposal on November 19, 2020 (the "Revised Proposal ") and notice of Chance's intention to submit the Revised Proposal to Yukon Environmental Socio-economic Assessment Board's designated office (the "DO") by "mid-week" of this week of November 23, 2020. In the current circumstances, Vuntut Gwitchin First Nation is not able to provide any detailed comments or views to Chance on the Revised Proposal within the very short timeline Chance has provided us for preliminary review before it submits to the DO. From our initial and limited review of the Revised Proposal , Vuntut Gwitchin First Nation has identified the following questions for clarification from Chance while reserving our ability to provide further and more detailed comments and views in the future once we have an opportunity to more fully understand the Revised Proposal : 1.What specific regulations does Chance rely for its assertion in the Revised Proposal that "wells which are converted to deep-injection wells are considered active" and that "if EFT is conducted on wells their status is considered active at which point they can be put into a suspended status for three additional years"? 2.Has Chance considered the potential interactions between EFT activities and birds, permafrost and air quality? The Revised Proposal continues to reject these candidate valued components for assessment despite the potential for interaction with EFT activities, particularly with respect to gas flaring. 3.Has Chance considered the potential impacts of EFT activities on caribou? The Revised Proposal identifies potential disturbance and localized effects on wildlife movement and distribution, but does not identify any effects on caribou. 4.Has Chance considered revising the COVID health and safety procedures due to increased number of personnel travelling to the Project site from out of territory and the changing context of the pandemic? Please be advised that these questions are in addition to outstanding questions and information requests previously sought by Vuntut Gwitchin First Nation on Chance's original Proposal to the extent they remain relevant to the Revised Proposal . Please also be advised by notice of this email message that I have been designated by Vuntut Gwitchin First Nation as the primary contact person in relation to all communications and engagement with Chance on a go forward basis. Until further notice, Chance is requested to direct all future correspondence and communications to me.	N/A	E00889_Chance Designated Office - Nov 19_ 2020 Revised Project Proposal
E00918	25-Nov-20	Email	Incoming	Vuntut Gwitchin First Nation	Erika Tizya-Tramm	Greg Charlie (Chance), Richard Wyman (Chance)	Erika Tizya-Tramm (Vuntut Gwitchin First Nation), Jordan Peterson, Derek Fraser	DO Project Engagement/Consultation	As requested, I have included Jordan Peterson into this email to begin discussions towards section 68 negotiations. As you've stated, Vuntut Gwitchin First Nation's previous questions under the former well abandonment Project will need to be revisited after Vuntut Gwitchin First Nation has fully reviewed the new Project Proposal .	N/A	E00916_FW_ Benefits Agreement - follow up (24)

E00919	25-Nov-20	Email	Incoming	Vuntut Gwitchin First Nation	Jordan Peterson	Greg Charlie (Chance), Richard Wyman (Chance)	Erika Tizya-Tramm (Vuntut Gwitchin First Nation), Jordan Peterson, Derek Fraser	DO Project Engagement/Consultation	Thank you for connecting me with Chance, really appreciate it. Greg, as Erika has stated through email and on your call in October I will be the lead for the Vuntut Gwitchin First Nation on the section 68 negotiations. As also communicated this morning I will be Vuntut Gwitchin First Nation's point of contact on all Chance communications and engagement on a go forward basis. Mahsi for also including Derek in the email Greg, we look forward to moving forward on discussions and planning some future dates that make sense. Derek, we should begin a new thread and include NND point person Skeeter Wright (First Nation of Na-cho Nyäk Dun) to begin assessing when we will need to meet to begin any discussions related to Chance Projects.	N/A	E00916_FW_ Benefits Agreement - follow up (24)
E00920	25-Nov-20	Email	Incoming	Vuntut Gwitchin First Nation	Derek Fraser	Greg Charlie (Chance), Richard Wyman (Chance)	Derek Fraser, Erika Tizya-Tramm (Vuntut Gwitchin First Nation), Skeeter Wright (First Nation of Na-cho Nyäk Dun), Jordan Peterson	DO Project Engagement/Consultation Benefits/Capacity Agreement	Thanks, Jordan. I've brought Skeeter into the discussion by copying him on this response. My understanding as communicated in Erika's email earlier is that Vuntut Gwitchin First Nation is seeking a more comprehensive understanding of the details around the recent amendments to the well program following the withdrawal of the previous Project Proposal from the YESAA process earlier this month. I am prepared to enter Benefits Agreement discussions when the other parties are ready to do so.	N/A	E00916_FW_ Benefits Agreement - follow up (24)
E00921	25-Nov-20	Email	Outgoing	Vuntut Gwitchin First Nation	Greg Charlie (Chance)	Greg Charlie (Chance), Richard Wyman (Chance), Cindy Dickson (Chance)	Derek Fraser, Erika Tizya-Tramm (Vuntut Gwitchin First Nation), Skeeter Wright (First Nation of Na-cho Nyäk Dun), Jordan Peterson	DO Project Engagement/Consultation Project Description/Activities	We are open and prepared to discuss any details of our proposed Project description that will be submitted to Dawson DO. We have indicated many times we need to work together as all parties to provide a common understanding with the right folks explaining the Project i.e. Engineers, Biologist etc. We have done a lot of work and prepared to address any items including the ecological values with our team. Again, we need to meet if we are going get a better understanding. For example, we had Todd Mohan from EDI at our public engagement in Old Crow (September 3rd) and he was a popular guy because his office (EDI) worked on Caribou, Fish, and Vegetation in the Project area. There was a lot of interest from the public on his work.	N/A	E00916_FW_ Benefits Agreement - follow up (24)
E00922	25-Nov-20	Email	Incoming	Vuntut Gwitchin First Nation	Jordan Peterson	Greg Charlie (Chance), Richard Wyman (Chance), Cindy Dickson (Chance)	Derek Fraser, Erika Tizya-Tramm (Vuntut Gwitchin First Nation), Jordan Peterson, Skeeter Wright (First Nation of Na-cho Nyäk Dun)	DO Project Engagement/Consultation	It sounds like your looking to provide a common understanding to the parties before submitting your revised Proposal to the Dawson DO?	N/A	E00916_FW_ Benefits Agreement - follow up (24)
E00938	25-Nov-20	Email	Incoming	Vuntut Gwitchin First Nation	Jordan Peterson	Greg Charlie (Chance)	Jordan Peterson	Cooperation Agreement	Details around capacity funding were discussed.	No record available due to confidentiality.	N/A
E00923	26-Nov-20	Email	Outgoing	Vuntut Gwitchin First Nation	Greg Charlie (Chance)	Greg Charlie (Chance), Richard Wyman (Chance), Cindy Dickson (Chance)	Derek Fraser, Erika Tizya-Tramm (Vuntut Gwitchin First Nation), Jordan Peterson	DO Project Engagement/Consultation	Yes, that would certainly benefit Chance and all parties if we can come up with common understanding. As you can appreciate we are pressured with time on many other fronts under the regulations and commitments with Yukon. However we have to manage to get it right for all parties and that has been Chance objective all along. We will get back to you very soon to address your concerns and I think it is important we address collectively with Yukon and First Nation partners prior to submission.	N/A	E00916_FW_ Benefits Agreement - follow up (24)
E00924	26-Nov-20	Email	Incoming	Vuntut Gwitchin First Nation	Derek Fraser	Greg Charlie (Chance), Richard Wyman (Chance), Cindy Dickson (Chance)	Derek Fraser, Erika Tizya-Tramm (Vuntut Gwitchin First Nation), Jordan Peterson, Skeeter Wright (First Nation of Na-cho Nyäk Dun)	DO Project Meeting Coordination/Planning	My team would certainly welcome the opportunity to meet as a group on this matter.	N/A	E00924_FW_ Benefits Agreement - follow up
E00925	26-Nov-20	Email	Incoming	Vuntut Gwitchin First Nation	Jordan Peterson	Greg Charlie (Chance), Richard Wyman (Chance), Cindy Dickson (Chance)	Derek Fraser, Erika Tizya-Tramm (Vuntut Gwitchin First Nation), Jordan Peterson, Skeeter Wright (First Nation of Na-cho Nyäk Dun)	DO Project Engagement/Consultation Project Description/Activities	It's great to hear Chance won't be submitting its new Proposal until any issues are dealt with, I'd also like to say mahsi for your considerate approach with Yukon First Nations regarding Chance's revised Project Proposal . Greg, given the objectives you've outlined below, when can the Natural Resources Committee expect Chance to organize a Meeting to bring a common understanding? Please ensure the organizing of such a meeting is in a different thread and communicated to me. It's important to ensure that we keep the threads of work separate and we look forward to setting up some of the logistics around the section 68 negotiations while we await a more comprehensive understanding of the Chance Proposal. Derek, is it a bad idea to have Yukon Government develop some of the processes involved in the negotiations?	N/A	E00924_FW_ Benefits Agreement - follow up
E01006	27-Nov-20	Email	Outgoing	Vuntut Gwitchin First Nation	Greg Charlie (Chance)	Richard Wyman (Chance), Cindy Dickson (Chance), Hemmera	Jordan Peterson, Erika Tizya-Tramm (Vuntut Gwitchin First Nation), Derek Fraser	DO Project Benefits/Capacity Agreement	Thank you Jordan, we are happy to continue to address any concerns in timely way. The following is our view of timelines in order to move forward. We would like to respond to Vuntut Gwitchin First Nation questions and concerns in our redraft submission and have our team work on that, with the hope to send another redraft to Yukon, Vuntut Gwitchin First Nation, NND, THFN and Gwich'in Tribal Council by end of next week. So that would take us into week December 7th ,this week we can have a group Zoom/Microsoft Team Meeting which Hemmera will assist in setting up. This will give everyone time to review our latest draft submission. I have included Hemmera folks in our email so they are in the loop with timelines. As stated we hope to address as much as we can prior to submission. We will certainly add more technical folks to our group Meeting in December 7th week to address any other concerns and questions. Also again, we are still sensitive to time, so we will do our best to get this done with reasonable timeframe for official submission.	N/A	E01006_RE_ Benefits Agreement - follow up.msg
E01016	01-Dec-20	Email	Incoming	Vuntut Gwitchin First Nation	Jordan Peterson	Greg Charlie (Chance), Richard Wyman (Chance), Cindy Dickson (Chance)	Erika Tizya-Tramm (Vuntut Gwitchin First Nation), Justin Page	DO Project Engagement/Consultation Project Description/Activities	There are a number of conversations going on that include Chance and Vuntut Gwitchin First Nation, in an attempt to ensure we don't cross the different threads I wanted to respond to this email specifically to communicate what we have heard regarding the Chance revised Proposal . Greg, you've communicated in the last week that Chance and Hemmera will be hosting a Zoom/Microsoft Meeting with the affected Indigenous Governments and Yukon Government the week of Dec 7 to provide a common understanding of the Chance Nov 19, 2020 Revised Project Proposal ? Calista, are you against providing Vuntut Gwitchin First Nation feedback to our questions below by end of the week?	N/A	E01016_Re_ Chance Designated Office - Nov 19_ 2020 Revised Project Proposal (22).msg

E01019	02-Dec-20	Email	Outgoing	Vuntut Gwitchin First Nation	Greg Charlie (Chance)	Cindy Dickson (Chance), Richard Wyman (Chance)	Jordan Peterson, Justin Page, Rebecca Shrubb (Vuntut Gwitchin First Nation)	DO Project Project Description/Activities	If I understand your email, you want to know if we will address Vuntut Gwitchin First Nation concerns and questions in our review of the revised draft submission. So the answer is yes, we are having our team of technical folks working on that as we email back and forth. It will be incorporated into the redraft for review and hopefully it will be done by end of this week. Nathan Aasman from Hemmera is facilitating the redraft and he can provide an update soon. Please refer to the email I sent November 27th as I was trying to layout the timeline. If it didn't come across that way I apologize.	N/A	E01019_RE_ Chance Designated Office - Nov 19_ 2020 Revised Project Proposal .msg
E00931	03-Dec-20	Email	Outgoing	Vuntut Gwitchin First Nation	Hemmera	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance)	Jordan Peterson	Meeting Coordination/Planning DO Project Information Sharing	I believe Greg has separately addressed your questions, but I can add a little more information. My colleagues Nathan Aasman and Chris Lovatt are working on addressing the four questions in your previous email (dated November 25th). At this time, it likely won't be ready for tomorrow, but we will send it to you as soon as we can. While the responses are being integrated into the Project Proposal , when I send that draft, I will include a cover letter to highlight where the changes are (i.e., to facilitate your review). Our hope is to arrange a Meeting with Vuntut Gwitchin First Nation after that response is shared. It's possible that Meeting could take place late next week or perhaps the week after (week of December 14th–18th). Are there any items in your schedule and that of the Natural Resource Committee that we need to work around? You had mentioned that the questions in your November 25th email were in addition to others previously submitted by Vuntut Gwitchin First Nation. Would it be possible for you to compile Vuntut Gwitchin First Nation's comments into an updated document? I've attached a document that Chance and Vuntut Gwitchin First Nation had exchanged over the summer. However, in early October, Erika communicated to Greg that Vuntut Gwitchin First Nation's questions/comments at that time were finalized but would form Vuntut Gwitchin First Nation's submission to Yukon Environmental Socio-economic Assessment Board. If there were any new concerns/issues raised at that time, we might not have seen them yet. Moving forward, I'll make sure to address all communications with Vuntut Gwitchin First Nation to you. If you have a specific CC list you'd like me to follow, just let me know. In hopes of keeping the emails streams separate as you requested, I've confirmed with Chance the main contacts for the following items: •Cooperation Agreement (in relation to the "Eagle Plains Exploration Project for Executive Committee": Greg (Chance) •Benefits Agreement (in relation to the "Well Maintenance and Winter Activities Project for Designated Office"): Greg (Chance) •Engagement with respect to Chance Yukon Environmental Socio-economic Assessment Board applications: Calista Morrison (Hemmera)	N/A	E00931_Engagement - Chance Well Maintenance and Winter Activities Project for Designated Office .msg 200721_Response to Vuntut Gwitchin First Nation Questions July 21.docx
E01039	07-Dec-20	Email	Incoming	Vuntut Gwitchin First Nation	Jordan Peterson	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance)	Jordan Peterson, Erika Tizya-Tramm (Vuntut Gwitchin First Nation)	DO Project	It remains Vuntut Gwitchin First Nation's objective to find a common understanding in all Chance proposed Project activities in Vuntut Gwitchin First Nation Traditional Territory before submitting to Yukon Environmental Socio-economic Assessment Board. It's great to see Chance committed to addressing the questions and concerns that Vuntut Gwitchin First Nation has on the original and revised Proposal . Am I correct that if Vuntut Gwitchin First Nation provides our compiled comments into an updated document that Chance will not submit to Yukon Environmental Socio-economic Assessment Board until they are fully addressed?	N/A	E01039_RE_ Engagement - Chance Well Maintenance and Winter Activities Project for Designated Office (18).msg
E01040	09-Dec-20	Email	Outgoing	Vuntut Gwitchin First Nation	Hemmera	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance)	Jordan Peterson, Erika Tizya-Tramm (Vuntut Gwitchin First Nation)	DO Project	At this time, Chance is working on it's response to the questions issued in your November 25th email. Those issues/topics will be integrated into Chance's Project Proposal . We should be able to send the document to you tomorrow. Our apologies for the delay. It is our understanding that Yukon Government's expectations are for Chance to submit the Project Proposal to Yukon Environmental Socio-economic Assessment Board before December 31st. This is in order for Chance to demonstrate to Yukon Government that it is actioning Yukon Government's instructions. Chance does however look forward to working with the Vuntut Gwitchin First Nation in a collaborative and cooperative way in order to respond to Vuntut Gwitchin First Nation's comments. Parties can discuss these timelines and how best to achieve both Chance's and Vuntut Gwitchin First Nation's goals at our upcoming Meeting. Perhaps we can work on scheduling that Meeting? Would late next week work? Chance and Hemmera can be flexible to whatever time works best for you. N/A	E00933_FW_ Chance and Vuntut Gwitchin First Nation Meeting - Discussion of Yukon Environmental Socio-economic Assessment Board DO Project Proposal for Well Maintenance and Winter Activities

E01009	16-Dec-20	Email	Outgoing	Vuntut Gwitchin First Nation	Hemmera	Greg Charlie (Chance), Richard Wyman (Chance), Cindy Dickson (Chance)	Erika Tizya-Tramm (Vuntut Gwitchin First Nation), Kris Statnyk (Vuntut Gwitchin First Nation), Justin Page, Todd Mahon	DO Project Meeting Coordination/Planning	Hemmera said it was very strange that the invitation could not be forwarded. They said they would take a look at it and see if there's anything that could be changed with respect to its Meeting properties/settings. In the mean time, if you want provide your list to me, I can send the invite along! Greg's previous comments were related to conversations around the benefits agreements, however they may have pulled in the DO Project Proposal . Previous emails frequently mixed topics like the DO Project Proposal development, the benefits agreements, and the cooperation agreements. At this time, Chance would like to have a Meeting with Vuntut Gwitchin First Nation to discuss and focus on Vuntut Gwitchin First Nation's comments, Chance's responses, and the revised draft of the DO Project Proposal that was shared on , December 14th. This will help Chance prepare for its upcoming submission to Yukon Environmental Socio-economic Assessment Board (i.e., that will happen before the end of the year). If Chance were to arrange a Meeting with all parties, that Meeting would also have to include representatives from TH and GTC (and Tetlit Gwich'in Council) in addition to NND and Yukon Government. If there was/is interest in an all parties meeting, that could be arranged in the new year but would take much more coordination. Chance has Engagement Plans with NND, TH, and GTC (and Tetlit Gwich'in Council) that has guided its engagement and communications. If Vuntut Gwitchin First Nation, and/or other parties, is interested in coordinating more joint Meetings moving forward (e.g., does Vuntut Gwitchin First Nation want all Meetings with Chance to include NND and Yukon Government?), perhaps that could also be discussed in the new year? E00988	20-Jan-21	Email	Incoming	Vuntut Gwitchin First Nation	Jordan Peterson	Greg Charlie (Chance), Richard Wyman (Chance), Cindy Dickson (Chance)	Jordan Peterson, Erika Tizya-Tramm (Vuntut Gwitchin First Nation), Skeeter Wright (First Nation of Na-cho Nyäk Dun), Derek Fraser	DO Project	We have a planning meeting on January 25 at 10:00am and we're looking forward to the meeting. Before the Christmas holidays there were a number of emails dealing with Chance revised Project Proposal and your commitment to helping all parties come to a "common understanding" before submitting the Chance revised Project Proposal to Yukon Environmental Socio-economic Assessment Board, which is why we found it unfortunate that during the holidays we had seen that Chance had submitted the Proposal on December 24, 2020 and the Vuntut Gwitchin First Nation was not notified by Chance. To help inform the discussions around planning for negotiations can Chance provide us with a deeper understanding of all details related to what the cost of the Project will be, potential employment, training and contracting opportunities there will be in relation to the Project? A detailed list would be beneficial for all parties.	N/A	E00989_RE_ Dawson DO Project Proposal (1).msg

E01069	22-Mar-21	Email	Outgoing	Vuntut Gwitchin First Nation	Hemmera	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance)	Jordan Peterson, Erika Tizya-Tramm (Vuntut Gwitchin First Nation)	Engagement/Consultation Meeting Coordination/Planning	As you may have previously discussed with Chance, Hemmera is currently resuming work on developing the Project Proposal for Chance's Eagle Plains Exploration Program and, at this time, planning for a late fall submission to Yukon Environmental Socio-economic Assessment Board for an Executive Committee level screening. As we have discussed in the past, critical to Chance's work will be engagement with both the Vuntut Gwitchin First Nation, in accordance with the Communication and Engagement Plan (the Plan) (and appended Vuntut Gwitchin First Nation Oil and Gas Engagement Policy (the Policy)) from 2018, as well as Vuntut Gwitchin Citizens. To that end, Chance has developed a schedule for internal planning purposes and discussion with Vuntut Gwitchin First Nation and the Natural Resources Committee. It coordinates engagement events over the coming months with the logistical/administrative items needed in order to deliver each event. attached is an overview of that schedule which shares the weeks that Chance anticipates being in Old Crow and the topics to be presented/discussed at each community event. Chance is also in the process of creating a Community Engagement Committee to assist in the delivery and effectiveness of its engagement activities over the coming months. Chance is finalizing the Terms of Reference for this committee and anticipates finalizing its membership over the coming weeks. Please note, Chance was careful to ensure that the Terms of Reference for the committee are in accordance with the Plan (and appended Policy) and that nothing about the committee is meant to replace or change Chance's commitments/responsibilities under the Plan. For your information, we have attached a copy of the Terms of Reference that's been drafted for the committee. We feel that both the schedule and the Community Engagement Committee will foster an environment for productive discussion regarding the environmental and socio-economic values of concern related to the multi-well exploration program. To answer any questions that the Natural Resources Committee or Vuntut Gwitchin First Nation may have pertaining to either item, Chance wanted to request a Meeting perhaps the week of March 29th – April 1st or April 5th – 9th. E01083	08-Apr-21	Email	Outgoing	Vuntut Gwitchin First Nation	Mike Chernoff	Mike Chernoff	Chief Dana Tizya-Tramm (Vuntut Gwitchin First Nation)	Project Description/Activities Engagement/Consultation Meeting Coordination/Planning Cooperation Agreement	I am writing to follow up our telephone conversation this morning. You asked that Chance delay having Meetings with Vuntut Gwitchin First Nation Citizens because of a lack of readiness on your part. I suggested that Chance could delay Meeting Vuntut Gwitchin First Nation Citizens by a month, but I made that offer without knowing that arrangements have already been made for Chance and Hemmera staff to travel to Old Crow later this month. Accommodation and meeting rooms have been booked too. We are now committed to be in Old Crow later in April. The Meetings later this month are meant to be introductory in the sense that there will be a refresher presentation on the Multi-well and seismic acquisition exploration Project since it has been nearly two years since Chance last presented to the community at the GA in August 2019. There will also be information about the process Chance has to follow for an Executive Committee Assessment of this Project and discussion about the plans Chance and its expert consultants have to meet in Old Crow with the community over the next several months. As such, there are going to be several occasions for the Natural Resources Committee to participate in these Meetings. A high level schedule was provided to the Natural Resources Committee a couple of weeks ago for its consideration.	N/A	E01083_FW_ Chance Community Meetings.msg

E01241	07-Jun-21	Email	Incoming	Vuntut Gwitchin First Nation	Erika Tizya-Tramm	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance)	Erika Tizya-Tramm (Vuntut Gwitchin First Nation), Jordan Peterson	Engagement/Consultation	Thank you Calista for this notice. As set out under section 21 of the Vuntut Gwitchin First Nation Oil and Gas Engagement Policy, notice of any materials to be relied on by Chance (Chance) for the purposes of consultations with Vuntut Gwitchin Citizens should also be provided in advance of the scheduled Meetings. We continue to seek upholding these policy requirements which Chance agreed to comply with under our joint Communication and Engagement Plan. Please also note that the Natural Resources Committee has received feedback from Vuntut Gwitchin Citizens that the "Open House" format of consultation has not been effective in meaningfully informing them and has not allowed for an open question and answer period. It is also important to note pursuant to section 22 of the Oil and Gas Engagement Policy that any consultations with Vuntut Gwitchin Citizens that are organized and carried out by Chance are not considered consultation with the Vuntut Gwitchin First Nation (Vuntut Gwitchin First Nation). The status of engagement between Vuntut Gwitchin First Nation and Chance remains as set out in Chief Tizya-Tramm's March 31 letter to Mr. Chernoff	N/A	E01241_RE_ Chance Eagle Plains Exploration Project (ExCom) - Upcoming Community Event in Old Crow June 15th (2).msg

E01242	09-Jun-21	Email	Outgoing	Vuntut Gwitchin First Nation	Hemmera	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance)	Erika Tizya-Tramm (Vuntut Gwitchin First Nation), Jordan Peterson	Engagement/Consultation	I will send you a separate file sharing link that will provide copies of the posters that were used at the open houses April 20th, April 21st, and May 18th. The poster titled "Regulatory Context" was first used at the May 18th open house. Chance/Hemmera will be bringing these same posters to the open house next week, June 15th. I've attached a PDF that has our collection of handouts and a PDF of the presentation we had Projected and automatically playing during the previous open houses. Please note, no presentations were actually delivered during the open houses April 20th, April 21st, and May 18th.We are currently in the process of designing additional posters to describe the work (studies conducted and baseline findings) of Chance's subconsultants (EDI, Peer Solutions, and Palmer) as well as a poster that describes Chance's exploration objectives, possible job opportunities, and training. However, we haven't finished designing these posters yet. We should complete the last posters for that package later today. I'll send them via the file sharing link. If we develop any additional handouts, I can commit to sending you copies next . Given the nature of the work load prior to an open house, we prioritize posters, then handouts, and finally any presentations. At the open house June 15th, we will likely present some slides providing an overview of the Chance's Project, however EDI will actually be providing the presentation. They will be presenting their work to date and seeking any comments, questions or concerns from the audience. We can share a copy of their presentation as soon as they have created it and it is finalized. That likely won't be until next week. Chance has also been asked to attend and provide a brief presentation to the NYRRC Meeting on June 16th next week. The content of this will be specific to fish and wildlife, as well as time for Q&A. Just yesterday we were finally able to confirm our venue. The June 15th open house will be held at the school gym from 4:00 – 7:00 pm. We plan on having the presentation at 5:30. The purpose of the previous open houses was to share information about Chance's Eagle Plains Exploration Project and to collect any feedback and concerns. That remains to be the purpose for the upcoming open house, as well as beginning to share information about studies conducted and baseline findings of Chance's subconsultants. Regarding your comment below with respect to the status of consultation with Vuntut Gwitchin First Nation, yes that is also our understanding of the status of consultation with Vuntut Gwitchin First Nation. All community open houses and presentations are intended to be aspects of consultation with residents of Old Crow and not consultation with the Vuntut Gwitchin First Nation. Thank you for sharing the feedback regarding the consultation format below. We're are hoping that by setting aside some time for a specific presentation and Q&A that we'll be able to address those concerns moving forward. E01301	08-Sep-21	Email	Incoming	Vuntut Gwitchin First Nation	Jordon Peterson	Richard Wyman (Chance)	Erika Tizya-Tramm (Vuntut Gwitchin First Nation)	Meeting Coordination/Planning Engagement/Consultation	Richard, The annual Meeting of the Vuntut Gwitchin First Nation (Vuntut Gwitchin First Nation) General Assembly (GA) is scheduled for September 22-24, 2021 which was posted and made public on multiple platforms. The timing of the community engagement Meetings Chance is proposing for September 21-22 would overlap with the GA's scheduled business. We therefore kindly ask you to reschedule your engagement Meetings to a future date so as to avoid any undue interference in the Meeting of the GA and the important internal governance processes of Vuntut Gwitchin First Nation, and to allow for greater participation of Vuntut Gwitchin First Nation Citizens in your planned engagement activities. We remind you that our March 31, 2021 letter to you arose out of our unresolved concerns regarding Chance's communication and engagement practices with the community, including events that occurred earlier that month which interfered with internal Vuntut Gwitchin First Nation discussions and deliberations at a special Meeting of the GA. As we also set out in the March 31st letter, the participation of individuals in their professional capacity as Chance Directors, officers, employees, consultants, professional advisors, and representatives in internal governance processes such as Meetings of the Vuntut Gwitchin First Nation GA are by invitation only. No such invitation has been extended to Chance to participate in the upcoming Meeting of the Vuntut Gwitchin First Nation GA therefore any Vuntut Gwitchin First Nation Citizens who are also Chance representatives will be understood to be participating in the discussions of the Vuntut Gwitchin First Nation GA as entitled to under Vuntut Gwitchin First Nation law in their personal capacity as Vuntut Gwitchin First Nation Citizens. E01298	14-Sep-21	Email	Outgoing	Vuntut Gwitchin First Nation	Richard Wyman (Chance)	Greg Charlie (Chance), Cindy Dickson (Chance), Lynn O'Neil	Jordan Peterson, Erika Tizya-Tramm (Vuntut Gwitchin First Nation)	Meeting Coordination/Planning Engagement/Consultation	Thank you for reaching out and sorry for the delay responding. I was off grid attending a family gathering last week. It did come to our attention on Sept 7 that the Vuntut Gwitchin First Nation (Vuntut Gwitchin First Nation) General Assembly (GA) has been re-scheduled to now occur September 22-24 and that GA events would overlap with one of our planned open houses. When we made our plans to host community meetings to share information about our proposed exploration Project, it was prior to our knowing the confirmed timing of the annual Vuntut Gwitchin First Nation GA. To avoid any meeting conflicts, we have cancelled our plans to have an open house during the evening of Sept 22nd . We are however hosting a dinner and open house presentations during the evening of Sept 21. Travel and accommodation arrangements for our party have been adjusted so our technical consultants will be departing YOC on Sept 22. As presentation materials are available, Calista Morrison (Hemmera) will forward them to you so you know what topics are being discussed. Otherwise, if you are in Old Crow while we are there, you are welcome to attend the Sept 21 open house.	N/A	E01298_Community Meetings and Vuntut Gwitchin First Nation GA.msg

As discussed I will provide you with our thoughts on moving forward with Chance 1. We would like to retain professional services from Mehaffey Consulting to assist the parties in facilitating the Cooperation Agreement and eventually the Benefit and Stewardship Agreement in Vuntut Gwitchin Oil and Gas policy as soon as possible. 2. Chance is prepared to hold off submission again and submit into the new Pre-submission Process in Spring of 2022. This will give parties more time get engaged in the new year. This position allows all parties, affected FN, Yukon and others to be involved with facilitation from Yukon Environmental Socio-economic Assessment Board. Chance is looking forward meeting with the Vuntut Gwitchin First Nation representatives again and including Natural Resources Committee members in Old Crow. I really appreciate our conservation and our willingness to move on and provide path forward to get information out to Citizens in Old Crow. Please don't hesitate to contact me if you have any questions or want to meet. Also as discussed in Old Crow, please feel free to contact Matt Mehaffey to discuss his role. E01366	21-Dec-21	Email	Incoming	Vuntut Gwitchin First Nation	Erika Tizya-Tramm	Greg Charlie (Chance)	Erika Tizya-Tramm (Vuntut Gwitchin First Nation)	Engagement/Consultation	Thank you for your message following up on our December 9 Meeting in Old Crow and setting out Chance's thoughts and Proposal s. As I have previously communicated, the NR committee will be seeking a decision from the Council on next steps with respect to Vuntut Gwitchin First Nation engagement on Chance's exploration Proposal following the previous decision to discontinue engagement communicated March 31, 2021. The details of our discussion on December 9, and your Proposal s below, including Chance's intentions to proceed to the Yukon Environmental Socio-economic Assessment Board process as early as Spring 2022, will help to inform that decision. With the holiday season, current emergeNorthern Cross Yukon circumstances in the community and Vuntut Gwitchin First Nation priorities at this time, we will likely be looking at sometime in January 2022 to be meeting with Council. We will ensure to keep Chance informed of the outcomes.	N/A	E01366_FW_ Chance Oil and Gas Proposal (6).msg
E01367	04-Jan-22	Email	Outgoing	Vuntut Gwitchin First Nation	Greg Charlie (Chance)	Greg Charlie (Chance)	Erika Tizya-Tramm (Vuntut Gwitchin First Nation)	Engagement/Consultation	Thanks for your email and look forward to resume process with Vuntut Gwitchin First Nation! Please let me know as soon as you can! I will also update Marvin and Roger about this email.	N/A	E01366_FW_ Chance Oil and Gas Proposal (6).msg
E01368	20-Jan-22	Email	Outgoing	Vuntut Gwitchin First Nation	Greg Charlie (Chance)	Greg Charlie (Chance)	Erika Tizya-Tramm (Vuntut Gwitchin First Nation)	Engagement/Consultation	I wanted to follow up via email on any progress on our progress to move forward on engagement and Chance Proposal . FYI, we are currently working on all documents and will be sending it to all affected FN and Yukon within weeks, so I just wanted to see where your at? It has been over month since the meeting took place in Old Crow (December 7, 2021) and as stated in our discussion at that time with the elders Marvin Frost and Roger Kyikavichik present, time is important to Chance	N/A	E01366_FW_ Chance Oil and Gas Proposal (6).msg

E01370	21-Feb-22	Email	Outgoing	Vuntut Gwitchin First Nation	Greg Charlie (Chance)	Greg Charlie (Chance)	Erika Tizya-Tramm (Vuntut Gwitchin First Nation)	Engagement/Consultation	I am just following up with you on the status of moving forward with Chance Proposal we discuss few months ago (December 9,2021) . We are still committed to move forward with Vuntut Gwitchin First Nation if you guys are still interested. As you may or may not know, Yukon Environmental Socio-economic Assessment Board as pushed back the new regulated Pre Submission start date for June 1, 2022. So we agree to move back our multi well submission as well to June 1, 2022. This will give us more time to work out solution for engagement with Vuntut Gwitchin First Nation and it's Citizens. E01371	04-Apr-22	Email	Outgoing	Vuntut Gwitchin First Nation	Hemmera	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance)	Erika Tizya-Tramm (Vuntut Gwitchin First Nation), Jordan Peterson	Engagement/Consultation	In accordance with Vuntut Gwitchin First Nation's March 3, 2021 letter to Chance and the Vuntut Gwitchin First Nation Oil and Gas Engagement Policy, Chance wanted to provide notice of upcoming community engagement events that are being planned in Old Crow. Chance, Hemmera, as well as additional consultants will be flying up to Old Crow the evening of May 4th. We are planning on holding one open house the following evening (May 5th) at the new community hall between 4:30 pm to 7:00 pm. The purpose of the open house will be to share information about Chance's Eagle Plains Exploration Project and to collect feedback and concerns. More specifically, Peer Solutions will be sharing information about the proposed seismic program and EDI (EDI) will be presenting findings of their baseline studies. We will be re-using posters already made and previously shared with you. Please let me know if you would like me to send a copy of them again. I can send copies of the presentations as soon as they're finalized.	N/A	E01371_Chance Eagle Plains Exploration Project (ExCom) - Upcoming Community Event in Old Crow May 5th.msg

Eliza Bethune (Two Worlds Consulting)	Meeting	Eliza (Two Worlds Consulting) emailed John and cc'd Chance representatives asking if Nations were still interested in an all-Nation meeting on October 13, 2023. Eliza asked John to answer the following: 1. Should Chance send a meeting invite to everyone included on the email you sent a few weeks ago? If yes, do the Nations prefer to meet via Zoom, Microsoft Teams, or another platform? What time would work best to meet and how long are the Nations interested in meeting for? 2. Should Chance prepare a draft agenda for the meeting to share with the Nations for review and confirmation? Potential agenda items could include Chance reviewing at a high-level the draft Table of Contents for the Project Proposal , Chance to review a high-level Project Proposal schedule, and First Nations and Chance to discuss future all-party meeting frequency, topics, format etc. This information will help Chance determine who from the Project Team should attend the meeting. 3. Should Chance prepare and send materials to the Nations prior to the meeting? Chance will try their best to accommodate material requests. If not possible, materials can be prepared and shared after the meeting.	N/A	N/A

VGFN0236	06-Dec-23	Community Event	N/A	Vuntut Gwitchin First Nation	N/A	Greg Charlie (Chance), Cindy Dickson (Chance)	N/A	World Café Event	Chance held a World Café event in Old Crow at the Darius Elias (Vuntut Gwitchin First Nation) Community Centre from 4:00 PM - 8:00 PM MST. World Café attendees were asked to sign in upon arrival and to complete a feedback form before leaving. Chance shared Project information on posterboards and a 1-page handout. Chance provided a catered dinner and presented Project information to World Café attendees. After dinner, technical experts from EDI, Ecofor, and Palmer were divided amongst the groups. Focus group #1 had a presentation from EDI on Wildlife and Fish and Fish Habitat. Focus group #2 had presentations from Ecofor and Palmer on Archaeology/Heritage Resources and Permafrost. Once presentations and comments/concerns were addressed, the technical experts switched tables and presented to the rest of the attendees. The World Café event had door prizes that were drawn throughout the event which included 2 Air North gift cards, 3 Co-op grocery gift cards, Ecofor packages, and a mug from Indigo.	N/A	N/A

Chance stated heritage resource studies have begun by Ecofor. Chance noted Chance has retained supervision of drilling and completions, well maintenance, and follow testing activities help from Mountford Consulting; Peer Solutions for seismic program design and project management; TetraTech for civil engineering advice; Ausenco for preparing YESAB submission documents and project management; and Two Worlds Consulting for engagement and communication processes and gathering socio-economic data to complete YESAB submissions. Chance stated that all information that is gathered can be shared with the Nations and their feedback is welcome. Chance noted that Chance intended to extend the Land Tenure of Exploration Permits that are due to expire August 30, 2023. Chance stated a Benefits Agreement needs to be completed by First Nation of Na-Cho Nyäk Dun, Gwich'in Tribal Council, and Vuntut Gwitchin First Nation. Chance said that accommodation in Old Crow is difficult to arrange and Chance had tentatively arrange accommodation on March 7, 2023 in Old Crow and March 8 to 9, 2023 in Inuvik and Fort McPherson for consideration. Chance noted no meetings in Mayo or other communities in the Yukon have been committed to.	N/A	N/A

Tr'ondëk Hwëch'in and Chance Oil and Gas Limited Meeting Notes

Date: November 23, 2018

Location: Teleconference

Attendees:

Tr'ondëk Hwëch'in:

[redacted], Senior Advisor, Mining and Strategic Initiatives
[redacted], Legal Counsel

Chance Oil and Gas Limited:

[redacted], President
[redacted], Vice President of Community and Government Relations
[redacted], Regulatory, Environmental and Community Relations Coordinator

Hemmera:

[redacted], Community Engagement and Consultation Specialist
[redacted], Human Environment Specialist

Introduction: Purpose and Objectives

Meeting Objectives:

The purpose of this meeting was to discuss the implementation of the TH and Chance Engagement and Communications Plan. Items also on the agenda were discussing the Confidentiality Agreement, and Letter of Agreement for Capacity Funding sent from TH to Chance on November 5, 2018. Chance also wished to discuss their proposal for an All-Party Meeting where the Five First Nations, Yukon Government, and Chance would meet to discuss key project items and areas for collaboration.

Meeting Objectives:

- Finalize Confidentiality Agreement;
- Discuss itemized budget for Capacity Funding; and
- Discuss All-Party Meeting.

Discussion of Key Topics:

[redacted] began the meeting by introducing meeting attendees and reviewing the agenda.

DRAFT

TH [redacted] informed attendees that [redacted] was no longer working for TH.

[redacted] initiated discussion of the Confidentiality Agreement.

[redacted] expressed that the Confidentiality Agreement was good to go, and that he would clean up the document and send it to TH for signing.

TH [redacted] stated that because of the staffing change an Acting-Executive Director would likely have to sign the agreement. However, it's possible that someone else would be responsible for signing. He stated that he would get direction from Council and that the process might take a couple weeks. TH asked Chance to provide a clean version of the agreement to both [redacted] and [redacted].

[redacted]

[redacted] moved on to discussing the VG election and that the transition to the new government might delay engaging with that First Nation. Transition to the new Chief and Council is expected to take place Jan 2019 and that there would likely be a series of information sessions over the coming months to bring them up to speed with respect to Chance. [redacted] mentioned that there appears to be interest in the other First Nations for an All-Party Meeting in the new year. They are tentatively scheduling this for February 1, 2019. Because of the change with VG, it's possible the Northern Chiefs would want to meet ahead of time.

TH [redacted] confirmed that a private meeting of the Northern Chiefs is desired.

[redacted] stated that could be arranged either before the All-Party Meeting or during it.

TH [redacted] will have to seek internal instructions and confirm schedules and availability for the date proposed.

[redacted] mentioned that the new Chief for VG had proposed an idea similar to the All-Party Meeting in the past. From that, Chance is assuming that VG would still be interested in the idea. [redacted] expressed that at this time, all Parties have generally been supportive.

TH [redacted] stated that Roundup is very busy for TH. [redacted] mentioned that he would work internally to check availability and will try to confirm dates and availability over email by December 13th.

[redacted] informed TH that Chance/Hemmera were hoping to include an In-Camera session in the agenda for the All-Party Meeting. It was also mentioned that Yukon Government is assisting with booking a room for the meeting. [redacted] offered to send a brief summary of the All-Party meeting to TH to aid in their internal discussions and planning.

[redacted] asked who the Letter of Agreement for the Capacity Funding should be addressed to.

[redacted]

TH [redacted] said to send the clean draft to himself and that he would follow up internally as to next steps and signatures. Similar to the direction required for the Confidentiality Agreement. [redacted] will also check in with the TH Finance Department on payment instructions (i.e., who to send the letter to and who it should be addressed to). TH did ask about extra costs that might in incurred by attending an All-Party Meeting.

[redacted] mentioned that Chance would provide funding for the additional costs incurred by TH representatives attending the All-Party meeting after Round Up.

APPENDIX 2-D-06. Letter Request to Extend Tenure on Exploration Permits 0006-0011 and 0019 at Eagle Plains

Chance
OIL AND GAS LIMITED

March 27, 2019.

Tr'ondek Hwech'in First Nation
P.O. Box 599
Dawson City, YT
Y0B 1G0

sent by email: [redacted]

Attention: [redacted], Senior Advisor, Mining and Strategic Initiatives

Dear [redacted]:

Re: Request to extend tenure on Exploration Permits 0006-0011 and 0019 at Eagle Plains

As you know, the Chance Oil and Gas Limited ("Chance", the "Company") currently has fourteen exploration permits located in the Eagle Plains area of northern Yukon. The permits are numbered 0006 to 0017 and 0019 to 0020. Of these, exploration permits 0006-0011 and 0019 will expire on August 30, 2019 unless extended in accordance with some combination of Sections 27, 28 and 31.01 of the Yukon *Oil and Gas Act* (the "Act"). For convenience, I have attached a map showing all the existing exploration permits held by the Company.

Pursuant to the Engagement and Communication Plan that was approved in August, 2018, I am writing to advise you that Chance wishes to extend the tenure of the expiring permits for a period of five years in order to continue exploring for crude oil and natural gas in the area of these Expiring Permits.

With the expiry deadline for the permits fast approaching and knowing that Yukon Government consultation needs to occur in relation to any tenure extension request of existing exploration permits, I wish to inform you that Chance will be submitting the tenure extension application this week to the Oil and Gas Branch of the Department of Energy, Mines and Resources.

CHANCE OIL AND GAS LIMITED

TR'ONDËK HWËCH'IN AND CHANCE OIL AND GAS MEETING ON THE DRAFT EXPLORATION PROJECT DESCRIPTION

Date: August 12, 2019

Location: Downtown Hotel Boardroom, Dawson City

Attendees:

Tr'ondëk Hwëch'in:

[redacted], Senior Advisor, Mining and Strategic Initiatives
[redacted], Natural Resources Director
[redacted], Legal Counsel (conference call)
[redacted] Development Assessment Coordinator
[redacted], Development Assessment Coordinator

Chance Oil and Gas Limited:

[redacted], President
[redacted], VP Government and Community Relations
[redacted] Regulatory, Environmental and Community Relations Coordinator

Hemmera:

[redacted], Human Environment Specialist
[redacted], Human Environment Specialist
[redacted], Human Environment Specialist (conference call)

Introduction: Purpose and Objectives

The purpose of this meeting was for Chance Oil and Gas Limited (Chance) to provide Tr'ondëk Hwëch'in (TH) with project updates and to answer questions TH might have with respect to exploration activities proposed in the Eagle Plains Exploration Project Description. Items also discussed were long-term capacity funding and a Cooperation Agreement.

Meeting Objectives

- Provide project updates and answer questions on project description
- Provide an update on the initial capacity funding budget and discuss additional capacity funding
- Discuss a Cooperation Agreement template and steps to complete an agreement

Meeting Discussion:

The meeting opened with introductions and a welcome.

[redacted] stated the purpose of this meeting was to provide updates on the project and answer questions on the project description provided in June 2019 as well as to discuss the capacity funding budget and a Cooperation Agreement.

[redacted] provided updates on 2019 summer field work and Chance's project proposal preparation activities. Baseline studies have been ongoing throughout the summer. EDI has been in the field twice to conduct surveys. They did a one-week program in June and a second program that was about two weeks long at the end of July/early August. They completed a bird survey, vegetation and ecosystem assessments, and fish surveys. Palmer also completed permafrost field surveys. Peer Solutions scouted the area to design the seismic program. Chance did a geologic sampling study at the end of July. At this point all activities have been focused on gathering data and no reporting has been done. It will likely be one to two months until reporting from this field season is done. Chance will share that information once it is available.

[redacted] explained that Chance and Hemmera were in Old Crow from August 5th to 8th, 2019 to meet with the Natural Resource Committee and present at the Vuntut Gwitchin First Nation (VGFN) General Assembly (GA). Chance may meet with Chief and Council of the First Nation of Na-cho Nyäk Dun (FNNND) on August 13, 2019. Chance is planning on visiting communities in the Northwest Territories in the coming weeks to present the Project Description and to provide an update on project activities and receive feedback on the project description from the Gwich'in Tribal Council. Those meetings and today's meeting are part of the community and First Nation consultation process.

[redacted] asked how Chance will handle Heritage Resource Assessments to address culture and heritage concerns.

[redacted] explained that Hemmera is currently working on completing a Gap Analysis. The Analysis is based on the 2014 Designated Office (DO) submission to see what heritage work was done at that time, and what needs to be done for an Executive Committee Screening. Once Hemmera completes the Gap Analysis, the next steps in heritage work will be assessed with each First Nation.

[redacted] acknowledged that Chance is expecting to do more heritage work because the scope of the project has expanded. Hemmera is doing community interviews as part of this process, in order to better understand heritage values and traditional use and knowledge in the area. [redacted] explained that Vuntut Gwitchin (VG) heritage research is informing the application to update the heritage assessment.

[redacted] added that Hemmera also expects information from users of the area to help create and assess the project's valued components (VCs). There is a need to understand how the project could affect communities such as Fort McPherson and Old Crow. Hemmera started their socio-economic research last week by interviewing service providers in Old Crow. That type of research will continue.

[redacted] asked what factors are affecting the socio-economic study at this time.

[redacted]xplained feedback from communities is the main source of information guiding the socio-economic research. Chance has received very little feedback on the Project Description from communities so far, and Chance needs to flesh out the project more based on feedback from the different First Nations. This feedback will be received through interviews, community meetings, and workshops that are focused on VCs. Consultants such as EDI and Palmer can present information from their field work at these workshops. They will be sharing that information in the next few months.

[redacted] acknowledged the North Yukon Regional Land Use Plan and the Peel Watershed Regional Land Use Plan [*signed August 22, 2019*] have been completed. Information in the Land Use Plans from each of the First Nations could be used for the Gap Analysis, instead of re-doing all that work. Chance could then supplement the information from the Land Use Plans with Hemmera's socio-economic research to complete the Gap Analysis.

[redacted] noted Chance has been working with [redacted], Senior Planner of the Yukon Land Use Planning Council. Chance has also been working with the North Yukon Regional Land Use Plan Working Group, with an emphasis on the permit area. The focus has been on identifying cumulative effects in the area, and they are hoping to finish that research this fall.

[redacted] asked if the project area is associated with the Peel district.

[redacted] presented the project area map and explained that approximately 90% of the project area is within the North Yukon Regional Land Use Plan area. A small section in the southeast is in the Peel drainage. However, project activity will start away from that drainage area, in the Northern part of the project area. The approximate timing for project activities to reach the Peel region is unknown at this point. Since this is exploration, the plan will change according to what information is gained as work continues.

[redacted] inquired as to where Chance expects to drill the first five wells. [redacted] explained that Chance will start work in the northern part of the project area, working southward. The geology is shallower to the northeast and slopes down to the southwest. [redacted] asked for clarification on what depth the term shallow refers to for this project. [redacted] stated that shallow means approximately 1000m or 800m deep.

[redacted] questioned how much of the hydrogeology in the project area is known. [redacted] explained the whole area is underlain with permafrost at 90m – 230m. There is no flowing potable water in the near surface. A well drilled near the Chance camp wasn't potable water. There were too many dissolved solids present and this made the water brackish (salty). The condition of the water is similar in the southern portion of the project area.

TH asked if there is natural seismic activity in the area. [redacted] explained there is some natural seismic activity, but that Chance hasn't been tracking it.

[redacted] added that the Yukon Government (YG) has been doing studies and tracking permafrost in the area. YG has been doing these surveys from around Blackstone creek to the border. [redacted] asked if YG's permafrost work has been focused on the Dempster corridor, or over the broader region. [redacted] explained climate change may have an impact on permafrost in the area, so YG has been monitoring it extensively over the broader region.

[redacted] explained that Palmer does permafrost work as well as geology and hydrogeology. Chance doesn't want to do exploration work in areas where loss of permafrost causes problems. Chance will stay on high ground where there is less permafrost and will avoid crossing creeks or working in valleys, where there is more permafrost, as much as possible. Horizontal Direction Drilling will be used from points of high ground to reach subsurface targets to reduce the surface impacts. [redacted] asked if that detail will be included in the project description. [redacted] responded that yes, those details will be provided, but that Chance must be careful with the language used. Chance has defined that they will stick to heights of land - not that they will stay on defined ridge tops - due to the geographic layout of the area.

[redacted] went on to say that Chance will limit the number of connection points to the Dempster Highway to control access for activities like hunting. Many of these details will be designed based on the feedback Chance receives. There could be road or trail networks developed in the back country to avoid sensitive areas and to reach geologic points. The trade off will be having more points of access along the Dempster Highway or more road/trail disturbance in the backcountry. [redacted] recommended that Chance ensure those types of details are recorded in the YESAB application.

[redacted] noted that further seismic work will help define some details and it is hard to be definitive with exploration work. The footprint in the early stages of the exploration program will consist of a winter trail, which might be turned into a road if the well is successful.

[redacted] asked if Chance has a definition of what makes a successful flow test.

[redacted] explained that extended flow tests assess how a well will perform. They allow Chance to determine the flow rate of the well and what the long-term recovery of the well will be like. Chance wants to be sure of the long-term recovery to understand the subsurface situation.

[redacted] commented that Chance's YESAB assessment is for exploration work, but flow tests would technically be production. [redacted] asked if that production would affect the scope of the assessment. [redacted] explained the flow tests are a testing method; they are not considered production.

[redacted] elaborated that if Chance goes into production there would be another assessment. Testing is part of the data set needed under the Yukon Oil and Gas regulations to justify the work. Facilities are needed to process the oil and production is a completely different process from the flow tests.

[redacted] added Chance needs data to understand how the reservoir will perform, which is derived from the flow tests.

[redacted] asked what kind of problems Chance foresees with the YESAB application and process, and noted that TH needs to plan their next steps so that they can provide feedback on the project.

[redacted] responded that Chance wants to minimize the amount of time spent going through YESAB, but that oil and gas discoveries may mean multiple YESAB submissions in the future.

[redacted] recognized that feedback is needed from YESAB to help scope the work. Chance has been putting together a list of things they want to do as part of the project, which includes the airport. [redacted] added that the airport and all associated development is hypothetical at this point.

Regarding the YESAB process, [redacted] noted that the Executive Committee has more resources for assessing a project like the one in question. Designated Offices have limited resources. YESAB has been clear the project will be more scrutinized during this assessment, there will be multiple steps throughout the process, and there will be plenty of information sharing and discussions.

[redacted] commented on the draft project proposal. In the proposal Chance referenced other jurisdictions to demonstrate the exploration process. [redacted] asked if those jurisdictions were referenced due to a lack of Yukon Oil and Gas regulations, or if Chance was just following the industry's best practices. [redacted] explained those jurisdictions were referenced to follow the best available practices. There is very little oil and gas work in the Yukon, so Chance has had to look to other regions like BC for appropriate examples.

[redacted] asked how First Nations and other organizations are dealing with wildlife and caribou concerns related to the project.

[redacted] responded that baseline data collection is ongoing. EDI has been doing wildlife surveys to collect baseline data on multiple species. Chance will be engaging First Nations, individuals, and the Porcupine Caribou Management Board to discuss wildlife and caribou. Project planning and assessment is at a very high level at this point, and the Porcupine Caribou Herd is considered a VC. [redacted] elaborated that most of the concerns Chance has heard about the caribou are focused on concerns related to increased access for hunting (i.e., increased hunting pressure). However, more information and feedback is needed to inform the VC assessment. G. Charlie added that Chance will be doing multiple workshops in Old Crow to gain that information from VGFN.

[redacted] explained that Hemmera and EDI will work together on community engagement focused on wildlife and the Porcupine Caribou Herd. EDI will finalize the data, and then together Hemmera and EDI will use the data for community meetings.

[redacted] mentioned that in the project proposal Chance mentioned 23 quarries and asked where those will be located.

[redacted] explained that Chance calculated the number of quarries by examining the project under the scenario of maximum infrastructure extent. In that setting, Chance looked at where and how many quarries would be needed, and that analysis gave the number 23. The actual number and location of the quarries would all depend on how the exploration program goes. Currently there aren't any points on the map for the quarries.

[redacted] noted there will be a high demand for construction materials for the project, on top of the YG's demand for gravel resources for the Dempster Highway. The Eagle Plains area is a high permafrost area so there is probably not a lot of gravel available. He wondered if Chance plans on collaborating with YG to avoid competing for gravel reserves. It would probably be in YG's interests to work with Chance to identify more gravel reserves in the area.

[redacted] and [redacted] explained Chance's demand for gravel will be unique to the project depending on the success of the exploration program. The gravel for the Dempster Highway was taken from along the highway right-of-way. For this project, Chance will have single lane roads with pullouts at certain intervals. The roads will be radio controlled and will have low traffic. The roads for the project will be about 1m thick and about 5m wide.

TH asked if Chance expects to have difficulties finding enough gravel for the project. [redacted] responded that Chance must ensure they are working with the right kind of material (for road construction) when sampling, however, there is adequate gravel in the area.

[redacted] inquired regarding the timeline for completing Chance's heritage work and Hemmera's Gap Analysis study and contacting the associated communities.

[redacted] explained Hemmera will have to get back to TH at a later date about the timeline for finishing the Gap Analysis. Nathan Aasman of Hemmera is working on completing the Gap Analysis so follow-up with him will be required. Hemmera might try to finish the Gap Analysis by the end of August. By that point, the data from EDI and Palmer should also be available. Hemmera and Chance can then initiate the next steps of the process.

[redacted] asked if engagement includes all VCs being considered as one package.

[redacted] explained Caribou will be one topic or VC, and Land Use and Heritage will be other VCs. Determining further VCs will depend on peoples' interests and the conversations Hemmera and Chance have with community members and First Nations. Hemmera will contact [redacted] about those VCs and about initiating the next step.

[redacted] commented that, informally, VG wants caribou to be its own VC, and there will be community visits specifically focused on the Porcupine Caribou Herd.

[redacted] asked how far TH Settlement Land is from the project area.

[redacted] presented the project area map and indicated that 10 km is the closest distance between the project area and TH Settlement Land. Chance will begin exploration work in the North, further away from TH Settlement Land. There won't be any overlap while the TH Settlement Land boundary is being finalized.

TH discussed the location of the TH boundary. TH mentioned Kris Statnyk, VGG's Intergovernmental Coordinator, may have more information on the boundary line, and that TH needs to identify specific landmarks along the boundary.

[redacted] noted she was told the TH Settlement Land border could change and asked if the border is in flux. [redacted] asked when Hemmera should expect to be able to update the project location map with the TH Settlement Land border.

[redacted] explained TH needs to verify the description of the boundary line, such as by land marks, but the line itself shouldn't move significantly. [redacted] is working on that file and is the person to refer to. [redacted] added that TH and VGFN want to get the border line finalized and the boundary shouldn't be very different from the 2015 agreement. It will just be a technical exercise of describing the border.

[redacted] asked how much of the historic data Chance can use for the exploration program, and wondered if the reservoir is mostly intact or if it is in patches.

[redacted] mentioned that data from the 1960's has a limited ability to support modern exploration work. Structurally the reservoir is fragmented, but hopefully not stratigraphically fragmented.

[redacted] commented that Settlement Land Parcels R-6A and R-8A were selected for economic development under the VGFN Final Agreement, and asked what the description is for R-49A. [redacted] initially R-49A was selected for Oil and Gas economic development. However, it is also an area used by the Porcupine Caribou Herd and impacts to the herd must be minimized.

[redacted] noted the scale of this project has similarities to work that was done from 1955 – 1973, when there were 25 or so wells in the project area, and the seismic work was split into two basins. There are about 38 or 39 wells in total, and four are Chance's. The current project has some similarities to that intensity, but it will take less time to drill wells using modern techniques and Chance won't be using sumps. [redacted] added that Chance's CEO [redacted] worked in Eagle Plains during the 1960's and 1970's so he is familiar with how things were done at that time.

[redacted] asked if Chance will be dealing with formation water during exploration work.

[redacted] explained that formation water should stay in the formation. If water is produced during the flow tests, it will be separated at the surface and then re-injected into suspended wells. [redacted] asked if there are regulations in the Yukon for that type of work, to which [redacted] responded there are, but

its unclear who the regulatory body is for deep subsurface water. It's uncertain if the Water Board will be involved yet. The Oil and Gas Committee and the Water Board still have to sort out who regulates the deep subsurface.

[redacted] asked if there is any part of the project that crosses into the NWT, and if the Mackenzie Valley Land and Water Board is involved at all.

Chance explained that the project is entirely in the Yukon so the Mackenzie Valley Land and Water Board is not involved. However, there is a NWT connection to the project via the Tetlit Gwich'in (TGC) Primary Use Area and Secondary Use Area with which the project overlaps.

[redacted] clarified that the TGC Secondary Use Area is a traditional use harvesting area, so TGC land rights are different from that of the Yukon First Nations. It is important to consider everyone's interests, but also important to make sure all involved parties are aware of who has authority.

[redacted] inquired regarding the roads and asked what Chance's plan is for assessing roads and conducting a basic survey. How will Chance deal with road impacts?

[redacted] explained Chance will be sourcing the building material and establishing the road design. Additional data is needed - after discoveries are made, Chance will know where roads are needed. Some information is available on the central portion of the area. Findings from Palmer will be available on permafrost and areas of risk. Geotechnical work will be done for sourcing material for road construction. Regarding road design, roads will be single lane roads with pullouts at certain intervals. The road will be 1 m thick and about 5 to 6 m wide, tapering to the base. Those dimensions multiplied by the length of the road will reveal the amount of material that is required. Access points will need to be determined based on feedback from the First Nations. Chance has an idea of the sensitivities, and the feedback received so far indicates that First Nations want fewer touchpoints to the Dempster Highway and a larger network in the back country. Having fewer connections to the Dempster Highway will allow Chance to better manage access and minimize the potential for increased harvest pressure.

[redacted]tated that road location and level of development would be dependant on the exploration program. Access control and successful decommissioning is the main concern associated with the roads. The Roads to Resources regulations are being made, which would help with planning this aspect of the project. However, those regulations may not be done in a timely manner regarding this project, so working with the communities is the best plan to follow at this point.

[redacted] mentioned that in the early stages of the project the roads will just be winter trails. The trails will need to be upgraded for extended flow tests if a discovery is made. Chance has successfully controlled access historically. One option to improve access control is to possibly use the Old Crow winter road. Crossing First Nation land adds a layer of control versus just going through public lands. In addition, depending how far away a well is from camp, an emergency shelter may be needed.

[redacted] noted VGFN land may be more appropriate to control access through Settlement Lands. Free infrastructure, such as roads, in Settlement Land has a cost-savings benefit to the First Nation.

[redacted] stated he hoped the Roads to Resources regulations are finished soon, and that it resolves the discussion about whether access is public or not. It will be late 2021 or 2022 before Chance can start work if things go smoothly, and it would be helpful if they have those regulations done by then. It would make Chance's role and responsibilities clearer in terms of controlling access.

[redacted] hoped that the Roads to Resources regulations are done soon as well. It is an issue that needs to be addressed. No legislation is holding yet, but he explained legislation and laws for Roads to Resources is needed to keep people accountable.

[redacted] asked if Chance has additional options for controlling access.

[redacted] explained Chance has had gates at entry points from the Dempster Highway that were effective. In the past Chance has only had winter trails, so has never had permanent access. Chance has never had someone get off the Dempster Highway and onto one of Chance's trails. The camp is also fenced and no one has ever accessed it.

[redacted] asked about the level of traffic on the Dempster Highway and how Chance calculates the volume of material or traffic that will be travelling on the Dempster for the project.

[redacted] explained that Chance will be bringing in food and fuel, so that provides the subsequent volume. Chance has operated the camp at capacity and has operated a deep well that required fuel runs. On a heavy day, that rig would use 15,000 L, which requires one fuel truck every three days. For the proposed project, the wells won't be as deep and smaller equipment will be used, so 15,000 L would be a maximum volume. A food truck comes to the camp once a week. Most staff members flew into Eagle Plains, but some of the locals drove to the camp. Therefor, the amount of traffic on the Dempster Highway for the project would be small.

[redacted] explained Chance supplies the camp with water from Glacier Creek and uses water from Eagle River for drilling. The project would require approximately one to two truck loads a day for water.

[redacted] asked if Chance will be using other materials such as hydrochloric acid (HCl) for the project. R. Wyman responded that yes HCl will be used, but very few truck loads will be required. Approximately one truck load a month would be needed to supply HCl.

[redacted] asked if Chance is operating on the water license of the Eagle Plains Hotel, and what volume the water license permits. [redacted] explained that Chance is secondary on the Eagle Plains Hotel water license. Chance uses Glacier Creek, Eagle River, and Ogilvie River. Chance will probably have their own water license under the land use permit. R. Wyman added Chance uses about 200 m^3 of water a day when the camp is at maximum capacity. Otherwise Chance uses 15-20 m^3 of water a day. [redacted] elaborated that Chance recycles the drilling water and uses water to make snow at the drill location, and the roads need to be iced in winter.

[redacted] stated that if Chance is using 300 m^3 of water for making snow and 300 m^3 for supplying camp, the maximum is 600 m^3 of water being used per day. Even at a maximum, the water usage won't be very high.

Chance discussed that they might have to go through the water board and will have to see what the water board decides is necessary. Chance has two years left on the water license so will need to renew it for the exploration program. The current water license goes to 2022. Chance will receive an update at the end of August 2019.

[redacted] asked what the duration of the updated water license is expected to be; if it isn't for a 10-year term, [redacted] asked if Chance will have to re-evaluate the exploration program. [redacted] explained the water license is already a five-year maximum, so Chance doesn't anticipate having to re-evaluate the program due to the duration of the water license.

[redacted] asked if Chance has baselines for air quality, emissions, and noise in the project area. [redacted] explained Chance has limited data on emissions. Chance uses natural gas to provide heat and fuel for mechanical requirements, and that extra gas is flared. Chance has discussed putting in monitoring equipment but hasn't developed a plan yet. [redacted] added that for the air emissions permit, the YESAB DO recommended monitoring a truck. However, this was expensive and was not required. There are no people living there to be affected and Chance will do air quality tests occasionally.

[redacted] noted that emissions monitoring could be part of Chance's climate change action plan by directly monitoring affecting emissions. [redacted] commented that there won't be a huge volume of emissions from the project, and that Chance is open to feedback on how to manage the emissions monitoring program.

[redacted] noted Chance's emissions will be below that of the gas plant in Whitehorse, where people live, so this project should be ok. Chance could compare this program to the Whitehorse gas plant as an example, as Chance's emissions would be much lower and are insignificant right now. A monitoring program would be valuable for tracking the level of emissions. Chance could design a monitoring program in the context of fish and wildlife since no one is living in the area. Factoring in the prevailing winds will also be a consideration.

[redacted] mentioned that there are shale outcroppings on the Eagle River. Organics in the shale are burning naturally and have been for about 20 years. There is lots of acid, such as Sulphur Dioxide (SO_2), being emitted from that burn. [redacted] used to go fishing in that area in the 1960s and 1970s, but there are no fish in that water now. The water is very acidic and its probably from that continued burning and releasing of acid. [redacted] noted that Palmer and Davis Lake also have a pH that is much lower than it was in the 60s.

[redacted] asked if there are any naturally high compounds in the water baseline data, or if some areas of the water shed have naturally higher (or lower) concentrations of certain compounds. [redacted] noted that sulphate is the most common naturally occurring element throughout the project area.

[redacted] asked if Chance has concerns about acid rock drainage and metal leaching (ARDML.)

[redacted] explained that the area's geology is composed of sedimentary rock, which does not pose concerns for ARDML. Chance will not be going into rocks with hydrothermic events. Chance doesn't know of any thermal events that will be present, but there are some data gaps and the answers depend on the exploration work.

[redacted] commented that a permit within a permit may be how the assessment goes with YESAB for this project. At the Executive Committee level, if mining projects were compared with oil and gas projects, the areas and regions are more defined in mining projects before this stage of assessment. There is lots of variability with this project and it is hard to nail down specifics. Chance might need permits for some aspects of data collection, which is why YESAB might want to take the approach of having a permit within a permit for this project.

[redacted] explained Chance began with a DO assessment and it got bumped to the Executive Committee level. Lot of questions about the project can only be answered by continued field work.

[redacted] noted the process is similar to placer and quartz mining. Exploration must always happen, and further details are a result of exploration work.

[redacted] commented that people are usually given longer permits for non-invasive exploration. Given that, [redacted] inquired as to why this project isn't being assessed at the DO level.

[redacted] explained that Chance tried submitting the project proposal at the DO level. Exploration for oil and gas is received differently from mining in the Yukon, so the DO approach wasn't suitable. [redacted] added that YESAB wanted to immediately jump to cumulative effects when discussing oil and gas exploration.

[redacted] noted that Chance met with the Executive Committee before writing the first draft of the Project Proposal to get some advice on how to proceed. The Designated Office's referral to the Executive Committee also provided six recommendations on further research that needed to be done on the project area and three of them were directly related to the North Yukon Regional Land Use Plan.

[redacted] suggested YESAB could be testing for a pre-screening process.

[redacted] commented that YESAB provided hardly any guidance on the project proposal. Chance is relying on Hemmera's experience to guide this process.

[redacted] asked if Chance has a timeline to receive additional feedback, such as feedback from heritage representatives. [redacted] responded that Chance will receive feedback up until the project proposal is submitted to YESAB. Chance has had little feedback so far but expects to receive a lot more feedback when the baseline environmental data is available.

[redacted] asked if there is any potential for some coordination with other First Nations. [redacted] noted it would be more efficient if the First Nations could coordinate and work together for giving feedback on the project. [redacted] explained TH can reference coordinating with the other First Nations when briefing council, but that it is up to them whether they take a collective or individual approach. The accord may provide guidance. It is typically in everyone's best interest to collectively work on larger projects.

[redacted] commented that YG recently held an Oil and Gas 101 course in Old Crow, and they expressed it was very helpful for VGFN's understanding of the process. [redacted] asked if TH has had that course offered yet. [redacted] noted that TH has not had the course offered yet. TH tried to organize the course for the summer but couldn't because of individual schedules. Now they are aiming to host the course in September 2019.

[redacted] mentioned VGFN has moved to discussing capacity funding and their benefits agreement, and Chance is looking at scheduling activities leading up to an expected proposal submission date at the end of January 2020. [redacted] asked if Chance should draft a schedule for their activities over the next few months to share with TH. [redacted] noted that an anticipated schedule of activities would be a good start. TH must discuss the capacity funding letter and framework further internally. Their discussion of capacity funding would be assisted with a detailed schedule.

[redacted] noted YESAB may require that Chance meet with TH Chief and Council and have public meetings. [redacted] asked that, if Chance gives TH a schedule, could TH let Chance know when those meetings could be done. S. Schafrik asked where in YESAB did they say Chance needs to meet with Chief and Council. [redacted] explained that it was verbally communicated to Chance. [redacted] asked if the meeting with Chief and Council is for Chance to present the project description, or for Chance to receive feedback on the project description. [redacted] replied both (i.e., presenting the project description and receiving feedback) would be appreciated, if possible. Chance wouldn't expect to receive immediate feedback from TH Chief and Council, but Chance wants to make sure all the steps are followed.

[redacted] mentioned that VGFN's Chief and Council want to be informed and FNNND's Chief [redacted] wants to participate.

[redacted] noted the timing will need to be discussed further to determine when to involve TH Chief and Council.

[redacted] noted that right now Chance and Hemmera are at a high level of scheduling and that the schedule will need to be narrowed down. [redacted] commented that once TH has the schedule delivered, TH can come up with a program of what activities need to be done internally.

[redacted] mentioned that engagement and consultation requirements in Legislation may not correspond well with internal processes. TH and Chance need to define what consultation entails for their relationship in their agreements and future documents. The two parties can come up with their own definition for how Chance and TH will engage as a part of the capacity funding plan. This may help avoid delays in consultation and would be more efficient.

[redacted] asked if there are any events in the TH community over the next five months that Chance should be aware of when developing the schedule. [redacted] stated that there are no events that are anticipated to conflict with the schedule. Chance should start with providing the schedule and further planning will proceed from there. The TH election in spring 2020 is the only major event, but that shouldn't affect engagement on this project. [redacted] commented that the schedule will assist with scoping TH's work, and TH will follow up once they have the schedule in hand. [redacted] mentioned that Hemmera and Chance should be able to have a defined schedule early September 2019. [redacted] stated TH can review the schedule after Hemmera delivers it, and then TH and Chance can meet again to discuss the next steps. [redacted] noted there will be strict protocols for engagement, and TH will follow-up about those protocols. Chance stated that Hemmera is responsible for the engagement program and will follow TH's guide.

[redacted] asked if Hemmera has a list of people they want to speak with. TH will also need to know the types of discussions Hemmera will be having and what Hemmera wants to learn. [redacted] replied that yes there are certain people that Hemmera wants to engage with. Hemmera can share that information via email. [redacted] added that Hemmera will share the interview guide that was developed for interviewing citizens and service providers in Old Crow. Some of the details would be different for TH, but it should give a good idea of what Hemmera plans on doing (at this point in time). [redacted] noted that the more detail the better so TH can understand what will be done. [redacted] stated that all of the interviews will be done anonymously through Hemmera.

[redacted] explained that consultation is built into the assessment process, but TH is more interested in time frames outlining what TH does at each step of engagement. A timeframe and a work plan will need to be developed to guide how TH and Chance will exchange information. YESAB has their own consultation process and TH and Chance should make their own consultation plan. TH just needs to be able to tell YESAB that they are satisfied with the consultation process.

[redacted] commented that he will be out of the office until mid September. Therefore, TH and Chance will be looking at mid to late September to meet again.

[redacted] noted that discussion is easier in person. It would work well if, for the next meeting, TH, Chance, and Hemmera could meet in Whitehorse. It would also be beneficial to have [redacted] at the meeting

in person instead of over the phone. Chance and Hemmera agreed that having the next meeting in Whitehorse was a good plan.

[redacted] mentioned she sent TH an outline of the Cooperation Agreement, and suggested they could fill out the sections together at the next meeting in Whitehorse. [redacted] agreed with annotating the Cooperation Agreement together at the next meeting and stated that the meeting should be focussed on discussing the capacity funding agreement and Cooperation Agreement.

Action Items/Next Steps:

Action Item	Responsible Party	Date Required
Hemmera and Chance will develop and share the schedule of activities leading up the YESAB project proposal submission	Chance/Hemmera	September 2019

Key Meeting Outcomes

Outcome	Responsible Party	Notes
Chance and Hemmera answered TH's detailed questions on the Draft Project Description and project proposal process going forward.	All	
Next steps for Capacity Funding and the Cooperation Agreement were discussed.	All	This will be a key agenda item for the next meeting between Chance and TH.

APPENDIX 2-D-09. June 17, 2020, Meeting Summary

TR'ONDËK HWËCH'IN AND CHANCE OIL AND GAS MEETING

PROPOSED WELL MAINTENANCE PROGRAM

Date: June 17, 2020

Location: Conference Call

Attendees:

Tr'ondëk Hwëch'in:

[redacted], Senior Advisor, Mining and Strategic Initiatives
[redacted], Land and Resources Manager

Chance Oil and Gas Limited:

[redacted] President
[redacted], VP Government and Community Relations
[redacted], Regulatory, Environmental and Community Relations Coordinator

Hemmera/EDI:

[redacted] Senior Environmental Specialist, Hemmera
[redacted], Human Environment Specialist, Hemmera
[redacted], Senior Wildlife Ecologist, Environmental Dynamics Inc.

Purpose and Objectives

The purpose of this meeting is for Chance to provide an overview of the proposed Eagle Plain Well Maintenance Project and to provide an opportunity for Tr'ondëk Hwëch'in to ask questions and/or provide any feedback with respect to the proposed project.

Meeting Discussion:

The meeting opened with identifying participants on the call.

TH added an additional agenda item for the end of the meeting: Capacity Funding.

TH provided a brief update on governance issues. Due to COVID-19 TH was unable to hold their election. A byelection for Chief is scheduled for end of July. Chance and Hemmera were instructed to include in-coming Deputy Chief [redacted] ([redacted]) in communications.

Chance applied to renew (for a period of 5 years) Permit 20 in March. Yukon Government should be in the process of consulting with First Nations at this time. If not renewed the permit will expire at the end of August. Permit 20 has a suspended well on it.

TH asked about well A-25 and what Chance intends to do with that well.

Chance explained that A-25 was never completed for production and is 1 of 4 suspended wells. This particular well may be a candidate for disposing of waste from other wells in the event of future potential Chance activities. Chance inspects all suspended wells every year as a part of their regular maintenance activities. However, this year, to continue the "suspended" status of these wells, Yukon Government has issued additional measures.

TH asked is Chance inspects wells every year, what additional information is Yukon Government asking for that is not already done by Chance.

Chance clarified that their annual activities look at surface infrastructure. The proposed maintenance project is looking at subsurface components. Yukon Government is requiring Chance to update some of the wells to meet current standards (i.e., cement full casing for wells that have been perforated). Chance clarified that, with respect to surface components, their annual maintenance activities have indicated that there are no issues. Chance then provided details on the proposed well maintenance project and timelines (see Project Description).

Chance and TH discussed the proposed project. Feedback from TH included:

- What problems could Chance expect during project activities?
    - With respect to potential problems sub-surface, Chance will forward that question to their engineering consultants and provide a response to TH. TH indicated that it would be beneficial to include potential risks and mitigation measures in Chance's Project Proposal. Hemmera confirmed that risks are being considered. Chance provided an example where project activities could be disrupted before maintenance activities even begin. For example, if winter 2020/2021 happens to be a low snow year. This will require alterations in project activities related to winter road construction. TH indicated that Management Plans will help Chance outline possible scenarios and help First Nations' review project activities and pre-empt questions from First Nations.
- Clarify in section 1.2.1 of Draft Project Description (affected First Nations) that even though project activities do not occur in TH Traditional Territory, TH are indirectly affected by project activities (e.g., increased traffic, impacts to wildlife in the region).
    - Chance and Hemmera indicated that the language in that section can be adjusted.
- Will there be a wildlife management plan? How will project activities be affected if wildlife, Porcupine Caribou, are in the area?
    - Hemmera indicated that Chance, Hemmera, and other consultants (e.g., Environmental Dynamics Inc.) are working on developing the rest of the project proposal. Including effects assessment sections and management plans. Environmental Dynamics Inc. indicated that they are working through the wildlife values now and their activities include mitigation measures and management plans. These components will be in the proposal and believe they can be shared with TH. TH stated that seeing drafts, especially prior to submission, would be ideal.
- Suggesting that Chance mention and consider potential impacts to 40 Mile Caribou Herd and Hart River Caribou Herd, in addition to the Porcupine Caribou Herd. While project activities may

not directly overlap the ranges of the 40 Mile and Hart herds, the ranges do come up to the Dempster Highway. As such, traffic through those ranges may impact the animals. E.g., particularly in a scenario when Chance may have to acquire water from different sources. TH highlighted that depending on the timeline for project activities, some areas in the region may have little to no traffic (i.e., even minimal vehicle activity may have effects). TH highlighted that it is good for Chance to explore these values and initiate these conversations now. Keeping in mind that communication now lays groundwork for future project proposals by Chance.

- Have traffic studies been done in the region?
    - Chance and Hemmera will dig into this topic. Recent Dempster Fibre Project may provide data on traffic in the region. Presence or absence of traffic data in the region could inform what baseline studies are conducted for Chance's future Executive Committee project proposal.

TH indicated that once Chance has additional materials (e.g., draft project proposal, management plans), TH can draft a workplan for their review which will outline potential need for capacity funding. TH will be in communication with other First Nations. When TH is aware of where and when there can be joint operations between First Nations, they will inform Chance.

Action Items/Next Steps:

Action Item	Responsible Party	Date Required
Provide TH an update on timelines for draft Project Proposal and additional project materials, in anticipation of sharing drafts with TH.	Chance/Hemmera	Week of June 23rd
Incorporate TH feedback (outlined above) into project proposal.	Chance/Hemmera	Ongoing

APPENDIX 2-D-10. Draft *2020 Annual Report Implementation of the Tr'ondëk Hwëch'in and Chance Oil and Gas Engagement and Communication Plan*

DRAFT 2020 ANNUAL REPORT

Implementation of the Tr'ondëk Hwëch'in and Chance Oil and Gas Engagement and Communication Plan

1.0 INTRODUCTION

This report demonstrates implementation of the *Tr'ondëk Hwëch'in and Chance Oil and Gas Limited Engagement and Communication Plan* (Plan) (see **Appendix A**) finalized on August 28, 2018. It summarizes discussions held between Tr'ondëk Hwëch'in (TH) and Chance Oil and Gas Limited (Chance) since the *2019 Annual Report: Implementation of the Tr'ondëk Hwëch'in and Chance Oil and Gas Engagement and Communication Plan* was submitted July 31, 2019. The purpose, objectives, and outcomes of each discussion are described below in order to fulfill the requirements of Ministerial Order (MO) 2018/42 (see **Appendix B**) issued to Chance on August 30, 2018.

2.0 BACKGROUND

The development of communications and engagement plans began with Order in Council (OIC) 2016/169. OIC 2016/169 required Chance to file a First Nations communication and engagement plan with the Minister of Energy, Mines and Resources in order to extend tenure on their northern permits: 0005, 0006, 0007, 0008, 0009, 0010, and 0011. Chance complied with OIC 2016/169 and received their tenure extension.

Chance subsequently received MO 2017/37 when applying for tenure extension on six of eight southern permits: 0012, 0013, 0014, 0015, 0016, and 0017. MO 2017/37 required Chance to revise, in consultation with affected First Nations, the consultation and engagement plan filed under OIC 2016/169. The affected First Nations listed in MO 2017/37 were Vuntut Gwitchin First Nation, Tr'ondëk Hwëch'in, First Nation of Na-Cho Nyäk Dun, Gwich'in Tribal Council, and Tetlit Gwich'in Council.

TH and Chance collaboratively developed their Plan through a series of in-person meetings and conference calls. Hemmera was retained by Chance in November 2017 to facilitate the development and completion of the communications and engagement plans with the affected First Nations and facilitated all discussions between TH and Chance.

TH and Chance submitted their finalized Plan to Minister Ranj Pillai on August 28, 2018. To satisfy its obligations under MO 2017/37, Chance filed a total of four communications and engagement plans. All four plans were approved by the Minister and Chance received a five-year tenure extension on the six southern permits.

A condition of the five-year tenure extension, issued via MO 2018/42, required that Chance submit annual reports summarizing actions taken to implement each communications and engagement plan.

See **Appendix C** for a map of Chance's current permits.

3.0 ENGAGEMENT AND COMMUNICATION PLAN IMPLEMENTATION SUMMARY

3.1 Summary

In the past year, TH and Chance have continued to build their relationship. Parties have advanced discussion in Chance's proposed Eagle Plains Exploration Project, Chance's proposed Eagle Plain Well Maintenance Project (see **Table 1**), and items outlined in Section 7.0 of the Plan (i.e., Adaptive Management of the Engagement and Communications Plan).

DRAFT

Table 1 Chance proposed projects

Project Name	Date Draft Project Description was Shared with VGG	YESAB Assessment Process	Anticipated Submission to YESAB
Eagle Plains Exploration Project	June 2019	Executive Committee Screening	Spring 2021
Eagle Plain Well Maintenance Project	May 2020	Designated Office Evaluation	July/August 2020

Between August 1, 2019 and June 30, 2020, Chance and TH have had one in-person meeting and exchanged informal phone calls and emails. The main themes of discussions between Chance and TH have been:

- Draft Project Description and scope of activities for Chance's proposed Eagle Plains Exploration Project
- Draft Project Description for Chance's proposed Eagle Plain well Maintenance Project
- Capacity Funding and Cooperation Agreement
- Proposal submission processes to Yukon Environmental and Socio-economic Assessment Board (YESAB)
- Tr'ondëk Hwëch'in Final Agreement
- Annual reporting requirements for the Plan

The correspondence between Chance and TH documented in the Engagement Log (see **Appendix D**).

3.2 August 12, 2019 – TH and Chance (In-Person Meeting)

Location: Dawson City, Downtown Hotel Boardroom

Attendees: TH Technical Staff, Chance Management, Hemmera

The purpose of this meeting was for Chance to provide TH with project updates and to answer questions TH might have with respect to the draft Project Description for Chance's proposed the Eagle Plains Exploration Project. Items also discussed were long-term capacity funding and a Cooperation Agreement.

Chance shared project updates including fieldwork that had been completed and/or planned for summer 2019. TH asked questions regarding road construction; required materials and construction activities (including quarries); site mapping; water use and licensing; air quality and emissions; and strategies for addressing wildlife concerns such as the Porcupine Caribou Herd. Chance and TH discussed these topics and Chance stated that they would provide more detailed responses once data was collected and analyzed from the summer field studies.

There was discussion regarding a Gap Analysis and a potential TH Heritage Resource Assessment. TH also asked about the factors affecting the socio-economic study. Chance stated that they were looking for more feedback from communities to inform this study and will seek community involvement from all affected First Nations through interviews, community meetings, and workshops. TH asked that when Hemmera was ready to conduct its socio-economic research that they provide a list of people they wish to speak with and what they wish to learn.

DRAFT

Topics also discussed were the Regional Land Use Plan, flow test logistics, access control to the site area, natural seismic activity in the region, and TH Traditional Territory boundary. A general timeline for project feedback, consultation, and YESAB proposal preparation was considered. TH stated that there were no events that are anticipated to conflict with the general timeline over the ensuing five months.

Both parties agreed that hosting the next meeting in Whitehorse would allow for more attendees to meet in person. Follow up agenda items for the next meeting were suggested to include collaborative annotating of a Cooperation Agreement and further discussion of a capacity funding agreement.

3.3 June 17, 2020 – TH and Chance Meeting (Conference Call)

Attendees: TH Technical Staff, Chance Management, Hemmera

The purpose of this meeting was for Chance to provide an overview of the proposed Eagle Plain Well Maintenance Project and to provide an opportunity for TH to ask questions and/or provide any feedback with respect to the proposed project..

Chance and TH discussed the proposed project. Feedback from TH included:

- Requesting additional information on what problems Chance could expect during project activities.
- Clarifying that TH are indirectly affected by project activities (e.g., increased traffic, impacts to wildlife in the region).
- Inquiring if there be a wildlife management plan, and clarity on how project activities will be affected if wildlife, Porcupine Caribou, are in the area?
- Suggesting that Chance mention and consider potential impacts to 40 Mile Caribou Herd and Hart River Caribou Herd, in addition to the Porcupine Caribou Herd.
- Inquiring if traffic studies had been done in the region

Chance and TH are currently reviewing the summary of this meeting to ensure it reflects both party's understanding. Additionally, Chance and Hemmera are working on follow-up activities in order to respond to TH's comments and continue discussions.

4.0 PLANS FOR ONGOING ENGAGEMENT AND NEXT STEPS

TH and Chance will continue to hold discussions at regular intervals as Chance develops its project proposals for YESAB. Upcoming engagement activities are expected to involve the following:

- Share data collected during 2019 Summer/Fall field season
- Proposed meeting with TH Chief and Council to present the Draft Project Description for proposed Eagle Plains Exploration Project
- Meetings between TH technical staff and technical consultants preparing the Project Proposal for proposed Eagle Plains Exploration Project
- Discussion on Capacity Funding to enable TH to engage on Chance's Project Proposals for the Eagle Plains Exploration Project and the Eagle Plain Well Maintenance Project
- Community consultation events in Dawson City for proposed Eagle Plains Exploration Project

DRAFT

5.0 APPROVAL OF IMPLEMENTATION SUMMARY

TH and Chance have reviewed this report and agree to its contents as an accurate summary of the engagement activities carried out between August 1, 2019 and June 30, 2020.

APPENDIX A

Tr'ondëk Hwëch'in and Chance Oil and Gas Limited Engagement and Communication Plan

DRAFT

Tr'ondëk Hwëch'in and Chance Oil and Gas Limited Engagement and Communication Plan

DRAFT

1.0 Introduction

Chance Oil and Gas Limited (Chance) is an oil and gas exploration company that holds permits to perform oil and gas exploration activities in the Eagle Plain basin of Yukon Territory, Canada. As part of Chance's exploration program, Chance seeks to develop engagement and communication plans with all the First Nations that are potentially affected by Chance's exploration program activities. Permits 15 and 17 fall partially within Tr'ondëk Hwëch'in Traditional Territory and Chance is seeking to engage Tr'ondëk Hwëch'in (TH) on its activities within these permits.

2.0 Purpose

This document serves as an Engagement and Communication Plan (Plan) to provide a mutually agreed upon framework to support collaborative and effective engagement and communication between Chance and TH now and into the future.

3.0 Relationship

Chance and TH will execute this Plan according to the following principles:

- Transparency and openness;
- Timeliness;
- Integrity;
- Adaptive Management;
- Mutual respect; and
- Working towards trust and understanding of one another.

4.0 Key Tr'ondëk Hwëch'in and Chance Connections

Engagement and communication between Chance and TH will be generally associated with the proposed work and potential effects associated with Chance's oil and gas exploration program and potential opportunities (via training, employment, contracting, and other community investments), as well as any topics or issues identified through engagement and communication associated with Chance's proposed activities. This section of the Plan identifies the key contacts related to these overarching engagement and communication themes. Key representatives involved in engagement and communication are expected to be as follows:

- Chief and Council;
- TH Government department officials and advisors;
- TH Business Development agencies;
- TH Citizens and communities at large; and
- Proponent Management and designated staff and advisors.

The table in the Schedule to this Plan lays out the key engagement and communication topics, in no particular order, and associated key contacts for both Chance and TH.

5.0 Engagement and Communication Methods

Chance and TH will employ the following engagement and communication methods for specific correspondence:

- In person meetings;
- Email;
- Letters;
- Sharing Power Point Presentations (to support in person meetings);
- Sharing reports and other documents (as requested and as required); and
- Telephone (teleconferences and less formal phone calls).

Engagement and communication methods that support general communication of Chance's activities are as follows:

- Chance newsletters; and
- The website for Chance Oil and Gas Limited.

Engagement and communication meetings will be executed in the following manner:

1. Chance or TH will request a meeting in writing to the other party according to the connections iterated in Table 1;
2. The parties to meet will develop the agenda collaboratively;
3. The party requesting the meeting will develop supporting materials (collaboratively, where possible), and share those in advance of the meeting; and
4. The meeting will take place in a mutually agreeable location.

The above general process applies to meetings with subject matter leads (Table 1) as well as meetings with Citizens and communities at large.

Through engagement with North Yukon First Nations, Chance understands that there are existing agreements between Tr'ondëk Hwëch'in, the First Nation of Na-Cho Nyak Dun, and Vuntut Gwitchin First Nation. In keeping with the relationship principle of mutual respect, Chance will work within any communications protocols or provisions existing or developed pursuant to these agreements, where applicable and as directed by TH.

The following documentation sharing and review protocols support the methods described above:

DRAFT

- Chance and TH will discuss and establish the confidentiality of meeting minutes in advance of each meeting; i.e. if a meeting is to not be included in the record that will be submitted to regulators and assessors, it is the responsibility of both parties to discuss and agree to this prior to the meeting beginning;
- Chance will take meeting minutes and send these to TH within two weeks via email. Within 30 days of receiving the minutes TH will review and make changes through tracked changes or another method agreed to by both parties. Should TH require more time to review the meeting minutes, TH will notify Chance by email within two weeks of receiving the minutes. The parties will agree on meeting minutes before such minutes become part of the record. No response by TH to Chance's email providing meeting minutes within the 30 days will be interpreted as general acceptance of the meeting minutes by TH, and no response by Chance to TH's email providing amended meeting minutes within 30 days will be interpreted as general acceptance of the amended meeting minutes by Chance;
- Action items and meeting outcomes will be logged during meetings and reviewed by both parties at the end of the meeting to ensure that there is general agreement on the list of actions and parties responsible for those actions. Chance will include the list of action items and meeting outcomes with the meeting minutes;
- Chance and TH will agree upon and use a password-protected file sharing platform to facilitate sharing of large files, such as Power Point presentations and reports; and,
- Should Chance or TH employ a third party for records development and management, the third party will follow the process iterated above for recording and providing meeting minutes.

6.0 Records Management

All information exchanged by Chance and TH is subject to a confidentiality agreement to be agreed upon in the future by Chance and TH.

Subject to collaborative review and the written agreement of both parties, Chance and TH consent to the disclosure of the following information to regulators and assessors for review if and when a potential project is assessed in the future:

- Meeting agendas;
- Non-confidential meeting minutes (finalized versions as described in section **5.0 Engagement and Communication Methods);**
- Invitee/Attendees lists and/or meeting sign-in sheets;
- Records log, which will include summaries of the following:
    - In person meetings;
    - Phone calls and teleconferences;
    - Incoming and outgoing emails between Chance and Chance's representatives and TH representatives;
    - Attachments to the above noted incoming and outgoing emails;

DRAFT

- Reports provided to TH by Chance and reports provided to Chance by TH for review and consideration for engagement and communication purposes; and
- Copies of Power Point presentations delivered by Chance to TH for engagement and communication purposes.

7.0 Adaptive Management of the Engagement and Communication Plan

Chance and TH will review and assess the effectiveness and success of this Plan on at least a 6-month basis.

Within 3 months of the Plan first being agreed to and implemented, Chance and TH will:

- as a first step, sign a confidentiality agreement as contemplated by Section 6.0 above;
- meet to check in on the progress made by both parties in implementing the Plan;
- develop a schedule for review of the Plan; and
- discuss the need for a long-term budget and a comprehensive formal capacity funding agreement to enable TH to participate in future engagement.

DRAFT

Schedule

Key Engagement and Communication Topics and Leads

Role or Subject Matter	TH Key Contact	Chance Key Contact
Project Lead	Sidney Schafrik, Senior Advisor, Mining and Strategic Initiatives (Sidney.schafrik@trondek.ca)	Greg Charlie, VP of Government and Community Relations (gcharlie@chanceyukon.ca)
Culture and Community (includes Indigenous Knowledge and Indigenous Land Use, heritage resources, social, health, and other "human environment" subjects)	Debbie Nagano, Director of Heritage (Debbie.nagano@trondek.ca)	Cindy Dickson Regulatory, Environmental and Community Relations Coordinator (cdickson@chanceyukon.ca)
Engineering and Geology	Sidney Schafrik, Senior Advisor, Mining and Strategic Initiatives (Sidney.schafrik@trondek.ca)	Richard Wyman, President (rwyman@chanceyukon.ca)
Environmental (includes water, aquatic environment, fish, wildlife, forest resources and other plants, and other environmental subjects)	Darren Taylor, Director of Natural Resources (Darren.taylor@trondek.ca)	Greg Charlie VP of Government and Community Relations (gcharlie@chanceyukon.ca) Cindy Dickson Regulatory, Environmental and Community Relations Coordinator (cdickson@chanceyukon.ca)
Opportunities (includes community investment, training, education, contracting, employment, and other business opportunities)	Sidney Schafrik, Senior Advisor, Mining and Strategic Initiatives (Sidney.schafrik@trondek.ca)	Mike Chernoff, Chairman/CEO (mchernoff@caribouca p.com); Richard Wyman, President (rwyman@chanceyukon.ca); Greg Charlie, VP of Government and Community Relations (gcharlie@chanceyukon.ca)
Agreements and Capacity Funding	Pat Titus, Executive Director (Pat.titus@trondek.ca)	Richard Wyman President (rwyman@chanceyukon.ca) Mike Chernoff CEO/Chairman (mchernoff@caribouca p.com)

DRAFT

APPENDIX B

Ministerial Order 2018/42

DRAFT

YUKON

CANADA

MINISTERIAL ORDER 2018/ 42

OIL AND GAS ACT

Pursuant to the *Oil and Gas Act*, the Minister of Energy, Mines and Resources orders

1 In this Order

"subject permit" means each of the following oil and gas permits held by Chance Oil and Gas Limited:

(a) oil and gas permit No. 0012,

(b) oil and gas permit No. 0013,

(c) oil and gas permit No. 0014,

(d) oil and gas permit No. 0015,

(e) oil and gas permit No. 0016,

(f) oil and gas permit No. 0017. « *permis visé* »

2 The renewal term of each subject permit is extended by five years (so that it ends on August 30, 2023).

3 The resulting total length of the initial term and the renewal term of a subject permit is 16 years.

YUKON

CANADA

ARRÊTÉ MINISTÉRIEL 2018/42

LOI SUR LE PÉTROLE ET LE GAZ

Le ministre de l'Énergie, des Mines et des Ressources, conformément à la *Loi sur le pétrole et le gaz*, arrête :

1 La définition suivante s'applique au présent arrêté.

« permis visé » Les permis suivants de pétrole et de gaz détenus par Chance Oil and Gas Limited :

a) permis de pétrole et de gaz nº 0012;

b) permis de pétrole et de gaz nº 0013;

c) permis de pétrole et de gaz nº 0014;

d) permis de pétrole et de gaz nº 0015;

e) permis de pétrole et de gaz nº 0016;

f) permis de pétrole et de gaz nº 0017. "*subject permit*"

2 La durée du renouvellement de chaque permis visé est prolongée de cinq ans, de façon à ce qu'elle se termine le 30 août 2023.

3 La durée totale d'un permis visé, y compris la durée initiale et la durée du renouvellement, est de 16 ans.

4(1) In this section

"first nations communications and engagement plan" means the plan filed under O.I.C. 2016/169 and revised in accordance with M.O. 2017/37. *« plan de participation et de communication avec les premières nations »*

(2) It is a condition of this Order that Chance Oil and Gas Limited must file annual reports with the Division Head, in accordance with subsection (3) and to the satisfaction of the Division Head, about the implementation of the first nations communications and engagement plan.

(3) For the purposes of subsection (2), Chance Oil and Gas Limited must file

(a) the first annual report on or before July 31, 2019, in respect of the period beginning on September 1, 2018, and ending on May 31, 2019; and

(b) each subsequent annual report on or before July 31 of each year in respect of the period beginning on June 1 of the preceding year and ending on May 31 of the year in which the report is to be filed.

4(1) La définition suivante s'applique au présent article.

« plan de participation et de communication avec les premières nations » Le plan déposé en vertu du Décret 2016/169 et révisé en conformité avec l'Arrêté 2017/37. *"first nations communications and engagement plan"*

(2) À titre de condition du présent arrêté, Chance Oil and Gas Limited dépose des rapports annuels auprès du chef de division, en conformité avec le paragraphe (3) et à la satisfaction du chef de division, concernant la mise en œuvre du plan de participation et de communication avec les premières nations.

(3) Pour l'application du paragraphe (2), Chance Oil and Gas Limited dépose :

a) le premier rapport annuel au plus tard le 31 juillet 2019, pour la période débutant le 1er septembre 2018 et se terminant le 31 mai 2019;

b) chaque rapport annuel subséquent, au plus tard le 31 juillet de chaque année pour la période débutant le 1er juin de l'année précédente et se terminant le 31 mai de l'année au cours de laquelle le rapport doit être déposé.

Dated at Whitehorse, Yukon,
~~Dc~~ August 30th 2018.

Fait à Whitehorse, au Yukon,
le August 30th 2018.

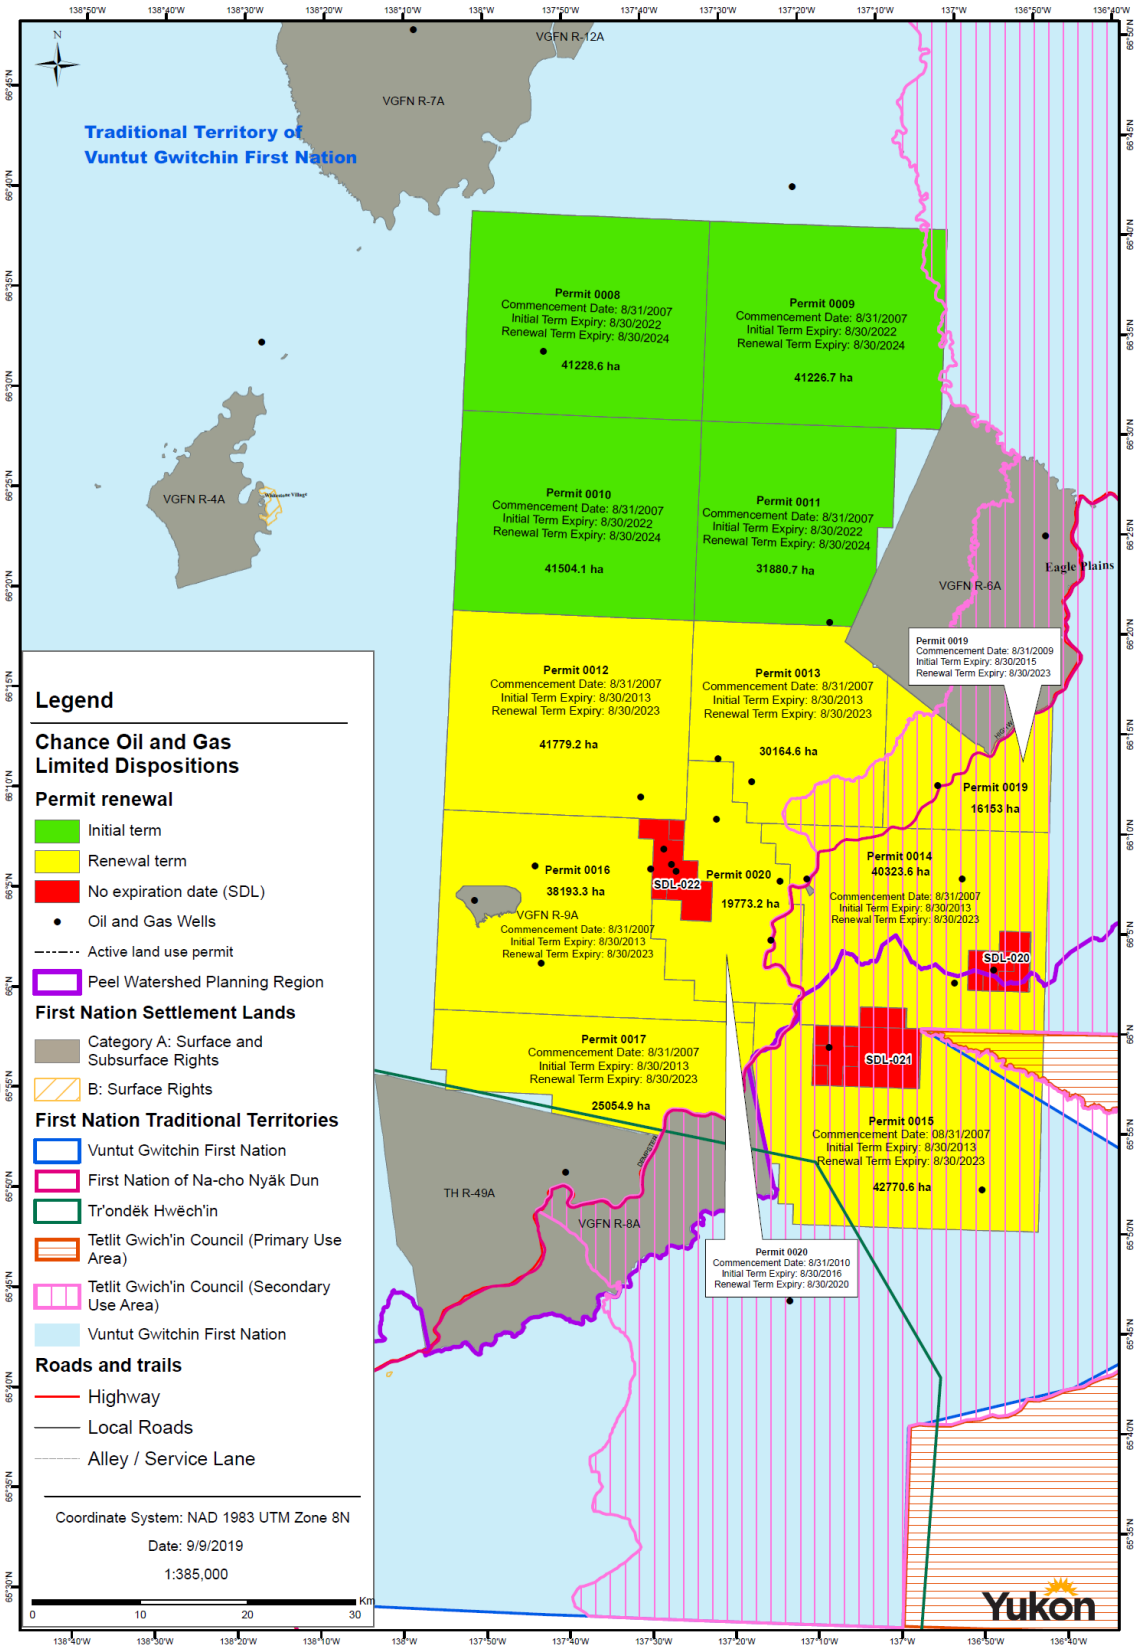
Chance Oil and Gas Limited Dispositions and Wells



APPENDIX D
Engagement Log

DRAFT

APPENDIX 2-D-11. April 27, 2021, Meeting Summary

TR'ONDËK HWËCH'IN AND CHANCE OIL AND GAS MEETING

Date: April 27, 2021

Location: Microsoft Teams

Attendees:

Tr'ondëk Hwëch'in:

[redacted], Senior Advisor, Mining & Strategic Initiatives

Chance Oil and Gas Limited:

Richard Wyman, President
[redacted], VP Government and Community Relations
[redacted], Regulatory, Environmental and Community Relations Coordinator

Hemmera:

[redacted], Human Environment Specialist (conference call)
[redacted], Business Leader
[redacted], Human Environment Specialist

Purpose and Objectives

The purpose of this meeting was for Chance to present a Draft Project Description of exploration activities proposed for the Eagle Plain Basin. Chance provided recent information and updates regarding baseline information gathered by consultants (Environmental Dynamics Inc (EDI), Peer Solutions, Palmer) and Parties discussed next steps with community engagement and consultation schedules for Tr'ondëk Hwëch'in (TH).

Meeting Discussion:

The meeting opened with introductions and a welcome.

[redacted]: Updates on the Eagles Plains Exploration Project, almost the same project as back in 2019, this presentation will highlight any changes that have happened since. Then we will go over next steps on developing the project proposal and community consultation and engagement schedules and preferences of the Tr'ondëk Hwëch'in Government.

[redacted]: This presentation will cover what has changed since sharing the 2019 project description. We have also undertaken a number of field studies, work on ecosystems characteristics, performed by EDI, permafrost processes by Palmer Environmental, and technical design by Peer Solutions. They worked on seismic activity, difficult terrain etc.

EDI had several teams go into the field in 2019 and 2020. They were looking at bird studies, seismic lines During the 50s to mid 80s there was 2D seismic activity. Then we did 3D seismic. Now, the footprint for seismic lines is much smaller today than 60 years ago. EDI looked at old seismic lines. If those lines get any sort of use from animals, if they are regenerating, if humans use them, etc. They have a good summary of this. EDI also did fish and aquatic studies. They are trying to find the types of fish and patterns. They obtained porcupine caribou information/data from the board. They have not finished their interpretation. EDI also visited quite a few spots and used lidar, which is a laser beam that is reflected off the surface, for land and ecosystem classification. Which is useful for determining access to sites. When you calibrate those images you get a pretty good snapshot of the area.

Palmer did a study to see where permafrost is active and visited those spots along with visiting spots that would make it difficult for access. They are going back to get geotechnical data. Palmer's work is substantially done. Aside from what would need to be done following regulation processes. All this information will be available to share with everybody.

Well maintenance work on suspended wells, this is now in the Designated Office (DO) undergoing assessment.

[redacted]: What has been done on the water side of things? With respect to baseline data collection.

[redacted]: Department of water resources is undertaking water samples over Eagle Plains. Other water stuff is more to gauge different orders of drainage. Where are we going to encounter fish? Where are fish over wintering? Are streams freezing solid? EDI has been investigating these items. They can share this when they give their presentation.

[redacted]: In general, easiest/best to just send this information through beforehand and then we set up meeting with consultants. I have no difficulties receiving this information without an initial presentation. Please feel free to send this along first.

[redacted]: Thank you, that's great feedback.

[redacted]: Is Chance still in legal litigation?

[redacted]: Still in litigation. Yukon Government (YG) is dragging it out.

[redacted]: What is the YG's definition of hydraulic fracking? What is your approach/definition? This will come up. There are many different forms. Clarification will be helpful to understand what the definition is – who is deciding this?

[redacted]: I do not think the litigation is going to decide this, or the threshold, or the technique – none of that is going to get decided by the courts. Our litigation is solely for compensation for approval of fracking before they set the moratorium.

[redacted]: If there are some references or standardized language that you would suggest, that would provide clarity throughout the YESAB process, please let us know. Any additional descriptions would be great if you have them handy.

[redacted]: I'm wondering how/of this could be boosted up to Panel. [S. Schafrik read an example] This is the definition from the European Union, who looked into this a few years ago, it's a good scientific definition. It implies all fluids are hydraulic fracking. Only jurisdiction that seems to have really defined it well. Yukon is very unclear, no one is happy with definitions so far. I would recommend that you put a lot of effort into what has been defined so far and how you are defining it – that is the difference between Executive Committee and Panel right there.

[redacted]: Huge difference between minor and large levels of the project up to the certain fluid.

[redacted]: The report, by the Joint Research Centre, titled an overview of hydraulic fracturing and other information stimulation technologies for shale gas production, the European Commission are the ones who defined it.

[redacted]: If it were shale, it would be permeability to flow to the well. We are hoping to get the focus off shale and to rocks that do not require hydraulic fluid. But you are right, there can be some chemistry in the rock system that still requires some fluid flow. Do they talk about a broad spectrum of techniques?

[redacted]: They do, it's water based, oil based, alcohol based. Pneumatic fracturing, mechanic cutting, and heating of the rock mass.

[redacted]: Moving on. Any updates from TH perspective?

[redacted]: In general, TH is still meeting with the Northern Chiefs Accord. They will be discussing these topics around mid-May. This is the only update that I can provide.

[redacted]: Ok, moving on to outline the project description:

Subset of exploration lands held by Chance, drilling up to 30 wells, 3D and 2D drilling. The footprint would be smaller based on modern techniques, narrow trails etc. Network of winter trails to seismic data. Alternate drilling systems use water-based, we can do something that is environmentally friendly enough to be disposed in the study area. If oil is discovered, longer testing needs to be done which would turn into longer development plans. The other part is to construct airstrip along the Chance winter trails. This could be elsewhere as well. Vuntut Gwitchin (VG) is interested in developing one nearby. Map overview hasn't changed since last time you saw this.

[redacted]: Do you have anymore idea about the chosen drill sites? Locating your targets more? This concern will continue to come up.

[redacted] The only data that we have on this is from 1960s data. We cannot put 30 spots on the map. We can only figure out approx. 2-3. Taking a phased approach. We need more seismic data, this would also happen upon discovery. There are different opportunities north to the south geologically. More rock as you move to the south west.

[redacted]: Permits 17 and 15 are going to be TH's particular interest. Water drainage systems are a concern to us. Both underground and above.

[redacted] Permit 17 is out of interest no to us.

[redacted]: Permit 15 goes into the Peel.

[redacted]: SDL 021 is in that area. Permit 15 has a natural gas discovery, dry gas. No liquids associated with it. Further south is more gassy and less liquid. Gas tends not to stay in liquid very long. Gas is also hard to commercialize due to little demand. We are preferential to oil.

[redacted]: One of the things we want to do for the project proposal, it's a big area, so we are hoping to develop a constraints map with Palmer, EDI, and the First Nations. We might not be able to put 30 X's on a map, but we might be able to narrow things down and create constrains. Like avoiding sensitive vegetation areas. Not working in valleys. Keeping to heights of land. Or using directional drilling. Our intention is to narrow it down to "best places" for well pads. Do you think that would be helpful?

[redacted]: That would help define exactly what is happening, having this generalized area makes it appear much more than it is. It would help visually. How is this project description area created? Particularly VG will want this information

[redacted]: We will be avoiding valleys, due to permafrost. The other component is horizontal directional drilling. We can reach/cover an area as much as 4-5 squared miles. You would not see much of a change in the surface operations.

[redacted]: What is the range for directional drilling?

[redacted]: Focused on depth, 1000 meters deep, you can get 2000-3000 meters horizontal reach.

[redacted]: Heritage resource studies?

[redacted]: This has been centered around 20km from the camp. Southern area has had more heritage work. May need more heritage work/projects in the northern project area.

[redacted]: Stantec, originally Matrix, did an archaeology study. We worked with VG citizens to do the archaeological assessments. We had consultants reach out to First Nations to add more Traditional Knowledge. We got our permits from Old Crow and the YG Heritage Department. There is going to be more updates on this going forward. We would love to have more feedback on this topic. To add into the project proposal. We got little from First Nation of Na-cho Nyäk Dun (FNNND), mostly from VG.

[redacted]: Sidney, you mentioned that TH would be interested in specific permits? Just 17 and 15? Was there a third?

[redacted]: More specifically, we are interested in the water systems in the area, affects to the dempster highway, and the caribou herds. The other stuff is up to VG since it is in their Traditional Territory.

[redacted]: A difference in the presentation today, is that is says up to 5 wells per year, that is the main change since the 2019 presentation. Which said 8 wells per year.

[redacted]: Does this change the manpower?

[redacted]: In this situation, where you could drill a 2500 m well, it would take more time. If we have 1 drilling rig and had a discovery, then we'd have to take more rigs in. This is hypothetical, will manage results as they come in. It could happen that we find something completely different than what drew us into the area. Allowing for flexibility in that reaction is not going to change what happens to the surface area.

[redacted]: Clarification on the number of rigs is important. The actual number of rigs you have is important. Will there be 30 1000m wells or 2500m wells versus 30 drilling rigs? That is a huge difference. Clarification will help.

[redacted]: Nothing much has changed here [R. Wyman referred to the presentation], sitting on higher ground is better for drainage and permafrost issues. Warmer weather up on the hill tops.

These are diagrams to give you an idea of the sub-surface. Our zones of interest are not any deeper than 2000-2500m. A 4000-5000m horizontal reach is quite significant the deeper you get. Extended flow testing cartoon on the right is not to scale. Both natural gas and oil is lighter than water, so they float. Chance wells back in the 1960s are similar to this.

[redacted]: There have been no changes to max numbers of wells.

[redacted]: Number of 20 is a wild guess based on if we have success.

[redacted]: What is the difference between exploratory and production? Thinking about the mining industry. When it comes to Extended Flow Testing, what is your categorization of success? What is the threshold on your decisions?

[redacted]: There is a number of factors on this, the deeper you go the more expansive. What is the discovery; is it liquid rich natural gas or is it dry gas or is it oil? This would make a difference. Also, a preliminary test to put packers on the zone of interest and conduct a flow and see what you get. This is what would make the decision. Bit of decision tree depends on what is the estimated cost of recovery, what is the discovery.

[redacted]: Decision tree on this would be helpful. Define the methodology on this and it will help people evaluate this project. When it's unknown then we assume the worst case on this. If I were with VG, I would really want to know.

[redacted]: One other influence that could affect this, is if we have a vertical well and encounter oil but have a slow flow. If the oil covers a larger area, it might be better if we drill horizontally to it. To get better flow.

[redacted]: Did you want to move on to the seismic exploration program?

[redacted]: Seismic program would be a maximum of / up to 1500km^2 of 3D and 2000km^2 of 2D. 3D will be helpful for the exploration expensive. Too shallow will mean seismic lines spaced too close to each other. We are probably not going to be able to do this all in 1 season. 2D could be done in 1 winter season. Only way to extend season is to push recording side into the summer. Bulk of it needs to be done in the winter. Helicopter flying the line, recording in the summer when caribou are unlikely found in the area.

Workforce in the camp. Drilling is 24 hours, seismic would be 10-12 hours a day. Any overflow in camp would be going to the hotel.

[redacted]: Look at Kudz Ze Kyah. The report on the social implications of the camp. Or the Coffee project. Taking a look at those reports can help you refine project descriptions, specifically for the camp A lot of work has been done lately on the sexual assault implications of a project; workforce wellbeing; vulnerable persons. This is something that can provide challenges related to the outcome of the conditions from YESAB.

[redacted]: We have policies for this.

[redacted]: It might be something you put additional work into. You see this stuff in a lot of the ExCom stuff coming out. Something to keep in mind.

[redacted]: There is not that much that has changed [R. Wyman referred to presentation.] Let's flip to timelines and next steps:

[redacted]: Chance has drafted internal engagement strategies. We were wondering if you were offering any guidance for TH – virtual or in-person meetings?

[redacted]: We are getting back into real engagement meetings. Timeline wise, we are not up to date on this. I need to get guidance/approval from Chief and Council first. Then we can come up with an engagement plan. Anything technical though that you have, send it through.

[redacted]: Our first package of information will be the revised project description. Following that will be the baseline studies. We'll send you those. Following that, there will be other thematic trips to talk to about wildlife and Traditional Knowledge and then water and permafrost. We have frontloaded EDI in the community engagement sessions. Palmer has been backloaded for the time being due to border restrictions. We can send you a tentative schedule of what we are thinking. You can take this to Chief and Council. Together, we can specify how we should be engaging with citizens vs NND government staff?

[redacted]: Direct engagement will be primarily required with community on caribou. Primary topic will be caribou. The Porcupine and Klaza herds. I'm working now with Chief and Council, but we naturally respect VG and Northern Chiefs Accord and they will discuss certain topics at the leadership level. This moves into capacity funding. For Wildlife, we do have technical teams available. I believe that this is going to become a joint item with northern Chiefs.

[redacted]: Existing agreement with Chance stands until Chance receives direct information from you?

[redacted]: Yes, moving forward that is the agreement. I am working on a budget and workplan. Once capacity agreement runs out, we can talk more.

[redacted]: Mentioned you would be seeking guidance from Chief and Council and northern Chiefs regarding engagement, do you have a timeline?

[redacted]: Aiming for end of May. When would you submit?

[redacted]: Late 2021 to submit

[redacted] I will still try to shoot for end of May, covid permitting. I'll be on vacation near end of May. Let's say 2nd week of June we have a catchup.

Action Items/Next Steps:

1. Hemmera to send Memo with tentative engagement schedule to TH.
2. Hemmera/Chance to send revised project description to TH.
3. Hemmera/Chance to send baseline information (EDI, Palmer, and Peer Solutions) to TH as it becomes available.
4. Hemmera to schedule meeting for 2nd week of June.

APPENDIX 2-D-12. Draft *2021 Annual Report Implementation of the Tr'ondëk Hwëch'in and Chance Oil and Gas Engagement and Communication Plan*

1.0 INTRODUCTION

This report demonstrates implementation of the *Tr'ondëk Hwëch'in and Chance Oil and Gas Limited Engagement and Communication Plan* (Plan) (see **Appendix A**) finalized on August 28, 2018. It summarizes discussions held between Tr'ondëk Hwëch'in (TH) and Chance Oil and Gas Limited (Chance) between June 1, 2020 and May 31, 2021. The purpose, objectives, and outcomes of each discussion are described below in order to fulfill the requirements of Ministerial Order (MO) 2018/42 (see **Appendix B**) issued to Chance on August 30, 2018.

2.0 BACKGROUND

The development of communications and engagement plans began with Order in Council (OIC) 2016/169. OIC 2016/169 required Chance to file a First Nations communication and engagement plan with the Minister of Energy, Mines and Resources in order to extend tenure on their northern permits: 0005, 0006, 0007, 0008, 0009, 0010, and 0011. Chance complied with OIC 2016/169 and received their tenure extension.

Chance subsequently received MO 2017/37 when applying for tenure extension on six of eight southern permits: 0012, 0013, 0014, 0015, 0016, and 0017. MO 2017/37 required Chance to revise, in consultation with affected First Nations, the consultation and engagement plan filed under OIC 2016/169. The affected First Nations listed in MO 2017/37 were Vuntut Gwitchin First Nation, Tr'ondëk Hwëch'in, First Nation of Na-Cho Nyäk Dun, Gwich'in Tribal Council, and Tetlit Gwich'in Council.

TH and Chance collaboratively developed their Plan through a series of in-person meetings and conference calls. Hemmera was retained by Chance in November 2017 to facilitate the development and completion of the communications and engagement plans with the affected First Nations and facilitated all discussions between TH and Chance.

TH and Chance submitted their finalized Plan to Minister Ranj Pillai on August 28, 2018. To satisfy its obligations under MO 2017/37, Chance filed a total of four communications and engagement plans. All four plans were approved by the Minister and Chance received a five-year tenure extension on the six southern permits.

A condition of the five-year tenure extension, issued via MO 2018/42, required that Chance submit annual reports summarizing actions taken to implement each communications and engagement plan.

See **Appendix C** for a map of Chance's current permits.

3.0 ENGAGEMENT AND COMMUNICATION PLAN IMPLEMENTATION SUMMARY

3.1 Overview

In the past year, TH and Chance have continued to build their relationship. Parties have advanced discussion on Chance's proposed Eagle Plains Exploration Project and Chance's proposed project for Well Maintenance and Extended Flow Testing. The following sections provide separate summaries of engagement activities that occurred for Chance's projects between June 1, 2020 and May 31, 2021.

3.2 Summary of Engagement – Well Maintenance and Extended Flow Testing Project

Initial notification was sent to TH on May 25, 2020. That package included a high-level overview of the project (e.g., project activities, components, goals, outcomes), the regulatory submissions Chance would be making, a brief introduction to Hemmera and its role, as well as a request to discuss any concerns the affected party may have and an offer to arrange a conference call should they so desire. Also included was a 4-page project summary and map of the project location.

A conference call was organized between Chance and TH for June 17, 2020. The purpose of that meeting was for Chance to provide an overview of the project and an opportunity for TH to ask questions and provide feedback on the project. During the conference call, TH requested to be identified as a potentially affected First Nation. While project activities will not occur in TH Traditional Territory, TH will be indirectly affected by activities (e.g., increased traffic, impacts to wildlife in the region). TH also requested additional information on the following themes:

- Potential risks associated with the project and identified mitigation measures
- The Project's Wildlife Management Plan and how project activities would be affected if Porcupine Caribou are in the area (possibly the 40 Mile Caribou Herd and Hart River Caribou Herd).

TH also recommended that Chance research the availability of traffic data in the project area and surrounding region. Knowledge of the available traffic data in the region would inform Chance on any additional baseline studies Chance may need to conduct for future project proposals.

At the time of the initial call between Chance and TH, no other materials were available (e.g., effects assessments, summaries of mitigation measures, management plans); however, Chance shared the draft project proposal with TH when it was completed on July 24, 2020.

Following additional conversations with the regulator (Government of Yukon), Chance was required to make changes to its project design. On August 7, 2020, TH was provided notice that revisions were being made to the project and that additional information would be forthcoming. A revised project proposal was provided, via email, to TH on August 28, 2020, along with a cover letter summarizing the revisions and providing a rationale for each.

Chance submitted an initial project proposal to Yukon Environmental and Socio-economic Assessment Board (YESAB) on September 11, 2020. However, after further consideration, Chance determined that additional changes were required. On November 2, 2020, via email, Chance notified TH that it had decided to withdraw its project proposal from YESAB and submit a revised version. In that email Chance stated that once a revised proposal had been drafted, Chance would notify TH by sharing a draft and requesting a meeting to discuss the changes further, and Chance stated at that time that after it had the opportunity to discuss those changes with TH, the project proposal would be finalized and resubmitted to the Dawson Designated Office.

The revised draft project proposal was provided via email to TH on November 19, 2020, and in that email Hemmera indicated that Chance would be submitting the proposal to YESAB the following day. On November 20, 2020, Hemmera informed TH that Chance would delay submission until the following week. However, to allow for additional revisions, the submission was delayed until December 24, 2020.

3.3 Summary of Engagement – Eagle Plains Exploration Project

Between June 1, 2020 and May 31, 2021, Chance and TH had only one meeting pertaining to the Eagles Plains Exploration Project.

3.3.1 Meeting Summaries

Date: April 27, 2021
Location: Microsoft Teams
Attendees: TH Mining & Strategic Initiatives Staff, Chance Management, Hemmera

Chance last engaged TH on the Eagle Plains Exploration Project in 2019 and the purpose of this meeting was for Chance to re-initiate engagement. Chance presented a high-level overview of exploration activities proposed for the Eagle Plain Basin. The presentation also highlighted any changes in project design that occurred since it had last been shared with TH in 2019. The presentation went over the layout of well sites, drilling methods, seismic program, and workforce. Chance also provided recent information and updates regarding baseline information gathered by Chance's consultants (Environmental Dynamics Inc (EDI), Peer Solutions, Palmer), and Parties discussed next steps regarding TH's preferences for community engagement and consultation (e.g., schedule, format).

TH asked about whether or not baseline information on water (surface and ground) was collected and that this topic would be of specific concern/interest to TH moving forward. TH raised that Territorial legislation is vague on the definition of fracking and suggested that Chance make efforts to address this in its project proposal. TH inquired as to whether or not Chance was able to identify the location of proposed well sites. Stating that this ambiguity in the project design is likely to raise concern. Chance stated that they likely cannot put more than 2-3 well sites on a map before additional seismic is completed. There was a discussion regarding the constraints map that Chance is developing with Palmer/EDI and the input of First Nations. Chance clarified the difference between exploration and production, and TH stated/recommended that Chance consider including a decision tree in its project proposal.

TH asked about heritage studies. Chance stated that they had previously completed heritage work and had worked with VG Citizens to do an archaeology assessment with permits from Old Crow and the YG Heritage Department. TH requested that Chance look into the social implications of a camp on the people and communities that may be involved or affected.

Chance and TH discussed community engagement strategies. TH stated that they are getting back into in-person engagement, but would require specific guidance from Chief and Council. Chance was to send the revised project description and baseline studies as they become available, as well as a tentative schedule for community engagement.

3.3.2 Communication Log

The correspondence between Chance and TH is documented in the Engagement Log (see **Appendix D**).

DRAFT

4.0 PLANS FOR ONGOING ENGAGEMENT AND NEXT STEPS

No additional engagement activities are expected for the Well Maintenance and Extended Flow Testing Project while it is undergoing YESAB's review.

TH and Chance will continue to hold discussions at regular intervals as Chance develops its project proposal for the Eagle Plains Exploration Project.

Upcoming engagement activities for the Eagle Plains Exploration Project are expected to involve the following:

- Sharing baseline data
- Meetings between TH technical staff and Chance's technical consultants preparing the project proposal for proposed Eagle Plains Exploration Project
- Community engagement events for TH citizens

DRAFT

5.0 APPROVAL OF IMPLEMENTATION SUMMARY

TH and Chance have reviewed this report and agree to its contents as an accurate summary of the engagement activities carried out between June 1, 2020 and May 31, 2021.

APPENDIX A

Tr'ondëk Hwëch'in and Chance Oil and Gas Limited Engagement and Communication Plan

DRAFT

Tr'ondëk Hwëch'in and Chance Oil and Gas Limited Engagement and Communication Plan

1.0 Introduction

Chance Oil and Gas Limited (Chance) is an oil and gas exploration company that holds permits to perform oil and gas exploration activities in the Eagle Plain basin of Yukon Territory, Canada. As part of Chance's exploration program, Chance seeks to develop engagement and communication plans with all the First Nations that are potentially affected by Chance's exploration program activities. Permits 15 and 17 fall partially within Tr'ondëk Hwëch'in Traditional Territory and Chance is seeking to engage Tr'ondëk Hwëch'in (TH) on its activities within these permits.

2.0 Purpose

This document serves as an Engagement and Communication Plan (Plan) to provide a mutually agreed upon framework to support collaborative and effective engagement and communication between Chance and TH now and into the future.

3.0 Relationship

Chance and TH will execute this Plan according to the following principles:

- Transparency and openness;
- Timeliness;
- Integrity;
- Adaptive Management;
- Mutual respect; and
- Working towards trust and understanding of one another.

4.0 Key Tr'ondëk Hwëch'in and Chance Connections

Engagement and communication between Chance and TH will be generally associated with the proposed work and potential effects associated with Chance's oil and gas exploration program and potential opportunities (via training, employment, contracting, and other community investments), as well as any topics or issues identified through engagement and communication associated with Chance's proposed activities. This section of the Plan identifies the key contacts related to these overarching engagement and communication themes. Key representatives involved in engagement and communication are expected to be as follows:

- Chief and Council;
- TH Government department officials and advisors;
- TH Business Development agencies;
- TH Citizens and communities at large; and
- Proponent Management and designated staff and advisors.

The table in the Schedule to this Plan lays out the key engagement and communication topics, in no particular order, and associated key contacts for both Chance and TH.

5.0 Engagement and Communication Methods

Chance and TH will employ the following engagement and communication methods for specific correspondence:

- In person meetings;
- Email;
- Letters;
- Sharing Power Point Presentations (to support in person meetings);
- Sharing reports and other documents (as requested and as required); and
- Telephone (teleconferences and less formal phone calls).

Engagement and communication methods that support general communication of Chance's activities are as follows:

- Chance newsletters; and
- The website for Chance Oil and Gas Limited.

Engagement and communication meetings will be executed in the following manner:

1. Chance or TH will request a meeting in writing to the other party according to the connections iterated in Table 1;
2. The parties to meet will develop the agenda collaboratively;
3. The party requesting the meeting will develop supporting materials (collaboratively, where possible), and share those in advance of the meeting; and
4. The meeting will take place in a mutually agreeable location.

The above general process applies to meetings with subject matter leads (Table 1) as well as meetings with Citizens and communities at large.

Through engagement with North Yukon First Nations, Chance understands that there are existing agreements between Tr'ondëk Hwëch'in, the First Nation of Na-Cho Nyäk Dun, and Vuntut Gwitchin First Nation. In keeping with the relationship principle of mutual respect, Chance will work within any communications protocols or provisions existing or developed pursuant to these agreements, where applicable and as directed by TH.

The following documentation sharing and review protocols support the methods described above:

- Chance and TH will discuss and establish the confidentiality of meeting minutes in advance of each meeting; i.e. if a meeting is to not be included in the record that will be submitted to regulators and assessors, it is the responsibility of both parties to discuss and agree to this prior to the meeting beginning;
- Chance will take meeting minutes and send these to TH within two weeks via email. Within 30 days of receiving the minutes TH will review and make changes through tracked changes or another method agreed to by both parties. Should TH require more time to review the meeting minutes, TH will notify Chance by email within two weeks of receiving the minutes. The parties will agree on meeting minutes before such minutes become part of the record. No response by TH to Chance's email providing meeting minutes within the 30 days will be interpreted as general acceptance of the meeting minutes by TH, and no response by Chance to TH's email providing amended meeting minutes within 30 days will be interpreted as general acceptance of the amended meeting minutes by Chance;
- Action items and meeting outcomes will be logged during meetings and reviewed by both parties at the end of the meeting to ensure that there is general agreement on the list of actions and parties responsible for those actions. Chance will include the list of action items and meeting outcomes with the meeting minutes;
- Chance and TH will agree upon and use a password-protected file sharing platform to facilitate sharing of large files, such as Power Point presentations and reports; and,
- Should Chance or TH employ a third party for records development and management, the third party will follow the process iterated above for recording and providing meeting minutes.

6.0 Records Management

All information exchanged by Chance and TH is subject to a confidentiality agreement to be agreed upon in the future by Chance and TH.

Subject to collaborative review and the written agreement of both parties, Chance and TH consent to the disclosure of the following information to regulators and assessors for review if and when a potential project is assessed in the future:

- Meeting agendas;
- Non-confidential meeting minutes (finalized versions as described in section **5.0 Engagement and Communication Methods);**
- Invitee/Attendees lists and/or meeting sign-in sheets;
- Records log, which will include summaries of the following:
    - In person meetings;
    - Phone calls and teleconferences;
    - Incoming and outgoing emails between Chance and Chance's representatives and TH representatives;
    - Attachments to the above noted incoming and outgoing emails;

- Reports provided to TH by Chance and reports provided to Chance by TH for review and consideration for engagement and communication purposes; and
- Copies of Power Point presentations delivered by Chance to TH for engagement and communication purposes.

7.0 Adaptive Management of the Engagement and Communication Plan

Chance and TH will review and assess the effectiveness and success of this Plan on at least a 6-month basis.

Within 3 months of the Plan first being agreed to and implemented, Chance and TH will:

- as a first step, sign a confidentiality agreement as contemplated by Section 6.0 above;
- meet to check in on the progress made by both parties in implementing the Plan;
- develop a schedule for review of the Plan; and
- discuss the need for a long-term budget and a comprehensive formal capacity funding agreement to enable TH to participate in future engagement.

Schedule

Key Engagement and Communication Topics and Leads

Role or Subject Matter	TH Key Contact	Chance Key Contact
Project Lead	Sidney Schafrik, Senior Advisor, Mining and Strategic Initiatives (Sidney.schafrik@trondek.ca)	Greg Charlie, VP of Government and Community Relations (gcharlie@chanceyukon.ca)
Culture and Community (includes Indigenous Knowledge and Indigenous Land Use, heritage resources, social, health, and other "human environment" subjects)	Debbie Nagano, Director of Heritage (Debbie.nagano@trondek.ca)	Cindy Dickson Regulatory, Environmental and Community Relations Coordinator (cdickson@chanceyukon.ca)
Engineering and Geology	Sidney Schafrik, Senior Advisor, Mining and Strategic Initiatives (Sidney.schafrik@trondek.ca)	Richard Wyman, President (rwyman@chanceyukon.ca)
Environmental (includes water, aquatic environment, fish, wildlife, forest resources and other plants, and other environmental subjects)	Darren Taylor, Director of Natural Resources (Darren.taylor@trondek.ca)	Greg Charlie VP of Government and Community Relations (gcharlie@chanceyukon.ca) Cindy Dickson Regulatory, Environmental and Community Relations Coordinator (cdickson@chanceyukon.ca)
Opportunities (includes community investment, training, education, contracting, employment, and other business opportunities)	Sidney Schafrik, Senior Advisor, Mining and Strategic Initiatives (Sidney.schafrik@trondek.ca)	Mike Chernoff, Chairman/CEO (mchernoff@caribouca p.com); Richard Wyman, President (rwyman@chanceyukon.ca); Greg Charlie, VP of Government and Community Relations (gcharlie@chanceyukon.ca)
Agreements and Capacity Funding	Charles Pugh, Executive Director (Charles.Pugh@trondek.ca)	Richard Wyman President (rwyman@chanceyukon.ca) Mike Chernoff CEO/Chairman (mchernoff@caribouca p.com)

APPENDIX B

Ministerial Order 2018/42

YUKON

CANADA

MINISTERIAL ORDER 2018/ 42

OIL AND GAS ACT

Pursuant to the *Oil and Gas Act*, the Minister of Energy, Mines and Resources orders

1 In this Order

"subject permit" means each of the following oil and gas permits held by Chance Oil and Gas Limited:

(a) oil and gas permit No. 0012,

(b) oil and gas permit No. 0013,

(c) oil and gas permit No. 0014,

(d) oil and gas permit No. 0015,

(e) oil and gas permit No. 0016,

(f) oil and gas permit No. 0017. « *permis visé* »

2 The renewal term of each subject permit is extended by five years (so that it ends on August 30, 2023).

3 The resulting total length of the initial term and the renewal term of a subject permit is 16 years.

YUKON

CANADA

ARRÊTÉ MINISTÉRIEL 2018/42

LOI SUR LE PÉTROLE ET LE GAZ

Le ministre de l'Énergie, des Mines et des Ressources, conformément à la *Loi sur le pétrole et le gaz*, arrête :

1 La définition suivante s'applique au présent arrêté.

« permis visé » Les permis suivants de pétrole et de gaz détenus par Chance Oil and Gas Limited :

a) permis de pétrole et de gaz nº 0012;

b) permis de pétrole et de gaz nº 0013;

c) permis de pétrole et de gaz nº 0014;

d) permis de pétrole et de gaz nº 0015;

e) permis de pétrole et de gaz nº 0016;

f) permis de pétrole et de gaz nº 0017. "*subject permit*"

2 La durée du renouvellement de chaque permis visé est prolongée de cinq ans, de façon à ce qu'elle se termine le 30 août 2023.

3 La durée totale d'un permis visé, y compris la durée initiale et la durée du renouvellement, est de 16 ans.

4(1) In this section

"first nations communications and engagement plan" means the plan filed under O.I.C. 2016/169 and revised in accordance with M.O. 2017/37. *« plan de participation et de communication avec les premières nations »*

(2) It is a condition of this Order that Chance Oil and Gas Limited must file annual reports with the Division Head, in accordance with subsection (3) and to the satisfaction of the Division Head, about the implementation of the first nations communications and engagement plan.

(3) For the purposes of subsection (2), Chance Oil and Gas Limited must file

(a) the first annual report on or before July 31, 2019, in respect of the period beginning on September 1, 2018, and ending on May 31, 2019; and

(b) each subsequent annual report on or before July 31 of each year in respect of the period beginning on June 1 of the preceding year and ending on May 31 of the year in which the report is to be filed.

4(1) La définition suivante s'applique au présent article.

« plan de participation et de communication avec les premières nations » Le plan déposé en vertu du Décret 2016/169 et révisé en conformité avec l'Arrêté 2017/37. *"first nations communications and engagement plan"*

(2) À titre de condition du présent arrêté, Chance Oil and Gas Limited dépose des rapports annuels auprès du chef de division, en conformité avec le paragraphe (3) et à la satisfaction du chef de division, concernant la mise en œuvre du plan de participation et de communication avec les premières nations.

(3) Pour l'application du paragraphe (2), Chance Oil and Gas Limited dépose :

a) le premier rapport annuel au plus tard le 31 juillet 2019, pour la période débutant le 1er septembre 2018 et se terminant le 31 mai 2019;

b) chaque rapport annuel subséquent, au plus tard le 31 juillet de chaque année pour la période débutant le 1er juin de l'année précédente et se terminant le 31 mai de l'année au cours de laquelle le rapport doit être déposé.

Dated at Whitehorse, Yukon,
~~Dc~~ August 30th 2018.

Fait à Whitehorse, au Yukon,
le August 30th 2018.

Subject	Draft Project Description Meeting
Prepared By	Two Worlds Consulting (TWC)
Groups Involved	Chance Oil and Gas Limited (Chance) First Nation Na-Cho Nyäk Dun (NND) Tr'ondëk Hwëch'in (TH) Environmental Dynamics Inc. (EDI) TWC
Participants	[redacted], Regulatory, Environmental and Community Relations Coordinator (Chance) [redacted], VP Government and Communication Relations (Chance) [redacted], Technical Advisor (TH and NND) [redacted], Regulatory Lead (EDI) [redacted], Senior Fisheries Biologist (EDI) [redacted], Engagement Facilitator (TWC)
Date/Time	August 3, 2023 8:30 AM – 9:30 AM
Copies to	Chance, NND, and TH

Purpose of Meeting

- Chance provided an Eagle Plains Exploration Project (Project) overview to Skeeter.

Topics Discussed

- Chance overview
- Project overview including information on exploration, design changes, baseline studies, regulatory process, schedule, engagement, proposed next steps

Key Issues Raised / Chance Responses to Issues

- Asked about availability of well abandonment service providers (i.e., future availability and anticipated service fees in the future).
    - Chance to inquire about well abandonment service providers (i.e., future availability and anticipated service fees in the future).
- Noted seismic impacts to predator-prey relationships had been a major objection from communities in the past.
- Inquired about outstanding Yukon Government directives.
    - Chance to follow up with Yukon Government about directives and confirm if anything is outstanding and then confirm with Nations when and how directives were or will be addressed.

Actions and Responsible Party

DRAFT

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

- Chance to inquire about well abandonment service providers (i.e., future availability and anticipated service fees in the future) – in progress.
- Chance to resend presentation to [redacted] – complete.
- Chance to send [redacted] 2D versus 3D seismic definition – complete.
- Chance to send [redacted] copies of primary socioeconomic baseline data and caribou baseline data – complete; Chance confirmed no socioeconomic baseline data was available to share at this time and that TWC has been engaged to draft the socioeconomic inputs of the draft Project Proposal.
- Chance to share linear features study with [redacted] – complete.
- Chance to check internal records to confirm receipt of [redacted] response to the 2022 Communication and Engagement Plan – in progress.
- Chance to follow up with Yukon Government about directives and confirm if anything is outstanding and then confirm with Nations when and how directives were or will be addressed – in progress.
- Chance to send meeting minutes to [redacted] – complete.
- Chance to send updated Project video to [redacted] – in progress.
- [redacted] to discuss information requests with leaderships from NND and TH and share feedback with Chance – in progress.

Details of Discussion

- [redacted] led a round of introductions.
- [redacted] introduced themselves.
- [redacted] shared he was attending the meeting on behalf of NND and TH. He previously worked as a land claims negotiator for the Yukon Government (YG) and other First Nations. He also worked on the drill floor for an exploration project.
- [redacted] said he is a senior fisheries biologist for the Project.
- [redacted] said she is supporting Chance in navigating regulatory requirements for the Project. This includes working with the Yukon Environmental and Socio-economic Assessment Board (YESAB) and the Project's consultants to submit a Project Proposal.
- [redacted] said the Project is the first oil and gas project going through YESAB. He shared that he was involved in writing the *Yukon Environmental and Socio-economic Assessment Act* (YESAA).
- [redacted] explained that [redacted] (Chance President) and [redacted] (Chance CEO) have been working together in the Eagle Plains area on oil and gas exploration for decades. He said 30 wells were drilled in the Eagle Plains area between 1959-1973. [redacted] shared that Chance has offices in Whitehorse and Calgary, and is a small company of approximately 5 people. [redacted] said oil and natural gas reserves were first discovered in the Eagle Plains area in 1958. Chance has focused on exploration activities to assess oil and gas potential in the Eagle Plains. More seismic and drilling is required to support this work. [redacted] said Chance wants to

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

be part of the Yukon energy strategy by providing oil and natural gas to Yukoners and businesses in the territory.

- [redacted] presented the Project's currently permitted area. He noted the Project falls within Gwich'in Tribal Council's (GTC) primary and secondary areas and Vuntut Gwitchin First Nation's primary area. He noted the Project area overlaps with the North Yukon Planning Region and Peel Watershed Planning Region (PWPR). Specifically, land use management zone 4. [redacted] acknowledged that the part of the Project area that overlaps with the PWPR is mostly in NND territory.
- [redacted] presented the proposed Project activities. He noted that Chance originally submitted an application to the Dawson City YESAB Designated Office (DO). The Project was referred by the DO to YESAB's Executive Committee in 2016. The referral was made after the DO determined that it was unable to assess whether the Project will have, or is likely to have, significant adverse environmental and socio-economic effects. Chance has been working on their Project Proposal for 9 years.
- [redacted] shared that Chance has completed seismic exploration across a 2500 sq km area and is proposing to drill up to 30 wells. This does not mean that Chance will necessarily drill 30 wells. The number of wells depends on the results from initial wells drilled. Drilling would be conducted during the winter, using a focused approach of approximately 5 to 7 wells per year. Good results will lead to extended flow testing of successful wells for 2 years.
- [redacted] shared the Project Proposal will include information on progressive reclamation.
- [redacted] presented the seismic program. He noted seismic will sometimes be done in the same location as the drilling.
- [redacted] asked what the difference is between 2D and 3D seismic.
- [redacted] responded that 3D is very dense and provides more detailed data.
- [redacted] asked if Chance would put the blasts closer together.
- [redacted] said the 3D seismic allows Chance to have a more detailed picture of the natural gas and oil reserves underground; similar to cutting a cake open.
- [redacted] followed up to ask if it's more how Chance is using the data that's different rather than the how Chance is obtaining it.
- [redacted] confirmed [redacted] understanding was correct. He noted the same method for 2D and 3D at the ground level. For example, there is a downhill target and both options support directional drilling.
- [redacted] asked if the data was being collected differently.
- [redacted] suggested Chance prepare and send [redacted] a plain language definition of 2D versus 3D seismic to support his discussions with leadership.
- [redacted] reviewed the use of the existing camp and proposed a remote camp. He noted the remote camp will have medical staff on site. He added that Chance is looking to build a winter airstrip to accommodate bigger aircraft to support crew changes, transportation of supplies, and emergency medivac if needed.
- [redacted] asked if Chance has received their water license yet.

DRAFT

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

- [redacted] confirmed Chance had not yet received their water licence. He shared the Project will also include a mix-bury-cover sumps and central processing facility. He noted the oil and gas will be sent to an approved site like Taylor, British Columbia for refinement.
- [redacted] said processing on site will create pure crude oil and that used water will be reinjected back to a regulator-approved zone. He added that oil gets trucked offsite. He said Chance will complete extended flow testing of the wells to understand the pressure, flow, and how many barrels per day the wells could yield as well as a reservoir analysis. [redacted] noted this data is just as important as seismic data [redacted] explained this part of the process will help Chance to understand the economic and production value of the oil and gas in the Project area.
- [redacted] said Chance's YESAB 2014 submission indicated that they wanted to build all season roads to the proposed drilling locations. Communities indicated they preferred not to see all season roads. In response, Chance's 2023 Project Proposal is focused on ice roads and 100% winter drilling. He noted camp operations would typically start in November/December and drilling would generally occur between December - March/April.
- [redacted] noted there are a lot of seismic lines in the Eagle Plains.
- [redacted] said the geophone data collection will be in spring and summer when the Porcupine Caribou Herd heads north.
- [redacted] added that seismic technology has changed over time, and noted the widths of rights-of-way are smaller than in the past.
- [redacted] reviewed how the current Project is different than the previously proposed Project, specifically, how Chance is looking to rebuild relationships and collaborate with First Nations, use low impact seismic, complete drilling activities only during the winter season, utilize the existing Project footprint and networks, spread activities across 10 years to minimize annual impacts and support steady employment, and use winter ice roads versus all season roads.
- Jennifer shared that many studies had been conducted since 2018 and are continuing this year, and noted Chance is trying to learn from past engagement and incorporate concerns. Jennifer presented completed baseline studies for terrain/surficial geology, permafrost, water quality and surface flows, fish and fish habitat, vegetation, wildlife (porcupine caribou, moose, American marten, grizzly bear, and birds), and heritage resources.
- [redacted] requested more recent caribou baseline information and primary socioeconomic baseline information.
- [redacted] said mapping has been completed across the whole Project area. That has been really helpful for the effects assessment. He also explained that Environmental Dynamics Inc. had completed a linear features study. They walked old seismic trails to get a feel for walking speed, how far you could see, etc.
- [redacted] said that is good because seismic impacts to predator-prey relationships had been a major objection from communities.
- [redacted] reviewed the regulatory process, and noted the Project was referred to the YESAB Executive Committee in 2016 and Chance is working on their Draft Project Proposal [redacted] said Chance was waiting for regulatory direction from YESAB on the Draft Project Proposal Table of Contents (TOC).

DRAFT

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

- [redacted] asked Chance to confirm that they had not gotten the TOC yet from YESAB.
- [redacted] confirmed Chance had not received a TOC from YESAB.
- [redacted] said they had all the information lined up and the First Nations told them not to come and do socioeconomic studies.
- [redacted] said he was not aware of that.
- [redacted] said the First Nations said no to meeting in 2019 and then the pandemic happened.
- [redacted] shared that Chance is hoping to submit an updated Draft Project Proposal on December 15th to YESAB.
- [redacted] said Chance is hoping to build trust in the communities and support their understanding of the Project. He noted the Project no longer includes fracking.
- [redacted] reviewed completed and proposed 2023 engagement activities.
- [redacted] asked [redacted] what NND's engagement preferences are. He asked if NND wants Chance to come to the community to conduct open houses and socioeconomic primary data collection. [redacted] said if NND prefers to defer engagement to Vuntut Gwitchin First Nation, Chance respectfully requests that deferral is made in writing to share with YESAB.
- [redacted] asked what level of involvement TH will have in the Project.
- [redacted] said Chance is legally required to consult all potentially impacted First Nations.
- [redacted] asked if Gwich'in Tribal Council has an interest in the Project and if the Project will impact their secondary use area.
- [redacted] confirmed the Project will impact Gwich'in Tribal Council's secondary use area.
- [redacted] suggested Chance follow the Yukon Oil and Gas Act, land claims, and North Yukon Regional Land Use Plan guidelines.
- [redacted] forwarded Chance's virtual meeting invite with YESAB on August 23, 2023 to [redacted]
- [redacted] asked what happens after the submission of the Project Proposal. He also asked what the referral process means and what are the milestones to accomplish to have an adequate submission.
- [redacted] said Chance is looking to get feedback from YESAB on the regulatory process for the Project. She added that Chance is trying to hit on the requirements and wants to submit a complete Project Proposal. [redacted] said Chance will append the baseline reports to the Project Proposal.
- [redacted] acknowledged YESAB is going through their own changes.
- [redacted] said Chance is open to meeting virtually as needed. Noted the logistical challenges of engaging in-person (e.g., lack of accommodation in Mayo).
- [redacted] asked Chance about three outstanding directives issued by Yukon Government to address old wells. He said the work has not been done and he had heard from the Yukon Government that Chance had yet to respond to the directives.

DRAFT

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

- [redacted] said one directive was to complete the consultation reports for the land disposition, and noted this year's reports were being submitted to Yukon Government that day. [redacted] said Chance did not receive responses on those reports for the last 3 years.
- [redacted] said he did respond to a previous consultation report for the land disposition.
- [redacted] confirmed they were meeting with Yukon Government that afternoon.
- [redacted] confirmed the Impact Benefits Agreement had been sent to leadership for signature. He also shared that NND is supporting the well maintenance work getting done as soon as possible.
- [redacted] explained that Chance's camp has a water system that treats water for cooking, bathing, etc. He said First Nations and Yukon Government want Chance to reassess the camp's wastewater management.

DRAFT

APPENDIX 2-D-14. December 20, 2023, Meeting Summary

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

Draft Meeting Minutes

Subject	Technical Working Group – Fish and Wildlife
Prepared By	Two Worlds Consulting
Groups Involved	Chance Oil and Gas (Chance) Environmental Dynamics Inc. (EDI) First Nation of Na-cho Nyäk Dun (NND) Porcupine Caribou Management Board (PCMB) Tr'ondëk Hwëch'in (TH) Two Worlds Consulting (TWC) Vuntut Gwitchin First Nation (VGFN) Yukon Government (YG)
Participants	**Chance Oil and Gas (Chance)** • [redacted], Community Engagement and Permitting • [redacted], Vice President Government and Community Relations **Environmental Dynamics Inc. (EDI)** • [redacted], Senior Biologist • [redacted], Senior Biologist • [redacted], Quantitative Ecologist **First Nation of Na-cho Nyäk Dun (NND)** • [redacted], Advisor **Porcupine Caribou Management Board (PCMB)** • [redacted], Executive Director • [redacted], Chair • [redacted], Minute Taker **Tr'ondëk Hwëch'in (TH)** • [redacted], Advisor **Two Worlds Consulting (TWC)** • [redacted], Engagement Facilitator • [redacted], Engagement Support **Vuntut Gwitchin First Nation (VGFN)** • [redacted] Technical Advisor **Yukon Government (YG)** • [redacted], Caribou Specialist
Date/Time	December 20, 2023, 8:00 to 12:00 am MST
Copies to	All groups involved

Purpose of Meeting

- To provide a Project summary and updates; and share results of Environmental Baseline Studies including preliminary potential effects and mitigation to Fish, Wildlife, Porcupine Caribou Herd, Linear Features, and North Yukon Land Use Planning Conformity.
- A question and answer period followed the information sharing.

Topics Discussed

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

- Project summary and updates
- Baseline Studies
- Effects Assessments
- Fish and Fish Habitat
- Wildlife and Wildlife Habitat
- Porcupine Caribou Herd

Key Issues Raised / Chance Responses to Issues

- Participants would like more detail about the Project Proposal and requested Chance to include all activities in the Project proposal. / Chance to review.
- Participant inquired about meandering seismic lines and how operators are informed about the design. / Chance confirmed that there is a design in place and that scouting will occur prior to the work, to understand the density of the forest and to optimize line locations.
- Asked if the Project videos are online. / Chance is developing a webpage.
- Requested more information on Chance's interpretation of disturbance. / Chance responded that key disturbance factors include noise, smells, and human movement/presence, and consider how far away caribou are from the well sites. Chance stated that disturbance is dependent on how the caribou are responding. Studies on Zone of influence are mixed, with various analytical methods, and depending on interpretation can range from no avoidance up to 40 kilometres of avoidance. There are many issues with analytical approaches that are scale dependent, and not often considered by those authors.
- The priority is to not disturb the caribou, but further work is needed to determine what is too much disturbance. Participants inquired about mitigations and if there is anything other than seasonality. / Chance responded that there will be mitigations in place, and there will be direct and indirect effects.
- A participant cautioned about using a 1-kilometrer Zone of Influence (ZOI), and believes the literature will reflect larger zones. Shared that he thinks Chance will have a difficulty finding that in the literature. / Chance responded that the primary reason for the buffer was because of sensory disturbance and that in larger ZOI assessments there is not a clear mechanism that is associated with the level of disturbance. Chance is focused on addressing local scale sensory disturbance within the work area, and that linear avoidance is assumed within the literature on ZOI's. The assessment applies a uniform 75% reduction across the 1-kilometre zone, which is a conservative (i.e., likely over-estimate) of the effect throughout the zone.
- PCTC (Porcupine Caribou Technical Committee) advised against doing the ZOI analysis based on low sample size (few caribou interacting with 3D seismic across the range). / Chance said that they could not ignore existing data and conducted the analysis regardless, and in the end did not rely on a 3D ZOI analysis as it was not conclusive.
- Participants expressed concerns about the ability of the Land Use Planning Council to review the Project for a conformity check, compared to the capacity of the North Yukon Commission. / Chance said that there are knowledgeable people on the council who have been there for a while. Shared that the North Yukon Commission no longer exists.
- Inquired about how Chance will be able to privatize a road. / Chance responded that the Chief Operating Officer can make it a private road. Said that that it is more of a safety concern, and that people are not interested in hunting around the drilling area. The company could grant access to subsistence harvesters, but this may create a safety concern for staff on site.
- Expressed concerns about the lack of communication between Chance and the Executive Committee. These conversations are important.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

- A participant shared concerns that their experience on drill projects, drill sites needed a 24-hour supply of water, which was trucked into the site. Unless technology has changed, that is one example of essential road traffic even if there are caribou in the area. Participant asked if the reduction would be sufficient or not. / Chance does not have the details on what is considered essential road traffic right now, but will include that in the Project Description.
- Participant requested an end of season report, to understand if caribou mitigation efforts worked and is concerned that this is not being considered. / Chance is interested in learning how the caribou are impacted, and that Chance will learn over the project lifecycle (10-year program).
- Participants encouraged ongoing in-person discussion outside of the YESAB review, which, through written format, can become hostile.

Actions and Responsible Party

- No actions.

Details of Discussion

[redacted] (Chance) gave a brief Project summary and added that [redacted] (EDI) would lead the presentation. [redacted] emphasized that the Project is a proposed exploration program and reiterated that the proposed submission of their Project Proposal is February 2024. Chance has been conducting virtual and in person engagement meetings. He mentioned First Nation of Na-Cho Nyäk Dun leadership currently does not want to participate in community engagement. Chance will continue to provide Project information and that engagement will continue with the First Nations and residents of communities. Chance will also share technical reports with First Nations. Chance is proposing a 10-year program.

The group shared a round of introductions.

[redacted] (EDI) stated the exploration area is around 2400 square kilometres, with clearing occurring during the winter and that it will be approximately 1500 square kilometres total of 3D seismic spread over 10 years. He added that there will be 2000 square kilometres of 2D seismic. [redacted] (EDI) noted that the Project is looking at up to 5 wells per year, equivalent to 2 hectares, and a maximum of 30 wells total. He stated that winter operations will last about 1 to 3 years in each area. He added that there will be three Project work areas and winter access roads will be created. He noted that there will be spring and summer seismic activities with helicopter support and extended flow testing. He stated that the seismic work is different than what was done in the 1950s.

[redacted] (Chance) added that extended flow testing occurs during the winter months and a well of interest will be flowed for natural gas and oil to a service rig. He shared that Chance will be abandoning 3 or up to 5 wells next winter.

[redacted] (PCMB) asked if the seismic testing will include installing and retrieving geophones, which was done previously.

[redacted] (Chance) said that it is new to Chance and that they use the same equipment from the seismic program in 2013.

[redacted] (PCMB) mentioned that he knew Chance was working on site.

[redacted] (Chance) stated that the geophones will be flown out when the snow and wildlife are gone in the spring. He added that if the caribou are hanging out, they can employ mitigation measures and hold off detonation and data collection until the caribou migrate north.

[redacted] (NND/TH) asked if this includes surface drilling.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

[redacted] (Chance) said that it would involves drilling a 3-to-5-meter hole, and the charge will be put down and repacked.

[redacted] (NND/TH) inquired if it was helicopter access and if Chance would be setting up a portable drill.

[redacted] (Chance) mentioned that the site is accessible by vehicle and that Chance would transport the drilling equipment. He added that Chance can hold off until late spring to detonate and take samples.

[redacted] (NND/TH) inquired if it was restricted access.

[redacted] (Chance) confirmed that it will be restricted access.

[redacted] (PCMB) stated that in 2013 there were caribou around. If caribou are around when Chance conducts work, will they hold off on the seismic activity?

[redacted] Chance) said Chance would hold off on detonation activities, but this needs to be discussed further. Chance will make these decisions as they occur and depending on how many caribou are in the area. [redacted] does not understand what the criteria is for this. In the baseline data being gathered for the technical review, there is the understanding that the caribou will migrate. He noted that Chance will go back to that location after the caribou move through. He stated that it depends on the number of caribou that are migrating in the winter range. Chance won't know until they do the field work and determine caribou movement through wildlife monitoring.

[redacted] PCMB) said that if there are caribou moving through the area, it won't be just one hundred in the Eagle Plains Basin. It will be a lot more caribou than that. This is what the collared data suggests.

[redacted] (EDI) noted that the Project team wants to have a good understanding of caribou movement. He added that protecting the lichen protects the herd. He noted that this is why activities are occurring in the winter to minimize the impacts. Seismic lines don't have to be straight anymore, and it is not the Project that was proposed in the past. This is a different seismic operation and that the key thing is that it will be spread out over 10 years.

[redacted] (EDI) presented the Baseline Studies Completed slide.

[redacted] (EDI) shared that the Project was bumped up to Executive Committee screening, which required Chance to do several studies.

[redacted] (PCMB) inquired about information on the Executive Committee.

[redacted] (EDI) said that it is a higher level of consultation and requirements. The Executive Committee reviews the Project.

[redacted] (Chance) said that they require additional data and baseline studies. The original Project went to the Yukon Environmental and Socioeconomic Assessment Board (YESAB) Dawson office and four out of six concerns came from it. These concerns put the Chance Project into a higher level of screening.

[redacted] (EDI) stated that field studies from 2019 to 2021 included: ecological mapping, linear features, fish, water, birds, and desktop studies that includes Porcupine Caribou Herd (PCH), moose, and martens. Chance wanted to do a linear features study to feed into the Land Use Plan (LUP) conformity check. He noted that the PCH are in the desktop studies because there is so much information available on them. He added that there were concerns about grizzly bears, but Chance doesn't have information on them.

[redacted] (EDI) presented the Effects Assessment Approach slide.

[redacted] (EDI) said there will be an impact on caribou, and we are assessing the significance of the effects. He added that Chance put the Environmental Assessment in the context of the LUP. He noted that there is more disturbance which is included in the Linear Features Study. The constraint maps help to develop scenarios to figure out future impacts. He noted that the spatial

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

scale is relevant to the species. He said that exploration programs typically do not trigger an Executive Committee review. He added that this Project is going through the same review as the Casino mine project. He said that there is enough concern that it triggered an Executive Committee screening. There are always questions about the Project. He stated that Chance can't do an impact assessment without confirmed sites, which is why the Project team is using scenarios.

[redacted] (Chance) stated that Chance is taking an ecological perspective. Chance is trying to do the Project in a sustainable way by using constraints mapping and studies. Chance knows where the Project would like to drill. Chance needs to design winter access that considers constraints and previous disturbances. The Project team has described this to the Executive Committee and to communities to understand that Chance is listening and modifying the Project Proposal. They are not drilling year-round, and Chance's approach is unique and hasn't been done in the Arctic.

[redacted] (PCMB) asked for clarification whether the Project team was talking about next steps in the permitting process and if they had stopped talking about drilling.

[redacted] (EDI) said seismic comes first to identify the drill targets.

[redacted] (PCMB) said drilling is part of the exploration program, but we are talking about seismic right now.

[redacted] (Chance) said that Chance will still have to drill but initially they must get the targets and do the seismic. He added that this is what will help us understand what kind of resources are out there.

[redacted] (PCMB) inquired as to whether seismic would give Chance that information.

[redacted] (Chance) responded that no, it won't. He added that once it is put in a controlled environment, seismic will be used to understand of the layers of rock formation, depth of it, and any anomalies. He noted that drill site locations will be determined in the seismic studies.

[redacted] (PCMB) questioned whether Greg believed seismic and drilling to be one and the same. [redacted] (Chance) stated they are indeed different, and that identifying drill targets requires the seismic work.

[redacted] (PCMB) said [redacted] (EDI) said the drill on the slide was unconventional.

[redacted] (VGFN) asked if the last step in the process is flow testing.

[redacted] (Chance) said that that is correct. Geologists have said there is a 10 to 20% success rate, which means that 3 of 30 wells or 6 of 30 wells may be successful. Currently they do not know how successful they will be, but that there is opportunity. He noted that the business plan is focused on local consumption and that the Yukon needs additional energy. He said that Chance needs to understand what kind of gas there is and flow it. He noted that the flow time is up to six weeks. Chance would like to understand what kind of gas there is.

[redacted]NND/TH) mentioned that even if heating oil is locally sourced, it would need to be refined down south and then shipped back up. To be a local supplier, Chance would still have to ship oil south.

[redacted] (Chance) said that oil would need to be shipped south during the flow tests, but that there is technology to be refined at the site, but that's not a part of this Project.

[redacted] (YG) said that natural gas flow testing would occur for 6 weeks to prove the resource and asked Greg how long it would be with oil.

[redacted] (Chance) said it would require two years for flow testing and that Chance would be awaiting recommendations from YESAB. He added that it is longer for oil than gas. He noted that when the pressure comes up, the oil is a heavier liquid. He said that it takes time to understand it.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

[redacted] (YG) inquired about how long it would need to flow for.

[redacted] (Chance) said that the Project is not able to flow test summer months as Chance does not have all season roads. If there are successful wells, then Chance will need to seek a permit for an all-season road.

[redacted]YG) said that he's trying to understand the level of disturbance and if Chance would have to turn off the tap and begin flow tests in the following year.

[redacted](EDI) stated that that is something that Chance will have to include in the Project description.

[redacted](Chance) said that winter activities will only be 4 to 5 months.

[redacted] (VGG) asked if flaring would occur during flow testing.

[redacted](Chance) said that yes that is why flow testing is shorter because it would include a minimum of 3 weeks of flaring.

[redacted] (YG) expressed concern about how the trucks would be staged up to get the oil.

[redacted](Chance) said that Chance could get him the information. There will be heated storage, and will include 400-barrel trucks to keep the crude oil in. He said that the oil will come into a station area and before it gets taken away, there will be separators. He stated that Chance will probably have to reinject produced water back down into the wells.

[redacted] (VGG) stated that there needs to be more details about the Project Proposal and what activities Chance is proposing. For example, what are the activities associated with flow testing so that it can be evaluated. He noted that if the detail is in the Project Proposal to start with it saves everyone time. Chance will review.

[redacted] (EDI) presented the Land Use Plan Context slide.

[redacted] (EDI) said there are differences between how it works. There is the Integrated Management Area Zone 4 and that this is where it is expected that development will occur in the area. This zone has a higher level of protection than other areas. Even though Chance is looking at development in this area, Chance is looking at a high level of environmental protection. He added that it is likely one of the highest levels of protection with protection covering 37% of late winter and 31% of the fall range.

[redacted] (EDI) presented the Low Impact Seismic slide.

[redacted] (EDI) said Chance will use meandering lines to avoid large trees and to make the lines of sight to be less than 70 meters. There will be small narrow mulchers used for the seismic lines (2.5 m), which will help to protect vegetation. There is low ground pressure equipment over at least 20 cm of packed snow/ice. The vegetation will be pushed over, not cut, which means a faster recovery.

[redacted] (YG) asked if that is 20 centimetres of snowpack.

[redacted] (EDI) confirmed that it is 20 centimetres of snowpack.

[redacted] (Chance) Chance wants 20 centimeters of snowpack for winter roads, and in Chance's mitigation section, it says Chance will strive to get 20 centimeters.

[redacted] (VGG) asked if there is a design in place for meandering seismic lines and how Chance will communicate this to the operator.

[redacted] (EDI) said that that is an excellent question and [redacted] is the expert.

[redacted](Chance) said that scouting will be done in advance to understand the density of the forest, determine the location, and design it based on that information. If there are dense trees on the south side, Chance will design it to go around.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

[redacted] (VGG) asked if Chance would design it.

[redacted] (Chance) responded yes, they go out and walk it before they design it. There was helicopter support in the past to scout areas, to avoid mulching and to decide where to mulch. He noted that Chance will get more information about the criteria.

[redacted]. (YG) said they are trying to avoid site lines from certain lengths.

[redacted](VGG) said that it is up to Chance to design meandering seismic lines.

[redacted] (EDI) said that is how it works operationally.

[redacted](YG) said aerial photos could be helpful.

[redacted] (EDI) noted that Chance does not have any high-definition photos.

[redacted] (YG) said that the Yukon Government has some photos.

[redacted] (EDI) presented the Linear Feature Disturbance slide.

[redacted] (EDI) said that there are indicator levels of linear disturbance. He added that cautionary is 0.75 kilometres/square kilometer and the Regional Study Area (RSA) is 1.79 kilometres/square kilometre (unadjusted), and 0.52 kilometres/square kilometres(adjusted). He said that if the 3D lines are removed, it could be down to 0.48 square kilometers. He added that the background isn't presented too much in the LUP. He noted that Chance is utilizing the cautionary level.

[redacted](YG) said this is all the discussion from the LUP process.

[redacted] (EDI) said that there is a lot of theory around it, and that is why Chance did a linear effects study.

[redacted](YG) said that the numbers came from the caribou work. He said that he was not at the table but talked to people, such as [redacted], after the plan was done.

[redacted] EDI) said that information came out of Alberta, for example, different land uses and species in the area such as wolves preying on moose rather than caribou.

[redacted] (YG) asked what Chance meant by vegetation recovery.

[redacted] (EDI) said that they used the tall shrub stage, which was 2 metres instead of 1.5 metres from the LUP.

[redacted] (EDI) added that the old seismic approach was to cut the vegetation down.

[redacted] (EDI) presented the Environmental Constraints Mapping slide.

[redacted] (EDI) said Chance intends to avoid heritage sites, permafrost/terrain sensitive areas, riparian management areas, priority ELC units, caribou habitat, and moose habitat. He added that directional drilling is good to avoid high quality habitat, another mitigation measure.

[redacted] (Chance) said that Chance needs to get surface distance between 1.5 to 2.0 kilometres. He said that the Project team could stay on top of the hill and still drill in the valley.

[redacted] (VGG) asked if the Project videos are online.

[redacted] (Chance) said that Chance is in the process of developing a webpage.

[redacted] (Chance) said that Chance wants to launch the website before the new year and the February 2024 submission.

[redacted] (EDI) presented the Well Site Scenarios slide.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

[redacted] (EDI) said that the well site locations are unknown. He added that Chance develops scenarios within constraints to the range of potential habitat effects. Chance develops scenarios based on Scenario 1 which is developed by the seismic team.

[redacted] EDI) presented the Project Interactions slide.

[redacted] (EDI) said that there will be direct and indirect habitat interactions. Direct being vegetation clearing and indirect such as sensory disturbance. He added that there are areas where the Project team will avoid human activity. He said that there will be an indirect and direct mortality risk, direct being vehicle collisions and indirect will be due to increased predator access. This is what YESAB brought up in the first review. Chance is trying to reach a balance in the assessment.

[redacted] (PCMB) inquired about Chance's interpretation of disturbance.

[redacted] (EDI) responded that key disturbing factors are noise, smells, and human movement/presence. He added that this depends how far away caribou are from the well sites. He noted, based on mixed results in literature using various analytical methods, some possibly erroneously, that disturbances could result in no avoidance and up to ~40 kilometres of avoidance. He said that it is dependent on how the caribou are responding to the disturbance.

[redacted] (NND/TH) asked if there would be something on the ground at whatever distance it is. He asked what mitigation is there. He added that the concern is not to disturb the caribou, but how much is too much disturbance. He asked if there were other mitigations other than seasonality.

[redacted] (EDI) responded that there is a mitigation. He added that Chance calls them direct and indirect effects.

[redacted] (EDI) presented the Porcupine Caribou slide.

[redacted] (EDI) said that the key resource in the LUP is the caribou. He added that the information that Chance presents on the caribou is far more descriptive than in 2013. He noted that it was important to characterize the caribou. He added that Chance must understand the caribou enough to understand interactions with the Project. He said that Chance can't avoid all locations, and that Chance has looked at potential effects on PCH habitat and movement. He said that when looking at mortality it is challenging to quantify. He added that Chance has looked at residual effects, which are effects that are left over after mitigation is applied and that cannot be addressed.

[redacted] (EDI) presented the Porcupine Caribou – Distribution slide.

[redacted] (EDI) identified the PCH-identified life cycle periods or seasons. He added that there are patterns of occurrence from 1970 to 2016, supplied by PCTC. He said that Chance is looking at rut and winter overlap. He added that there is no doubt that Chance will see the caribou and that they will likely show up some time during the 10 year operation, and when they do, they will show up in large numbers.

[redacted] (EDI) shared movement of the PCH after the 2013/2014 seismic program. He said that the PCH moved through the Project area in 2015. He added that there were 13,000 to 14,000 observations through the cameras. He said that it was evident that they had moved through there. He noted that this has not happened ever since. He said that he is unsure where the PCH are now in the winter.

[redacted] (YG) said that the time where it does split, they used winter ranges in Alaska recently. He added that the challenge is that the PCH may go to the same area for two decades and then never go there again. He noted that he has not seen them in the uplands for two decades but that is where they used to be. He said that it is common to see them overlap with the December range.

[redacted] (EDI) said that there could be richer detail to describe. He said that when the PCH do show up it will be a lot.

[redacted] (YG) said that they do not have detailed GPS data prior to 2015. He added that collared data did not start until 2012.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

[redacted] (EDI) added that before, there were different collars.

[redacted] (YG) confirmed that previously, the location was tracked every day versus now, where you can track every minute of their movement. He added that most survey work occurs during the summer periods. He said that they had late winter data to look at distribution.

[redacted] (EDI) presented the Porcupine Caribou – Movement slide.

[redacted] (EDI) stated that in 2015, caribou travelled through a network of 2D seismic lines, winter roads, and a large 3D seismic grid. He said that the PCH will probably show up in abundance based on the work Chance has done.

[redacted] (YG) said this is late winter data. He added that that is when distribution would be done.

[redacted] (EDI) said that this is why the Project went to the Executive Committee. He added that Chance doesn't know enough about the PCH in the winter. He said that in the baseline effects, the Project can compile that data. He shared that a lot of the information was not available to the Chance team. He noted that if Chance misses anything, that this is what Chance is looking for.

[redacted] (EDI) said that caribou occupy the RSA in less than 20% of previous years. He added that rut/late fall and winter seasons are considered the least biologically sensitive periods for the herd. He said that that doesn't mean that the Project team isn't treating them sensitively, caribou are just less sensitive during these times. Winter is the least sensitive period relative to all seasons. He said that protecting calving grounds is key. He added that this herd keeps going back and other caribou herds are quite different. He noted that, the PCH are in good health this time of year and less sensitive than other times of the year. He shared that this information came from the PCTC report.

[redacted] (EDI) said that they are looking at the movement rate of PCH and what will they be exposed to. He said that based on the PCH collared data, it is evident that they move through the area. He added that it is roughly 4 to 5 days in the rut and late fall or 15 to 16 days in the winter.

[redacted] (EDI) said that the analysis consisted of quantifying daily travel times. He added that Chance characterized the seasonal ranges by dividing the seasonal range into around 2500 square kilometres of cells. He said that after that, they compared the different travel rates and residency times. He noted that the Project can say that the RSA is around half in the late fall and there are about ten days less spent in the winter. He shared that overall, caribou are spending less time in the RSA when they are there.

[redacted] (EDI) said that this is why it is important to characterize what the caribou are doing in the area. He added that they seem to be moving through the area quickly.

[redacted] (YG) asked if Chance is characterizing that their residency will be half of when they are going into the area.

[redacted] (EDI) said that we calculated residency times as an average, and that we are making a relative comparison of residency in the RSA versus the broader seasonal ranges using the collar data. He said that when the Project team is making a comparison of residency times, they are seeing this much of a difference.

[redacted] (YG) said that he is unsure if he would base the data on the limited set of examples, but it does give a sense. He added he would be leaning more on to the seasonal range data (SRD). He shared that the residency of SRD is useful. He said that he would be careful saying that about collared data.

[redacted] (EDI) said that there will be a list of uncertainties in the Environmental Assessment.

[redacted] (EDI) said that the standard error is associated with the ranges. He shared that the seasonal range average is not directly comparable to the RSA and that he is not sure if the seasonal range residency time is the best average to use. He said

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

that the composition of the eco ranges is different. He added that they wouldn't expect the same amount of residency time in the RSA.

[redacted] (YG) said that there is a lot of data, around 50 years of movement data for the herd. He added that there is only GPS data for a decade, which isn't that much.

[redacted] (EDI) said that the Project team must move through with some level of confidence. He said that the Project talks about reversibility of effects and if it is reversible.

[redacted] (EDI) presented the Porcupine Caribou – Habitat Selection slide.

[redacted] (EDI) shared a recap of the methods and results for PCH. He said that they used a standard approach to developing these models and used a generalized linear mixed model. He added that it was a 1:10 used-available design. He shared that they are looking at interactions with lichens, and plant functional type layers (e.g., light microlichens, conifer, forbs, deciduous shrubs, graminoids, and evergreen shrubs). He said that it included elevation, slops, aspect, and distance to waterbodies. He added that they did random effects on the caribou year and did a 5-fold cross variation of model predictions. He added that they mapped RSF predictions across seasonal ranges.

[redacted] (EDI) said that they used selection ratios to identify the RSF prediction threshold where the proportion of used locations is greater than available. He added that this corresponds to selected habitat by caribou; these predictions considers the partial effects of all habitat covariates (rather than single covariate coefficients). He shared that they were able to identify four habitat ratings: high, moderate, low, and very low. He said that the selection threshold identified the split between high/moderate and low/very low and that the split between high and moderate was based on midpoint value, the same for low and very low.

A participant asked if this is describing the quality of the habitat or the ratio of use.

[redacted] (EDI) said that it is quantifying selection. He added that when Chance maps that, it has been classified as a habitat with high or moderate rating. He shared that it is selection, not use.

[redacted] (EDI) said that the moderate and high ratings are the areas associated with selected habitat. He shared that that corresponds to caribou using the areas more frequently than what would be expected by random chance. He added that the Project team chose the term 'selected' habitat and didn't want to use 'suitable' habitat because all habitats can potentially be suitable and used by caribou. He said that the habitat ratings are associated with higher macrolichen cover.

[redacted] (YG) asked what the Y-axis on the top graph said.

[redacted] (EDI) responded that it is the proportion of locations. He said that both figures show the same information in a different type of way.

[redacted] (EDI) presented the Caribou / Project Interaction – Review slide.

[redacted] (EDI) shared that the RSA overlaps with the PCH seasonal ranges. He added that the caribou occupy the RSA in less than 20% of years (or approximately 1 in 5 years). He shared that rut/late fall and winter seasons are considered the least sensitive periods for the herd. He added that the exposure period of individual caribou is expected to be 1 to 2 weeks. He said that Chance is looking at the assessment of criteria of seasonal habitats and that they were built into the LUP.

[redacted] (EDI) presented the Potential Habitat Effects slide.

[redacted] (EDI) shared that direct habitat effects refers to areas cleared of vegetation. He said that this affects 2% of selected rut/late fall and winter habitats within the RSA. He added that it affects 0.2% of selected rut/late fall and winter habitats at the Eagle Plains ecoregion scale. He said that the 3D seismic may not create a functional loss if lichen persists. He shared that it should not affect the lichen.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

[redacted] (EDI) shared that the indirect habitat effects refer to sensory disturbance. He added that they did a ZOI study that was applied around all disturbances. He said that they assumed a 75% reduced habitat effectiveness within a 1-kilometer ZOI. He shared that it is hard to quantify the area. He said that it means that there is a 75% chance that caribou are less likely to select the area. He added that annually, about 32% of the RSA experiences sensory disturbance and affects 23% of the selected rut/late fall and winter habitats within the RSA. He said that it affects 5% of selected rut/late fall and winter habitats at the Eagle Plains ecoregion scale. He added that it is a temporary effect which is reversed once activity stops.

[redacted] (YG) asked where 1 kilometre came from.

[redacted] (EDI) said that it is based on the permanent disturbance, which was their own zone of disturbance. He added that they looked to find a balance of something that was reasonable. He said that 1 kilometer seemed like a reasonable measure.

[redacted] (YG) said that activities like helicopter work and safety checks, cause greater disturbance than the mulcher. He added that he cautions using the 1-kilometer buffer. He shared that he thinks Chance will have a hard time supporting that in the literature.

[redacted] (EDI) said that the primary reason was to associate the ZOI with sensory disturbance. He said that in assessments where ZOIs were found to be large, there hasn't been a test or link to a clear mechanism that could lead to such large areas of avoidance. He argues that studies with large ZOIs often capture broad changes in a herd's range distribution rather than local effects of a Project. He added that this assessment is focused on local-scale sensory disturbance which covers the work area. He said that, in the literature, ZOIs are most often quantified as linear avoidance up to the ZOI threshold. This causes the average avoidance effect to be about halfway up the sloped line. He shared that, for this assessment, they applied a uniform 75% reduction across the 1-kilometer buffer.

[redacted] (YG) said there is a potential effect for the whole area. He asked how they could get this into more detail. He said they will be looking at it very closely.

[redacted] (EDI) said that they identified a 2- or 4-kilometre ZOI associated with the 2D seismic lines (including winter roads and trails). However, he stated that they identified attraction (rather than avoidance) to the 3D seismic grid. He added that the 2–4-kilometre ZOIs for historical 2D seismic are small in magnitude. Habitat effectiveness is reduced by 20–40% on the footprint itself, but the average reduction across the ZOI is much smaller.

[redacted] (EDI) asked what the sample size for the 3D seismic sample size analysis was.

[redacted] (EDI) said that he will have to circle back.

[redacted] (YG) said that the PCTC advised against doing that analysis.

[redacted] (EDI) said that Chance did not rely on a 3D ZOI analysis.

[redacted] (YG) said that it was raised. He added that it may or may not be the case, but they don't have the data.

[redacted] (EDI) added that it is not conclusive.

[redacted] (YG) said that's perfect.

[redacted] (EDI) said that Chance expects those comments to come up too and that's why the analysis is there.

[redacted] said that when you talk about all this data, so next year when you are doing the seismic, there is no additional effects to the PCH at that location.

[redacted] (EDI) said that there will be a leftover footprint. He added that there is a linear disturbance that brings in predators.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

A participant said that it seems reasonable for seismic activity, but then there is a well being drilled. They said that the ZOI would be much bigger based on that. They said that there is going to be less of an impact.

[redacted]. (EDI) said that the impact could be up to 1 kilometer, but Chance could revisit that and rethink the details of that too.

[redacted] (EDI) shared that it was 1 kilometer impact for everything sticking to sensory disturbance.

[redacted] (NND/TH) said that if the caribou are discouraged from using the ZOI and activity stops, that they came back through. He added that he doesn't know if there is any information on prolonged activity. He said that they are talking about several winters. He said that if there is a prolonged period of disturbance, he hasn't come across the information. He asked if there is any information on permanent discouragement of using the area, even after the mulching disturbance stops.

[redacted] (EDI) said that he would look at caribou near mine sites and the Central Arctic Herd and how they responded. He said that they looked it on a herd basis, but he is unsure if they respond well. He shared that work has been done on caribou response to roads, and other development. He said he cannot think of whether they responded to any well site. He said thinking about the development in Prudhoe Bay, there was work on the caribou's response to the road and pipeline. He added that they had deemed a 300-meter zone. He said that if it is not fenced off, the caribou will move through.

[redacted] (YG) said Heather did the most recent analysis on that, and their role is to do objective PCTC science. He said it is the calving and post calving information that has not been developed in the last 30 years. He added that it was around 5 or 6 kilometers. He said that it was a tundra environment and oil field, in the summer. He shared that there were many differences.

[redacted] (EDI) said that it is hard to make that comparison of linear disturbance in Alberta to Eagle Plains. He shared that a caribou response to a single well site would need a wealth of data. He said that there are forty well sites out there.

[redacted] YG) said a camera on the well site would be good.

[redacted] (EDI) said that if you look at an oil rig and the caribou herd are going through, there is a clear answer to that.

[redacted] (VGG) asked if the linear thresholds Chance talks about, are based on the proposed linear disturbance.

[redacted] (EDI) said that that is why the planning commission did their own effects strategy.

[redacted](VGG) asked if Chance has talked to anyone at the Yukon Government about cumulative effects or linear features.

[redacted] (YG) said one of the linear things that was discussed was that the threshold is 1.5 meters of wooded vegetation. He added that they just don't know.

[redacted] (Chance) said that the last direction that Chance got was from [redacted] office when she was Deputy Minister and that the challenge is that the environmental groups are challenging the Yukon Government because the proponent is responsible to go to First Nations to work with them to get their permission on conformity checks. He asked if the proponents are responsible for making communities understand the effects.

[redacted] EDI) said that at the community level during our meetings, it has not been a topic of discussion.

[redacted] (VGG) said that it's coming up in another process around cumulative effects. He added that he is curious as it sounds like a lot of that work was based on studies from Alberta. He asked what the underpinning of the analysis is and if there is other information that is new to him.

[redacted] (EDI) said that Chance looked at the line of sight, travel speeds, visibility, and different levels of regeneration. He added that the Project team wanted to inform the planning commission.

[redacted](Chance) said that when Chance made the original submission, their understanding was that the Land Use Planning Council was working with them. He stated that they were told that Chance must figure that out and convince any other affected

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

parties. He asked how Chance does that work. Chance completed what it was required to do based on what was agreed to. He said that it is basically an EMR (Energy, Mines, and Resources) office that is just trying to figure it out. He shared that Chance is confused on who will oversee the old studies and disturbance that didn't occur from Chance/Northern Cross.

[redacted] (EDI) added that Chance did their own studies of effects. He added that that is how Chance came up with adjusted numbers.

[redacted] (NND/TH) said that he's come across concerns about the Land Use Planning Council not having the background that the commission has. He added that this is a compounding factor. He said that the council doesn't have a knowledge of history that the commission developed under the treaty, and that the council doesn't have the background to consider a project. He said that there are concerns about the council being capable of having a reliable opinion.

[redacted] (Chance) said that Sam is at the council and has a lot of knowledge and has been there for a while. He shared that there is no North Yukon Commission now.

[redacted] (YG) said that he is interested in talking about mitigations. By focusing on if the herd is coming through, it minimizes the issue. What happens when they do come through. It may be important to get information from the PCTC or Mike Suitor from the Yukon Government. If you hear caribou are coming your way and will be there in 3 days, what will the response be to that data.

[redacted] (EDI) said that they will get into that. He added that the monitoring part is an important part of the assessment.

[redacted] (EDI) presented the Potential Movement Effects slide.

[redacted] (EDI) said that there will be local movement effects such as reduced crossing if there is traffic on roads and seismic lines. Effects to seasonal movements or migrations are unlikely. Long distance movements will mostly be in fall and do not overlap with the bulk of Project activities. Short residency times and fast movement rates through the RSA and caribou travel through network of linear features in the RSA.

[redacted] (YG) said that pertaining to the effect of harvesting activities, there are areas where similar work has been done. A similar migrating effect can be seen and that it is possible that it may change a migration pattern. He said that he doesn't want to discount it.

[redacted] (Chance) asked what the probability is of that occurring.

[redacted] (YG) said that he is unsure exactly. He added that in 2015 it almost happened.

[redacted] (Chance) said that it is easy to tell that they go along the Dempster Highway.

[redacted] (YG) said that humans are travelling the same way the PCH like to because it is the easier travel. He added that it is a scenario that could occur, and it shouldn't be discounted.

[redacted] (PCMB) said that if looking at the probability, what's going to be in place with the PCTC, the people, and what is the plan to respond.

[redacted] (EDI) said that Chance will note it. He asked if it is going to stop them from entering the work area. He stated that Chance is assuming a 75% probability. He said that he is not trying to downplay the potential effects, but it is only an exploration project.

[redacted] (YG) said that YG has programs that shut down for 2 to 3 weeks when the herd hits.

[redacted] (EDI) said that that will certainly happen. He said that the Project team can't operate with thousand caribou around us. He added that it will affect their localized movement.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

[redacted] (EDI) presented the Potential Mortality Effects slide.

[redacted] (EDI) said that direct effects are vehicle collisions, but this is low risk on access roads and seismic lines. He said that by restricting the road, it won't be public access. He stated that the indirect effects are predation and hunting. He added that linear features might give more access to humans.

[redacted] (NND/TH) said that the resource road regulation on the Territorial Roads Land Act should give Chance permission to make the road private. He asked how Chance can use it as a private road. He asked if under the Oil and Gas Act they would be able to say it is a private road. He asked if Chance has had that discussion.

[redacted] (Chance) said that the Chief Operating Officer (COO) can make it a private road. He said that it is more of a safety concern, and no one wants to hunt around the drilling area. He added that it is one thing to give the access to an Indigenous harvester, from a safety point of view there is an issue around the work area buffer.

[redacted] (NND/TH) asked if the COO has the capability to give Chance a private road.

[redacted] Chance) confirmed yes and that they have had a COO do it before.

[redacted] (EDI) said that any predator wants easier access. He shared that it would have a temporary effect, limited to annual work areas where activities pack the snow on linear feature. He added that there aren't resident caribou in the Project area compared to other herds. He said that it is hard to conceptualize.

[redacted] (YG) said that he has seen people using the seismic lines. He said that there is no real monitoring of it. He stated that on predation, it is a different scenario. He shared that it is complicated because there are migratory wolves. He added that the question is if the herd has a major decline. He said that it is being anticipated sooner or later but they don't know.

[redacted] (EDI) said that there is uncertainty around mortality effects. He shared that it is more around Indigenous access, but Chance doesn't know how to move around that.

[redacted] (YG) said that the affected harvest on ZOI basically has a double effect.

[redacted] (EDI) said that as soon as the Project increases predation risk, there will be an increased effect. He added that it is important to increase local awareness there.

[redacted] (YG) said that this can be dealt with in the Project Effects Assessment.

[redacted]. (EDI) said that there is no harvest policy other than the Indigenous Rights to Harvest.

[redacted]. (EDI) presented the General Protection Measures slide.

[redacted] (EDI) said there is environmental constraints mapping to reduce habitat loss. Chance will stay out of this area when caribou are coming. There will be a limited annual footprint, reducing sensory disturbance. There will be access management to reduce mortality risk. People will probably use the winter access. He shared that he doubts that individuals will use the 3D seismic access.

[redacted] (YG) agreed that people likely won't use it as well.

[redacted] (EDI) shared that low impact seismic will help to reduce habitat loss and has been developed over the years. He added that there will be a maximum width of 2.5 meters that will retain ground vegetation. There will be speed limits in place to reduce mortality risk. He emphasized the importance of worker awareness, including reporting any sightings. There will be a caribou interaction response plan. He asked if there is an information database that Chance can use to understand weekly migration patterns.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

[redacted] (YG) said that the YG is trying to get a database in place. He shared that the PCTC updates their website and YG does the updates as they can. He said that the YG has a regulatory meeting that often changes things.

[redacted] (EDI) asked if YG will tell them when the caribou are coming.

[redacted] (YG) said that some companies are required to contact YG on a schedule. The other more likely scenario is just paying attention to the herd. He said the Chief of Mine and Land Use provides emails and the YG provides weekly updates after that. He shared that YG has been doing it for 5 years and it is working well.

[redacted] (EDI) said that there is flexibility with the seismic operation and that it will be Chance's bad luck. He added that Chance can't move the seismic and once a drill is spinning, the Project team can't stop.

[redacted] (NND/TH) said that it is possible to stop the drill.

[redacted] Chance) said that when driving, risks of potential impacts are increased. He added that there are speed controls, traffic controls, and the only traffic would be wildlife monitors.

[redacted] (EDI) said anything that is necessary.

[redacted] (NND/TH) said there was a constant of bringing water in with big trucks when he worked at the mine sites.

[redacted] (EDI) said that once the drill is going, it is not stopping.

[redacted] (PCMB) said that a caribou action response plan has potential, and he knows PCMB would be interested. He said it would be great if Chance could get their caribou information from PCMB and PCTC. He added that it would be good to see something established. If Chance is responding to caribou interactions, it would be nice to have a plan established. It would make sense if there was official communication linkage to be notified. These communications could establish a cooperative protocol. He added that this could help PCMB study the herd.

[redacted] (EDI) said that he wouldn't be able to develop that independently.

[redacted] (Chance) said that he agrees with getting the real data.

[redacted] (YG) said there will always be redundancy on this, and YG is trying to figure that out. He added that there are ways to do it. He said that the challenge for using satellites to track is that there could be several thousand caribou that don't have collars.

[redacted] (EDI) said that he agrees that it is only a small portion.

[redacted] (YG) said that there are 110 collars on the caribou.

[redacted] (EDI) said there is a level of warning from local monitors. He added that there will be a balance of reported observations, onsite. He shared that Chance would have to do aerial surveys.

[redacted] (YG) said there is no need for aerial surveys. He added that it can give you a sense of what you are dealing with and that they did that in 2013.

[redacted] (PCMB) said that it makes her think about how PCMB could help. If there are wildlife monitors around, it would be great to get regular updates on what they are observing. She added that if there is a situation where several caribou are coming to the Project area, the PCMB has connections to the Porcupine Caribou communities to get the word out. PCMB can help communicate things to bring show that we are engaged and that communities can be confident that Chance and PMCB are working together and sharing accurate information. PCMB wants the communities to be comfortable with what is happening. She added that there is the opportunity to look at the PCMB and Chance engagement as a very positive thing.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

[redacted] (EDI) said that this could be something to work on. He said that he agrees on collaboration and that aerial surveys during operation will be good. He shared that he thinks that the project can operate safely. He said that a lot of this relies on the observers being there.

[redacted] (NND/TH) said that with an existing drill site, and caribou in the area, Chance won't be able to shut down the drill. He said that the idea being that traffic could be reduced. He doesn't know where the water is coming from for the drill. He said that in past projects, there was a 24-hour supply of water from the water source to the drill site. He said that unless technology has changed, that is one example of traffic that can't be stopped if there are caribou in the area. He asked if the reduction would be sufficient or not.

[redacted] (EDI) shared that Chance doesn't have the details on what is considered essential road traffic right now. He shared that 5 vehicles a day sounds manageable.

[redacted] (YG) said that his issue is that there are no communications occurring with the Executive Committee. He said that it is important to have these conversations. These conversations will greatly increase Indigenous relations.

[redacted] (PCMB) said that the PCMB represents PCMB from the PCMB Agreement parties. She said that the PCMB isn't a decision-making board, but they can provide input to regulatory processes and review processes. She added that the PCMB knows trust is important with communities and when working with groups that are willing to go over and above what is specified in regulatory decisions. When the PCMB knows that there is an interest in building that trust, if anyone is looking at building positive relationships, it must be a collaborative process. There needs to be transparency and a willingness to work together no matter what the information may be. It is important for PCMB to do that and that the PCMB wants to work together. It is reasonable to say Chance can't shut down a well in production if there is a conversation ahead of time. If they know about these concerns in advance, there could be something in place that incorporates Traditional Knowledge that would address the communities' concerns. She shared that when caribou come and you can't shut down the well, the PCMB knows that that is reasonable, and they can support that. The PCMB can help with mitigation around that. She said not to underestimate the trust with PCMB and that the PCMB wants to work with Chance to do a good job of this. She shared that what happens with the Project will last in people's minds.

[redacted] (NND/TH) said that even if the PCMB aren't a decision maker, they are important.

[redacted] (EDI) said that the next step is mitigation. He said that he has seen a change in the approach by Chance. It comes down to the communication aspect and the seismic program is flexible.

[redacted] (YG) said regarding the effects monitoring piece, that looking at developing a couple of well-focused designs would be helpful. He said that if the exploration project is successful, Chance will get towards a development stage and there won't be any data.

[redacted] (EDI) said that to determine if mitigation is successful, Chance will have to do an experimental approach.

[redacted] (NND/TH) said that they do a report at the end of the season, to understand if it worked. He is amazed that this is not being considered.

[redacted] (EDI) said that this is a 10-year program, and it is Chance's opportunity to learn. He added that Chance wants to understand what the caribou do.

[redacted] (YG) said that the collared data is one scale.

[redacted] (EDI) said that it makes sense to put in effects monitoring.

[redacted] (YG) said that he is happy to work with Chance and discuss with PCTC to provide input. It is going to have to be a collaborative approach somehow.

Calgary, AB T2R 1L5

APPENDIX 2-D-15. Open House Flyer

OPEN HOUSE

June 18, 2014

4PM - 6PM YOOP Hall

SNACKS WILL BE SERVED

Northern Cross (Yukon) Limited is hosting a series of information sessions across Yukon to present its plans for the next phase of exploration activities at Eagle Plains. These information sessions are open to the public to attend.

Using information obtained from the recently concluded 3D seismic program, the next phase of exploration activity is planned to be a targeted exploration drilling program. The format of the Open House will be a formal presentation by representatives of Northern Cross followed by a period of questions and answers. The entire management team at Northern Cross will be participating at the Open House in Dawson City.

Attention: [redacted] **Senior Advisor – Mining and strategic Initiatives**

Dear [redacted],

Re: DFO License Application Notice

The purpose of this letter is to provide notice to Tr'ondëk Hwëch'in (TH) of the intention of Environmental Dynamics Inc. (EDI) to submit an Application for a *License to Fish for Scientific, Experimental, Education, or Public Display Purposes, Under Section 52 of the Fishery (General) Regulations.* Chance Oil and Gas Limited (Chance) has contracted EDI to perform fish studies, among other environmental studies, within the project area described in the Draft Project Description delivered to TH on June 11, 2019.

The fish studies are scheduled to take place from July 1, 2019 to July 10, 2019 pending approval of the DFO license. Please see attached for EDI's application and list of watersheds and species for the permit.

If any questions should arise regarding the license application or EDI's field work, please contact [redacted] at Hemmera and she will coordinate a reply.

Sincerely,

[redacted]

Vice President Government and Community Relations

APPLICATION FOR A LICENCE TO FISH FOR SCIENTIFIC, EXPERIMENTAL, EDUCATIONAL or PUBLIC DISPLAY PURPOSES, UNDER SECTION 52 OF THE FISHERY (GENERAL) REGULATIONS *(Yukon /Transboundary Rivers Area)*

(Check one)
- ☐ SCIENTIFIC PURPOSES *
- ☐ EXPERIMENTAL PURPOSES**
- ☐ EDUCATIONAL PURPOSES***
- ☐ PUBLIC DISPLAY PURPOSES****

(see footnote for descriptions)

(Check one, and provide the additional info if required)
- ☒ New Application
- ☐ Renewal of previous year's licence — Previous Licence #:
- ☐ Amendment to a current licence — Current Licence #:

Yes ☐ No ☒ **Do you have an Animal-Use protocol approved by a CCAC-accredited animal care committee?** *(http://www.ccac.ca/en_/standards/guidelines)*

1. Please briefly describe the purpose of your application request. If this is an amendment to a previous license, briefly describe the requested changes to the original license.

The Chance Oil and Gas Project Area covers approximately 2,500 km^2 and includes 1,467 streams. Very little fisheries data exists for the proposed Project Area, with the most recent (limited) sampling occurring in 2001. EDI Environmental Dynamics Inc. proposes to conduct fish sampling on streams from each order throughout the Project Area. Fish sampling will mostly be conducted using electrofishing methods, with beach seining where necessary on 4th or 5th order streams. Electrofishing effort will be approximately 100-300 meters and for a minimum of 400 seconds in order to adequately sample each site. The length of stream sampled will be proportional to the stream width (i.e., narrow creeks will be sampled for longer distance than wide creeks). Sites will be sampled a minimum of 100 m upstream from the nearest confluence. The planned target of sites is 50, with an allowance up to 100.

2. Indicate the desired start and end date for the requested licence/permit. (Licence/permits may only be issued for up to one year.)

Start Date: 2019-07-01 End Date: 2019-10-01

Details (Specify sampling periods, if applicable): *Sampling is intended to begin in mid-July, but may require subsequent sampling.*

3. Applicant Information:

Legal Name of Applicant: [redacted] Date of Birth: 1990-07-24

Organization or School: EDI Environmental Dynamics Inc.

Street Address/Unit#: 2195 Second Avenue City: Whitehorse

Province/Territory: Yukon Postal Code: Y1A 3T8

Phone: [redacted] Fax: Email: [redacted]

Cell:

List individuals that will be assisting with the activity, DOB is required. *(Attach additional page if needed)*

[redacted]

4. SAMPLING PROGRAM - METHODS/LOCATION/SPECIES/DETAILS/OBJECTIVE etc..

Details of where the sampling is to occur, and the gear being used (*Provide detailed information including when, where, and how much sampling will occur)*

Name of River/Stream/Lake/Creek *(use a separate line for each waterbody)* **Watershed codes:** *search http://cmnmaps.ca/fiss_yukon/*	Detail of each sampling method *(ie. #trap nights, electrofishing seconds, # and duration of net sets, mesh size, etc. per sampling site etc. Also specify details of multiple sampling periods if applicable)*
See attached.	

Include species and life stage. Specify planned upper limit of sample size, maximum number and species of specimens that will be retained (if any). (Details not provided in specified fields, to be completed in "Additional Details" below.)

Species *(attach additional page if needed)*	Life stage	# of Fish Sampled	# of Fish Retained	# Estimates of Mortalities	Specify location of all mortalities and/or # retained
Arctic grayling	subadult/adult	200	0	5	
Arctic grayling	juvenile	200	0	10	
Slimy sculpin	subadult/adult	200	15	25	5 Peel w/s, 5 Bell w/s, 5 Whitestone w/s
Round whitefish	subadult/adult	100	0	10	
Lake whitefish	subadult/adult	100	0	10	
Longnose sucker	subadult/adult	100	0	10	

Details (Explain the purpose of retaining mortalities and/or lethal samples):	For the 15 retained slimy sculpin, the purpose is to provide DNA samples (fin clips) for the University of Montana to identify additional potential conservation units (subspecies, species) for a North America wide project. These individuals will ideally be chosen from any incidental mortalities and will only be retained in the event of no incidental mortalities. If there are any incidental mortalities of other species they will also have fin clips submitted to support this initiative.

Additional details (attach additional page if needed).

Include as much detail as possible including your research activities, methods of collection provide details, disposition of the specimens details of regarding release methods and location, and precautions that will be taken to avoid fish mortality. Provide information on handling of non target species if appropriate. etc..

Sites will be chosen to cover the spatial extent of the Project Area to provide a general understanding of fish distribution in different ordered streams. Each stream site will have a Site Card completed as well as fish sampling and in-situ water quality will be taken. Fish sampling will mostly be conducted using electrofishing methods, with beach seining where necessary on 4th or 5th order streams. Electrofishing effort will be approximately 100-300 meters and for a minimum of 400 seconds in order to adequately sample each site. The length of stream sampled will be proportional to the stream width. Sites will be sampled a minimum of 100 m upstream from the nearest confluence. In-situ water quality will be taken at each site, which includes the collection of temperature (degrees Celsius), pH, dissolved oxygen (mg and %), and specific conductivity (µS/cm). All fish captured will be identified to species and enumerated; up to 10 individuals from each species caught will be measured at each site before being returned to the water. Handling and air exposure will be kept to a minimum for all fish.

Footnotes:
* Scientific Purposes includes: Salvage (for fish collection associated with in-stream works etc.); Environmental Impact assessment (pre and/or post development project monitoring); Inventory (species abundance and distribution and/or presence/absence study)
** Experimental Purposes: Research (i.e., fish collection as part of a experimental procedure, or research to determine how fish populations respond to habitat manipulations)
*** Educational Purposes: Training
**** Public Display Purposes: Samples for display purpose

Applications are to be submitted to:

PRIVACY NOTICE STATEMENT
The information you provide on this form is collected under the authority of the Fishery General Regulations for the purpose of issuing a licence for scientific, experimental, educational or public display purposes. The information may be used for program planning or management, reporting, audit, administration purposes or disclosed to other government departments or agencies, within other divisions or branches of the institution, with provincial, territorial or foreign government or First Nation organizations as applicable. Failure to provide this personal information may result in your licence being denied. You have the right to the correction of, access to, and protection of, your personal information under the Privacy Act and to file a complaint with the Privacy Commissioner of Canada over DFO's handling of your information. Personal information collected through the processing of your application is described in DFO Personal Information Banks and can be accessed and assessed for accuracy. For more information visit Info Source www.infosource.gc.ca.

5. RELATED LINKS INFORMATION ETC

Collection Period: Sensitive timing periods in aquatic environments in Yukon and transboundary waters can be found at: http://www.dfo-mpo.gc.ca/pnw-ppe/timing-periodes/index-eng.html. If you plan to sample using instream methods during sensitive periods, we suggest you describe means by which you will mitigate any negative effects.

Transfer or Transplant of Live fish/eggs/milt: Any transfer of live fish into fish habitat and transfer of live fish to a fish rearing facility, requires a permit from the Federal/Provincial/Territorial Introductions and Transfers Committee. Applications and contacts can be found at:
BC - http://www.pac.dfo-mpo.gc.ca/aquaculture/licence-permis/intro-trans/process-processus-eng.html
Yukon – http://www.pac.dfo-mpo.gc.ca/yukon/trans-eng.html

Species At Risk: Research into any species listed in the Species At Risk Act (SARA) requires a permit issued under SARA. Application forms can be found at: http://www.dfo-mpo.gc.ca/species-especes/permits-permis/permits-eng.htm

Canadian Council on Animal Care (CCAC): DFO is a member of the Canadian Council on Animal Care (CCAC) and has committed at the Ministerial level to follow the entire CCAC program in Departmental activities in research, teaching and testing with vertebrate animals. Nearly all universities and colleges in Canada follow this program as well. It is expected that if DFO financial or human resources are involved in the work under this requested licence, or if the applicant is based at an institution having a CCAC-accredited Animal Care Committee, then evidence of an approved Animal Use Protocol (AUP) will be submitted with this application, and CCAC guidelines will be adhered to in any work with live vertebrates. The issuing authority for this licence accepts the CCAC's exemptions for certain animal-use activities as not requiring an approved AUP. More information about the CCAC program is at *www.ccac.ca*.

Note: - Use of carbon dioxide/CO2 (e.g. Alka-Seltzer tablets) to immobilize fish for sampling should not be done without a continuous supply of oxygen, with levels of both gases monitored and regulated.
- Clove-oil products are not regulator-approved in Canada, as a fish anaesthetic.

Aquatic Invasive Species: To prevent the introduction of aquatic invasive species there are a few simple things that can be considered:
a) Before leaving an area: Drain water from boat, trailer and gear, remove all plant parts and mud and.
b) before entering another water body: Wash all your gear including waders with soapy water.

PROJECT DESCRIPTION

This document presents the location of the proposed Eagle Plains Exploration Project (Project), the preliminary scope of the Project, the principal and accessory Project components, and Project phases and scheduling. The descriptions provided below are conceptual and intended to provide the level of detail necessary to initiate discussions with stakeholders on the Project Description.

Detailed design and implementation procedures will be developed following Project approvals. All design, methodology, or procedural changes will conform to the commitments made by Chance Oil and Gas Ltd. (Proponent), as well as the terms and conditions stated in any Decision Document resulting from the Yukon Environmental and Socio-economic Assessment Board (YESAB) Executive Screening process and permits, approvals, and authorizations once issued.

The development of this section is based on the *Proponent's Guide to Information Requirements for Executive Committee Project Proposal Submissions* (YESAB 2005), specifically Part 1, Section 5.0 Project Description.

The Proponent will develop a series of management plans to provide additional information on infrastructure design and phase-specific activities including monitoring. These management plans are referenced throughout this section where relevant.

1.1 Project Description Overview

The Proponent intends to conduct exploration drilling and flow testing of any discoveries over an area of approximately 2,400 square kilometres (km²) in the Eagle Plains area, located between the Ogilvie and Richardson mountain ranges along the Dempster highway in Yukon. The purpose of this exploration drilling and flow testing program is to confirm the quality, quantity, and areal extent of any accumulations of hydrocarbons. The Proponent will drill up to 30 wells sequentially over a period of up to 10 years. If a well is successful (i.e., if there is a discovery of crude oil or natural gas in sufficient quantities), the Proponent will conduct an extended flow test (EFT) for a period up to 2 years on that particular well. There is considerable uncertainty in terms of outcome from exploration drilling, so it is only possible at this stage to speculate on the number of discoveries that will be made. For the purposes of this assessment, the Proponent estimates that crews may conduct EFTs on up to 20 wells, depending on the drilling success. Due to the exploratory nature of the work, it is impossible to predict the timing of any discovery and therefore the timing of any EFTs.

The Proponent will drill one well at a time and up to five wells per year. Assuming all wells are successful and EFTs are conducted for 2 years at each well, there may be up to 10 EFTs being conducted at one time. The information obtained from the EFTs is critical to establishing the future development plan for each discovery.

If several wells reach successful outcomes and are identified for extended flow testing, the wells will have completion equipment installed within their wellbores, the casing will be perforated, and the wells will be flowed. This would require a completion or service rig to install the completion equipment and the tubing used to conduct produced well fluid to ground surface, at which point surface equipment would then be installed, which may include artificial lift equipment to help the fluid continue to flow.

Fluids produced during EFT will need to be measured, processed, and dealt with in an environmentally responsible manner. Depending on the nature of a discovery, the Proponent anticipates that some combination of natural gas, crude oil, and possibly formation water will be extracted during the EFTs. These fluids are separated and measured in facilities on the surface. Natural gas could be flared for short periods of time, but the Proponent prefers to conserve it to provide fuel for process heating, fuel for engines providing mechanical power, and possibly onsite power generation. If natural gas quantities are significant, the Proponent would consider re-injecting surplus natural gas into a compatible reservoir in the Eagle Plains basin using an existing suspended well. The Proponent currently has 8 suspended wells that were drilled in the past, which could be used for re-injection. Alternatively, some of the new wells, drilled as part of this 30-well Project, may be used.

Fluid transportation vehicles will be required to travel from site to site and transport the produced fluid back to the Central Process Facility for storage, further treatment, and transfer to trucks for transport to market or disposal. To the greatest extent possible, crude oil produced during the EFTs will be conserved instead of flared. This will require some processing to stabilize the crude oil for truck transport to a suitable, approved crude oil marketing point, such as terminals in the vicinity of Fort Nelson or Fort. St. John, British Columbia or Grand Prairie, Alberta. All these locations are ready to receive and utilize crude oil produced from Yukon sources in the absence of such destinations existing within Yukon. The Proponent may also consider trucking crude oil produced during the EFT to ports in Alaska such as Skagway, Haines, or Valdez for onward shipping to suitable markets elsewhere in North America.

Formation water produced in conjunction with crude oil or natural gas will be separated from the hydrocarbon streams and disposed of underground into a compatible and approved geological formation at Eagle Plain using one of the suspended wells or one of the wells drilled as part of this Project. These procedures to process, transport, and dispose of various fluids produced are common practice using proven technologies and equipment in every oil and gas province in Canada.

The Proponent also intends to conduct a seismic exploration program consisting of up to 1,500 km² of three-dimensional (3D) seismic and up to 2,000 km² of two-dimensional (2D) seismic to identify and map oil and gas geological structures in the area.

Additional activities are required to support the drilling and seismic exploration, including:

- Mix Bury Cover (MBC) sump area to dispose of drill cuttings
- Construct winter and all-season access roads
- Construct airstrip
- Advance borrow source developments
- Transport equipment and supplies to the site and within the Project area
- Use existing camp at kilometre (km) 325 of the Dempster Highway and periodic use of the Eagle Plains Hotel.

The Proponent is planning to begin exploration activities as early as the end of 2021 and continue for a period of 10 years to cover the various stages of drilling and extended flow testing of the proposed wells. The execution of the EFTs will likely be phased, depending on the nature of the discovery (e.g., natural gas versus crude oil) and the capacity of the 75-person base camp and the Eagle Plains Hotel to accommodate

the necessary crews. Until there is more information about the resources discovered, it is difficult to accurately predict the full duration the complete flow testing program.

1.2 Project Location

The Project is located within the southern part of Eagle Plain Sedimentary Basin in northern Yukon (**Figure 1.1)**. The main camp is located at km 325 of the Dempster Highway, with one MBC sump area located at km 336. **Figure 1.1** illustrates the overall Project area.

The proposed Project area overlaps with the following three First Nation Traditional Territories:

- Vuntut Gwitchin First Nation
- First Nation of Na-Cho Nyäk Dun
- Tetlit Gwich'in Council Secondary Use Area.

The proposed Project area is north of the Tr'ondëk Hwëch'in First Nation Traditional Territory and Settlement Land. The Traditional Territories and Settlement Land blocks in the vicinity of the Project are detailed on **Figure 1.1**.

The proposed Project is located within the boundaries of the North Yukon Planning Region and is therefore subject to the North Yukon Land Use Plan (Plan). A main purpose of the Plan is to address oil and gas development in North Yukon. The locations of proposed well sites are within the region of the Plan designated for the highest level of development. In the Plan, this designation is described as Lower ecological and heritage/cultural values within a moderately sensitive biophysical setting.

1.3 Project Components and Activities

This section describes the principal Project components, along with accessory components that are necessary to support Project activities. Information provided below for each Project component includes its location, key design features, and, where applicable, the results of any relevant investigations to establish site conditions (e.g., seismicity, geotechnical parameters). The three main components of the Project are described as follows:

1. Exploration well program – comprising 30 wells within an area of approximately 2,400 km². Wells will be located within areas identified in **Figure 1.1**. The program includes drilling, drill stem testing, and extended flow testing of the wells. Hydraulic fracturing is not being proposed as part of the Project. See **Section 1.3.2** for details.
2. Construction of access roads to each proposed well location – roads required for the Project will be a combination of winter and all-season access roads. Details regarding road construction and location are provided in **Section 1.3.3.1**.
3. Construction of a new MBC sump area and all-season access road – (approximately 400 metres (m) long) at km 336 of the Dempster Highway, and construction of additional MBC sumps in other suitable areas. Details are provided in **Section 1.3.2.7**.
4. Seismic exploration program (**Section 1.3.2.9**) consisting of up to 2,000 km² of 2D seismic exploration and up to 1,500 km² of 3D seismic exploration.

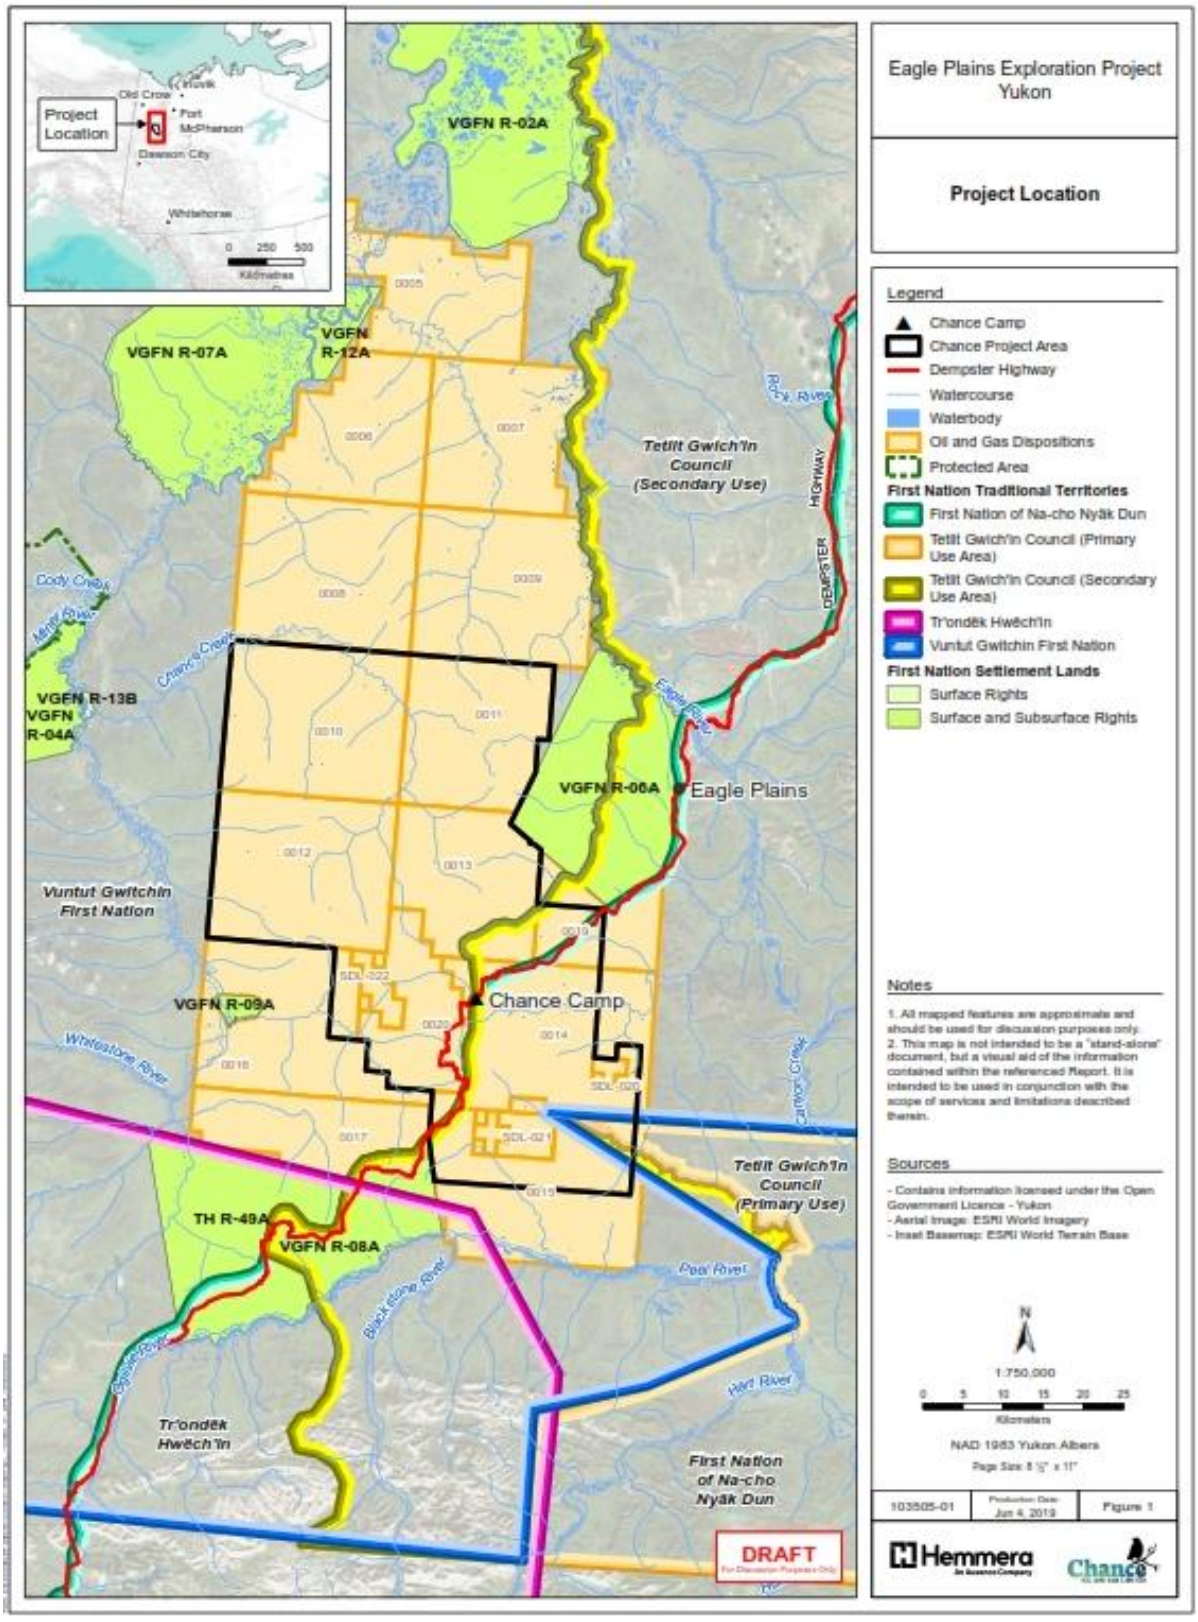

Figure 1.1 Project Location

Details related to the project components and activities are provided in **Section 1.3 Project Components and Activities** noting that the development of some Project components occurs in both phases. That is, once a well site has been prepared, drilling and well development will occur at that site, and additional well sites may be prepared simultaneously. Reclamation activities are described in **Section 1.4.4 Reclamation, Abandonment, and Closure Phase**.

1.3.1 Preliminary Scope of the Project

The preliminary scope of each Project component is described in **Table 1.1**.

Table 1.1 Preliminary Scope of Project

Project Component	Activities
General Project	• Exploration activities for oil and gas in the Eagle Plains area ▫ Exploration well drilling, testing, suspension, decommissioning, and abandonment ▫ Successful wells will be suspended and may be brought forward in future development project proposals ▫ 2D and 3D seismic exploration • Project phases will occur sequentially over a 10-year period and include ▫ Initial mobilization of equipment to the Project site ▫ Construction of required infrastructure ▫ Well development, testing, decommissioning, and abandonment ▫ Progressive reclamation ▫ Final closure and reclamation • The Project will occur over an area covering approximately 2,400 km² located at approximately km 325 of the Dempster Highway
Exploration Well Drilling	• Establishment of up to 30 well sites each, approximately 1.44 hectares (ha) in size within the overall Project area (approximately 2,400 km²) ▫ Site levelling using gravel, packed snow or ice and rig matting as required • Installation of surface infrastructure on drill sites including: ▫ Drill rig ▫ Mud tanks, pumps, and mud processing systems ▫ Power generators ▫ Boilers ▫ Blowout preventer accumulator system ▫ Fuel storage ▫ Flare tank and flare stack ▫ Cement mixing and storage ▫ Storage bins for rock cuttings ▫ Trailers for offices, first aid, rig crew sleeping quarters, water storage and treatment, sewage storage, and food waste incinerator • Drilling of up to 30 wells to a depth up to approximately 2,500 m ▫ Wells will be drilled sequentially, one well at a time, up to four wells per year • Use of low-toxicity, water-based mud system • Use of up to 15 cubic metres (m³) of water per operating day for drilling

Project Component	Activities
Drill Stem Testing	• One or more drill stem tests (DSTs) on each well to analyze prospective/productive formation areas • Potential acid stimulation using a weak concentration (10% to 20%) of hydrochloric acid approximately 5 to 10 m3 per well • Flaring natural gas • Production of crude oil and transport from the site to markets outside of Yukon
Extended Flow Testing	• Conduct EFTs on up to 20 successful wells ▫ May be conducted within a month for a predominantly natural gas well or up to 2 years for a predominately crude oil well ▫ Up to 10 EFTs conducted at the same time • Installation of surface and subsurface equipment and facilities to enable EFT including: ▫ Casing of entire wellbore and perforation of casing at zone or zones of interest ▫ Packer, tubing, and downhole gauges ▫ Wellhead valving assembly ▫ Flare systems ▫ Separator vessel, treating vessel, and storage tanks ▫ Appropriate artificial lift systems ▫ Heaters ▫ Dehydrators ▫ Flow lines ▫ Metering equipment ▫ Portable generators • Separation of natural gas, crude oil, and formation water • Flaring natural gas for a period of several days to several weeks • Production of crude oil and transportation of produced crude oil from the site to markets outside of Yukon • Use of natural gas on site for power generation, tank heating, fuelling artificial lifting to assist crude oil production, or compression for re-injection of natural gas • Disposal of formation water underground in existing suspended wells, or wells suspended as part of this exploration Project
Drilling Waste Disposal	• Construction of MBC sump approximately 6.4 ha in area to dispose of drill cuttings • Disposal of drill cuttings in MBC pods approximately 300 m³ over an area of 800 square metres (m²) (estimated volume of drill cuttings for one well) • Disposal of approximately 200 m³ of drilling mud in MBC and drilling fluid underground in existing suspended wells, or wells suspended as part of this exploration Project • Disposal of the following liquid waste in existing suspended wells, or wells suspended as part of this exploration Project: ▫ Formation water ▫ Saline fluids ▫ Liquid fraction of drilling fluids ▫ Rig wash
Seismic Exploration	• Up to 1,500 km² of 3D seismic

Project Component	Activities
	• Up to 2,000 km² of 2D seismic • Establishment of seismic survey lines • Air hammer drilling • Receiver stations and source stations • Storage (in magazines), transportation, and use (1 kg per source station) of dynamite
Well Maintenance (Workovers)	• Mobilization and installation of a service rig to the well site • Conduct maintenance to: ▫ Install, change, or modify the production flow control equipment ▫ Perforate zones of interest for EFTs ▫ Seal some or all perforations made across productive zones ▫ Re-perforate a zone or zones elsewhere in the wellbore ▫ Other routine maintenance practices to ensure optimal production performance of the producing formation
Access Roads	• Use of permitted Chance Road all-season road for Project activities • Construction of all-season access roads to well sites requiring EFT and borrow source locations ▫ Approximately 7 m in width with pullouts on average every 750 m ▫ Up to approximately 87 km total in length ▫ Clearing and mulching of vegetation ▫ Removal and stockpile of organic cover material for use in reclamation • Construction of winter access to well sites for initial well drilling and DST
Borrow Source Development	• Quarrying of approximately 1,800,000 m³ of aggregate for use in Project activities, including: ▫ Winter development of up to 23 quarries ▫ Use of approximately 450,000 m³ of aggregate for well pads ▫ Use of approximately 1,350,000 m³ of aggregate for access road construction ▫ Use of aggregate for airstrip construction ▫ Use of aggregate for Central Processing Facility construction ▫ Use of explosives • Removal and stockpile of organic cover material and silts for use in reclamation
Central Processing Facility	• Construction of central processing facility adjacent to camp • Processing facility ▫ Multi-stage and multi-phase separators ▫ Heater treaters ▫ Vapour and gas collection system to flares or to provide fuel for camp use ▫ Processing of crude oil to stabilize and meet market specs for truck transport ▫ Storage of approximately 3,180 m³ of produced crude oil ▫ Storage of approximately 119 m³ of produced (formation) water • Fuel storage facility ▫ 151 000 litres (L) diesel fuel ▫ 24 000 L propane

Project Component	Activities
	• Storage and use of chemicals and reagents: ▫ Hydrochloric acid (10% to 20% concentration) ▫ Methanol ▫ Additives to prevent corrosion ▫ Demulsifiers • Bulk explosive compound to store dynamite for use in construction of borrow sources and for seismic exploration
Airstrip	• Construction of airstrip approximately 1,500 m long at km 4 of the Chance winter road • Use of airstrip during all phases of the Project approximately 2 flights in/out per week • Storage of aviation fuel
Water Use	• Use of up to 300 m³ of water per day for making snow to build winter trails, ice roads and temporary well sites, not exceeding 10% of instantaneous flow from the following extraction points: ▫ Year-round extraction from the Eagle River and Ogilvie ▫ Seasonal extraction from Glacier Creek and Fly Camp • Use of up to 300 m³ of water per day for camp from existing onsite groundwater water well. • Construction of portable water reservoir at the camp for water storage and use during low water periods
Transportation	• Use of Dempster Highway, North and South Klondike Highway, and Alaska Highway to access Project site and to transport crude oil to potential markets • Approximate offsite traffic on public roads between the site and supply points • Onsite traffic on Proponent-controlled roads ▫ 15 to 20 truckloads over approximately 5-day period to mobilize the drill rig to each well site
Camp and Workforce	• Workforce up to 75 people during all phases of the Project • Continued use of existing permitted 75-person camp located at km 325 of the Dempster Highway ▫ Municipal waste management and disposal ▫ Sewage treatment facilities
Reclamation and Closure	• Progressive abandonment of unsuccessful wells ▫ Installation of cement plugs across all porous/permeable zones, across the base of each casing string and at surface ▫ Cutting of well casing(s) off 1 m below ground level and weld steel plates across each string ▫ recontouring and revegetation of area • Progressive decommissioning and reclamation of borrow source and quarry areas when they are no longer useful or necessary ▫ Recontouring of area and replacement of stockpiled silts and organic cover material • Well suspension and abandonment at end of Project

1.3.2 Principal Project Components

1.3.2.1 Overview

The principal Project activities are the drilling program, well testing, and seismic exploration program. The goal of the proposed drilling program is to obtain the maximum amount of information to determine the geological settings and evaluate oil and gas reserves in the Eagle Plains area. During operation, drilling will occur 24 hours per day, and 7 days per week. Chance will drill 1, possibly 2, wells at a time and up to 5 wells per year.

Initial drill stem tests (DSTs) will occur on any or all of the 30 proposed wells. Up to 5 wells could be tested each year. Chance will conduct EFT on successful wells, where hydrocarbon resources are discovered, to gather important information about the nature of the resource accumulation and its productive capability. EFT for wells with a primarily natural gas discovery may take place over a maximum period of 1 to 2 months maximum. EFT for wells with a primarily crude oil discovery may take place over a period up to 2 years. Chance may conduct up to 10 EFTs concurrently and EFTs on up to 20 wells over the life of the Project. The information obtained from the EFTs is critical to determining the future development plan for each discovery. **Table 1.2** outlines the sequence of activities in developing the well site areas.

The Proponent also intends to conduct a seismic exploration program consisting of up to 1,500 km² of 3D seismic and up to 2,000 km² of 2D seismic to identify and map oil and gas geological structures in the area. The 3D seismic program is likely going to be undertaken in a series of smaller projects, each of approximately 400 km². The 2D seismic program could be done either as one project or as a series of smaller projects. Details on the Project components and activities are provided in the following sections.

Table 1.2 Sequence of Well Development Activities

Initial Exploration Drilling		
Develop winter access trail to well site		
Develop well site approximately 1.44 ha in area		
Install surface infrastructure on well site necessary for drilling and testing exploratory well		
Drill well		
Transport and dispose of drill cuttings in MBC sump		
Conduct DSTs to determine whether successful or not in order to move on to EFT		
Move drill rig to next well site area		
If not successful	**If successful**	
	Primarily Natural Gas Discovery	**Primarily Crude Oil Discovery**
Abandon well (cement all perforated producing zones, install shallow cement plugs, and cut surface casing 1 m below normal ground surface).	Complete well (finish casing, perforate the casing, and install production flow control devices, steel tubing, and wellhead components).	Complete well (finish casing, perforate the casing, and install production flow control devices, steel tubing, and wellhead components).
Remove all surface infrastructure.	Install required surface facilities (separator vessel, heaters, dehydrators, stock tanks, flow lines,	Construct all-season access to well site.

Initial Exploration Drilling		
	metering equipment, portable generators, and flare stack).	
Remediate well site area (remove mats and gravel fill material).	Conduct EFT over period of 1 – 2 months	Install required surface facilities (separator vessel, heaters, dehydrators, stock tanks, flow lines, metering equipment, portable generators, and flare stack).
Recontour well site area and revegetate disturbed areas to natural conditions.	Measure natural gas and water from wells.	Conduct EFT over period up to 2 years
Recontour access roads and revegetate disturbed areas to natural conditions.	Conduct maintenance on well as required (work over).	Measure, store, and process crude oil, natural gas, and water from wells.
	Once EFT is, complete either 1. develop a new proposal to bring into production, or 2. decommission and abandon well.	Conduct maintenance on well as required (work over).
	Abandon well (cement all perforated producing zones, install shallow cement plugs, and cut surface casing 1 m below normal ground surface).	Transport crude oil from EFT to central processing facility then to acceptable market.
	Remove all surface infrastructure.	Once EFT is complete, either 1. prepare development plans for future assessment and regulatory review to bring into production, or 2. decommission and abandon well.
	Remediate well site area (remove mats and gravel fill material).	Abandon well (cement all perforated producing zones, install shallow cement plugs, and cut surface casing 1 m below normal ground surface).
	Recontour well site area and revegetate disturbed areas to natural conditions.	Remove all surface infrastructure.
	Recontour access roads and revegetate disturbed areas to natural conditions.	Remediate well site area (remove mats and gravel fill material).
		Recontour well site area and revegetate disturbed areas to natural conditions.
		Recontour access roads and revegetate disturbed areas to natural conditions.

1.3.2.2 Exploration Well Drilling Program

Establishment of Well Sites and Drilling

Chance will establish up to 30 well sites, each approximately 1.44 ha in size within the overall Project area (approximately 2,400 km²). Total approximate disturbance for well site locations will be up to 43.2 ha if all 30 wells are drilled. Exact well locations and sequencing cannot be determined at this time as they are dependent on seismic data interpretation, drilling results, EFT results, weather, and local surface conditions and other environmental factors. The Proponent is continuing the ongoing process of interpreting seismic data to better understand the geological setting, size, and geometry of potential prospects. Each well drilled will add to that understanding.

Generally, well sites will be located on the heights of land. Criteria for well site locations include the following:

- Avoidance of areas with challenging permafrost conditions and ecologically sensitive areas such as riparian corridors, wetlands, steep slopes, old growth forest, and critical wildlife habitat and permafrost features.
- No drilling within 45 m of a perennial watercourse
- Avoidance of areas identified with heritage values (noted as “avoidance areas”) in the Heritage Resource Overview Assessment and Heritage Resource Impact Assessment (Matrix 2013).
- Requirements from the Yukon *Oil and Gas Act*, SY 2019, c.6 (YOGA) and the Oil and Gas Drilling and Production Regulations.

Drill Program

The first of the exploratory wells will be drilled in winter commencing around mid-January 2021. Pre-drilling preparation will entail building winter trails to gain access to the first selected well sites and to build access roads and the leases to accommodate the mobilization and setup of the drilling rig. Winter road and lease building can only commence once there is the 10 cm of snow cover required to facilitate construction. Based on historical trends, this could occur as early as December or as late as mid- to late January in any year.

Summer well sites may be established if there is already a year-round access road built nearby to service a well or wells undergoing EFT. Summer well sites will allow the Proponent to extend the drilling season into the summer if new wells can be drilled within a few kilometres of an existing road. A summer well site will require all-season access to the site.

Once established, the well site will contain the drill rig, flare stack, rig trailers, and office trailers and will provide sleeping capacity for the required number of key people to stay at the rig full time. Each well site will be approximately 1.44 ha in size to facilitate drilling and any subsequent EFTs. The amount of clearing will be kept to a minimum.

The well site dimensions should be adequate for advancing to a possible production operation in the future and therefore should accommodate all field production equipment.

Winter Matting Use

Matting for winter operations will be used when a) the ground is too uneven, b) it may not be possible to level the lease using earth-moving equipment and when the ground may not be competent enough to support the heavy rig loads, or c) when it is not possible to level the ground by laying down a base of gravel or soils. Matting may be used in drilling operations to reduce ground surface disturbance and distribute the ground pressure of equipment. Matting may also be used to stabilize the drill rig to provide insulation and protection to the snow and ground surface. Matting will not be used on the proposed roads.

The Proponent intends that well sites would be built with fill material from other well sites or from borrow sources. Should matting be used, it may cover the entire well site area (several locations of 1.44 ha) or the area immediately adjacent to where a drilling rig may be placed.

Well sites will be levelled by bringing in material such as gravel, or possibly snow for packing and then icing. An impermeable liner will then be laid on top of the pad, followed by wooden rig mats that interlock. Rig mats are approximately 16 feet by 8 feet in area, though there is some variance from one manufacturer to another.

Any matting used for this Project will be designed to support heavy loads and distribute the weight over large surface areas. The use of matting is a common practice for oil and gas drilling operations in northern locations. Any matting used for this Project will be placed on the frozen ground with snowpack and removed before spring melt.

The well site area adjacent to where the rig is situated and the road access will be matted if an unprecedented early melt occurs. In the event of an unprecedented early melt, rig equipment will be “leapfrogged” along the access road to support equipment and protect the vegetative mat as the rig is being demobilized and on its way out from the well site location. If leases are not constructed from densified fill material, equipment will remain on matted surfaces at all times in the event of early melt conditions.

Mats currently placed on previous well locations are periodically inspected for any movement or deterioration that could affect their ability to support intended loads. All matted well sites are maintained as much as possible because suspended wells must be usable by Chance in future exploratory and appraisal programs.

Summer Matting Use

The laying of matting in summer first requires the frozen level ground to be insulated with an impermeable textile layer. Laying matting early, before the thaw, ensures vegetation is not yet active and may be covered by a layer of snow or frozen soil. The Proponent plans to drill summer wells (following early exploratory successes from the winter wells) by constructing gravel pads of sufficient thickness to facilitate levelling and a firm base to support drilling loads.

The Proponent will likely use double-matting procedures where required to provide a stable, level surface on a summer location if the terrain is uneven. If double matting is used, the upper layer of mats can be lifted independently while the lower mats are left in place if frost adhesion is evident.

The Proponent expects future leases for well sites will be constructed from a more durable borrow site fill material of a suitable thickness to protect and insulate the permafrost and provide a safe and stable working surface for the drilling and subsequent extended flow testing. Should any well also become a long-term producer, the lease condition will be expected to endure for a longer term of several more years.

Geotextile membrane would only be applied over the vegetation surface as an option for locally levelling terrain. This would be necessary if double matting techniques were not possible as a solution for stabilizing mats on the vegetation surface. Geotextile will be used when:

- Levelling using fill material on top of natural vegetation could compromise the stability of the surface under loads.
- Levelling by double matting is not the best solution in the circumstances.
- Geotextile use would help protect vegetation or be a valuable aid in site clean-up.

Geotextile may be used prior to application of fill to level part of the drill site or access route, which could involve applying a minimal thickness of granular material (local rock or soil fill).

The Proponent retained EBA Engineering Consultants Ltd. (EBA) in 2008 to provide permafrost, soil, and vegetation expertise to evaluate the proposed use of industrial wooden mats for summer access. Tetra Tech/EBA (the successor company to EBA) or a similarly qualified individual or firm will be required to perform site-specific geotechnical pre-drilling investigations to confirm amounts of fill required and the proper placement of fill material to support the anticipated rig loads in accordance with good engineering practices.

Well Site Surface Infrastructure

The Proponent plans to use a drill rig with similar characteristics to Chance Rig #1 as presented in past assessments. The rig is capable of drilling to depths of up to 2,500 m. A normal rate of drilling would be to drill 1 well at a time during this exploratory phase.

Figure 1.2 illustrates the general layout of the proposed well site. The rig is designed to fit on a much smaller layout, but the planned 1.44 ha (120 m × 120 m) square layout is designed to accommodate not only the drilling operation but also the well completion and EFT equipment, and to preserve setback distances from surrounding vegetation and from personnel working and sleeping quarters. Note that the final area may not be square since the area will depend on topographical constraints. However, the total area for a well site will be approximately 1.44 ha. The rig layout depicted would likely be for a winter drilling operation distinguished by the number of boilers onsite. Boilers are used extensively in very cold or Arctic climates for preventing equipment and drilling fluids from freezing Arctic temperatures. **Table 1.3** provides a description of the drill rig components identified in **Figure 1.2**.

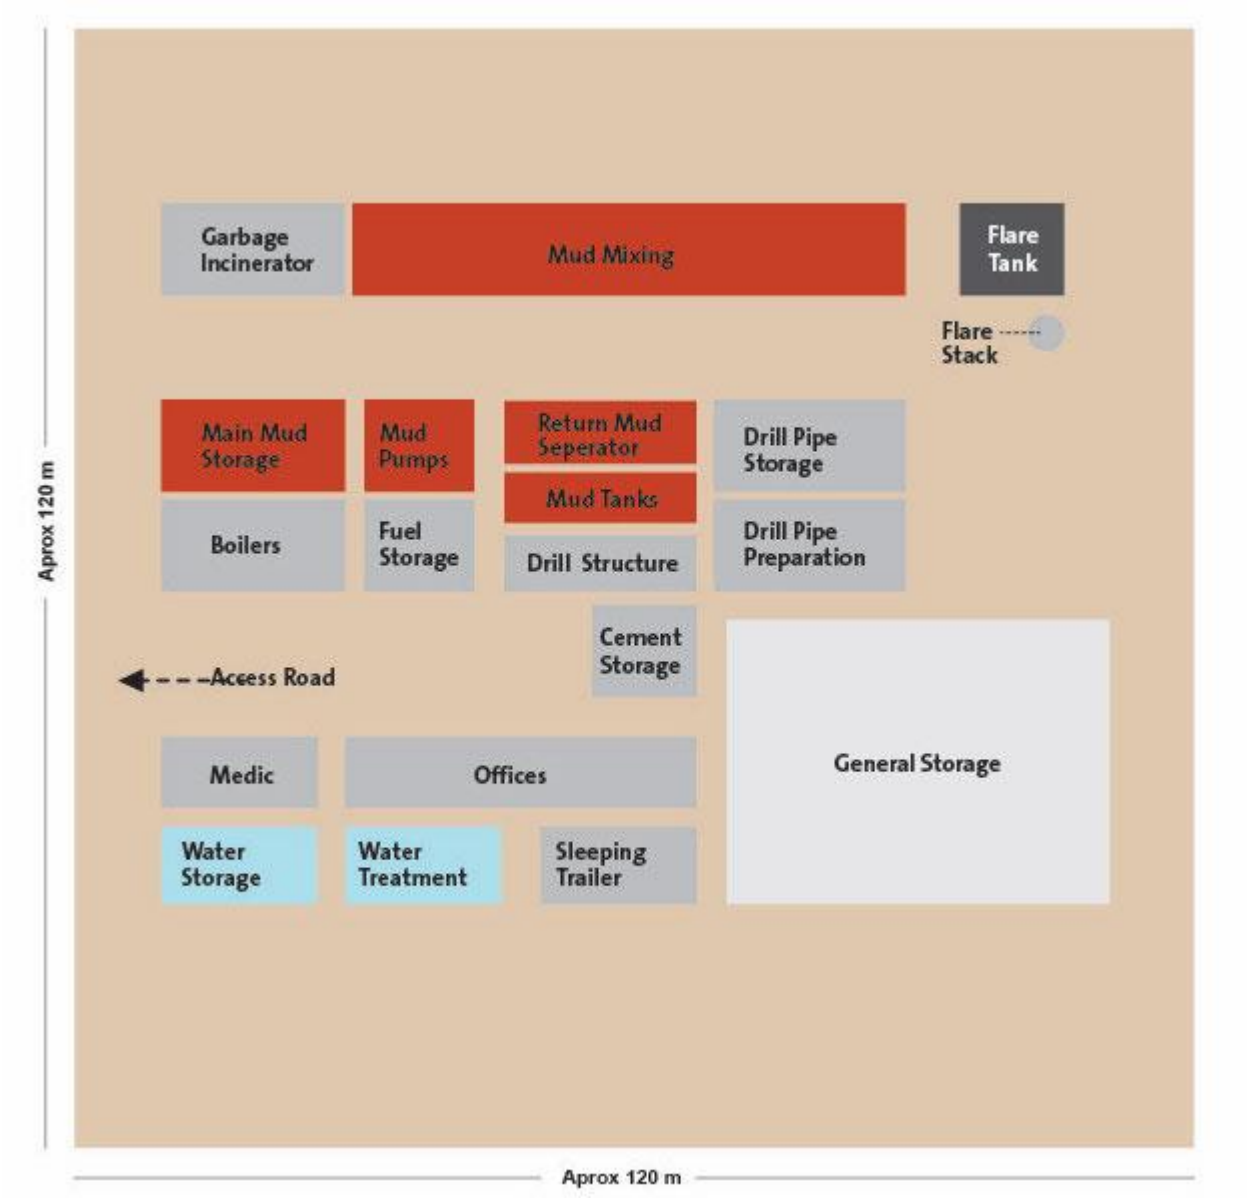

Figure 1.2 General Layout of a Well Site

Table 1.3 Well Site Components Shown on Figure 1-3

Component	Description
Boilers	Used extensively in very cold and Arctic climates for preventing equipment and drilling fluids from freezing Arctic temperatures.
Cement	Cement storage and mixing for use in wells.
Medic, Offices, and Sleeping Trailer	Essential personnel trailers which serve as offices as well as sleeping quarters and include a multi-room sleeper for some of the rig crew.

Component	Description
Flare Tank and Flare	Flare used to incinerate combustible fluids from the well. The flare tank is a reservoir to ensure the flare does not starve of combustible fluids.
Fuel Storage	Fuel for use on well site for equipment including drill rig, pumps, generators, etc.
Garbage and Incinerator	Storage area for waste and incinerator to dispose of food waste.
General Storage	Storage and laydown area for equipment needed onsite.
Mud Tanks	Tanks where all the surface mud volume is stored. Section 31 of the Drilling and Production Regulations under YOGA (Government of Yukon 2004) stipulates that the "combined capacity of the drilling fluid tanks of every fluid system must not be less than the greater of 120 m³ and 50% excess of the volume of the wellbore."
Main Mud Storage	Location where all the mud materials are stored. Normally these materials are delivered on pallets neatly stacked and shrink wrapped to protect them during the truck journey north.
Drill Pipe Storage	Receptacle in which drill pipe is stored until required to be run in the hole.
Mud Mixing	Tank in which certain mud products are first hydrated to render them miscible with the fluid phase of the mud. Products such as bentonite clay, for example, require a caustic soda solution to neutralize the ionic attraction forces between clay flakes, allowing the water to lose its surface tension and to completely wet the flakes.
Mud Tanks	Large tanks, normally upright, fully enclosed and pressurized, where cement or bulk mud products are stored. Cement or barite (drilling mud weighting material) are pneumatically pumped from the P Tank into a smaller surge tank and then to the cementing unit or, alternatively, to the mixing or premix tank to enter the mud system.
Mud Pumps	Pumps used to circulate the drilling mud down the drill pipe, around the drill bit, and up the annular space between the drill pipe and the open hole or casing to surface.
Return Mud Separator	Area where the return mud separator known as a shale shaker is housed. The CF is the centrifuge that uses centrifugal force through high-speed rotation to separate the fluid part of the mud from the solids.
Drill Structure	Components required to drill the well, including: • Sub-structure, or base, to which the derrick is fixed • Derrick that supports the draw works and top drive • Top drive that is a mechanical, electrically powered linking device that attaches to the pipe in the hole and rotates it when drilling while simultaneously pumping drilling mud through the drill pipe and out of the drill bit at the bottom end • Draw works that lifts and lowers the travelling block in the derrick/mast to run pipe in and out of the hole • Blowout preventers, which are a series of closing valves that can hydraulically shut in a well in the event of unplanned influxes of formation fluids into the wellbore
Water Storage and Water Treatment	Water storage tank and treatment containers to provide potable water for the rig crew and personnel.

Any well site is an industrial area and therefore has restricted entry requirements, allowing entry to only authorized personnel wearing personal protective equipment (coveralls, steel-toed boots, hard hat, gloves, and safety glasses).

Figure 1.3 and **Figure 1.4** show the rig set up at the Chance camp located at km 325 of the Dempster Highway.

Figure 1.3 Chance Rig #1

Figure 1.4 Chance Rig #1 and Chance Camp at km 325 of the Dempster Highway

Drilling Operations

Well sites will be designed and constructed to support the rig and ancillary equipment positioned on them. The well site locations will be determined based on geotechnical assessments. Because construction will use borrow source fill, the well sites will be able to accommodate the drilling, EFT, and eventual production phases of well operating life. The lease area will be sized to fully accommodate a purpose-designed well pad, process facilities, and possible service rig equipment spreads that may follow in the future. Eagle Plains well sites and well design will incorporate the following key features to enhance efficiencies and reduce waste and general impact to the surroundings:

- The rig will use the minimal number of casings necessary to reach the projected total depth of approximately 2,500 m. The schematic well profile shown in Figure 1.5 illustrates a cross-section of the casing run, including annular cementation and other well features together with drilling equipment. For reference, the well casing program will typically comprise the following elements:
  - Conductor of 13-3/8-inch diameter to approximately 25 m below ground level, cemented to surface.
  - Surface casing of 9-5/8-inch diameter to approximately 400 m below ground level, cemented to surface.
  - Production casing of 7-inch diameter either to total depth or to just above the top of the Hart River formation at circa 1600 m, to comply with Yukon's Drilling and Production Regulations requirement of not more than 25% of open hole remaining uncased at any time (Drilling and Production Regulations Section 55-(1) (c) (i)). This casing will also be cemented to surface.
  - 4-1/2-inch liner to total depth at 2,200 m, cemented with a minimum 100 m overlap into the previous casing.
- The nominal diameter of the casings (all selected to remain industry standard dimensions) will reduce the size of holes drilled and of drill cuttings generated. For example, a 3,500 m exploratory well would typically produce 400 to 500 metric tons of cuttings. Less than 150 metric tons will be produced for the typical exploratory well depth of 2,200 m proposed at Eagle Plains.
- A water-based mud system will be developed and managed by a specialized service contractor with comprehensive knowledge of the Alberta Energy Regulator (AER) Directive 50 requirements as they pertain to the Yukon jurisdiction being operated in.
- All requirements in Sections 26 to 65 of the Drilling and Production Regulations (covering well design, casing design, groundwater protection, mud products, blowout prevention and choke/kill systems, fire detection and gas detection systems, safety of personnel, mitigation of operations impact, and more) will be either met or exceeded in the design, selection, and deployment of materials.
- The Yukon Oil & Gas drilling and production regulator will review proposed drilling design and planned operations procedures, as well as the health, safety, and environment policies and manual; oil spill contingency plans; and emergency response plans. Any perceived or identified deficiencies will be discussed, addressed and reported back to the regulator to confirm what action had been or needs to be taken before operations can proceed.
- The Proponent will enforce compliance on all third-party service suppliers to ensure that (1) their health, safety, and environment management systems address all regulatory requirements in personnel training and skill development; (2) personal protection equipment provided to workers

meets all Canadian Standards Association and international safety standards; and (3) supervisors are knowledgeable about operational standards related to health, safety, and environment. Periodic inspections and audits will be performed by Chance company representatives while operations are mobilized and ongoing at well sites.

- All wells will be drilled as "keepers" to facilitate EFTs and/or to become early producers in the event the Project advances to a full development. The only wells likely to be abandoned would be unsuccessful (dry) wells with no potential to be used as water or gas disposal wells.
- Leases will be designed and constructed to contain any fluid runoff into purpose-built collection ditches for recovery and disposal. A non-permeable layer will be laid during lease / well pad construction to prevent any seepage into the natural ground layer below the fill material pad.
- Rig deployment will ensure any rig wash; drilling, cementing, or DSTs fluids will be contained and recovered at all times.
- The standard and proven drilling method proposed has many advantages, including the following:
  - Large volumes of water will not be required for the drilling process because of the use of solids control equipment allows recycling of the majority of drilling fluid. Chance Rig #1 normally consumes approximately 15 m^3 water per operating day averaged over the duration of the well being drilled.
  - Minimal volumes of water are expected to be lost into the formation. The Proponent's experience drilling to these depths confirms this. Studies of other offset/nearby wells also confirm this expectation.
  - In the event that hydrocarbons are encountered, they will be controlled by the drilling mud contained in the hole; as a secondary barrier, the blowout preventer system will comprise two or more rams to fully close in the well within seconds of detecting an influx into the wellbore.
  - In the unlikely event that abnormally pressured zones are encountered (all formations to be encountered in the proposed program have been previously drilled in past wells A-25, H-28 and B-73 and no overpressures have been experienced or detected), the Proponent has designed a comprehensive drilling fluids management, casing, and blow-out prevention system to control such occurrences. Well conditions and all pressure parameters are constantly monitored and detected first by the frontline drill crew members (driller constantly on the drilling control brake, mudman aided by the well monitoring personnel constantly viewing and responding to sensor responses). As an added backup, electronic detection alarms are set to trip when very small influxes occur.

Chance Rig #1 is approved to have a Class IV BOP system, which in Yukon Drilling and Production Regulations Section 33 (1) (d) permits the rig to drill wells between 1,800 m and less than 3,600 m and is rated for 21,000 kilopascals (kPa) (3,000 psi) working pressure (Drilling and Production Regulations Section 33 (2) (c)).

Drill crews, by professional training and enforced by regulatory requirement, must be fully trained and certified in blowout prevention and well control. Crews undergo simulated drills at each shift on a 2-shift, 24-hour work rotation. During these drills, the response and efficiency of drill crews are evaluated. The equipment is also evaluated, and any deficiencies are corrected immediately following the drills. Drill crew

and well supervisor well control / blowout prevention / hydrogen sulphide certificates are normally inspected by a visiting inspector to confirm compliance at all times when operating.

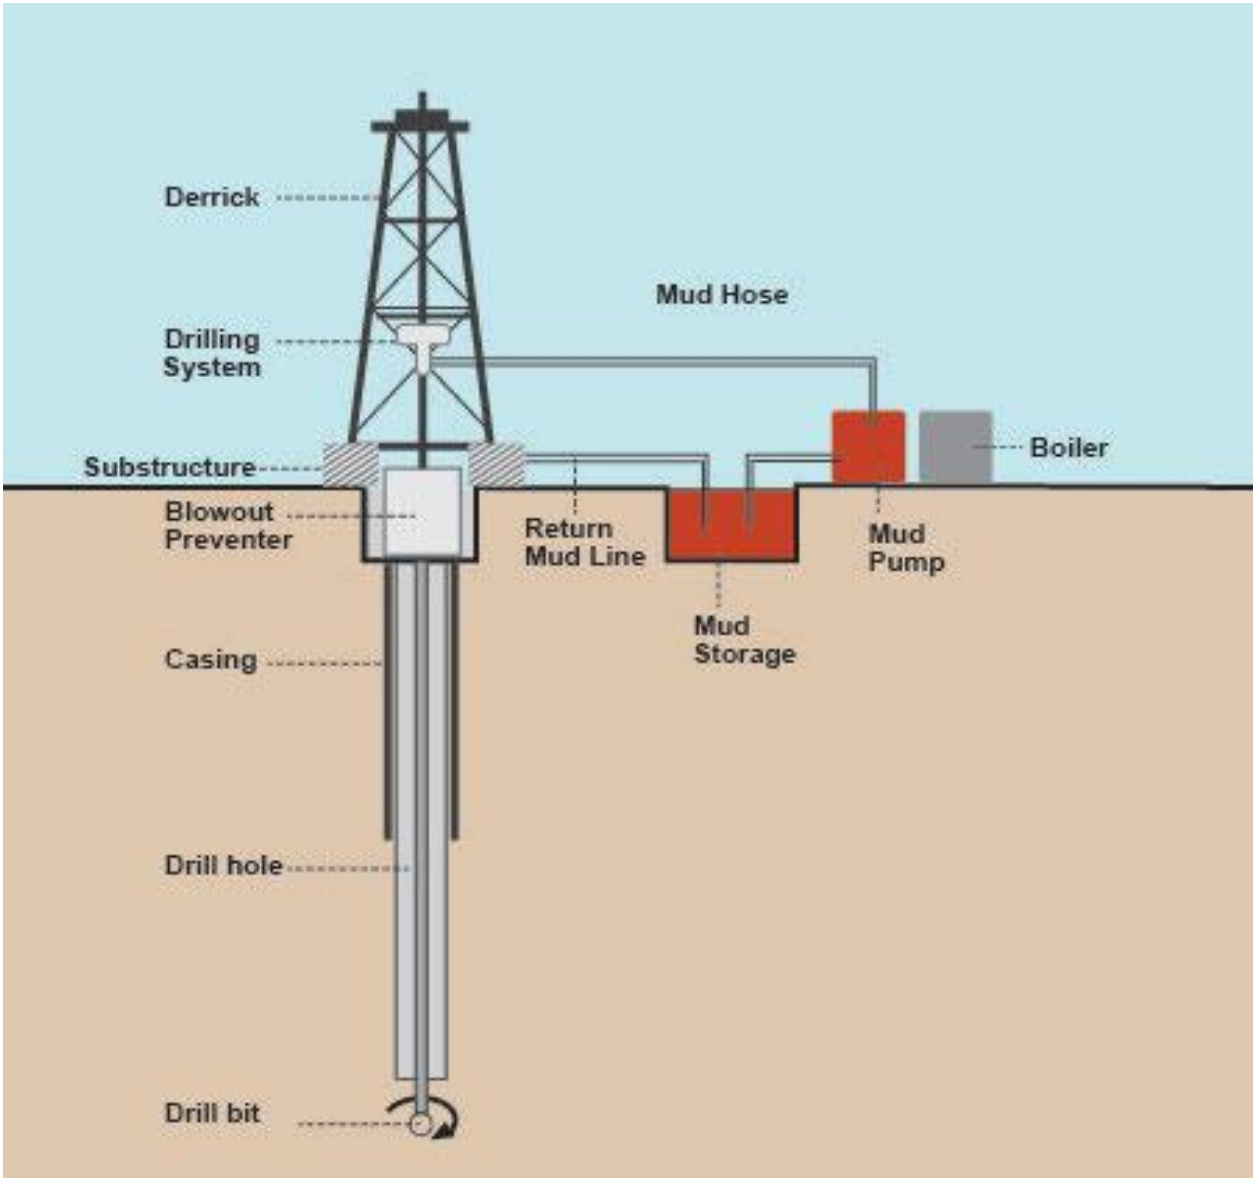

Figure 1.5 Well Profile

Drilling Fluids

Drilling fluid (or mud) is a vital component used in drilling oil, gas, and water wells. The drilling fluid system being currently researched for evaluation will be low-toxicity water-based drilling system similar to those in extensive use in other parts of western Canada. The supplier of any system will be assessed on previous comparative experience and required to pay great attention to mud system drilling performance and enhance ease of disposal to the highest standards demanded by AER Directive 50 for chemical constituents, dissolved salts, minimal oils, miscibility with native soils, and other characteristics.

A typical water-based mud system may be one of the following:

- Weighted (low-solids, non-dispersed) mud
- Glycol/glycerol mud system
- Saturated salt water mud (using sodium chloride, i.e., common salt)
- Calcium-based mud.

The list of typical mud formulations above covers a wide range of basic muds suitable for drilling in relatively benign (non-active clay), low-temperature environments. Simple muds comprise bentonite clay, caustic soda, shale inhibitors (common salt, hydrated gypsum, or lime) all well mixed together to help lift drill cuttings as well as minor additives to prevent drilling equipment corrosion, balance acidity or pH, permit the removal of drilled solids, and keep the ingredients in a slurry rather than separating or flocculating.

The Proponent has used a gel/chemical system on E-78, a relatively shallow well (approximately 1,000 m total depth). This system is used extensively in western Canada and exhibits the low-toxicity features desired for the proposed exploratory program. However, there remains the need to perform compatibility tests or analyses to confirm its suitability for drilling to 2,200 metres at Eagle Plains.

The Proponent is undertaking interviews and expanded discussions with a select number of well-established medium-sized mud services suppliers in conjunction with cuttings disposal specialists, all very active in other drilling jurisdictions. A mud services scope of work will emerge from these discussions to request proposals for providing the service for all exploratory wells. Once the system is designed and validated, all drilling mud characteristics, , such as mineralogy, lithology, pH levels, and others, will be known and can be disseminated to Yukon regulators.

The main function of drilling fluid is to over-balance the well pressure to ensure that the pressure in the wellbore is higher than the pressures expected to be encountered from the various geological formations as the drill bit penetrates them. The drilling fluid prevents formation fluids from entering the wellbore, keeps the drill bit cool and lubricated, circulates out drill cuttings, and keep in fluid suspension the drill cuttings during periods when drilling is paused or when the drilling assembly is cycled in and out of the hole. Drilling fluid is selected to provide operational efficiency, minimize formation damage, reduce corrosion, and minimize environmental impact for handling and disposal.

Project operations will utilize drilling practices that minimize the volume of drill cuttings and drilling waste generated. This minimization will in large part be due to drilling smaller-diameter holes to what will be a relatively shallow total depth. Drilling waste is composed of rock chips and cuttings and the drilling fluid that is recirculated. The drill fluid returned to the surface is sent through a shale shaker and centrifuge where the drill cuttings are separated and have most of the mud removed. The liquid fraction from the separation will be returned to the active tankage system for reuse.

Flaring

Flaring of gases during the drill stem testing part of well evaluation is a widely applied activity. The process, however, can only be undertaken in compliance with rigid regulatory controls. The requirements establish that the flare line must originate downstream of the choke manifold, must be designed to prevent the accumulation of any fluid within the line, and must be properly installed and anchored. Any amount of gas

encountered would be circulated through the rig degasser system to remove it from the drilling mud, thereby rendering the mud safe to pump back into the wellbore. Larger volumes of gas may be control-burned through the flare stack according the flare permit issued by Yukon Oil & Gas.

An example of a typical well site flare layout is illustrated below (**Figure 1.6**). Normally the flare line from the Choke Manifold is connected to the Flare Stack inlet to permit the directing of the gas to the flare until total control in terms of flow rate and flow pressures.

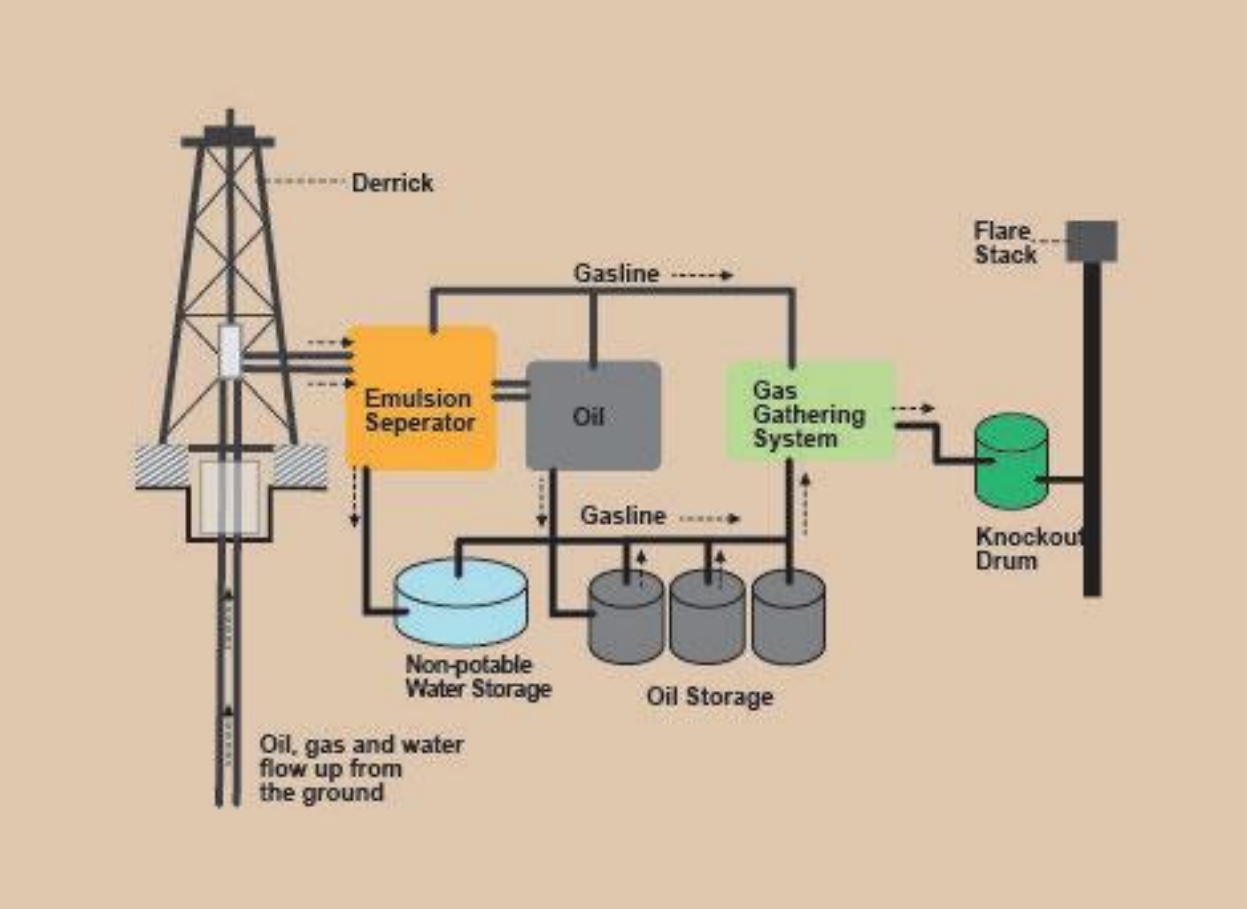

Figure 1.6 Typical Flare Stack and Gas/Vapour Recovery Flowsheet

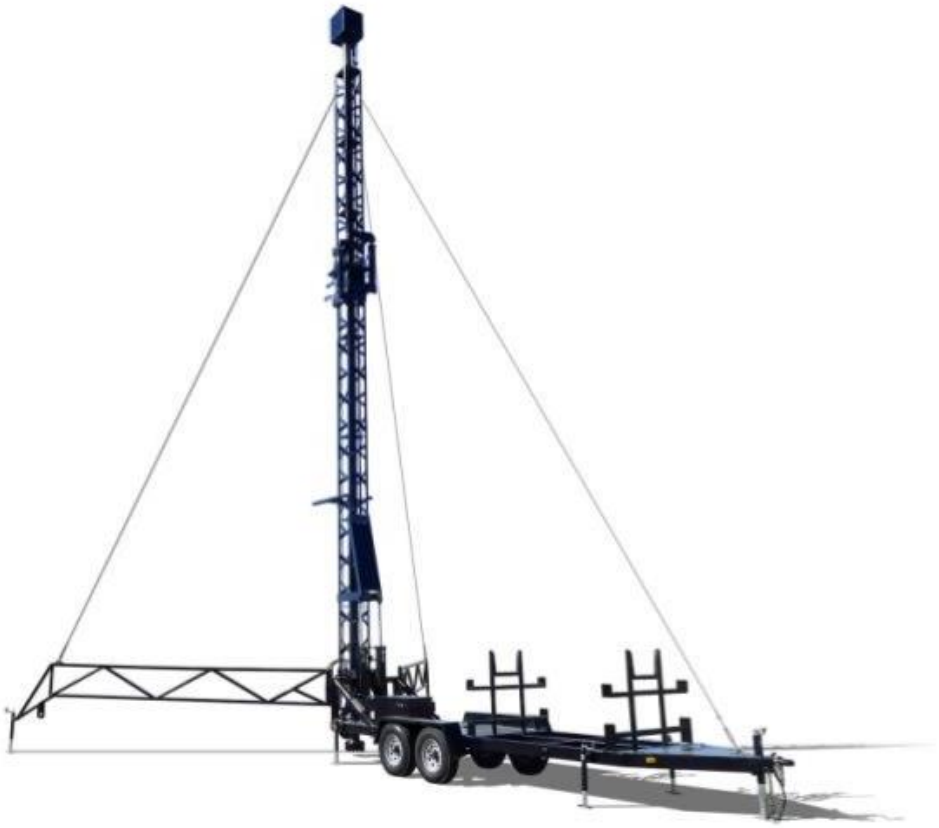

Figure 3-11 Typical Portable Rig Flare Stack Unit

Figure 1.7 Typical Flare Stack Unit on a Portable Rig.

It is expected that the targeted formations will produce less gas than in the past. Newly drilled wells will not contain the anaerobic bacterial contamination present in some of the older wells which may have caused small amounts of H_2S to be present.

The Proponent has not flared gases during the previous exploration programs; however it is likely to occur during some of the flow test operations until a use is found for the gas (heating, power generation, re-injection in a formation etc.).

In the event flaring is necessary, the flare will be higher than the surrounding area and designed to be well above vegetation or trees for example (both specific references made in the YOGA Drilling and Production Regulations quoted earlier). Noise from flaring normally only occurs when very large volumes of high pressure natural gas are being flared.

Flaring would only occur over a period of a maximum 1 day while conducting a DSTs at the end of a drilling program of one well. During extended flow testing, flaring may be necessary for between a few days to a few weeks. After that time actions would be taken to utilize the gas for power generation, tank heating or

possibly, gas lifting to assist crude oil production or re-injection. It would be the intent to eliminate gas flaring and reduce gas emissions to very small amounts when unavoidable.

The Oil and Gas group of Yukon Government's Department of Energy, Mines and Resources has adopted the AER Directive 50 – Drilling Waste Management (as recently amended and updated) procedures for the disposal of drilling wastes within the Yukon. The Proponent will manage the operation in accordance with the MBC requirements of AER Directive 50 – Drilling Waste Management for the remote sump locations and/or Alberta Forestry's "Drilling Waste Management, Disposal on Licence of Occupation" for the LWD disposal method (AER 2016).

It is not anticipated that significant levels of residue chemicals will be deposited on terrestrial and aquatic environmental components. The flare stack will be at 10 m high to assist in air dispersal of combustible end products and will be positioned on the well site in accordance with the regulated spacing requirements. All flaring processes will be in accordance with the air emission permit regulations and best practices.

To ensure that vegetation and soil are not be impacted by residual chemicals, the site design will include an appropriate spacing between the flare stack and any vegetation. Vegetation and soil samples will be taken adjacent and downwind (prevalent) and analyzed for identified chemicals of concern. These lab results will be compared to results obtained from control vegetation and soil samples taken at a similar ecosite, but not near the influence of flaring. Visual monitoring will occur throughout flaring period to ensure safety and protection of nearby vegetation.

YOG Drilling & Production Regulations specify these parameter in Part 9 of the Regulations: In summary the flarestack has to meet the following requirements (Note: operations when flaring will be conducted in full compliance with these requirements):

Flare requirements

128. Unless otherwise approved or directed by the Chief Operations Officer, any gas that is flared will be discharged from a flare stack that:

(a) is at least
    (i) 50 metres from any well, treater, separator, compressor, crude oil storage tank or any other unprotected source of ignitable vapours
    (ii) 80 metres from any right-of-way, easement, road, public utility, building, installation, works, place of public concourse or any reservation for national defence, except only when there may exist special circumstances that, in the opinion of the Chief Operations Officer, justify the positioning of the stack at a greater or lesser distance
(b) is adequately anchored and suitably protected against freezing
(c) is designed to ensure flame stability and efficient combustion
(d) is of sufficient height and diameter to ensure
    (i) that the average concentrations of hydrogen sulphide and sulphur dioxide in the ambient air do not exceed limits specified under the Occupational Health and Safety Act
    (ii) that vegetation combustion is prevented by maintaining an area free of vegetation and combustible debris around the base of the flare stack or the end of the flare line to the following minimum distances:

(A) 10 metres or 1.5 times the stack height, whichever is greater, in cultivated areas

(B) 30 metres or 2.5 times the stack height, whichever is greater, in forested areas

(C) 1.5 times the stack height, in any other area

(ii) that a minimum stack height of 2.5 times the height of the highest third party building located within a distance equal to 5 times the height of the building is maintained

(iii) that any heat generated around the base of the stack does not exceed the manufacturer's specifications for any equipment situated there, to a maximum of 4.73 kW/m²

(e) (e) has a sufficient exit velocity and is provided with guards or other features to prevent extinction of the flame

(f) (f) if the gas flow is intermittent, is provided with an ignition device to ensure continuous ignition of any gases.

Cement Plugs and Permafrost

Cement is a chemical mixture which reacts with and changes form when mixed with water. The reaction gives off heat when mixed with water. As the reaction progresses, the cement hardens. Cementing casing to attain the desired minimum hardness to withstand 500 psi (approximately 3,500 kPa) takes 6-8 hours depending on the amount of accelerator or retarder compound is mixed with the cement. This setting pressure permits the pressure testing of the casing within 12 hours of the cement job concluding to reach 80% of the casing internal yield pressure to confirm pressure integrity. Production casing for example, has an internal yield strength of 56,260 kPa (8160 psi); so 80 % test pressure would be 6525 psi or 45,000 kPa.

Permafrost cement (also named Arcticset or Polarset Cement by different suppliers) is manufactured reduce the amount of heat released during the reaction caused by mixing cement with water by adding Silica Flour mainly. When the cement is mixed with water the reaction proceeds with minimal heat generation and therefore does not contribute to permafrost degradation.

Typical oilfield cements, when mixed with water and begin to set, produce substantial levels of heat, known as the heat of hydration. This heat can melt the permafrost in the near wellbore region. Permafrost cements are a specific mixture of typical oilfield cement (Portland Cements) with additives such as gypsum and/or Calcium sulphate. This blend is specifically designed to create cement that, when mixed with water and begins to set, produces no increase in temperature of the slurry (no additional heat of hydration). This eliminates any permafrost degradation.

Permafrost cement is normally only used for the Surface Casing which is installed to protect any shallow aquifers and permafrost. The Proponent plans to install Surface Casing to a depth of 400 metres at minimum.

1.3.2.3 Drill Stem Testing

All well testing will be performed with the Guidance of AER, Directive 034: Well Testing, Theory and Practice and in consultation with Yukon Government's Energy, Mines and Resources- Oil and Gas Branch. As well, the Proponent will follow related non-discretionary legislations, such as the Drilling and Production Regulations. Part 5 of this Regulation provides detail on well evaluation and testing requirements.

Depending on analysis of rock cuttings, fluid measurements made during the drilling operation, and the well log results, it may be desirable to test prospective zones prior to drilling deeper or running casing. In these cases, a DST is commonly done. Drill stem testing or well flow tests are conducted through a special string of drill pipe anchored at the bottom of the well just above the target zone. The drill pipe would be made up to a packer that isolates the zone from the rest of the well and which would be mechanically fixed to the side wall of the wellbore A special annular pressure operated valve is placed above the packer and with either a small amount of fluid (e.g. water, diesel or other light density fluid) or with the pipe mostly empty of liquid to promote immediate flow from the formation in a controlled manner.

The surface end of the pipe would be connected to a well head made up of a series of valves to control flow and direct it where the operator requires but always with complete control. From the well head, the fluids from the well are carried by surface flow lines to a test separator. The separator splits the fluid mixture into its component elements which could be some combination of crude oil, natural gas and formation water, each stream of which is accurately measured by flow meters, to confirm the volume, pressure, temperature and rate of flow. From the separator, the crude oil stream is sent to a holding tank, the natural gas flows to the choke manifold to the approved flare or other pre-determined place (e.g. burned for heat, power or injected into an appropriate formation below ground) and the water would be filtered or treated in some manner to make is usable elsewhere or pumped back into an approved disposal well (most likely an existing suspended well in the area) in a similar manner as natural gas being injected in a suitable formation.

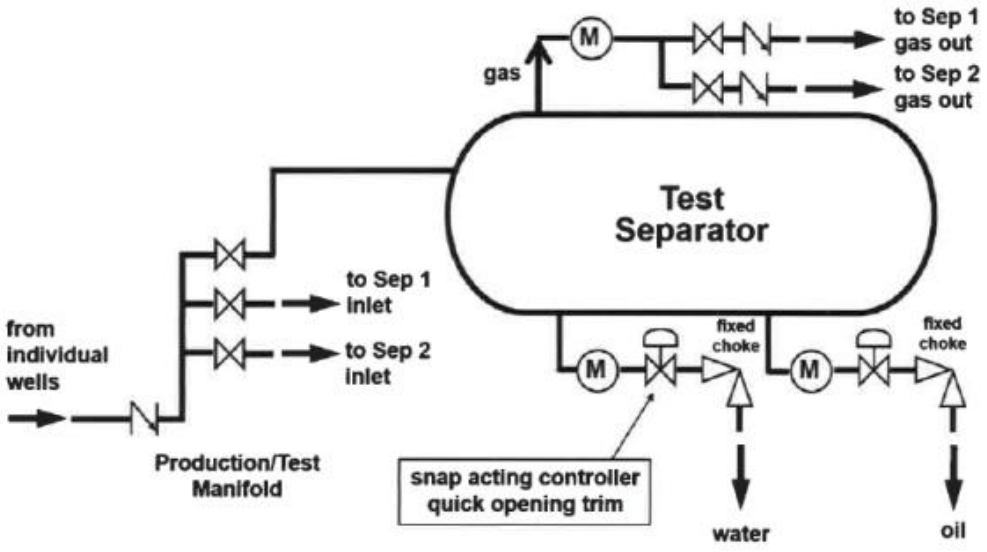

Figure 1.8 Typical Test Separator Schematic

The test separator (**Figure 1.8**) is kept operational permanently in every processing facility. This enables plant operators to assess the performance of the operation periodically. Outflow from the test separator normally is directed to a Central Processing Facility to join production from other wells. Separated natural gas may be piped to a dehydration vessel for future use as fuel or for injection downhole in a suitable well formation.

A typical operational sequence of DST is:

- Well is logged using various diagnostic tools and intervals for testing are selected.
- Test equipment is connected to the end of drill string and run into the well bor. The test equipment, generally consists of one or two packers for isolating the perforated intervals (to be tested), an annular pressure controlled downhole valve to open and shut in the well test and pressure gauges to measure the bottom flowing and shut-in pressures.
- Surface flow lines carry the fluids produced during the test from the wellhead (or surface test tree) to a test separator, where any natural gas is separated and either flared or utilized as fuel and any crude oil is separated and stored in tanks located onsite.
- A cushion of fluid contained in the drill pipe to initially ensure back pressure on the formation, which may be required to control initial flow rates.
- Once the test string is positioned at the zone to be tested, the packer is set and the down hole valve is opened to allow formation fluids to flow into the drill string.
- Initially, the well flows for relatively short period of time to clean up the wells (normally, this period may be a few hours). Following this period, flow is temporarily shut in downhole and a pressure buildup is recorded (with the initial shut-in period lasting for a period lasting 2 or 3 times the initial flow period).
- The test zone is now ready to be flowed at constant or variable rates, with each constant flow period normally followed by a shut-in period.
- Before concluding the series of test rates, bottom hole and surface samples are collected.

At the conclusion of the test, the tools are closed, packers unset and any samples within the drill pipe reverse circulated to surface. Formation fluids that may be produced during a successful test are piped into a test separator with produced gas being metered then flared and oil and/or water stored in sealed tanks.

Samples are taken of all fluids for analysis (both Pressure Volume Temperature samples under the flowing reservoir pressure, temperature conditions and atmospheric samples to check for “base sediments and water characteristics of the produced fluid”). A normal DST duration is approximately a few hours, not including the time required to make up the tools and run pipe to depth and do the reverse on completion. In addition to the time required to flow the well is an even longer period with the well shut in to determine the time it takes for the formation pressure to fully recover to pre-tests levels.

Depending on well log results, sample analysis and potential DST results, the decision is made either to abandon or case the well for further evaluation. In the former event, cement plugs are run using open-ended drill pipe across all porous/permeable zones, across the base of each casing string and at surface, the well casing(s) are cut off 1 m below ground level and steel plates welded across each string, a well sign is erected and the well site returned to original contours and re-vegetated, all pursuant to various oil and gas and land use regulations (all actions in compliance with Sections 90 to 96 of the YOGA Drilling and Production Regulations).

For each DST (minimum one per successful well unless several discrete zones require testing) one well flow should be sufficient and 30 in total days for 30 well DSTs would be typical. Should there be more than one prospective/productive formation which is separate from the other, a second (or more) DST will be

conducted on that formation. In some cases, a DST may need to re-done if there is a misrun. In addition, the DSTs may or may not be done in a steady sequence. Sequencing will depend on where the zones of interest are found in relation to the various casing strings that could be set as the well is being drilled.

Further Testing Details

The DST guidelines outlined in Enform IRP 4 are intended to ensure that safe work procedures are in place and to "minimize the probability of either the mechanical or human systems failing during a test, as well as establishing minimum health, safety and operating standards". In addition, they are "designed to allow flexibility and must be used in conjunction with competent technical judgment".

The exploration wells to be drilled may encounter hydrocarbon bearing zones that could be evaluated by conducting a DST (or DSTs). If DSTs are conducted a plan and testing procedures program will be in place, prior to conducting the test. The plan will be specific to the formation to be tested and the wellbore conditions existing at that time. The plan will be designed to ensure the safety of personnel and equipment and will provide for handling of any fluids that may be recovered. Enform IRP 4 guidelines are one of the sources that will be referenced in preparation of the plan.

Although the Proponent is the only operator currently active in the Eagle Plains basin, there have been several other operators in the past. The records of the historic wells in the basin are available on the website of Yukon Oil and Gas Resources. Nearly 200 DSTs were conducted on approximately 28 wells in the Eagle Plains during the period from 1960 to 2005. To our knowledge, there were no incidents where these tests had any adverse impact on the environment or presented any operational problems. Drill stem tests are a common method of evaluating potential hydrocarbon intervals in exploration wells and have been performed for over 60 years. They are usually of short duration. Flow periods are usually only 1 to 4 hours in duration, and seldom more than one day. The procedures for handling any produced hydrocarbons, and other fluids are the same as for any other operations conducted on the wells.

Three of the wells drilled in the Eagle Plains basin have had one, or more, acid stimulation treatments performed. One of these treatments was conducted by the Proponent. Records of these treatments are available on the Yukon Oil and Gas Resources website. These treatments are usually of small volume where the acid required for the stimulation treatment is transported in a single truck, and the treatment is performed in a single day. The fluid management practices utilized, as for other operations conducted on the well, prevent the release of any fluids to the environment.

Specific details of past drilling experiences can be found on the Yukon Oil and Gas Online Information Site: (http://maps.gov.yk.ca/imf.jsp?site=OilandGas_wells). For reference: the Proponent’s comprehensive casing designs and rig and blow-out prevention system conforms fully to the YOGA (http://www.emr.gov.yk.ca/oilandgas/pdf/unofficial_office_consolidation_oil_and_gas.pdf), and the Drilling and Production Regulations (Sections 33- 61) (http://www.gov.yk.ca/legislation/regs/oic2004_158.pdf).

Further details of the Proponent’s system configuration are confidential as per Section 176 (4) of the Yukon Oil and Gas Regulations. This section outlines what information is required to be non-confidential.

In consideration of the above text, it is not possible to accurately determine the number of DSTs that may be conducted at a well site. A more accurate estimation can only be determined after initial work occurs

which will inform Chance personnel of the geology, potential of oil and gas reserves. Plans for all DSTs will be based on well results and will be discussed with the Oil and Gas Resources branch of the Yukon Department of Energy, Mines and Resources.

Swabbing

There is the possibility that any well may be swabbed (normally a service/work over operation). Swabbing is a procedure to unload wellbores of heavier fluids thereby permitting the formation fluids to enter the wellbore and be circulated to surface. Wells will only be swabbed if the well is drilled, cased and a potential reservoir is:

- Identified,
- Perforated; and,
- Testing reveals that reservoir pressure is insufficient to flow liquids to surface; or,
- If well stimulation results in wellbore liquids that prevent flow to surface.

If the above criteria are met, swabbing is an accepted practice to reduce the pressure preventing a potentially productive formation from flowing to surface naturally. The same regulations affecting the handling and disposal of these fluids apply to fluids produced by swabbing as to recovery by any other means.

Acid Stimulation

Previous formation analyses have indicated small volume acid stimulation treatments would work well to clean up wells, remove scale and other impedances from formation pore throats to allow or improve flow into the wellbore. Acid stimulation entails the pumping of discrete amounts of normally hydrochloric acid at varying concentrations of 10%, 15% or 20%. The acid is trucked to location in specially sealed tanks in compliance with Transport of Dangerous Goods regulations and transferred to the cement pumping unit for pumping downhole. Treatment batches of 10 to 25 barrels (approximately 1.60 to 4 cubic metres) are pumped slowly controlled pressure until the entire batch is pumped. The relatively weak acid serves to dissolve scale (calcium Carbonate) deposited in flow paths over time. Successful stimulation is when the well flows at increased daily rates which could be +30 to 150 % of pre-stimulation rates.

The toxicity limits for oilfield hydrochloric acid are described in the Environment Canada documents and the Material Safety Data Sheets for the products. Hydrochloric acid is a gas dissolved in water to form hydrochloric acid. If heated the gas evaporates from the aqueous phase and water will be left. The chemical reaction of acid with carbonates renders the carbonates to form a harmless Calcium Chloride salt and water as by-products.

Oilfield concentrations are normally 10%, 15%, or 20% concentration hydrochloric acid. 5ppm (5mg/cubic metre) is considered safe concentration from an environmental perspective. Acid stimulation is normally only used once per well operation. The acid is transported in a special truck mounted tank that are designed and constructed for safe acid transport according to Transport Canada and Department of Transport regulations. A small quantity of relatively weak acid (10%, 15% or 20% concentration) is used on any occasion normally 5 to 10 cubic metres maximum. The acid is pumped from the truck into the pumper unit and from there downhole and never actually “sees daylight”. In winter, if acid is spilled as with water, it

would freeze and can be recovered from the surface snow or a thin surface soil layer. In summer, immediately flushing the spill with water would neutralize the acid and render it harmless (less damaging than vinegar). Flowing the well to “clean it up” would return the “spent acid solution” as Calcium Chloride, Carbon Dioxide and water.

In summary, acid stimulation is a common practice and an economic means to enhance well flow and reduce if not remove the materials impairing the ability of the formation to allow fluids to flow into the wellbore.

1.3.2.4 Extended Flow Testing

As noted above, all well testing will be performed with the Guidance of AER, Directive 034: Well Testing, Theory and Practice and in consultation with Yukon Government’s Energy, Mines and Resources- Oil and Gas Branch. As well, the Proponent will follow related non-discretionary legislations, such as the Drilling and Production Regulations. Part 5 of this Regulation provides detail on well evaluation and testing requirements.

In addition to drilling, any discoveries identified through DST are expected to undergo extended flow testing in order to gather important information about the nature of the resource accumulation and its productive capability. Given the remoteness of the region, the limited infrastructure to support oil and gas industry activities and the very early stage of oil industry evolution at Eagle Plains, the duration of these EFTs at each discovery could be up to 2 years. The information obtained from EFTs is critical to determining the future development plan for each discovery. The planned wells are exploratory; any flow testing will be contingent on discovery of formations potentially containing hydrocarbons. Part 8, Section 103 (1) of the Yukon Drilling and Production Regulations requires:

> *“The Licensee of a well shall obtain sufficient well tests, formation flow tests, wireline logs, analyses, surveys, conventional cores, cuttings and samples during the drilling of the well to ensure that a comprehensive geological and reservoir evaluation can be made.”*

EFTs will be undertaken if preliminary results from DST are encouraging and the following criteria have been met:

1. The well is drilled and cased; and,
2. A potential reservoir is:
    a. Identified
    b. DST has been conducted and
    c. Test analysis of the DST concludes sufficient hydrocarbons present to proceed to further evaluation of the hydrocarbon bearing formation.

In such a case, an EFT will be conducted to obtain more extensive information on reservoir characteristics and potential reserves. The same regulatory constraints apply to fluids produced by extended flow testing as to recovery by any other means.

EFT operates in a similar principal to DST. The main difference is that EFTs are undertaken after the well has been cased. To allow the zone of interest to flow into the wellbore, the casing has to be perforated

which is a routine procedure carried by either using a wireline from surface or attached the end of the production tubing from the surface to the zone of interest. The well, in this case, is first completed with a packer attached to a tubing string and have special downhole gauges to record flowing temperatures and pressures in real time. The surface would have the proper “Christmas Tree” wellhead equipment and be flow line connected to the test separator through a choke manifold. Well fluids (gas, oil and water) would then be handled in a similar manner as described previously. In an EFT however, the drilling rig would be removed to drill another well while the drilled well is prepared for testing.

Depending on drilling success several wells in different prospects would be flow tested simultaneously. As each well is drilled and drill stem tested to evaluate its candidacy for extended testing, it is left in a safe, secure state for further testing to take place after the drilling rig has been removed. It may become necessary to mobilize a small service rig to perform the completion work before turning the well to extended testing, but Chance Rig #1 could also perform this task and the solitary drilling/service unit at Eagle Plains. A well service rig has very similar capabilities and equipment as a drilling rig except that it generally has fewer modules and is also lighter equipment. If a service is required, it would be incremental equipment to the drilling rig.

Well testing is normally performed by specialized experts who would provide the specialized equipment, operating and safety procedures and the certification to be able to perform the associated tasks. Extended flow testing however would be handled in the same fashion as production operations and still be conducted by trained professional operators under the direct supervision of a Production Superintendent.

EFTs will require the installation of surface and subsurface equipment and facilities at each well site to measure, store and process produced fluids before it can be safely consumed, transported out of the operating area, or disposed at an approved location. The specific details of this equipment is subject to the nature of the discovery and could include:

- Casing of entire wellbore and perforate casing at zone of interest
- Packer, tubing and downhole gauges
- Wellhead valving assembly
- Flare systems
- Separator vessel
- Treater to do additional phase separation of the fluids
- Storage tanks
- Appropriate artificial lift systems
- Heaters
- Dehydrators
- Flow lines
- Metering equipment
- Portable generators

The Proponent anticipates a period of time to elapse between confirming a discovery worthy of further evaluation and commencing the EFT to allow time to properly design, fabricate, install, and commission the extended flow testing facilities.

The Proponent will conduct EFT on up to 20 successful wells. EFT may be completed within a month for a predominantly natural gas well or up to 2 years for a predominately crude oil well. There may be up to eight EFTs conducted at the same time.

Fluids produced during extended well flow testing will need to be measured, processed and dealt with in an environmentally responsible manner. Depending on the nature of a discovery, the Proponent anticipates that some combination of natural gas, crude oil and possibly formation water will be extracted during the EFTs. These fluids are separated and measured in facilities on the surface.

Natural gas could be flared for short periods of time. However, the Proponent may conserve natural gas and use it to provide fuel for process heating and possibly onsite power generation. Heaters are burners in a contained system of firetubes and the heat given off from combustion is used to provide heat to vessels treating the produced fluids or keeping stored fluids warm. The design of heaters can include heating an intermediate fluid such as glycol at the heater and circulating the glycol in a network of pipes to the places where heat is required. The generators are likely going to be small engines fuelled with natural gas and sized according to the power needs of the location.

Crude oil produced during the EFTs will also be conserved instead of flared to the greatest extent possible. This will require some processing at the well site or the central processing facility to stabilize the crude oil for truck transport to a suitable, approved crude oil marketing point, such as terminals near Ft. Nelson or Ft. St. John in British Columbia or Grand Prairie in Alberta. All of these locations are ready to receive and utilize crude oil produced from Yukon sources in the absence of such destinations within the Yukon. The Proponent may also consider trucking crude oil produced during the EFTs to ports in Alaska such as Skagway, Haines or Valdez for onward shipping to suitable markets elsewhere in North America.

Formation water produced in conjunction with crude oil and/or natural gas will be separated from the hydrocarbon streams and disposed of underground into a compatible and approved formation at Eagle Plains using one of the suspended wells. These procedures to process, transport and dispose of various fluids produced are common practice in every oil and gas province in Canada.

While water injection as a means to replace produced crude oil in the underground reservoir to maintain pressure in the reservoir is universally used in the oil and gas industry. The Proponent does not feel there is enough reservoir information data to predict the need for water injection in the future life of an Eagle Plains producing oilfield. The normal ratio of produced oil to injected water is 1:1. That is for every barrel of oil produced, there will be a requirement for a barrel of water to be injected following an initial period without water injection. The need for and the design of a water injection operational procedure will accompany and be part of a full field development plan should one transpire. One of the objectives of EFT is to gauge whether reservoir pressure maintenance occurs naturally or whether it needs to be done artificially using water or natural gas injection. This information will in turn support any longer term, development plan.

An EFT of any well can only be accomplished when year-round access to the each well is established. Producing wells require periodic inspection by field personnel to ensure the operation is proceeding within design parameters and safely. The well fluids have to be trucked out periodically as well.

During an EFT, all produced fluids will be separated into fluids that can safely be disposed of in the area (clean water) and fluids that must be transported to distant markets or safe disposal sites (crude oil, condensates). The natural gas element will, as previously stated, metered to accurately determine its volume/production rate and likely flared onsite, unless a local use can be identified (or burned for heating, gas lifting and/or power generation).

The average production rate experienced from previous well testing on the Proponent's old wells, 200 barrels of oil per day is expected to be the average per well production and less than 5% water cut is planned for. Therefore 4,000 barrels per day is likely the upper limit and a design limit of 2,000 barrels per day is more realistic for the daily maximums.

1.3.2.5 Well Maintenance (Workovers)

Any well completed for EFT or longer-term production may require workovers during its lifetime. A work over entails the manipulation of the wellbore production equipment (pumps, tubing, packers, etc.) using a suitably sized service rig or occasionally a drilling rig. In this activity the objective would be to change the condition of a well to improve productivity, replace faulty components or extend the well's productive life in some manner.

Over time, a reservoir depletes in such a way at to permit the water interface with crude oil or natural gas in the formation to rise to a point where only water flows from the wellbore. Producing too much water over a period of time could impair the ultimate recovery of crude oil or natural gas and possibly shorten the life of a producing well. Measures are needed to reduce or shut off the water flow to allow continued recovery of crude oil or natural gas. These include plugging some or all of the perforations and perforating at different section of the wellbore casing. Other factors that impair production of crude oil and natural gas include scale buildup, asphaltene (a constituent of some crude oils) plugging, etc. need remediation and this work is done using service rigs, wireline services and so on. These practices are commonly used by the oil and gas industry and conforms to the regulatory requirements to optimize the recovery of the resources from the reservoir.

The well completion design and installation phase is critical in ensuring the well maintains a longer period of uninterrupted production. To this end completions are designed to require minimal intervention for many years by installing simple less mechanically operated systems, superior corrosion protection, erosion protection, possible use of internally coated production tubing etc. All such actions are focused on making product flow as smoothly as possible. Furthermore, the actual tubular components are selected to minimize changes in internal diameter, prevent areas where turbulence is generated and reduce if not eliminate leakage paths.

The completion is also designed to make its installation as trouble free and time saving as possible (have components which could assist in pressure testing the tubing internally while being run to eliminate leaks. The simplest completion should comprise of tubing and perhaps a tubing anchor or packer. Seating or landing nipples are installed to enable internal pressure testing of a completion string as well as land

downhole pressure gauges while flowing, permit circulation of kill fluids from the annulus into the tubing bore or reverse and possibly plug a well at a certain depth. The term “kill fluid” describes a fluid of sufficient density that creates a hydrostatic pressure at the bottom of the fluid column that is equal to or great than the formation pressure and prevents formation fluid from flowing into the wellbore.

Work overs nearly always start with “killing the well” to prevent further flow and circulating the wellbore contents to be replaced with a stable, non-flammable fluid. The kill fluid is normally weighted brine with corrosion inhibitive features. Salt dissolved in water (Brine) makes the water “heavier” (denser) and therefore an over balance medium fluid to keep formation fluids in the formation and not allow then to enter the casing/well. Normal completion brines are Sodium Chloride, Potassium Chloride and Calcium Chloride depending on the bottom hole pressures encountered. Eagle Plains conventional wells can be completed with Sodium Chloride (common salt) brine mediums. Only additives that may be added to the workover brine is corrosion inhibitors and/or biocide.

Following that activity, the wellhead is removed and a blowout preventer is installed to provide additional control of the well during the work over. The production tubing is recovered to surface for reuse or disposal if it is too eroded or corroded for future use. The wellbore would be cleaned of debris accumulating over a production period (normally a bit and casing scraper run accomplishes this). The remedial work is done to the well to fix whatever problems were encountered and the well is returned to a condition that allows production to resume.

1.3.2.6 Drilling By-Products

Within the described drilling program, two forms of drilling by-products will be produced. The following sections will describe and detail their creation and industry wide solutions for dealing with these by-products.

Please note, the Proponent is drilling within a sedimentary basin. Drill cuttings consist of sandstone, shale, and carbonate rock and are therefore, not significantly sulphide bearing. These rocks have been examined by Chance geologists and do not contain the materials that cause acid creation and as such the potential for acid rock drainage caused by the disposal of drill cuttings is remote to non-existent.

Naturally occurring radioactivity will be measured by gamma ray or spectral gamma ray wireline logs, which is a regulatory requirement in the Yukon Government Drilling and Production Regulations. GR is a radioactivity detection device (similar to a Geiger Counter) and therefore detects any existence of radioactive Uranium, Thorium and/or Potassium isotopes in the rock formations drilled. To date no abnormal detections have been made other than that attributed to natural rock formation radioactivity and therefore, radioactivity appears absent or undetectable in the fluid of the Eagle Plains sedimentary formations.

Solid Drill Cuttings

When drilling a well, cuttings are produced. These cuttings are a direct by-product of the drilling action caused by the bit grinding rock. After being drilled, these cuttings are brought to surface with the drilling fluid and separated from the drilling fluid using sophisticated equipment (e.g., shale shakers and centrifuges). These cuttings are stored onsite in metal bins referred to as shale bins. Close attention is

given to the dryness of the cuttings coming across the shale shakers and collected in the shale bins. It is important that as much fluid as possible be recovered from the cuttings for a few reasons:

- Less total weight in the cuttings, hence less cost associated with future handling of the drill cuttings.
- In the winter, it is easier to handle and move dry cuttings as they do not freeze and create large blocks of material.
- Reduces the need for additional make-up drilling fluid by recycling more fluid that is separated from the cuttings.

Drilling Fluid

The Proponent is proposing to use water-based drilling fluid systems. It is not uncommon that after drilling a few wells using the recycled drilling fluids, a mud system may need to be partially or fully reconstituted (disposal of the current system and mixing of fresh water and new drilling fluid products). This ensures the drilling fluid is fresh and capable of drilling through the different rock types found in the proposed wells. It is unclear how often a reconstitution process will be needed. The Proponent has had success with re-using drilling fluid systems across multiple wells to reduce the overall need for make-up water and reduce ultimate disposal of material at the conclusion of its use. As drilling is likely confined to a winter drilling season, the Proponent will likely re-use drilling fluid throughout one drilling season.

The first stage of fluid and material management is called ‘Stripping’; this is the process of running the drilling fluid as it returns to surface through centrifuges multiple times to separate the water from any solids suspended in the fluid stream. The fluid is then either recycled back into the mud system or used elsewhere on the rig

The disposal options outlined for the drilling program have been directly influenced by both the proposed drilling system and the site conditions present at the drilling locations and in the Eagle Plains area generally.

- Accordingly, the following conditions were established for selection of the drilling mud system: a low-toxicity mud system confirmed through laboratory analysis; and
- Meet operational requirements (maintain formation stability, hole cleaning and well control, etc.)
- The following conditions were established for selection of a cutting disposal method:
  - minimize the extent of surface disturbance; and
  - minimize transporting the material off-site for disposal.

In response to both these sets of conditions, the Proponent plans to select a water-based mud system as generally described which has been previously proven suitable for the MBC disposal process in an approved nearby site.

Any drill fluid selected will first have to satisfy Section 32 “Approved Drilling Fluid” of YOGA Drilling and Production Regulations. The type and chemistry of the drilling fluid will be a key part of the drilling Program issued in application for a Well Licence. This is explained and described further in this section.

1.3.2.7 Mix Bury Cover Sump

The Yukon has accepted AER Directive 50 as the governing regulation to determine the eligibility and applicability of various disposal alternatives for various drilling by-products and mud systems. Mix-bury-cover, as described and detailed in AER Directive 50 Section 13, is a method of disposing of drilling waste (both drill cuttings and drilling fluid or just drill cuttings) by which the by-products and spent mud is mixed with a local receiving soil at a specific mix ratio, then deposited into a sump, and then covered with clean subsoil.

A typical MBC sump design consists of three distinct layers:

- A clean subsoil layer 1 to 1.5 m in depth. This layer acts as an insulator between the subsoil/drill cutting mix and the vegetative layer to ensure that, after final reclamation, the site is returned to its original state.
- The subsoil/drill cutting mix layer is where the receiving subsoil is mixed at a specified mix ration with the disposed material (e.g., drill cuttings, spent drilling mud, etc.).
- Clayey material exceeding 1 m in depth, or alternative impermeable liner, acting as a hydraulic isolator.

Sump Suitability

Initial investigation into sump locations is required. AER Directive 50 Section 6.3 specifies the procedures and parameters for sump site investigation. Any proposed location will have cores drilled and the subsoil will be analyzed to confirm the following for a proposed sump:

- Sump soil has appropriate deposits of clayey soils.
- Must have appropriate clayey material of 1 m beyond the horizontal and vertical dimensions of the sump to ensure hydraulic containment.
- Absence of hydraulic defects or ways for fluid to leak out of sump.
- A composite sample, made up of five subsamples, is required for every 3 000 m² proposed to be used for MBC.

In the instance where the subsoil is found to be saline, special care will be taken when these sumps are excavated to ensure the non-saline active layer and subsurface materials are returned to the surface allowing the site to return to its equivalent land capability.

The Proponent has begun a sump suitability study of chosen locations throughout the area proposed in this application. Core samples, from existing and potential future locations for MBC style disposal, are being examined and analyzed by qualified experts. The results of this work will determine the course the Proponent will pursue for MBC at Eagle Plains.

The actual drilling fluid system that the Proponent plans to use has not yet been determined due to the exploratory nature of the drilling program (uncertainty of lithology), more information about this can be found in the Environmental Conditions report (Appendix D) describing the geology in the area. Before the Proponent begins the drilling of a well, a test sample of the drilling fluid will be prepared. The properties of

this fluid will be analyzed and compared against the receiving soils at the MBC site(s) to estimate the soil/waste mix ratio to ensure the final soil composition complies with AER Directive 50 section 3.

The Proponent intends to assign cuttings disposal management and direction to a competent individual representing an organization with the most experience operating under the terms and conditions of AER Directive 50.

MBC is not a viable disposal option if:

- Suitable sump site that meets all of the requirements established under AER directive 50 cannot be found.
- Drilling fluid that is incompatible with receiving soils or prohibited for MBC under AER Directive 50 is used.
- Drilling by-products/receiving-soil properties require a mix ratio greater than 7.

In order to minimize the potential for deep permafrost exposure during summer exploratory drilling program, the following mitigating procedures will be adopted:

- The sump will be excavated as disposal volume is required, in order to minimize the area of basal and wall permafrost exposure at any time. This may be in the form of narrow compartments oriented E-W to maximize shading of the basal permafrost surfaces or any other field procedure determined superior at the time.
- The top of the open area of the sump may be covered if environmental/geotechnical monitoring indicates degradation of wall structures in the sump trench due to thaw.

While an MBC sump is actively being used, the Proponent will monitor and inspect the site to evaluate sump integrity, volumes of material involved and to assess if further work is needed to the sump location. The drilling operations will utilize practices that minimize the volume of drill cuttings and drilling by-products generated.

The Proponent will arrange for full-time disposal expertise, provided from the selected mud services contractor, who will be available for Project management and consultation regarding disposal operations.

As noted above, all materials to be disposed of in the sump will meet AER Directive 50. If materials to be disposed of do not meet AER Directive 50, the disposal material will be transported to an appropriate permitted facility for disposal consistent with the practice employed in previous exploratory wells drilled at Eagle Plains. The Proponent has used permitted facilities that can accept specified waste in Whitehorse and northeast British Columbia.

Drill cuttings and fluids will be held in containers for minimal periods before disposal. After drill cuttings are circulated out of the hole, they are separated from the drilling fluid and stored in 3-sided metal bins. For final disposal, the cuttings are transported to the proposed MBC site for mixing with the subsoil. After the three-sided bins have been emptied, they will be moved, along with the rig, to the next drilling location. Disposal will take place as and when required during drilling or when the shale bins contain a full truck load of material.

For the proposed Project, drill cuttings will be transported to and disposed of at the MBC sump site, while fluids will be reused until the end of the Project. The Proponent plans to construct a new MBC sump adjacent to the Devon sump area to the same specifications to dispose of drill cuttings from the proposed 30 wells (see **Figure 1.9**). The Proponent has not used the Devon site for any drill cuttings or drilling fluid disposal to date and does not intend to use the site for disposal in the future. The Proponent's preferred disposal site is separate from where Devon drill cuttings and drilling fluid were buried but in an adjacent, previously undisturbed area,The Proponent has not monitored or inspected any of the Devon sumps. The proposed exploration drilling program will be performed under a comprehensive drilling fluids management process managed by a services supplier competent in AER Directive 50 and fully versed in safe MBC techniques in use in western Canada.

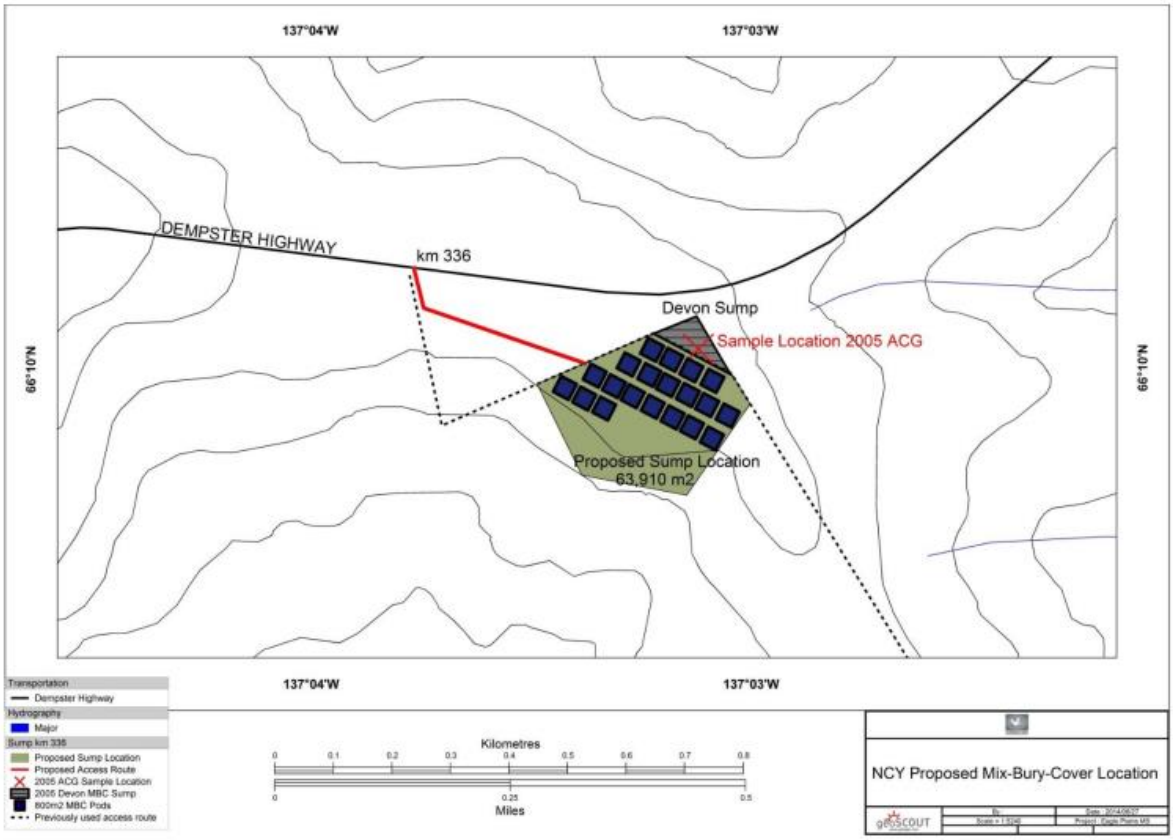

Figure 1.9 General Location and Typical Plan of MBC Sump Site

Figure 1.9 shows the 63,910 m² area proposed for MBC disposal. This area was determined based on the estimated area required for disposal. Each 800 m² MBC pod signifies an estimate of how much area would be required to dispose of one well's drill cuttings. The additional area, a rough estimate, would allow for spacing between MBCs for truck access and to pile excavated material before MBC commences. All estimated calculations, as required by Yukon Government Drilling and Production Regulations (Government of Yukon 2004), were made in accordance with the requirements of AER Directive 50. Typical operational practice is to have only one MBC open at a time.

MBC pods will be sized based on the anticipated volume of drill cuttings disposal required per well. This will ensure that the MBC opening time is minimal. As mentioned previously, a typical well would produce up to 300 m³ of drill cuttings and require an area of approximately 800 m² to dispose the drill cuttings. The Proponent proposes to only use the site described in **Figure 1.9** for the MBC sump. The section of area where the Devon 2005 MBC was located and whose exact location is known, will not be disturbed by any of the proposed operations. The Proponent aims to minimize surface disturbance by using a single previously disturbed area for multiple MBC pods. The site is adjacent to an already disturbed site used by previous oil and gas activity (Devon access road 2004) and it has already proven to have the soil characteristics required as stated in AER Directive 50 Section 6.3. There is no operational need to establish other discrete MBC locations.

1.3.2.8 Injection Well

DIR 50 covers the disposal of drilling fluid. In this case the fluid would be added to the drill cutting and then mixed with the required amount of soil in accordance with AER Dir 50. Drilling fluid may also be stripped back to just the clear portion and disposed of using an approved water injection well.

Well choice requires further injectivity and suitability investigations. This cannot occur until the wells are re-entered and made ready for the investigation trials. Chance Candidate wells could be one or more of the following suspended well(s): Chance J-19, Chance M-08, Chance G-08, Blackie M-59 and Chance E-78 all located within the Chance licence areas. Any well that is not a preferred EFT or future production candidate could be an injection well if strategically located in close proximity to a usable well or wells and if it exhibits the required characteristics for injecting fluids.

The YOGA Drilling and Production Regulations require reservoir produced water not be disposed of at the surface unless its quality and/or salinity is equal to or better than the quality limits set out in producing filed facility licence.

Any plans or intention to dispose of produced water from reservoir fluids separation have to be submitted to the regulatory authority and must meet the pertinent environmental standards as well the oilfield waste disposal standards and limits (reference YOGA Drilling and Production Regulations Sections 122. 123. 124, 130 and 165). The YOG regulator will only authorize produced water disposal when the operator demonstrates all legislation in force requirements have been met and that good oilfield exploitation and reservoir management practices are satisfied.

Once their disposal suitability is established, the following liquid materials (all treated with bactericide) and their volumes may be disposed of:

- Produced water per well (water cut 20% to 60% for 200 BOPD) = 40 to 120 barrels water/day
- Workover fluids: Maximum 7” casing volume full= 276 barrels
- Rig wash: hose flowing at 5gpm water for one hour = ±7 barrels per day in summer
- Saline fluids (completion brines) same as workover fluids = 276 barrels
- Liquid fraction of drilling fluids = approximately 200 cubic metres at end of Project

The zone must have an impermeable barrier above it to prevent migration of the injected fluid and be deeper than 750 metres. Permeability and porosity of the rock must permit pumping of the fluid at low surface pressure and especially well below formation breakdown pressure. Testing will also have to determine injection fluid compatibility between the rock and native reservoir before injection.

The injection pressure and rate, and the pressure in the casing tubing annulus will be monitored at all times. Accurate/calibrated surface pressure gauges will continually monitor pressure readings and any fluctuations. The conditions are injectivity rate, porosity and permeability of the formation being injected into.

Disposal of highly saline produced water at surface disposal sites may be greatly restricted in quality and quantity. To this end and to support best reservoir management practices, it may at times be mandatory to re-inject reservoir produced water back downhole as the only viable and environmentally safe option.

1.3.2.9 Seismic Exploration

The seismic program will consist of approximately 1,500 km² of 3D and 2,000 km² of 2D reflection seismic exploration. Actual final seismic survey location, design and layout will be dependent on drilling outcomes as they progress. Utilization of the low-impact seismic methodology will result in very low impact on the environment. Source lines are limited to 3 metres in width and receiver lines limited to 2 metres in width. The Proponent intends to leave a small amount of snow on the lines so that the tundra and permafrost are not disturbed. The low-impact seismic drills are outfitted with air hammers and as a result will not require water for drilling.

The Proponent plans to deploy a wireless recording system. This wireless system is preferred since a cabled system could present a hazard for migrating animals and requires a larger hand cut line than is necessary for a cable-less system where the layout crew only requires a path 2 metre or less through the land. A cable-less system is also less impactful on the environment as it is easier to carry down the receiver lines and requires fewer personnel on the recording crew.

Preflagging (Cruising)

Prior to line preparation, a detailed line by line spatial analysis (area examination) is performed utilizing a combination of air photos (2011 vintage with 2 m resolution), LIDAR (Light Detecting and Ranging), field scout information, GIS information, First Nation cultural inputs, and any information identified by the preflagging/cruising phase. This greatly helps reduce time spent in the field dealing with localized line preparation issues.

Preflagging (cruising) will be conducted to identify and mark line locations, areas containing riparian areas, difficult terrain, historical/archaeological areas, animal sites and facilities. This is done by having personnel on the ground marking the line locations and areas of concern for the mulchers and chainsaw operators to follow or avoid. These areas will be added to the Project map. Handheld Global Positioning Systems (GPS) units ensures accurate line placement and automatic notifications are sent to management when the mechanical equipment is approaching a “Hot Spot”, or stations that are encroaching any buffered zones or areas.

Line Preparation

A combination of low-impact seismic mulchers and chainsaw operators will be utilized to prepare source and receiver lines. Both source and receiver lines will be slashed to ensure there are no pokers or leaning trees for safety reasons. On board GPS on all mulching equipment ensures accurate line placement and automatic notifications are sent to management when the mechanical equipment is approaching an area of concern, or stations that are encroaching any buffered zones or areas. Lines will be doglegged or bent from any access point to avoid creation of a line of site and will meander to avoid disturbance of any timber larger than 20 to 30 centimetres in diameter. Source lines will be 3.0 metres wide to accommodate vehicles. A minimum of 20 centimetres of packed snow will be left on line to avoid possible damage to vegetation or permafrost. Receiver lines will be 1.75 metres wide to accommodate personnel.

Survey

After source and receiver lines are prepared, surveyors travel the source lines to mark the location of where the low-impact seismic drills will create the source points, and the receiver lines to mark where the recording crew will place the wireless recording equipment. They do this using GPS which allows for meandering and narrow lines.

Source Point Preparation

Source point holes 9 m in depth and 10 cm in diameter will be drilled every 60 m along the source lines using a small, low-impact seismic air hammer drill. A charge of one kilogram of dynamite is then loaded into the hole to be detonated by the recording crew. Dynamite is transported and stored at one of the staging sites in a federally regulated Explosives Magazine.

Recording

With the use of a long line and helibags, a helicopter will place and retrieve recording equipment at pre-determined intervals along the receiver lines. Recording personnel will access the equipment in the helibags and will place a series of geophones every 60 m along the receiver lines. The recording crew will be using a cable-less recording system. Cable-less recording systems are ideal for gathering seismic data because they reduce the constraints on geophone placement, eliminate downtime for cable repair, and reduces the impact on the environment. The geophones record the vibration created by the charges being detonated on the source lines. The data that is recorded is relayed to the observer truck. Once the data is relayed, personnel and helicopter return to retrieve the equipment and any debris used to mark the surveyed receiver and source locations.

The helicopter will be based out of the camp and the use of the helicopter will be minimal. The Proponent will follow the Flying in Caribou Country guide. Helipads will be built for safety and medevac reasons.

Access Trails/Creek Crossings

For safety reasons, vehicular and personnel movement a minimal amount of access trails will be required within the program area. This will be done on existing trails, historical seismic lines or lines that will also be used for source lines and receiver lines. The width of the access trails will be a maximum width of 5.5 metres wide and will also have a minimum of 20 centimetres of packed snow.

1.3.3 Accessory Project Components

The following activities are expected to be completed, as required, to support the principal activity of drilling completing, and testing exploration wells:

- Well site(s) preparation
- Other Project Facilities (i.e., camps and fuel storage)
- Some surface facilities (e.g., storage, processing, injections)
- Airstrip construction and operations, and 2 fixed-wing aircraft flights per week
- Building and maintenance of access roads (all-season and winter roads)
- Development of borrow sources for airstrip and roads
- Water use for drilling and camp

For drilling: Camp 325 will be the main accommodation facility for the exploration program. The Chance Rig #1 will also have a smaller mobile camp, occupied 24 hours per day, 7 days per week, to house essential personnel (rig supervisors, medic, geologist, etc.).

1.3.3.1 Access Roads

Assuming all wells are successful, all-season roads will then be required to access all 30 wells. Access to wells that are proximate to the Dempster Highway , drilled in proximity, or enroute to a successful well will have all-season access built to them. Wells undergoing EFTs, including the legacy suspended wells located on the Chance Significant Discovery Licence, will require all-season access. The Chance Road will be established as an all-season road regardless of the results of the drilling program.

After drilling several wells and depending on success in discovering hydrocarbon-bearing formations, access roads will be upgraded to all-season roads constructed from rock material from borrow fill sites. The diagram below, prepared by Boreal Engineering Ltd., illustrates a typical road construction design. The pad will be constructed to be approximately 7 m in width, sufficient for safely accommodating a transport truck, but also having roadside passing areas to allow 2 trucks to pass beside one another. Passing bays will likely have frequency of 1 approximately every 750 m allowing vehicles coming from opposite directions to have a clear view and prepare to enter the nearest passing area on their side of the road.

The estimated distance between pull outs to be 1 km; however, they should occur as/when required when the roads winds and visibility for oncoming traffic is impaired. Pullouts will be 150 m long, at inter-visible locations and identified with signs indicating the km / station. It is intended that the maximum distance between pullouts will be 1 000 m; however, they may be as close as 300 m to provide a passing lane to ensure that pullouts are inter-visible. The purpose is that if a vehicle were on the road without radio control, a widened road would be available for passing transport trucks. For the purpose of volume calculations, it is estimated that average distance between pullouts will be 750 m. Well site access roads would, in turn, also be constructed using a similar design.

The base road pad will be ultimately covered with a sandy material for protection of the road surface and endurance. All-season roads will require periodic maintenance as surface material is removed or eroded by the elements or vehicular traffic.

Winter road construction will utilize similar techniques as previously applied. Once snow cover equals or exceeds 10 cm there should be adequate snow to build winter roads. Well site access roads will also be constructed in a similar fashion using accumulated snow to construct berms on the road margins and filling the space between with amounts of snow and water trucked from approved sources. All roads will be supervised by a competent and qualified geotechnical engineer to ensure their ability to safely support the drilling rig and other similar heavy loads that will be transported across them.

Water Crossings

The access routes are designed to have as few water crossings as possible by following previously travelled trails and roads located on ridges or higher areas well above the water drainage valleys in between. The normal techniques applied when constructing water crossings is to lay a culvert of a sufficient outside diameter as to not reduce or obstruct the water flow, nor impeded fish movement along the water course. To this end, the Proponent has directed that water crossings must meet all the Yukon Government land use and transportation requirements.

Culverts will be installed per the Yukon Government Highways and Public Works standard drawing for culverts in permafrost conditions. Culverts will be installed using standard engineering practice in permafrost areas and per the attached Yukon Government standard drawing 06010-5. Culverts will be sized following a hydrological assessment by a Professional Engineer registered in Yukon to determine flow volumes. Culverts will be sized accordingly to the 100-year return event. Minimum culvert size will be 600 millimetres (mm). Culvert installation methods will follow those methods provided by *Best Management Practices for Contractors and Inspectors* handbook. The hydrological assessment is necessary to determine the stream flow for culvert sizes of each water crossing. The Alaska document urges the understanding and appreciation for the thermal effects of standing and running water because water can initiate thaw settlement and erosion that can destroy the road.

It is recommended that “the velocity and volume of water running beside the toe of a road should be carefully evaluated, providing for a series of culverts, rather than large culverts at discrete intervals rather than large culverts at great distances” (Author year) The Guidelines further recommend “Culverts should be considered in three distinct phases: 1) during the original deployment, 2) during the first summer after snow is gone and actual drainage cane be seen and reassessed and 3) in subsequent summers when perhaps the roadway and culverts have settled or other factors have influenced their effectiveness” (Author year).

The Proponent will commission a fully qualified road Arctic construction organization currently operating in Yukon who are versed in the construction techniques applied to remote areas as Eagle Plains.

Water courses will not be diverted. A culvert will be installed within the flow path of the stream. Following completion of the culvert installation, water will be directed through the culvert prior to placement of fill for road construction. Following closure of the road, the culvert will be removed and the water course will be returned to its natural state.

MBC Sump Access Road

The Proponent also proposes to construct a 400 m all-season access road to MBC sump area (Error! Reference source not found.). This road will be constructed as early in Project as possible (soon after mid-

January as snow and weather permit) and will take approximately 2 weeks to complete. The minority of the road follows an existing access trail, and no major clearing will be required. Please see photos of access and terrain. The road does not span any waterways and is 800 m away from the nearest water drainage. The road dimensions will be approximately 400 m long by 6 m wide. The material used for road construction will be approximately 3,000 m³ of locally sourced granular material.

Well Site Access – Summer

All material used for road construction will be locally sourced granular material. Materials utilized will be those approved for use as a road construction material. Several identified borrow sites have been cored and evaluated for quality and quantity of fill material by geotechnical engineers from Tetra Tech/EBA and Yukon Engineering Services. Kryotek Engineering and Boreal Engineering have also been consulted for expert advice regarding Arctic road construction techniques in Yukon. A combination of the previously mentioned engineering organizations will be contracted to undertake road design, construction, and general project management. The construction of a summer access road will be completed as described above.

Well Site Access – Winter

Winter access will only be constructed if the ground and water bodies are frozen and if there is adequate snow coverage. The Proponent will ensure there is a minimum packed snow cover of 10 cm to the vegetation layer. Where required, an increased snow depth will be maintained to avoid disturbing surface vegetation and duff (i.e., tussock terrain).

The factors that will be considered while making the determination will be terrain features, vegetation present, and local topography. If this snow depth (minimum of 10 cm) is not sufficient in certain areas, additional snow depth will be ensured to provide adequate protection to surface vegetation and duff (i.e., tussock terrain). If this is required, snow will be removed from appropriate locations in the direct vicinity of the winter road (i.e., surrounding areas that have ample snow coverage) and added to the snow pack on the winter road. Vegetation will be cut, with no disturbances to the vegetation mat. Access routes will be constructed using equipment appropriate for packing snow.

Several water bodies may require ice bridges/snow construction. All water bodies will be treated as fish-bearing and will be constructed as per Fisheries and Oceans Canada's (DFO's) Operational Statement on Ice Bridges and Snowfill (http://www.pac.dfo-mpo.gc.ca/habitat/oseo /icebridge-pontsduglace-eng.htm) as well as the Safety Guide for Operations over Ice. As well, if water is required to be withdrawn from nearby water sources, adequately sized intakes will be used and screened to prevent debris blockage and fish mortality (refer to DFO's Freshwater Intake End-of-Pipe Fish Screen Guidelines (DFO 1995).

A minimum snowpack of 10 cm is required for the winter road. However, if the amount of snowfall in the area allows for a thicker snowpack (i.e. 15 cm to 20 cm) during initial road construction, a thicker snowpack will be used. As the winter progresses, the Proponent will continue to add to the snowpack.

If natural snowfall is below the minimum required to commence access and well site construction, the Proponent will consider artificially making snow to make up the shortfall. This is a contingent consideration and could require up to 300 m³ of water per day for a short period of time (several days to a week) if more than 1 access route is under construction at any given time. The sources of water are likely to include the

Eagle River, the Ogilvie River, and the water well at Chance's camp once proper treatment facilities are in place. The water to be used to make snow and ice the winter road(s) will be trucked from the source to the point of use. At maximum, between 20 and 30 truckloads per day would be needed. The actual number of trucks being used would be less since a truck can probably complete 4 to 6 deliveries per day. Generally low snowpack is only an issue during the early part of winter, so this provision would only apply on a contingent basis during the months of November, December, and January. The timing for making artificial snow will depend on how late in the winter season winter road construction begins. If, for example, in late December there is little or no snow fall or snow accumulation on the ground, snow making could ensure a sufficient snow base to commence winter road construction. Snow can only be made when the ambient temperature drops to 0 degrees (°) Centigrade.

Access Road Maintenance

Maintenance will involve grading and filling to ensure a smooth travelling surface, cleaning/maintenance of drainage structures, snow removal in winter, and to ensure signage remains suitable for service. Maintenance equipment will include a road grader, a mid-size (D6) dozer, trucks to haul aggregate, and an excavator for maintenance of drainage structures. Maintenance of winter access routes may include low-ground-pressure vehicles, a road grader equipped with a wing snow plow, some water application, and use of matting where required. Grading may be required over certain stretches of the routes, and depressions along the roads will be filled with snow to smooth the surface. If required, water will be withdrawn from approved water sources using adequately sized intakes and screened to prevent debris blockage and fish mortality; refer to DFO's Freshwater Intake End-of-Pipe Fish Screen Guidelines (DFO 1995). The Proponent will avoid using small streams as a water source. Should winter access roads convert to all-season roads, maintenance will be ongoing to ensure road safety and reliability. This will be especially valid when wells are transformed into extended flow sites and require constant year-round access for operational reasons. Road repair and maintenance for all-season roads will require additional machinery, specified and supplied by the selected qualified contractor.

Dust will be kept to a minimum by enforcing reduced speeds on access roads. Dust will also be kept to a minimum by spraying the road surfaces with water whenever they become too dry; some fine airborne dust may become deposited on the surrounding vegetation. The small quantities of fine dust should not cause vegetation to be affected but periodic visual inspections will be made to check for any visible changes to the surrounding areas.

1.3.3.2 Borrow Source Development

Borrow material will be required for the Project for activities such as road and well pad construction. Approximately 21,600 m^3 of borrow material will be needed per well site. The borrow material will come from the closest approved borrow site. In total, the Proponent anticipates requiring up to approximately 1.7 million m^3 of borrow material for the Project.

Borrow Pit locations will be confirmed throughout drilling proposed locations and are identified in **Figure 1.10** and **Table 1.4**. To eliminate any water pooling, borrow pit design and development will be done in the winter while ground is frozen. Borrow pit access roads will be built to the same standards as the main access roads. Timing of construction is for 2016 winter season.

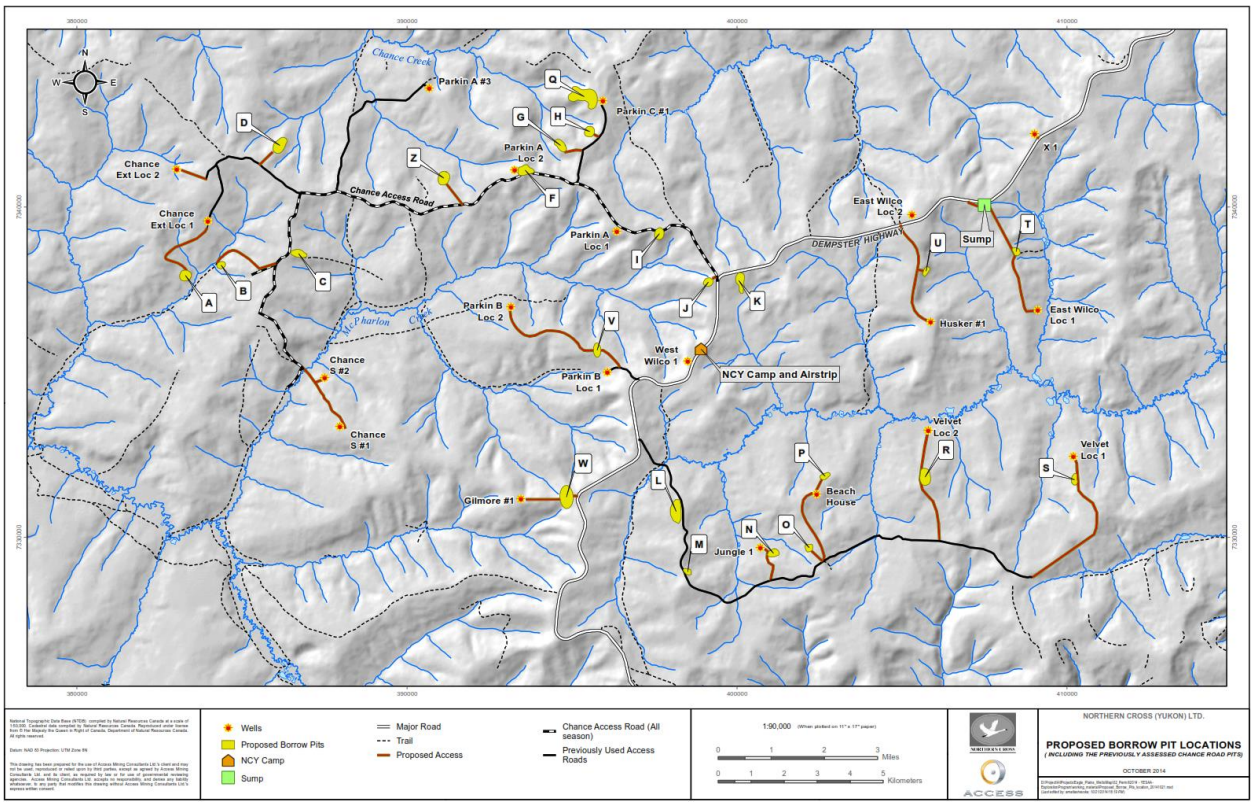

Figure 1.10 Borrow Pit Locations

The Proponent intends that initial access to each well site will be acquired through winter construction of an ice road and placement of rig matting for drilling the well. If the well is successful in finding testable hydrocarbons and it is determined that flow testing will take place, an all-weather road will be constructed. Design and construction of each all-weather access road will only occur once the well has been drilled and a determination has been made whether flow testing will take place. Details of the design of each specific access road including sources, volumes, lifespan, environmental conditions, and closure planning will be provided to regulators prior to construction.

Materials for construction of the access roads will be sourced by drilling the alignment of the proposed access road to each well site to determine the depth of overburden and the geotechnical properties of the bedrock (sand/silt stone, shale, etc.). The general trend has been that those areas higher in elevation along ridges and the crests of hills have less depth of overburden, so materials will be sourced in those locations. There may be a requirement (if the overburden is too deep along the alignment) to source materials from a borrow source off alignment. Access roads will require 15 m³ per m of road constructed plus pullout and drill pad requirements.

The borrow site locations were determined using lithological data gathered from the shot holes drilled as part of the 2014 3D seismic program. Borrow sites will be accessed in March to April of 2021 when sufficient well results are known to merit access. Summer access could be anytime from May to October any year. Fill sources will be located along the road alignment at those locations identified through drilling at which

lesser amounts of overburden will be required to be excavated. The potential life span of the access will be determined by the drilling and any EFT results. The access life span has the potential to be as long as the life of the well. The closure plan will follow the previously submitted plan. Subject to road design, drill samples will be identified to determine the depth of bedrock of the borrow sources adjacent to the proposed road alignment, and information will be taken from the 3D seismic program.

Organic cover will be removed, and stockpiled for reclamation purposes, using a large crawler tractor. Underlying silts will be excavated by ripping and dozing with a large tractor and stock piled separately for reclamation purposes. Bedrock that consists of siltstone and sandstone or shale (depending on the difficulty of using large equipment, it may be necessary to drill and blast) will be excavated with large excavator and or dozer. The excavated material will be loaded directly from the borrow pit for use in the construction of roads. There will be no water pooling; borrow sources will be constructed to prevent water pooling. Any blasting will be performed by a certified experienced blaster according to all applicable Yukon regulations. The necessary metal sulphides required for acid rock drainage are not present because the borrow sites contain sedimentary rock. To date, acid rock is not known to exist in the Eagle Plains area.

For the purpose of the current assessment the following volumes are expected to be sourced, with the preference to source materials along the alignment. (See **Figure 1.10** and **Table 1.4**).

Borrow sources will be decommissioned when the Proponent deems them no longer useful or necessary for the Project. Decommissioning is described in **Section 1.3.4.2** and will be carried out in accordance with the Decommissioning Plan.

Table 1.4 Borrow Source Material Required and Areas of Disturbance

Length and Volume of Pads and Roads

	Length	Volume	Pullouts	Well Sites	Totals	Borrow Source
Chance rd to Parkin A Loc 1	370	5550	0	21,600	27150

1.3.3.3 Central Processing Facility

The camp's Central Processing Facility (CPF) will comprise additional multi-stage and multi-phase separators, heater treaters (to help remove remaining amounts of emulsified formation water), vapour and gas collection system, and possibly central power generation facility to power all discrete well batteries. Separated water will be further treated to remove any hydrocarbons, scale, anaerobic bacteria, and other colloidal or suspended solids ready for disposal in a suspended well nearby following in a pre-approved process. The CPF will be located at the furthest (southernmost) point away from the camp for safety of the camp and its occupants. Having the CPF at the far end of the camp area will ensure trucks can turn around and exit safely without encroaching on any other activity or building. This should also ensure the camp remains upwind from the CPF.

The CPF will have enough storage to contain produced crude oil for loading onto longer distance trucks ("B" trains) and hauling to a pre-approved market site in British Columbia, Alberta, or possibly Alaska. It is estimated that the CFP will accommodate approximately 10 days of storage capacity for crude oil at an approximate daily rate of 2,000 barrels of oil per day or total 20,000 barrels. The volume (stored in up to 5 surface tanks in full compliance with Yukon and Canadian standards and regulations) also ensures the safe crude stabilization before loading onto southbound trucks. In terms of maintenance, the only treatments appearing necessary at this stage of design are fluid separation (to separate oil from gas and water into 3 distinct streams), heat treating the crude to remove water remnants from the separated crude, and gas dehydration to make the gas useable as a fuel.

1.3.3.4 Airstrip

The Proponent will construct an airstrip located along the existing Chance winter trail at a location approximately 4 km off the Dempster Highway. The airstrip will be approximately 1,500 m long and will be part of the road network west of the Dempster Highway. In the early years of the Project, this airstrip will likely be used only during the winter, but could graduate to year-round usage if discoveries support the investment. Until the Chance road airstrip becomes serviceable each winter, or at the end of the winter season operations when trail conditions deteriorate, the Proponent will continue to use the Dempster Highway adjacent to the camp as a periodic airstrip.

1.3.3.5 Transportation

For the majority of the exploration program, the Proponent will attempt to limit traffic on the winter access roads to authorized personnel. Traffic will include approximately 8 to 9 light-weight service trucks (for supplies and personnel), 1 water truck, and one fuel truck. The fuel and water trucks will come to the Project site approximately once per week or as demand dictates, and there will be occasional transport of drill cuttings from the well sites to the sump location. Air traffic estimated at 2 flights in/out per week (normal arrival times from approximately 10:30 a.m. to 12:00 p.m.).

A majority of the traffic volume will be related to mobilizing the drill rig and constructing the site infrastructure. As mentioned above, the setup of the well sites will take approximately 5 days to complete. Included in this amount, the drill rig will require 15 to 20 loads to mobilize. Unauthorized vehicles will not be permitted on the winter roads and the roads will be restricted from public access. The Proponent will be transporting crews using company vehicles; all vehicles will be equipped with radio communication and,

particularly during busy times (i.e., setup and demobilization), traffic will be radio controlled. For safety reasons, any personnel accessing the areas (i.e., winter roads) will be required to notify appropriate staff (i.e., security personnel and/or managers/supervisors) when they leave the Dempster Highway and when they arrive at the well sites. Access to the winter roads will be monitored by Chance staff hired as wildlife monitors/ security personnel.

A typical description of road traffic during the prime operating periods (January 1 to April 15; May 1 to December 1) is presented in **Table 1.5** below and road users will follow the Operations Activity Schedule introduced in **Section 1.4**.

Table 1.5 Typical Road Traffic during Prime Operating Hours

Table 3-4 Typical Road Traffic During Prime Operating

	Activity Description	Peak Traffic	Normal Traffic
1	Early Season Mobilization (Winter)	High	Medium
2	Rig Mobilization (Winter)	Very High	Medium
3	Winter Operating (Drilling)	Very High/High	Medium
4	Access Road Construction (Winter)	Very High	Medium
5	Summer Mobilization	Very High	Medium
6	Summer Rig Mobilization	Very High	Medium
7	Summer Normal Operating (Drilling)	Medium/High	Medium
8	Extended Testing Winter	High/Medium	Light
9	Extended Flow Testing Summer	Medium	Light

LEGEND:

Very High	More than 50 vehicles per 24 hour day
High Traffic	50 or more vehicles per 24 hour day
Medium Traffic	20-50 vehicles per 24 hour day
Light Traffic	Less than 20 vehicles per 24 hour day

The Proponent expects exploration drilling operations activities will range between medium and light traffic volumes. Crude oil produced during the flow-testing phases of exploration work, as described in this document, will be transported to an acceptable market.

Trucking of a stabilized crude cargo in specially constructed transporting tanks presents the same risk as transporting the diesel fuel required and used in Yukon. The process of loading and dispatching trucks at regular intervals will be planned and handled by professionals who will also maintain constant communication and GPS tracking of trucks as they travel down the Dempster and on other connecting routes to their destination. Trucking is by nature a very controlled process. Truck drivers are only permitted a fixed number of driving hours per 24-hour period and are expected to stop for refresher breaks at regular intervals. All their movements are accurately tracked through their onboard GPS, which can provide any truck's location to within a few metres anywhere in Canada or the USA.

The Proponent has practised Journey Management on its previous exploration drilling work at Eagle Plains. In this instance, any unit transporting materials to Chance's camp 325 will be called and tracked periodically by its company dispatcher. The exact location when reaching certain pre-determined check points will be relayed to Chance camp management and Logistics coordinator; this will ensure road safety for the truck driver and other road users and safety of the vital cargo and provides critical planning information for receiving staff to plan for offloading its cargo and possibly loading backhauls.

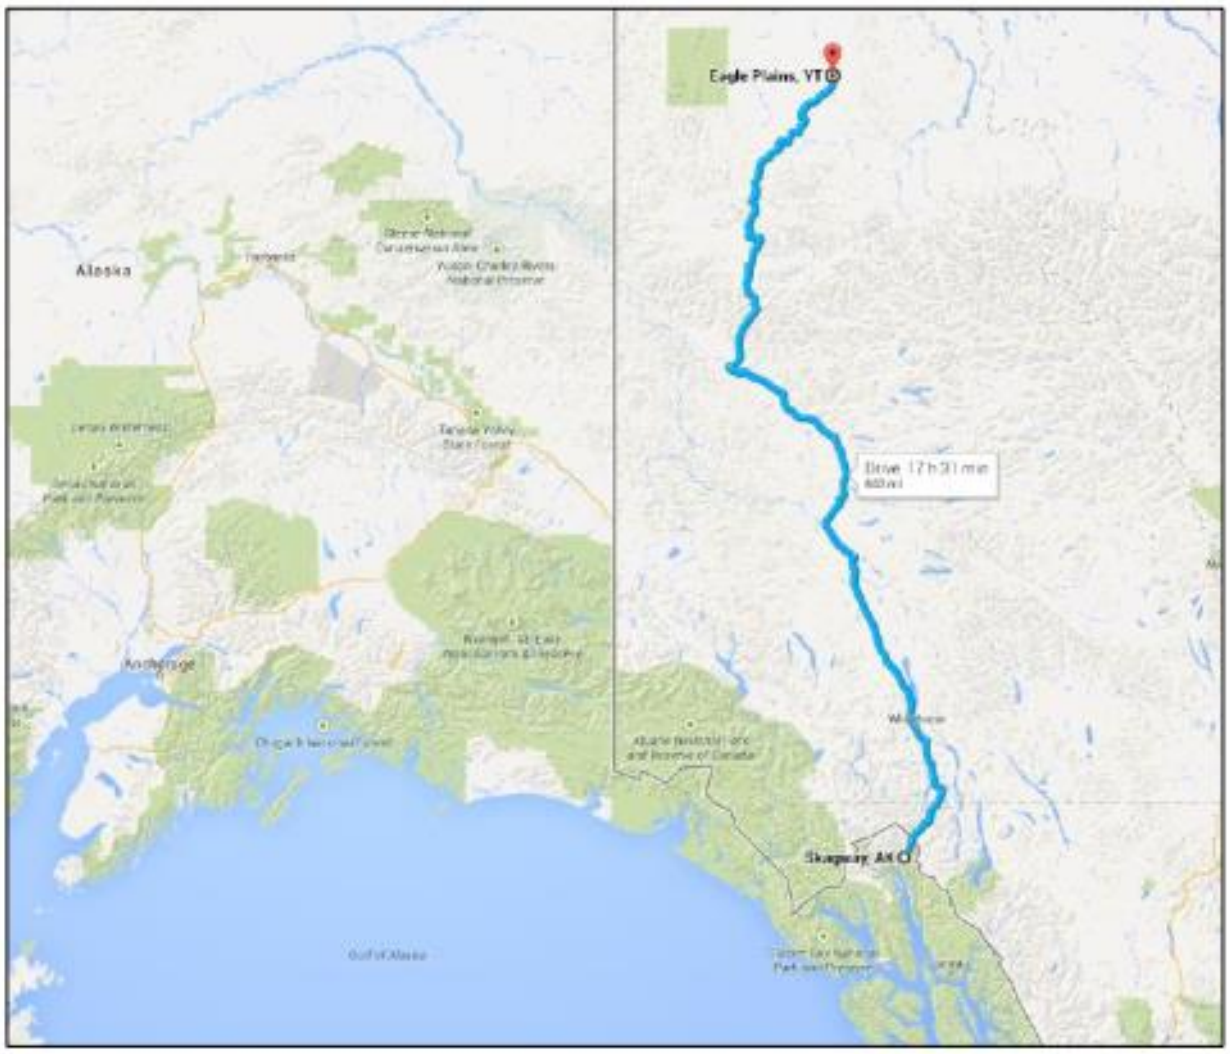

Figure 1.11 Typical Export Truck Route to Skagway, Alaska

Figure 1.11 illustrates one of the possible export truck routes to Skagway Alaska. The journey distance is 1,029 km from Eagle Plains to Skagway. The journey duration is approximately 17.5 hours driving at an average speed 59 km/hr. Other options exist, which include delivery by truck to terminals in Fort Nelson and Fort St. John, British Columbia, or Grand Prairie, Alberta. Depending on which of these options is used, the driving times will vary but the management procedures will remain the same.

The Proponent and its trucking contractor(s) will develop and Alert and Emergency Response Plan to address any incident or accident while in transit on Yukon roads and highways. The same plan will also address any other Provincial routes and routes within the United States border. All reputable trucking contractors versed with transporting flammable liquids and petroleum products in general are mandated to follow the Transportation of Dangerous Goods Federal Legislation. The legislation dictates such activities as how truck contents are identified on the outside of the tank; how the tank is installed on the truck body and strengthened; the level of knowledge and training the driver and any assistant travelling with them must

have to be eligible to operate the particular truck; and the spill response equipment needed to be readily available. Ensuring the truck is safety-checked and the drivers are qualified and adheres to their company's safety policies are the key means of preventing an incident or accident. Tracking the drivers to check on transit speed on a real-time basis means the truck's progress is never neglected and the driver is on notice to observe all road traffic rules at all times.

All incidents affecting the Proponent's trucking contractor are reported back to Chance Operations Management and form part of the Proponent's safety statistics. Every incident is investigated and the causes for each occurrence are closely analyzed and discussed with the truck owner. Should any trucking contractor exhibit an undue number of close calls/near misses or a series of incidents with the same causes, they would be removed from the contract without delay and replaced with a more competent and safety-minded contractor.

1.3.3.6 Workforce

Work force requirements will vary over the life of the Project and will ultimately be limited by the existing camp capacity. During past drilling and seismic exploration programs undertaken between 2012 and 2014, the Proponent had no more than 75 to 80 people onsite at any one time. During drilling, the Proponent operated on a 24-hour clock with a 20-day-on and 10-day-off crew rotation cycle, which means that one-third of the crew was off duty at any point in time. For the seismic exploration program, the Proponent operated on a 12-hour clock and cycled the various services through as the program unfolded with only limited crew changes, mostly connected with the camp catering operation.

The Proponent has an arrangement with Northern First Nation groups and will have time to define their involvement to participate during this exploration program. It is Chance's objective to provide all available work and contracts to its FN/Yukon partners as identified in sec. 68 of YOGA. Chance was successful during its last drilling/seismic program hiring a workforce from the communities from Old Crow, Fort McPherson, Dawson, Whitehorse, and Inuvik.

1.3.4 Reclamation and Closure

1.3.4.1 MBC Sump Site Reclamation

Before the MBC Sump disposal site is opened, the top soil and the vegetative layer will be removed and stored separately from the lower subsoils. This material will then be re-applied after the MBC Sump has been covered by the 1 m of unmixed subsoil. This will bring the disturbed area back to its equivalent land capability. No further reclamation plan is warranted. The standard Directive 050 Drilling Waste Management (D50) plan (AER 2016) of action entails the following:

- The environmental monitor must be onsite during drilling to conduct D50 sampling to ensure that drilling waste is compliant and accurate records are being kept and respond to any spills that may occur.
- The environmental monitor will sample pre- and post-MBC.
- Upon completion of the Project, remote disposal locations will be covered with a minimum of 1.0 m of capping material and contoured to meet background topography.

- A Phase 1 Environmental Site Assessment (ESA) will be completed for each well and corresponding remote MBC location to identify any potential areas of environmental concern.
- If the Phase 1 ESA triggers a Phase 2 ESA, soil samples will be collected and analyzed at an accredited laboratory.
- If contamination is identified, a Remediation Action Plan will be prepared and upon approval, the remedial program will be completed. Once all contamination is addressed either in the Phase 1 ESA, Phase 2 ESA, or Remediation, a surface program including soil and vegetation will be conducted.
- Once vegetation is established, a Detailed Site Assessment; comparing soil lithology and vegetation onsite to offsite) will be completed.

For clarification, environmental monitors will be sampling the following, as per ref AER DIR 50; table 13.1 of this directive lists the Testing Requirements (AER 2016):

1. Receiving soil
    a. Electrical conductivity and sodium adsorption ratio
2. Waste (solids or total waste)
    a. pH, electrical conductivity, sodium adsorption ratio, Sodium (Na)
    b. Nitrogen (N), if additives/products added to the drilling mud/waste system contain any amount of N or if N content was unknown
    c. metals, if concentrations exceeding limits were added to the drilling mud system or if the metal content of additives/products is not known
    d. hydrocarbons, if a hydrocarbon flag was encountered
    e. toxicity, if toxicity data are unknown for any of the mud additives/ products used in the drilling mud system or if concentrations used exceeded pass threshold for luminescent bacteria toxicity test
3. Waste/soil mix (post-disposal)
    a. EC, SAR, and Na, if drilling waste EC > 10 dS/m or Na > 3000 mg/L (saturated paste extract or filtrate from oversaturated waste)
    b. metals, if concentrations in drilling waste exceed concentrations listed
    c. hydrocarbons, if concentrations in the drilling waste exceed concentrations
    d. N, if the nitrogen concentration in the drilling waste (wet weight) is ≥6 mg/kg for disposals in coarse soil or ≥120 mg/kg for disposals in fine soil.

Furthermore, in terms of soil sampling, commencing operations in winter does not necessarily mean sampling would not be possible or even preferable. Sampling can also be accomplished from the surface snow deposits around the well site. The Proponent selected lease dimensions to ensure there is a sizable perimeter for full containment of generated or airborne wastes from the Project.

The first task on any well site would be to construct the well pad or prepare the surface on which matting could be safely placed. The next step is to lay the mats on previously densified/well-trodden surface to render the suface as flat as possible. The final process, before deploying the drilling equipment, would be to undertake a professional geotechnical check on the stability of the surface and its resultant ability to

support the maximum anticipated loads with a suitable safety factor. Finally, the geotechnical engineer will provide a signed/stamped report attesting to the stability and strength of the facility for the work contemplated.

1.3.4.2 Well Decommissioning and Abandonment

As previously mentioned, the 30 proposed wells are part of an exploration program to help determine the oil and gas potential of the region. Depending on the outcome of results, a given well may be tested and additional plans developed to bring into production or be determined to be unproductive and require decommissioning and abandonment. As the Operator, Chance will always carry the full responsibility for all wells deemed to be its property. This responsibility can never be delegated to any other party unless and until such time the Proponent relinquishes ownership according to YOGA and its regulations.

Wells required for further operational uses such as producing wells, water or gas injectors will be maintained in a suspended state with an ability to be converted for use in the future. The Drilling and Production Regulations under YOGA have specific actions required from an operator to maintain a well in a suspended state; key among these actions is to periodically conduct inspections to ensure that the integrity of the well is intact. While in a suspended status, the regulator requires a sum of money be placed on deposit to cover the cost of abandonment and remediation of the site. Once abandoned, the status becomes permanent and there would not be an option to re-enter such a well.

The normal stages before decommissioning/abandonment of a well are as follows:

- The well is first determined as unusable.
- The perforations are first cemented by placing a cement plug below and above them and squeezing some amount of cement into the formations to permanently isolate them within the wellbore. A mechanical shut-off device called a bridge plug may also be wireline set above the cement plug to add protection or isolation.
- Higher in the production casing and below the estimated permafrost maximum depth, a second cement plug would be set. This plug is normally set on top of a bridge plug to ensure it does not leak down in the casing. The plug is also “felt” with a drill bit to confirm its existence and hardness.
- The casing at surface is cut 1 m below the original ground and buried under the soil to finally remediate the location entirely.
- The lease is remediated by removing fill material to restore the location to original status. The surface location would be revegetated with what is normally growing there in the first place.

When appropriate, a decommissioning/abandonment plan for the well sites will be developed that will comply with Part 7 of the Yukon Government Oil and Gas Drilling Regulations (Sections 95, 96, 97, 99). Wells would require final well abandonment according to the YOGA Drilling and Production Regulations. Wells would be sealed with cement, and casings would be cut off below ground level. The casing stubs would be buried below ground surface as required by the Regulations and a surface-visible sign would be installed for identification. The entire site will then be cleared of all debris and refuse. Finally, the site will be contoured, seeded, and left to naturally reclaim.

An outline procedure prepared by the Proponent in compliance with the YOGA Regulations is presented as follows:

- Seal off all perforations in the casings that are not already sealed with cement squeezes.
- Pressure test the casings to 7000 kilopascals (kPa) to confirm formations are isolated and sealed.
- Cut off the wellhead and casings to 1 m below ground level and weld/install plates to cover each casing string at surface.
- Install well identification marker visible above ground level.
- Bury the cut casings to complete the abandonment.

If the entire Project had to be suspended but not completed, the infrastructure would be preserved and maintained until the Project resumes. If it is decided for whatever reason to terminate the Project, then the infrastructure would be decommissioned. While operations are temporarily suspended, the Proponent will ensure access from the Dempster Highway will be barricaded and visually inspected periodically.

1.4 Project Phases and Scheduling

1.4.1 Project Schedule

The Project plan is to have all necessary permitting and approvals in place by the end of 2021 and begin drilling in December 2021. The construction of winter roads, drilling and testing of the first few wells is anticipated to occur during the winter (December to April) and summer months (May 1 to October 31), commencing in December 2021 with the first winter locations.

In the early years it is assumed that all wells will be drilled in the winter. Summer drilling might happen in future locations that are in reasonably close proximity to yet to be developed all-season access. Well priorities and their drilling order can only be best determined after the program commences and in response to drilling results and Chance corporate exploratory information gathering requirements.

The construction of the 400 m all-season access road to the MBC sump location is anticipated to occur in March 2022 and take not more than 2 weeks to complete.

The Proponent anticipates a period to elapse between confirming a discovery worthy of further evaluation and commencing the EFTs to allow time to properly design, fabricate, install, and commission the extended flow testing facilities. This period could be up to 6 months. If drilling is successful and significant hydrocarbons are discovered, the access roads would be upgraded to year-round access to undertake the EFTs. Year-round access to flowing wells is critical to daily well inspections and safety assurance of all operations.

The previously summarized scope of the Proponent’s exploration activity can be expected to start as early as December 2021 and continue over a period up to 10 years to cover the various stages of drilling and extended flow testing of the wells. The actual execution of the EFTs could be phased depending on the nature of the discovery (e.g. natural gas versus crude oil) and the capacity of the base camp and the Eagle Plains Hotel to accommodate the necessary crews. Until there is more information about discovered resources, it is impossible to predict with any precision the full duration of the flow testing program. At least 8 wells could be tested in each year.

In summary, the chronological activities can be best described as follows:

1. Complete 3D seismic processing & interpretation (Chance Exploration rank prospects and establish company exploration objectives to meet Yukon Government lease commitments and CHANCE corporate objectives for exploration)
2. All preparations completed by December 31, 2021 (Seismic, YESAB, Well Licences, Camp, rig upgrade & certify, consumables and services, geotechnical prep work)
3. Prepare first location to mobilize Chance Rig #1 (start January 1, 2022 or soon thereafter)
4. Drill & test winter wells (possibly as many as 4; suspend operations April 15th ±)
5. Prepare for summer drilling (contingent on positive drilling results); ready to construct all-season access to next drill and test targets on schedule. Subsequent wells may be predicated on encouraging well results influencing more follow-up appraisal drilling
6. Continue drilling exploration wells in the remaining prospects to build on positive previous drilling results.
7. Identify wells with positive results meriting extended flow testing to acquire in depth reservoir information.
8. Design order/fabricate well site battery processing equipment in preparation for extended flow testing of selected wells.
9. Re-enter selected wells; install completion tubulars and other accessories, Christmas trees and ready for extended flow testing.
10. Install surface pumping equipment (standard pump jack device to lift the well fluids to surface); hook up well Flowline to well site battery (separator, flare system, crude oil storage tank and water disposal tank).
11. Supervise and operate well pumping, transfer stabilized (crude that has been allowed to “age” in atmospheric storage tanks; made safer for trucking) crude from tanks to truck for transport to the camp’s Central Process Facility.
12. Construct the camp’s Central Process Facility.
13. All vapour and gas removed from the well fluids will either be used for fuel to prevent storage tanks contents from freezing, generating electricity, pumped downhole in an approved manner or flared at site.
14. Progressively more wells would be drilled and brought on stream while extended flow testing and contribute to the accumulated fluid to be removed by trucks to a suitable market.
15. During EFTs flowing information would be gathered including bottom hole pressure profiles to learn about the reservoir flow characteristics and understand more about the prospect’s full development potential.
16. Development would become the subsequent phase of continuing operations. The nature and details of that operation will be described in later submissions as per the YOGA and regulations derived from it.
17. To complete the life cycle of a well, wells drilled, evaluated, tested and completed as part of a field development plan, would be either worked over and recompleted in the event of, for example, water ingress; or, if deemed not having future production potential, would be abandoned according to the YOGA Drilling and Production Regulations. In this instance, all previously perforated producing zones would be cemented shallower cement plugs would be placed and the casing at surface cut

to 1 metre below the normal ground surface. The surface lease would be fully remediated and restored to its original state.

18. The Proponent's future operating schedule for exploratory drilling assumes a continual, year-round program in order to benefit from the economies of scale of uninterrupted operations involving several wells rather than discrete ones with breaks in between. This will also contribute to a stable employment and goods and services market for Yukon residents servicing and supplying operations at Eagle Plains.
19. EFTs involve the flowing of a well or wells. There is no human intervention while wells flow unimpeded for the duration required for the test. In a multi-well producing field, for example, a maximum of three persons can handle all the production operator tasks of a field with 50 or more producing wells (double that number if working a 24-hour day). Field production operators visit each well at least once daily unless there is a need for other demanding work. They record flowing well pressures, ensure fluid pumps operate properly, have enough fuel to continue operating and visually inspect the facility for anything out of the ordinary.
20. The Proponent plans to have three operators managing the EFT wells in any 12-hour cycle. A second set of three will form the cross-shift making a total number of operators 6.

The sequence of wells is dependent on drilling success, discovery, weather and road conditions. The Proponent is continuing the ongoing process of interpreting seismic data in order to better understand the geological setting and size/geometry of potential prospects. Each well drilled will add to that understanding.

In summary: the Proponent will drill up to 30 wells sequentially over a period of 10 years starting in 2022. If a well is successful (i.e., if there is a discovery of crude oil or natural gas in sufficient quantities) the Proponent will conduct an EFT for a period up to 2 years on that particular well. There may be EFTs on up to 20 wells depending on the success of each well. The Proponent will drill one well at a time and up to 5 wells per year. Assuming all wells are successful and EFTs are conducted for 2 years at each well, there may be up to 10 EFTs being conducted at one time.

The schedule illustrates the breakdown as it is known at this time. The maximum time is estimated to be 10 years. The schedule does not account for operations interruptions owing to weather, geological re-interpretation, equipment breakdown or other delays beyond the control of the operator. A normal rate of drilling would be to drill one well at a time during this exploratory phase.

1.4.2 Construction Phase

The mobilization and Construction Phase of the Project is expected to commence in Q4 of 2022. Key activities during the Construction Phase are summarized by Project component in **Table 1.6**.

Table 1.6 Summary of Key Construction Phase Activities

Project Activity	Key Construction Phase Activity
Tree Clearing and Grubbing	Salvage to be completed prior to construction of the well pads and portions of the access roads (winter and all-season)
Road Construction	Completed as roads are required to access facilities and well pads

Project Activity	Key Construction Phase Activity
Quarry Development	Quarries will be developed based on volume of material required to build leases and roads.
Lease Construction	Topsoil and subsoil salvage and local stockpiling
	Lease pads will be constructed on an as-needed basis using material from nearby quarries
Main Camp	Camp will be used to house drilling crew
	Construction of the Central Processing Facility
Accessory Activities	Road construction and upgrades to roads as required
	Construction of an airstrip
	Vehicle traffic related to drilling and construction activities
	Transportation of production fluids to Central Processing Facility and to market
	Follow Blasting Mitigation Plan
	Water use permit for lease and road construction
	Baseline data collection and environmental monitoring
	Monitoring and establishing erosion control features for roads, leases, and the Central Processing Facility
	Updating and following the Emergency Response and Risk Management Plans, as required
	Following a Weed Management Plan for soil stockpiles and leases
	Maintaining and snow-clearing roads and leases for all-season access

1.4.3 Operation Phase

The Operation Phase will begin in Q1 of 2022 and will continue through to the end of 2031. The key activities occurring during this phase are summarized in **Table 1.7**. This section describes the main operational activities that will occur during the Operation Phase.

Table 1.7 Summary of Key Operation Phase Activities

Project Activity	Key Operation Phase Activity
Road Construction	Upgrade roads to all-season roads, with water crossings, as required. Road maintenance will be conducted, as required
Drilling	Up to 30 pads will be constructed and drilled for oil and gas products
	Remote sump access for drilling fluid waste disposal
	Excess drilling mud to be disposed of offsite at the remote sump
	Completing drill stem tests
	Acid stimulation and completion of wells for testing
Well Testing	Facilities to be installed, as needed, for testing and extended well tests
	Routine maintenance of facilities, as needed

Project Activity	Key Operation Phase Activity
	Gas is to be flared off, and oil placed in storage tanks
	Production fluid transport to Central Processing Facility and market
Accessory Activities	Road Maintenance
	Energy may include switching power generation from diesel generators to natural gas produced from the wells
	Updating and following the Emergency Response and Risk Management Plans, as required
	Water permit use for boilers during winter drilling
	Following Weed Management Plan
	Central Processing Facility to handle production fluids, disposal fluids and fuels
	Maintaining and snow-clearing roads and leases for all-season access
	Environmental Monitoring

1.4.4 Reclamation, Abandonment and Closure Phase

Reclamation, abandonment and closure activities will be detailed in a Conceptual Reclamation and Closure Plan. A summary description of key activities is provided below for the Reclamation, Abandonment and Closure phase are described in **Table 1.8**.

Table 1.8 Summary of Key Reclamation Phase Activities

Project Activity	Key Reclamation Phase Activity
Well Abandonment	Wellheads will be abandoned when testing or production phases are complete
	Testing or production facilities are to be removed from each site
MBC Sump Site Reclamation	Site will be reclaimed as per Directive 50
Central Processing Facility	Upon complete field decommissioning activities, the removal of the Central Processing Facility will occur
Well Site Reclamation	Imported material will be removed, and area reclaimed to natural conditions, as much as possible
	Revegetation of disturbed areas to natural conditions and follow-up monitoring
Infrastructure Decommissioning	Water crossings will be removed
	Appropriate sloping and seeding to prevent erosion and scarification to encourage revegetation
Borrow Source Reclamation	To be reclaimed as soon as materials are exhausted or no longer required
	Revegetation to natural conditions and follow-up monitoring
List Accessory Activities	Discussions with YESAB (and other Regulators, as necessary) prior to reclamation work to determine whether there should be changes to the Plan
	Updating the Reclamation Plan to meet new criteria, if required
	Following Weed Management Plan until sufficient revegetation has occurred on reclaimed sites

Project Activity	Key Reclamation Phase Activity
	Annual monitoring until vegetation regrowth deemed satisfactory
	Soil Detailed Site Assessment prior to seeding
	Conduct a Phase 1 Environmental Site Assessment for each location
	Potential Phase 2 environmental assessments of soil and groundwater
	Obtain Regulatory Closure

1.0 INTRODUCTION

This report demonstrates implementation of the Tr'ondëk Hwëch'in (TH) and Chance Oil and Gas Limited (Chance) Engagement and Communication Plan (Plan) since it was finalized on August 28, 2018. Please see **Appendix A** for the Plan. This report summarizes the discussions held between TH and Chance, the purpose and objectives of each discussion, and outcomes of each discussion to fulfill the requirements of Ministerial Order (MO) 2018/ 42 issued to Chance on August 30, 2018. Please see **Appendix B** for MO 2018/ 42.

2.0 BACKGROUND

The development of communications and engagement plans began with Order in Council (OIC) 2016/ 169 that required Chance to file a First Nations communication and engagement plan with the Minister of Energy, Mines and Resources in order to extend tenure on their Northern permits, 0005, 0006, 0007, 0008, 0009, 0010, and 0011 (**see map in Appendix C**). Chance complied with OIC 2016/ 169 and received their tenure extension.

Upon applying for tenure extension on six of Chance's eight Southern permits, 0012, 0013, 0014, 0015, 0016, and 0017, Chance received MO 2017/ 37 that required Chance to revise the consultation and engagement plan filed under OIC 2016/ 169 with each affected First Nation. The affected First Nations listed in MO 2017/ 37 were Vuntut Gwitchin First Nation, Tr'ondëk Hwëch'in (TH), First Nation of Na-Cho Nyak Dun (FNNND), Gwich'in Tribal Council (GTC) and Tetlit Gwich'in Council (TGC).

Chance and TH collaboratively developed their Plan through a series of in-person meetings and conference calls. Hemmera was retained by Chance in November 2017 to facilitate the development and completion of the communications and engagement plans with each of the abovementioned First Nations and facilitated all discussions on the Plan between TH and Chance. Chance and TH submitted their finalized Plan to Minister Ranj Pillai on August 28, 2018. To complete their obligations under MO 2017/ 37, Chance filed four communications and engagement plans which were approved by the Minister and resultantly Chance received a five-year tenure extension on the six Southern permits.

With the five-year tenure extension Chance received MO 2018/ 42 which requires that Chance submit annual reports summarizing the actions taken to implement each communications and engagement plan each year.

3.0 ENGAGEMENT AND COMMUNICATION PLAN IMPLEMENTATION SUMMARY

Since completing the Plan, TH and Chance have continued to build their relationship by discussing advances in Chance's proposed oil and gas exploration project in Eagle Plain Basin along with items outlined in the Plan in Section 7.0 Adaptive Management of the Engagement and Communications Plan. In the following section, a summary is provided of all of Chance and TH meetings conducted since completing the Plan on August 28, 2018.

Chance and TH have had three in-person meetings or teleconferences which are each summarized below. Informal phone calls and emails have also been exchanged between the parties on smaller matters. The main themes of discussion between Chance and TH have been the following:

- Capacity Funding
- Confidentiality Agreement
- All-Party Meeting
- Draft Project Description and scope of activities for Chance's proposed exploration project in Eagle Plains Basin

October 23, 2018 – Teleconference Meeting

Location: Teleconference

Attendees: TH technical staff, Chance management, Hemmera facilitators

The purpose of this meeting was to initiate the implementation the Plan according to Section 7 – Adaptive Management of the Engagement and Communication Plan. This included reviewing the Draft Confidentiality Agreements presented by both TH and Chance and discussing the development of a long-term budget and a formal capacity funding agreement. In addition, Chance's upcoming project plans were also discussed.

When reviewing the Confidentiality Agreements, TH expressed that they had no significant concern with Chance's draft Confidentiality Agreement, however provided some amendments to which Chance agreed. Both parties agreed to a term for the Confidentiality Agreement, and the finalization of the draft was discussed.

Both parties discussed the need for a Capacity Funding Agreement and what this agreement should entail. TH was actioned with providing Chance an initial budget to cover engagement on implementation of the Plan. More in-depth capacity funding would be discussed once Chance was preparing a Project Proposal for the Yukon Environmental and Socio-Economic Assessment Board (YESAB) and further consultation was required.

Chance explained their near-term project plans, which would focus on small geological field studies and preparation of an exploration project proposal for YESAB to allow them to drill exploration wells and do seismic data acquisition in the Eagle Plains basin.

November 23, 2018 – Teleconference Meeting

Location: Teleconference

Attendees: TH technical staff, Chance management, Hemmera facilitators

The purpose of this meeting was to finalize the Confidentiality Agreement and Letter of Agreement for Capacity Funding, discuss the itemized budget for Capacity Funding, and to discuss the All-Party Meeting.

Regarding the Confidentiality Agreement, Chance and TH agreed to the final version; it was prepared for signing after the meeting. Regarding initial capacity funding, Chance was satisfied with the itemized budget structure and the Letter of Agreement for Capacity Funding. Chance and TH agreed that the document would be finalized and sent to TH for signing. TH will provide payment instructions to Chance for the Capacity Funding.

Chance explained that there was interest from the other First Nations for an All-Party Meeting to be held in the new year. TH emphasised the desire that the North Yukon First Nations Chiefs meet first but agreed to check internal availability and confirm by way of email. An action item for Chance after the meeting was to send a brief introduction summary of the All-Party meeting to TH to aid in their internal discussions and planning.

The key meeting outcomes were the finalization of the Confidentiality Agreement, the acceptance of the itemized budget by the Parties and the finalization of the Letter of Agreement for Capacity Funding.

June 11, 2019 – In-person Meeting

Location: Dawson City, Klondike Institute of Art and Culture

Attendees: TH technical staff, Chance management, Hemmera facilitators

The purpose of this meeting was for Chance to present a Draft Project Description of exploration activities proposed for the Eagle Plain Basin, discuss and answer questions on the proposed activities, as well as to discuss next steps in the YESAB process.

Chance presented the Draft Project Description which included the scope of activities for Chance's proposed Exploration Project in Eagle Plain Basin, the timing of activities, and where the activities would overlap with TH Traditional Territory.

Chance and TH also discussed the expected YESAB process. Hemmera explained that Chance was submitting a project proposal to the Executive Committee for screening and the expected pre-submission engagement and consultation for all First Nations.

Chance and TH agreed to review the Letter of Agreement for Capacity Funding, evaluate what funds are remaining, and confirm additional funding needed for TH to engage on the Exploration Project Proposal.

4.0 PLANS FOR ONGOING ENGAGEMENT AND NEXT STEPS

TH and Chance will continue to hold discussions at regular intervals as Chance develops their project proposal for YESAB. Upcoming engagement activities are expected to involve the following:

- Proposed meeting with TH Chief and Council to present the Draft Project Description
- Discussion on Capacity Funding to enable TH to engage on the Exploration Project Proposal for YESAB
- Meetings between TH technical staff and technical consultants preparing the project proposal
- Community consultation events in Dawson City

5.0 APPROVAL OF IMPLEMENTATION SUMMARY

TH and Chance have reviewed this report and agree to its contents as an accurate summary of the engagement and consultation meetings executed since the completion of the Plan.

APPENDIX A

Tr'ondëk Hwëch'in and Chance Oil and Gas Limited
Engagement and Communication Plan

[Insert Tr'ondëk Hwëch'in Logo]

Tr'ondëk Hwëch'in and Chance Oil and Gas Limited Engagement and Communication Plan

1.0 Introduction

Chance Oil and Gas Limited (Chance) is an oil and gas exploration company that holds permits to perform oil and gas exploration activities in the Eagle Plain basin of Yukon Territory, Canada. As part of Chance's exploration program, Chance seeks to develop engagement and communication plans with all the First Nations that are potentially affected by Chance's exploration program activities. Permits 15 and 17 fall partially within Tr'ondëk Hwëch'in Traditional Territory and Chance is seeking to engage Tr'ondëk Hwëch'in (TH) on its activities within these permits.

2.0 Purpose

This document serves as an Engagement and Communication Plan (Plan) to provide a mutually agreed upon framework to support collaborative and effective engagement and communication between Chance and TH now and into the future.

3.0 Relationship

Chance and TH will execute this Plan according to the following principles:

- Transparency and openness;
- Timeliness;
- Integrity;
- Adaptive Management;
- Mutual respect; and
- Working towards trust and understanding of one another.

4.0 Key Tr'ondëk Hwëch'in and Chance Connections

Engagement and communication between Chance and TH will be generally associated with the proposed work and potential effects associated with Chance's oil and gas exploration program and potential opportunities (via training, employment, contracting, and other community investments), as well as any topics or issues identified through engagement and communication associated with Chance's proposed activities. This section of the Plan identifies the key contacts related to these overarching engagement and communication themes. Key representatives involved in engagement and communication are expected to be as follows:

- Chief and Council;
- TH Government department officials and advisors;
- TH Business Development agencies;
- TH Citizens and communities at large; and
- Proponent Management and designated staff and advisors.

The table in the Schedule to this Plan lays out the key engagement and communication topics, in no particular order, and associated key contacts for both Chance and TH.

5.0 Engagement and Communication Methods

Chance and TH will employ the following engagement and communication methods for specific correspondence:

- In person meetings;
- Email;
- Letters;
- Sharing Power Point Presentations (to support in person meetings);
- Sharing reports and other documents (as requested and as required); and
- Telephone (teleconferences and less formal phone calls).

Engagement and communication methods that support general communication of Chance's activities are as follows:

- Chance newsletters; and
- The website for Chance Oil and Gas Limited.

Engagement and communication meetings will be executed in the following manner:

1. Chance or TH will request a meeting in writing to the other party according to the connections iterated in Table 1;
2. The parties to meet will develop the agenda collaboratively;
3. The party requesting the meeting will develop supporting materials (collaboratively, where possible), and share those in advance of the meeting; and
4. The meeting will take place in a mutually agreeable location.

The above general process applies to meetings with subject matter leads (Table 1) as well as meetings with Citizens and communities at large.

Through engagement with North Yukon First Nations, Chance understands that there are existing agreements between Tr'ondëk Hwech'in, the First Nation of Na-Cho Nyak Dun, and Vuntut Gwitchin First Nation. In keeping with the relationship principle of mutual respect, Chance will work within any communications protocols or provisions existing or developed pursuant to these agreements, where applicable and as directed by TH.

The following documentation sharing and review protocols support the methods described above:

- Chance and TH will discuss and establish the confidentiality of meeting minutes in advance of each meeting; i.e. if a meeting is to not be included in the record that will be submitted to regulators and assessors, it is the responsibility of both parties to discuss and agree to this prior to the meeting beginning;
- Chance will take meeting minutes and send these to TH within two weeks via email. Within 30 days of receiving the minutes TH will review and make changes through tracked changes or another method agreed to by both parties. Should TH require more time to review the meeting minutes, TH will notify Chance by email within two weeks of receiving the minutes. The parties will agree on meeting minutes before such minutes become part of the record. No response by TH to Chance's email providing meeting minutes within the 30 days will be interpreted as general acceptance of the meeting minutes by TH, and no response by Chance to TH's email providing amended meeting minutes within 30 days will be interpreted as general acceptance of the amended meeting minutes by Chance;
- Action items and meeting outcomes will be logged during meetings and reviewed by both parties at the end of the meeting to ensure that there is general agreement on the list of actions and parties responsible for those actions. Chance will include the list of action items and meeting outcomes with the meeting minutes;
- Chance and TH will agree upon and use a password-protected file sharing platform to facilitate sharing of large files, such as Power Point presentations and reports; and,
- Should Chance or TH employ a third party for records development and management, the third party will follow the process iterated above for recording and providing meeting minutes.

6.0 Records Management

All information exchanged by Chance and TH is subject to a confidentiality agreement to be agreed upon in the future by Chance and TH.

Subject to collaborative review and the written agreement of both parties, Chance and TH consent to the disclosure of the following information to regulators and assessors for review if and when a potential project is assessed in the future:

- Meeting agendas;
- Non-confidential meeting minutes (finalized versions as described in section **5.0 Engagement and Communication Methods);**
- Invitee/Attendees lists and/or meeting sign-in sheets;
- Records log, which will include summaries of the following:
    - In person meetings;
    - Phone calls and teleconferences;
    - Incoming and outgoing emails between Chance and Chance's representatives and TH representatives;
    - Attachments to the above noted incoming and outgoing emails;

- Reports provided to TH by Chance and reports provided to Chance by TH for review and consideration for engagement and communication purposes; and
- Copies of Power Point presentations delivered by Chance to TH for engagement and communication purposes.

7.0 Adaptive Management of the Engagement and Communication Plan

Chance and TH will review and assess the effectiveness and success of this Plan on at least a 6-month basis.

Within 3 months of the Plan first being agreed to and implemented, Chance and TH will:

- as a first step, sign a confidentiality agreement as contemplated by Section 6.0 above;
- meet to check in on the progress made by both parties in implementing the Plan;
- develop a schedule for review of the Plan; and
- discuss the need for a long-term budget and a comprehensive formal capacity funding agreement to enable TH to participate in future engagement.

Schedule

Key Engagement and Communication Topics and Leads

Role or Subject Matter	TH Key Contact	Chance Key Contact
Project Lead	Sidney Schafrik, Senior Advisor, Mining and Strategic Initiatives (Sidney.schafrik@trondek.ca)	Greg Charlie, VP of Government and Community Relations (gcharlie@chanceyukon.ca)
Culture and Community (includes Indigenous Knowledge and Indigenous Land Use, heritage resources, social, health, and other "human environment" subjects)	Debbie Nagano, Director of Heritage (Debbie.nagano@trondek.ca)	Cindy Dickson Regulatory, Environmental and Community Relations Coordinator (cdickson@chanceyukon.ca)
Engineering and Geology	Sidney Schafrik, Senior Advisor, Mining and Strategic Initiatives (Sidney.schafrik@trondek.ca)	Richard Wyman, President (rwyman@chanceyukon.ca)
Environmental (includes water, aquatic environment, fish, wildlife, forest resources and other plants, and other environmental subjects)	Darren Taylor, Director of Natural Resources (Darren.taylor@trondek.ca)	Greg Charlie VP of Government and Community Relations (gcharlie@chanceyukon.ca) Cindy Dickson Regulatory, Environmental and Community Relations Coordinator (cdickson@chanceyukon.ca)
Opportunities (includes community investment, training, education, contracting, employment, and other business opportunities)	Sidney Schafrik, Senior Advisor, Mining and Strategic Initiatives (Sidney.schafrik@trondek.ca)	Mike Chernoff, Chairman/CEO (mchernoff@cariboucap.com); Richard Wyman, President (rwyman@chanceyukon.ca); Greg Charlie, VP of Government and Community Relations (gcharlie@chanceyukon.ca)
Agreements and Capacity Funding	Pat Titus, Executive Director (Pat.titus@trondek.ca)	Richard Wyman President (rwyman@chanceyukon.ca) Mike Chernoff CEO/Chairman (mchernoff@cariboucap.com)

APPENDIX B

Ministerial Order 2018/ 42

YUKON

CANADA

MINISTERIAL ORDER 2018/ 42

OIL AND GAS ACT

Pursuant to the *Oil and Gas Act*, the Minister of Energy, Mines and Resources orders

1 In this Order

"subject permit" means each of the following oil and gas permits held by Chance Oil and Gas Limited:

(a) oil and gas permit No. 0012,

(b) oil and gas permit No. 0013,

(c) oil and gas permit No. 0014,

(d) oil and gas permit No. 0015,

(e) oil and gas permit No. 0016,

(f) oil and gas permit No. 0017. « *permis visé* »

2 The renewal term of each subject permit is extended by five years (so that it ends on August 30, 2023).

3 The resulting total length of the initial term and the renewal term of a subject permit is 16 years.

YUKON

CANADA

ARRÊTÉ MINISTÉRIEL 2018/42

LOI SUR LE PÉTROLE ET LE GAZ

Le ministre de l'Énergie, des Mines et des Ressources, conformément à la *Loi sur le pétrole et le gaz*, arrête :

1 La définition suivante s'applique au présent arrêté.

« permis visé » Les permis suivants de pétrole et de gaz détenus par Chance Oil and Gas Limited :

a) permis de pétrole et de gaz nº 0012;

b) permis de pétrole et de gaz nº 0013;

c) permis de pétrole et de gaz nº 0014;

d) permis de pétrole et de gaz nº 0015;

e) permis de pétrole et de gaz nº 0016;

f) permis de pétrole et de gaz nº 0017. "*subject permit*"

2 La durée du renouvellement de chaque permis visé est prolongée de cinq ans, de façon à ce qu'elle se termine le 30 août 2023.

3 La durée totale d'un permis visé, y compris la durée initiale et la durée du renouvellement, est de 16 ans.

4(1) In this section

"first nations communications and engagement plan" means the plan filed under O.I.C. 2016/169 and revised in accordance with M.O. 2017/37. « *plan de participation et de communication avec les premières nations* »

(2) It is a condition of this Order that Chance Oil and Gas Limited must file annual reports with the Division Head, in accordance with subsection (3) and to the satisfaction of the Division Head, about the implementation of the first nations communications and engagement plan.

(3) For the purposes of subsection (2), Chance Oil and Gas Limited must file

(a) the first annual report on or before July 31, 2019, in respect of the period beginning on September 1, 2018, and ending on May 31, 2019; and

(b) each subsequent annual report on or before July 31 of each year in respect of the period beginning on June 1 of the preceding year and ending on May 31 of the year in which the report is to be filed.

4(1) La définition suivante s'applique au présent article.

« plan de participation et de communication avec les premières nations » Le plan déposé en vertu du Décret 2016/169 et révisé en conformité avec l'Arrêté 2017/37. "*first nations communications and engagement plan*"

(2) À titre de condition du présent arrêté, Chance Oil and Gas Limited dépose des rapports annuels auprès du chef de division, en conformité avec le paragraphe (3) et à la satisfaction du chef de division, concernant la mise en œuvre du plan de participation et de communication avec les premières nations.

(3) Pour l'application du paragraphe (2), Chance Oil and Gas Limited dépose :

a) le premier rapport annuel au plus tard le 31 juillet 2019, pour la période débutant le 1er septembre 2018 et se terminant le 31 mai 2019;

b) chaque rapport annuel subséquent, au plus tard le 31 juillet de chaque année pour la période débutant le 1er juin de l'année précédente et se terminant le 31 mai de l'année au cours de laquelle le rapport doit être déposé.

Dated at Whitehorse, Yukon,
~~on~~ August 30th 2018.

Fait à Whitehorse, au Yukon,
le August 30th 2018.

1.0 INTRODUCTION

Chance Oil and Gas Limited (Chance) (the "Proponent") is proposing to conduct routine maintenance on eight of its suspended wells near Eagle Plains, Yukon (the "Project"). Government of Yukon, Oil and Gas Branch (the "Regulator"), has notified Chance that well maintenance is required in order to maintain the suspended well status on four of the wells: NCY McParlon A-25, NCY Ehnjuu Choo B-73, NCY East Chance E-78 and NCY West Chance H-28. Wells Canoe River Chance J-19, Socony Mobil WM Blackie No 1 M-59, Socony Mobil WM Chance YT No 1 YT G-08, and Western Minerals Chance YT No 1 M-08 will also undergo maintenance work. A suspended well is considered a well that is not producing and has been safely secured. With a well in suspension, there is potential to restart production later. This differs from well abandonment where the well is permanently shut down, plugged, the well head is removed and is considered safe and secure by regulators (CAPP, 2019). The well maintenance activities will be executed within the confines of the Oil and Gas Drilling and Production Regulations (OGDPR). Well maintenance activities, also known as well workovers, generally include the following activities:

- Pressure testing to confirm integrity of the casing and well head valves;
- Removal of equipment in the well bores such as tubing and plugs;
- Wireline investigations to measure temperatures and cement integrity and to convey any perforating equipment;
- Remedial work such as cement squeezes; and
- Conducting a wellbore integrity analysis to determine possible well abandonment.

To mobilize maintenance equipment and crews to the well sites, the project will require re-establishment of the Chance and Blackie winter roads.

The proposal is being submitted to the Yukon Environmental and Socio-economic Assessment Board (YESAB) for an assessment under the *Yukon Environmental and Socio-economic Act* (YESAA). This is required in order to obtain the necessary permits and authorizations to perform the work.

1.1 Proponent Contact Information

The Proponent has retained Hemmera to prepare and submit the Project Proposal to the Dawson Designated Office (DO).

The Proponent contact information is:

Greg Charlie, Vice President
Chance Oil and Gas Ltd.
Suite 202, 208 Main Street
Whitehorse, Yukon, Y1A 2A9
Email: gcharlie@chanceyukon.ca
Phone: 867-456-7805

The Agent contact information is:

Andrew MacPhail, Project Manager
Hemmera Envirochem Inc.

230 - 2237 2nd Avenue
Whitehorse, Y1A 0K7 Yukon
Email: andrew.macphail@hemmera.com
Phone: 867-456-4865 ext. 717

The preferred method of communication for the Proponent and Agent is via email. The Agent authorization form has been submitted to the Dawson DO as part of the Project Proposal documents.

1.2 Location

The Project is located 30 to 70 km south of Eagle Plains Hotel, in northeast Yukon (**Figure 1-1**). The exploration wells requiring maintenance are detailed in **Table 2-1** and **Figure 2-1**.

Seven of the wells are located in the upper reaches of the Porcupine River watershed on the west side of the Dempster Highway and one is located in the upper reaches of the Peel River watershed on the east side of the Dempster Highway. The nearest watercourse to the wells located in the Porcupine watershed are McParlon Creek which has two tributaries framing the south and western sides of the Chance Significant Discovery License and Ehnjuu Choo Creek. The watercourse nearest the Blackie M-59 well is Dalgleish Creek which flows into the Ogilvie River. There are no water bodies (i.e., lakes or ponds) in the area of proposed activities.

The Dempster Highway transects the area and provides the all season access to the Blackie winter road, the Chance winter road, and the suspended wells at McParlon A-25 and Ehnjuu Choo B-73 which are located immediately adjacent to the Dempster Highway. The nearest outpost is the Eagle Plains Hotel and Highway Maintenance Base which is located approximately 30 to 70 km north of the locations where the workovers are planned to occur. (**Figure 2-1**).

The latitude and longitude coordinates for the proposed Project are:

NW:	66.20808719	(lat/northing)	-137.6280058	(long/easting)
NE:	66.21832565	(lat/northing)	-136.9320243	(long/easting)
SW:	65.96218433	(lat/northing)	-137.6037058	(long/easting)
SE:	65.97269282	(lat/northing)	-136.9164459	(long/easting)

Figure 1-1 Project Location

1.3 Regional Land Use Plans

The proposed Project is located within the boundaries of the North Yukon Planning Region and Peel Watershed Planning Region and is therefore subject to the North Yukon Land Use Plan and (NYLUP) Peel Watershed Land Use Plan (PWLUP). Locations of proposed Project activities are within Land Management Unit (LMU) 9 of the NYLUP and LMU 7 of the PWLUP. (**Table 1.1**). Both are located within the Eagle Plains basin, with the highest potential for oil and gas development. Details regarding how the Project will meet the requirements of the Northern Land Use Plan and Peel Watershed Land Use Plan is provided in **Section 7.5** and **Table 7.2**.

Table 1.1 Landscape Management Units Overlapping the Project

Landscape Management Unit Number	Landscape Management Unit Name	Integrated Management Area (IMA)
9 (NYLUP)	Eagle Plains	4
7 (PWLUP)	Dalglish Creek	4

1.3.1 First Nations and Indigenous Groups

The proposed Project is located in the following First Nations and Indigenous groups' traditional territories (**Figure 1.1**):

- First Nation of Na-Cho Nyäk Dun (FNNND)
- Tetlit Gwich'in Council (TGC)
- Gwich'in Gwich'in Tribal Council (GTC)
- Vuntut Gwitchin First Nation (VGFN)

Vuntut Gwitchin First Nation (VGFN) and Tetlit Gwich'in Council (TGC) are Gwich'in First Nations that have traditionally used and occupied lands in the Northwest Territories and the Yukon, and are linked by close cultural and linguistic (Athapaskan) traditions. VGFN are based in Old Crow, Yukon, while the TGC are based in Fort McPherson, Northwest Territories. The Gwich'in Tribal Council (GTC) is an Indigenous organization based in Inuvik, Northwest Territories. The GTC holds rights under Section 35 of the Constitution Act, 1982, Treaty 11 and the Gwich'in Comprehensive Land Claim Agreement (GCLCA),– Yukon Transboundary Agreement (YTA). Under the GCLCA, GTC is the body responsible for representing the collective rights of GCLCA participants, including all Tetlit Gwich'in as defined in the YTA. Yukon lands of the TGC are identified in the YTA as the Primary Use Area and the Secondary Use Area lands.

The proposed Project area is immediately north of the Tr'ondëk Hwëch'in First Nation Traditional Territory and Settlement Land. The Tr'ondëk Hwëch'in (TH) are a Yukon First Nation based in Dawson City, Yukon. They are descendants of the Hän-speaking people and are a diverse mix of families descended from Gwich'in, Northern Tutchone, and other language groups. The First Nation of Na-Cho Nyäk Dun (FNNND) are a Yukon First Nation based in Mayo, Yukon. They are also of the Northern Tutchone language and cultural group.

1.3.2 Yukon Environmental and Socio-Economic Assessment Act (YESAA) Triggers

The proposed Project requires an evaluation by a Yukon Environmental and Socio-economic Assessment Board (YESAB) Designated Office (DO) because:

1. The project location is in the Yukon;
2. The *Assessable Activities, Exceptions and Executive Committee Projects Regulations* identifies several triggers for the Project including:
    a. Schedule 1, Part 3, Oil and Natural Gas, Item 2:

    On other than an Indian reserve, drilling, operation, modification, decommissioning or abandonment of, or other activity in relation to, an oil or natural gas well or seismic shot hole, but not including a hole drilled to obtain geological information.

    b. Schedule 1, Part 13, Miscellaneous, Item 13:

    On Crown land or settlement land, levelling, grading, clearing cutting or snow ploughing of a route that provides access to land for the purposes of a geophysical, geological or engineering survey.

3. An authorization by a government agency is required for the activities to be undertaken.

The Project is located near Eagle Plains, Yukon and it is understood that the Dawson Designated Office will carry out the evaluation.

1.4 Permits and Licenses / Regulatory Requirements

Chance currently holds the following licenses and approvals from previous activities at the Site:

- Type B Water Licence (MN12-061-1)

To complete the Project the following approvals are required.

- Air Emission Permit
- Land Use Permits
- Dempster Highway Authorization Permit
- Storage Tank Permit
- Waste Management Permit
- Work within Highway Right-of-Way Permit

1.5 Alternatives

Currently there are no alternatives being considered. The proposed well maintenance work has been directed by the Government of Yukon and is designed in accordance with Part 7 of the OGDPR. Alternative technologies and methods for accessing the well sites are also not feasible. Winter access and work are being proposed in order to reduce and eliminate potential effects to various valued components (e.g., permafrost, vegetation, etc.) and has been designed according to best practices and Government of Yukon standards. Other means of access such as helicopter supported are not feasible during winter and low light conditions for personnel health and safety considerations.

2.0 PROJECT DESCRIPTION

2.1 Project Activities

This section provides an overview of the proposed Well Maintenance Program. There are two main components to the Project that include:

- Routine maintenance of suspended wells (well workover); and
- Re-establishment of the Chance winter road and Blackie winter road.

The well maintenance activities proposed are being conducted in order to satisfy a direct order from Government of Yukon, Oil and Gas Branch. Accessory activities, such as construction and re-establishment of the winter roads, is required to access the suspended well sites and complete the maintenance of each well. A letter outlining the order from the Government of Yukon, Oil and Gas Branch is provided in **Appendix A**. Locations for each of the wells is provided in **Table 2.1** and **Figure 2-1**.

2.2 Well Maintenance

The following section describes the work proposed at each of the wells. Each of the wells is deemed suspended by the *Yukon Oil and Gas and Drilling Production Regulations* (OGDPR) (is not producing and safely secured). Well maintenance is required to continue to meet the OGDPR suspended well status regulations. Well servicing equipment may include a service rig, wireline truck and cementing trucks along with the associated support equipment. All equipment will be mobilized to each of the wells on a sequential basis (one at a time) to complete the required maintenance work (downhole suspension, wellbore fluid replacement, replace substandard equipment). The eight wells that require maintenance include:

- Socony Mobil WM Blackie No 1 M-59 (M-59);
- Western Minerals Chance YT No 1 M-08 (M-08);
- Canoe River Chance YT J-19 (J-19);
- Socony Mobil WM Chance YT No 1 YT G-08 (G-08);
- NCY McParlon A-25 (A-25);
- NCY Ehnjuu Choo B-73 (B-73);
- NCY West Chance H-28 (H-28); and
- NCY East Chance E-78 (E-78).

A detailed description of the planned maintenance activities at each well is summarized in the following sections. A summary of the activities at each well is provided in **Table 2.2**.

Table 2.1: Well Locations

Well Name	Location	
	Latitude	Longitude
Socony Mobil WM Blackie No 1 YT M-59	65° 58’ 54.93.9” N	137° 18’ 58.2” W
Western Minerals Chance YT No 1 M-08	66° 07’ 46.0” N	137° 31’ 27.3” W
Canoe River Chance YT J-19	66° 08’ 31.0” N	137° 32’ 27.0” W

Figure 2-1: Well and winter road locations

2.2.1.1 Legacy Wells

Legacy wells were drilled by other operators from 1959-1968,and are located on Significant Discovery Licenses Blackie (021) and Chance (022).The Legacy wells requiring maintenance include:

- Socony Mobil WM Blackie No 1 YT M-59
- Western Minerals Chance YT No 1 M-08
- Canoe River Chance YT J-19, and
- Socony Mobil WM Chance YT No 1 YT G-08

A pressure test is conducted to ensure the integrity of the wellhead and the existing casing in the wellbore. The well will then undergo surface casing vent flow and gas migration testing. Surface casing vent flow (SCVF) is a condition where fluid or gas is flowing from the surface casing vent assembly. A well that has a leak, or a well integrity problem may exhibit signs of SCVF. Gas migration tests are conducted to determine if the well has a gas migration problem. For the purpose of this test, gas migration can be defined as the movement of gas from a subsurface zone to surface through a barrier that should prevent its movement, whether this barrier is natural (overburden, shale) or artificial (cement sheath, external casing packed, pipe joints etc.). It should be noted that during annual inspections, no SCVF has ever been detected. If there is evidence of surface casing vent flow the well will be logged with a variety of tools (e.g., noise tool, temperature tool, bond log tool) to determine the source of the surface casing vent flow and/or gas migration. The logs will be analyzed and a plan will be formulated to complete a downhole shut off at the source of the surface casing vent flow and/or gas migration.

Once the pressure testing, surface casing vent flow testing and gas migration testing is complete, the service rig, support equipment and wireline will be moved to the wellsite. A blowout preventer (BOP) will be installed on the well. Blowout preventers are specialized pressure-control equipment attached to the wellhead to seal, control and monitor oil and gas wells to prevent the uncontrolled release of crude oil or natural gas while operations are occurring on the well. A temperature log will then be conducted to a depth of 300 meters below Kelly bushing (mKB). The temperature log is interpreted by looking for anomalies, or departures, from the reference gradient. This reference gradient might be the geothermal gradient, a log recorded before production or started, or a log recorded with the well shut in. Most anomalies are related to the entry of fluids into the borehole or fluid exit into the formation. Following the temperature log, a cement bond log will be run. The cement log is a log that uses the variations in amplitude of an acoustic signal travelling down the casing wall between a transmitter and receiver to determine the quality of cement bond on the exterior casing wall. The fundamental principal is that the acoustic signal will be more attenuated in the presence of cement than if the casings were uncemented. The cement log is used to identify sections of the well bore that will need interventions to isolate porous formations from adjacent formations.

To isolate a formation from an adjacent formation, the casing will be perforated at the appropriate depth with a wireline conveyed perforating gun. Tubing will then be used to inject cement through the perforations in sufficient quantity to ensure adjacent formations are isolated from each other, at which point pressure will be applied from surface to force the cement into the perforations. Once the cement has cured, the cement will be pressure tested as per the Yukon Oil and Gas and Drilling Production Regulations. The process is then repeated until all formations are isolated from one another and pressure tested. The isolation operations will begin with the deepest non-isolated formation and progress to the shallowest non-isolated formation. Once all the testing/isolation procedures are complete, the tubing will be pulled from the

well, a new well head assembly will be installed, and the well head will be pressure tested once more. The service rig and all support equipment will then be removed from the site.

Additional activities at M-59 include installation of a wellhead that conforms to the OGDPR regulation. In addition, for G-08 and J-19, the tubing and packer will be removed during the workover following completion of gas migration testing.

2.2.1.2 Modern Wells

The modern wells were drilled by Chance/Northern Cross in 2012-2013. The modern wells requiring maintenance include:

- NCY McParlon A-25
- NCY Ehnjuu Choo B-73
- NCY West Chance H-28, and
- NCY East Chance E-78

A pressure test is conducted to ensure the integrity of the wellhead and the existing casing in the wellbore. The well will then undergo surface casing vent flow and gas migration testing. SCVF is a condition where fluid or gas is flowing from the surface casing vent assembly. A well that has a leak, or a well integrity problem may exhibit signs of SCVF. Gas migration tests are conducted to determine if the well has a gas migration problem. For the purpose of this test, gas migration can be defined as the movement of gas from a subsurface zone to surface through a barrier that should prevent its movement, whether this barrier is natural (overburden, shale) or artificial (cement sheath, external casing packed, pipe joints etc.). It should be noted that during annual inspections, no SCVF has ever been detected on any of the wells. If there is evidence of surface casing vent flow the well will be logged with a variety of tools (e.g., noise tool, temperature tool, bond log tool) to determine the source of the surface casing vent flow and/or gas migration. The logs will be analyzed and a plan will be formulated to complete a downhole shut off at the source of the surface casing vent flow and/or gas migration.

A temperature log will then be conducted to a depth of 300 meters below Kelly bushing (mKB). The temperature log is interpreted by looking for anomalies, or departures, from the reference gradient. This reference gradient might be the geothermal gradient, a log recorded before production or started, or a log recorded with the well shut in. Most anomalies are related to the entry of fluids into the borehole or fluid exit into the formation. Following the temperature log, a cement bond log will be run. The cement log is a log that uses the variations in amplitude of an acoustic signal travelling down the casing wall between a transmitter and receiver to determine of the quality of cement bond on the exterior casing wall. The fundamental principal is that the acoustic signal will be more attenuated in the presence of cement than if the casings were uncemented. The cement log is used to identify sections of the well bore that will need to be hydraulically isolated.

The wellbore fluid will be sampled and tested to determine if the fluid meets the OGDPR regulations. After the wellbore fluid is tested and if necessary, a service rig may be moved in to replace the well fluid to conform to the Yukon Oil and Gas and Drilling Production Regulations 99(a) and 99(b). A wellbore fluid test is a test or series of tests, performed to check that no undesirable reactions occur with a specific fluid. The testing process may include checks for compatibility with other treating fluids, wellbore fluids, reservoir fluids, and the reservoir formation. The removed fluid from the wellbore is anticipated to be recycled and

used in the well to meet OGDPR Part 7 Section 99 requirements. If it can't be recycled the fluid will be transported to and disposed of at a permitted waste disposal site. No other activities are anticipated at these wells.

2.2.1.3 Wellbore Integrity Analysis

To determine if a well will be abandoned, the wellbore integrity will be analyzed to determine the suitability of the well for future use. The wellbore integrity analysis will include:

- Pressure testing of the wellhead and casing;
- Bit and scraper run on tubing to ensure the wellbore is still full drift;
- Analysis of the cement behind the production casing and/or liner casing with a cement bond log tool to determine the cement quality;
- Geological analysis to determine what formations need to be isolated after the cement analysis;
- Sampling of wellbore fluid on the wells (if necessary); and
- Location of the well with respect to the other wells which remain.

The wellbore integrity analysis is required to formulate the final plan for each of the wellbores. The analysis will determine if any the following are required:

- No action;
- Cement squeezes to isolate formations from other formations in accordance with OGDPR Part 7 Section 95(1)(b);
- Casing patches to repair any casing breaches found;
- Cement plugs and/or bridge plugs set to suspend or abandon producing formations in accordance with OGDPR Part 7 Section 97 (1) and Section 97 (2); and
- Surface abandonment in accordance with OGDPR Part 7 Section 96.

Cement squeezes, if required to isolate a formation to satisfy OGDPR Part 7 Section 95(1)(b), will entail perforating an interval close to the formation top and squeezing arctic compatible cement in to the annular space between the production casing and the formation face to create a cement sheath that will isolate the formation from other formations above it in the wellbore. The cement squeeze and remaining plug left in the wellbore will conform to the requirements set out in OGDPR Section 98 (1)(b) and Section 98(2) and location of the remaining cement plug will be located afterwards with the method of setting down on the cement plug with a minimum 90 kN force with the cementing string after 12 hours as set out in OGDPR Section 100(1)(b). Fluid in the wellbore may have to be replaced in a wellbore if it does not meet the requirements of OGDPR Part 7 Section 99.

2.2.1.4 Equipment

Equipment required for well maintenance is described below in **Table 2.3**. Equipment will be stored on site mainly on trucks and flatbed trailers. Some items such as the boiler and cement tanks will be placed on the ground on skids.

Table 2.3: Equipment and Infrastructure components

Quantity	Component	Description
	Re-establishment of Winter Road	
Multiple as needed	Construction Equipment	Challenger cats, D6 cats, snow cats, graders, snow making equipment, water trucks and with drags (small trailer pulled behind truck) will be utilized during the initial phase of the project to prepare the roads and well pads for the operations
	Mobilization and Demobilization for Well Maintenance	
6	8' x 40' mats	These can be wooden or steel mats placed on the ground in an interlocking manner for the service rig and connected equipment to sit on.
1	Skid Service Rig Structure (likely 32-40 wheeled loads)	Components required to service the well, including: • Sub-structure, or base, to which the derrick (i.e., framework to support drilling apparatus) is fixed • Derrick that supports the draw works and handling equipment • Draw works that lifts and lowers the handling equipment in the derrick/mast to run pipe in and out of the hole • Blowout preventers, which are pressure control equipment that can hydraulically shut in a well in the event of unplanned influxes of formation fluids into the wellbore
1	Skid Dog House	Skid mounted unit which contains a generator for supplying power to the rig, an office and change rooms for the crew, and a hydraulic control system to operate the BOP stack remotely
1	Skid Pump	Skid mounted unit which contains a pump to provide hydraulic pumping power to pump fluids in to the wellbore (same as pumps below)
1	Skid Tank	Skid mounted fluid storage tank for the service rig. Can store fluid to be pumped in to the wellbore or store fluid which is pumped out of the wellbore.
1	Skid Boiler	Used extensively in very cold and Arctic climates for preventing equipment and fluids from freezing.
1	Junk Skid	This is skid mounted trailer with an inventory of spare parts and equipment used during the well maintenance work
1	Catwalk and Pipe Racks	These are used for the storage of tubing or tools which is removed from or to be ran in to the wellbore and for picking up / laying down tubing or tools.
1	Enclosed Trailer (chemicals, tools, etc)	Dry storage trailer to keep tools, and chemicals to be used during the operations
5	Baskets of Tools	Tools used in the operation of the service rig
350	Tubing Storage: Joints of 73.0 mm, L-80, 9.67 kg/m tubing (9.5 m average length)	Tubing will be stored on location until required to be run in the hole.
1	Super Single Shack	Skid mounted office and accommodation for wellsite supervisors
3	20 kw Generator / Light towers, miscellaneous equipment	Light towers will be required on the wellsites as the operations will run 24 hours a day

Quantity	Component	Description
2	400 bbl tanks	These are skid mounted cylindrical steel tanks about 10 feet in diameter and stand about 20 feet high used for the storage of fluid
1	Miscellaneous Equipment	Additional equipment brought up on a trailer to be used in the operation of the service rig (example – downhole tools, fan heaters, etc.)
1	Skidded Office/Medic Trailer	Essential personnel trailers which serve as offices. All office trailers will have self-contained sewage storage and sewage will be moved periodically to the sewage lagoon at the Chance camp at Km 324.
1	Fuel Storage	Fuel for use for equipment including service rig, pumps, generators, etc. Bulk fuel will be staged at the Chance camp at Km 324 and daily needs will be distributed via pickup trucks with slip tanks during crew changes.
1	Tank Truck	Used to transport fluid to the service rig during operations (mainly fresh water)
1	Vacuum Truck	Used for removal and transportation of wastewater and sewage from the medic/first aid trailer for disposal.
1	Cement Bulker	Cement storage and mixing for use in wells.
1	Cementing Unit	Unit used top pump cement in to the wellbore during the required cementing operations
1	Cement Bins	Large tanks, normally upright, fully enclosed and pressurized, where cement products are stored. Cement is pneumatically pumped from the tank into the cementing unit.
1	Wireline Unit	Unit to convey tools into the wellbore on wire rope to allow for analysis of the casing integrity, setting of bridge plugs and perforating of the casing
1	Slickline Unit	Unite to convey tools into and out of the wellbore on steel wire to allow for the pulling or setting of bridge plugs in the tubing
1	Pumps	Pumps used to circulate the fluid down the pipe, around and up the annular space between the pipe and the casing to surface.
1	Main Workover Fluid Storage	Location where all the fluid additive materials are stored. Normally these materials are delivered on pallets neatly stacked and shrink wrapped to protect them during the truck journey north.
1	Flare Tank and Flare	Flare used to burn combustible gas from the well. The flare tank is a reservoir to ensure the flare does not starve of combustible gases. Flaring is only planned in the unlikely event the wells that have perforated intervals require depressurization prior to the planned workover operations. The flaring cannot be scheduled in an operation as it may or may not be required depending on the circumstances encountered. The flare stack will be a minimum of 18 metres off the ground.
1	Water Storage and Water Treatment	Water storage tank and treatment containers to provide potable water for the rig crew and personnel.
6-10	1/2 Ton Trucks	Pickup trucks will be used for transportation of work crews, fuel and other supplies between the camp/Eagle Plains Hotel and the wellsites.
	Throughout Project	
1	Cement Bulker (2 -3 times throughout project)	A transport truck to deliver cement to the sites for cementing operations
1	Fuel Tank Bulker (7-8 times throughout project)	A transport truck to deliver fuel (diesel and gasoline) to site to be used for fueling equipment on the sites.

2.2.2 Winter Road Construction

2.2.2.1 Site Access

The Project is accessed via the Dempster Highway. Wells H-28, J-19, M-08, G-08 and H-28 will be accessed by re-establishing the Chance winter road. Wells A-25 and B-73 are located immediately adjacent to the Dempster highway, and already have access with rig matting in place. Well M-59 will be accessed by re-establishing the Blackie winter road. The Blackie winter road is approximately 6.5 km in length and approximately 8-10 m in width. The Chance winter road is approximately 25 km long and 8-10 m in width (**Figure 2.1**). The total surface area of the both the Chance winter road and Blackie winter road is approximately 1,875 m^2. The footprint at each wellsite is anticipated to be approximately 100 m x 100 m (1 Ha) with the wellhead at the centre. Exact dimensions of the well sites are dependent on topography and may not be exact squares but will cover an area approximately 1 Ha (e.g., 125 m x 80 m).

2.2.2.2 Winter Road Construction Methods

Winter road construction will utilize similar techniques as previously applied by Chance in previous assessments (YESAB # 2006-0237, 2006-0285, 2007-0219, 2008-0047 and 2012-0140). Before any winter road construction will proceed, a minimum snow depth of 10 cm will be verified to ensure there is sufficient snow cover to protect the ground surface from tires or tracks of vehicles. To promote snow compaction in the early winter, the Chance winter road and Blackie winter road will be driven with snowmobiles and snowcats in late fall/early winter. Priority will be given to re-establishing the Chance winter road first and the Blackie winter road second. This is because there are four wells to access from the Chance road and no overgrowth limiting access, while there is only one well to access from the Blackie winter road, which is more overgrown and requires the development of a substantial snowpack. This will allow more time for the snowpack to develop at the Blackie winter road. Upon construction, if the snow depth (minimum of 10 cm) is not sufficient in certain areas, additional snow will only be collected from areas where a surplus of snow is available or from areas where there is no potential for disturbance to the surrounding environment. These areas may include depressions where significant amounts of snow have accumulated. Snow will only be removed where 10 cm of base will remain compacted to protect surface vegetation. Alternatively, as done in previous years, additional snow may be removed from the Chance camp laydown area (approximately 13 Ha area). Only clean snow, free of deleterious substances, will be used for winter road re-establishment.

Once the snow depth is adequate (i.e., 10 cm or greater in depth without compaction), vegetation along the routes will be cleared using a bulldozer and mulcher. The bulldozer blade will be raised off the ground such that it does not cut the tops of hummocks, tussocks or high spots. The vegetation removed will be mulched with a track mounted mulcher and distributed on the road. Any trees or large brush encountered will be removed at the ground surface using a mulcher to avoid tearing the surface organic layer thereby reducing the chance of thawing ice-rich mineral soil beneath. The mulch helps keeps the soil in place while protecting the root system of ground-cover plants and natural grasses. The likelihood of large trees or brush is low on the Chance winter as the road was last used in April 2014. Where it is safe and practical, standing live or dead trees along the route that provide wildlife habitat will be saved.

Following vegetation removal, the surface of the road will be constructed using accumulated snow to construct berms on the road margins and filling the space at the roads edge with snow and water trucked from approved sources. A combination of snowcats and bulldozers using drags will be used to push and

compact the snow along the access routes. To ensure the roads ability to safely support the service rig and other heavy loads, all construction activities will be supervised by a qualified geotechnical engineer.

The same methods will be utilized to establish well sites and clear any vegetation surrounding the well site for equipment and site infrastructure.

2.2.2.3 Water Withdrawal

Water for the service rig and winter road icing will be primarily sourced from existing withdrawal locations on the Eagle River, with locations on the Ogilvie River as an alternative source. The Eagle River is preferred due to its closer proximity to Chance's operations, with the Ogilvie River being more convenient for the Socony Mobil WM Blackie No 1 (M-59) and NCY McParlon (A-25) operations. No more than 100 m³ of water will be withdrawn daily. All water withdrawal will be conducted following Department of Fisheries and Oceans (DFO) Freshwater Intake End-of-Pipe Fish Screen Guidelines (DFO 2020).

2.2.2.4 Maintenance

Maintenance of winter access routes may include low ground pressure vehicles (e.g., snowcats), a road grader equipped with a wing snow plow and some water application. Grading may be required over certain stretches and depressions along the roads filled with snow, to smooth the surface.

In the event that natural snowfall is below the minimum required depth to construct and maintain the winter roads, snow making may be used to make up the shortfall. This is a contingent consideration and could require up to 100 m³ of water per day for a short period of time (a few days to a week). The sources of water include the Eagle River and the Ogilvie River. The water to be used to make snow and ice the winter road(s) will be trucked from the source to the point of use. The actual number of trucks being used will be less since a truck can probably complete 1 to 3 deliveries per day. Generally low snowpack is only an issue during the early part of winter so this provision would only apply on a contingent basis during the months of November, December and January. The timing for making artificial snow will depend on how late in the winter season winter road construction begins. If, for example, in late December there is little or no snowfall or snow accumulation on the ground, snow making could ensure a sufficient snow base to commence winter road construction. Snow can only be made when the ambient temperature drops to zero degrees centigrade.

2.2.2.5 Equipment

Equipment will be required for clearing, grading, water transport, and material transport. Light equipment for personnel, fuel and other supply transport will be required periodically during construction and well maintenance.

It is anticipated that Challenger cats, D6 cats, snow cats, graders, snow making equipment, water trucks and drags will be the primary construction equipment. Pickup trucks will be used for transportation of work crews, fuel and other supplies. Water trucks will be used for transport of water from the Eagle River and the Ogilvie River to the Project. Flatbed trailers would be used to transport equipment and larger supplies.

2.2.3 Access Control

Chance understands that increased winter access into the area is of significant concern to First Nations and Indigenous Groups, local residents, trappers and outfitters. Chance has safety concerns regarding unauthorized users due to the potential for sour gas (H_2S) to be present at some wells, and the use of narrow access routes. Additionally, Chance cannot allow the use of firearms in areas where crews are working to ensure safety of their crew. These access routes will be radio controlled by Chance to ensure authorized personnel gain unobstructed access, but this could be adversely impacted by the presence of unauthorized users. To address concerns related to access (e.g., increased use and ease of access, increased hunting, public safety, and safety of Chance personnel) gates will be placed at the junction of the Blackie and Chance winter roads with the Dempster Highway. The gates will be constructed of heavy materials and located such that there are obstacles on either side as much as possible (e.g., heavy forest) to restrict vehicle access.

2.2.4 Anticipated Road Use

The majority of the traffic volumes include mobilizing the service rig and site infrastructure, the setup of the service rig will take approximately one day to complete at each well site. A total of approximately eleven flatbed truck loads will be required to mobilize equipment into each well site. Once a site is established (i.e., maintenance equipment set up), traffic will include approximately 1-2 pickup trucks (for supplies and personnel), 1 water truck and one fuel truck. The fuel and water trucks will come to the project site approximately every three days or as demand dictates.

All vehicles will be equipped with radio communication and any traffic on the roads will be radio controlled. Unauthorized vehicles will not be allowed on the winter roads and the roads will be restricted from public access.

2.2.5 Reclamation

The Project proposes to re-establish the Blackie winter road to one existing well site (M-59), and the Chance winter road for J-19, M-08, G-08 and H-28. Wells A-25, E-78 and B-73 are located immediately adjacent to the highway, and already have access with rig matting in place and/or pre-existing cleared area as a borrow pit or Chance's Base Camp.

Reclamation activities will aim to return the site as closely as possible to its pre-project condition. These activities are intended to effectively:

- Leave the site clean following project completion;
- Remove all garbage, petroleum products, and equipment; and
- Prevent long-term erosion/slumping and promote successful natural revegetation of disturbed areas.

Given the winter road construction methods employed (i.e. allowing for 10cm of snow cover before building the winter road) it is not anticipated that additional reclamation is required for the winter roads. As discussed in **Section 2.1.3**, access to each of the roads will be restricted during operations and following the completion of the proposed activities. This will ensure that the road can fully melt, without any potential for more disturbance from outside users. It is less harmful to leave the road to melt in the spring.

2.2.6 Camp Facilities

Chance anticipates using the Eagle Plains Hotel for housing workers for the Project. The Eagle Plains Hotel, located at kilometer 371 of the Dempster Highway, has been operating since the late 1970's and provides a variety of services including hotel facilities, accommodations (64 people during peak use), restaurant, lounge, public washroom, laundromat and service garage. The hotel is a recognized tourist destination and provides support services to the Government of Yukon, Department of Highways and Public Works, Eagle Plains Maintenance Camp.

Chance's existing camp, office and storage yard was established in October 2011 and is located at km 325 of the Dempster Highway. It is accessible year-round by vehicle unless the highway is closed due to weather or construction. For this Project, Chance plans to utilize the camp for storing and transporting equipment and supplies needed for operations, but Chance personnel will not stay at the camp, and will instead utilize the Eagle Plains Hotel.

Approximately 7-12 fixed wing flights over the course of the entire project, with up to 2 flights per week, will be required for shift changes. Flights will be privately chartered from Edmonton to Inuvik and then to the Wiley airstrip located at km 389.5 of the Dempster highway or the Chance Camp airstrip, located at km 325 of the Dempster highway.

A small medic/first aid trailer equipped with a heater may be installed at the wellsite being where work over operations are occurring to provide refuge for workers and essential first aid supplies. Sewer facilities and water will be available in the trailer. All wastewater and sewage will be collected in CSA approved tanks and transported offsite for disposal at an approved facility in Fort McPherson.

2.2.7 COVID-19 Safety Considerations

Coronaviruses are a large family of viruses found mostly in animals. In humans, they can cause diseases ranging from the common cold to more severe diseases such as Severe Acute Respiratory Syndrome (SARS) and Middle East Respiratory Syndrome (MERS). The disease caused by the new coronavirus has been named COVID-19.

While many of the characteristics of COVID-19 are still unknown, mild to severe illness has been reported for confirmed cases. Common symptoms for COVID-19 are:

- Fever
- Cough
- Sneezing
- Sore throat
- Difficulty breathing

Coronavirus is transmitted via larger liquid droplets when a person coughs or sneezes. The virus can enter through these droplets through the eyes, nose or throat if you are in close contact. The virus is not known to be airborne (e.g., transmitted through the particles floating in the air) and it is not something that comes in through the skin. It can be spread by touch if a person has used their hands to cover their mouth or nose when they cough.

Droplet Contact: Some diseases can be transferred by large infected droplets contacting surfaces of the eye, nose, or mouth. For example, large droplets that may be visible to the naked eye are generated when a person sneezes or coughs. These droplets typically spread only one to two metres and are too large to float in the air (i.e., airborne) and quickly fall to the ground. Influenza and SARS are two examples of diseases capable of being transmitted from droplet contact. Currently, health experts believe that coronavirus can also be transmitted in this way.

Airborne transmission: This occurs when much smaller evaporated droplets or dust particles containing the microorganism float in the air for long periods of time. Currently, health experts believe that coronavirus cannot be transmitted through airborne transmission.

At present, COVID-19 is a public health emergency in Yukon. Guidelines for ensuring public safety have been established by the Chief Medical Officer of Health for Yukon. These guidelines include physical distancing, enhanced cleaning, infectious disease control strategies, and hand hygiene. The state of the pandemic and the responding guidelines are rapidly evolving and will be monitored and followed throughout the duration of the Project.

The camp utilized for Project activities and the Eagle Plains Hotel used for crew housing will follow all guidelines including physical distancing and sanitization procedures to ensure a healthy environment for workers. The Eagle Plains Hotel currently abides to all guidelines established by the Chief Medical Officer of Health for Yukon. Crew members will be provided with up to date information regarding the current state of the pandemic and the procedures in place to address it while they are at camp. A screening procedure conducted prior to a worker's arrival at the Eagle Plains Hotel will include questions related to symptoms, travel, and known interaction with an infected person. Face masks will be worn during air travel to the site. Crew members who fail the pre-screening will not be permitted to travel to site. As per the Yukon Government guidelines, only staff arriving from outside British Columbia, Yukon, Northwest Territories and Nunavut will be required to self-isolate prior to their travel to site. During the duration of construction, daily screening, including temperature checks, will occur and workers will be instructed to monitor and report any symptoms they may develop. In the event that a crew member reports a COVID-19 symptom, they will be isolated until a COVID-19 test result can be confirmed. Confidential documentation of Project information including crew member names, arrivals and departures details, and worker origin will be kept.

2.2.8 Fuel Storage

A draft Spill Response Plan is available in **Appendix B**. The plan will outline the procedures to be followed in the event of a petroleum product spill during all phases of the project. Safety procedures for personnel and proper equipment usage during such operations will be discussed in the plan

Fuel will be stored in portable tanks (i.e., slip tanks) and tanker trucks and will not exceed 8000 litres in aggregate. Fuel storage will only occur during periods necessary for the road construction and well maintenance and will be removed upon completion. All fuel caches will be located a minimum of 60 m from the high water mark of any nearby watercourse. Fuel will be transported in tidy tanks or by tanker truck, as required. A fuel spill contingency plan will be posted at all storage areas and fueling stations.

The fluid additive materials will be stored in the Chance lay down yard located at km 325 of the Dempster Highway. They will be stored in a dry trailer/s in their original packaging. The cement will be transported to site in a bulk trailer and left at the lay down yard. Fluid additive materials will include:

- Potassium Chloride (KCL)
- Fluid Inhibitor
- Cement

2.2.9 Waste Management

All garbage and recyclable materials will be taken off site and disposed of at a licensed disposal facility.

Once all the testing/isolation procedures are complete, the tubing will be pulled from the J-19 and G-08 wells. If it is deemed that it is still usable, it will be stored at Chance's camp and if not, it will be transported to approved disposal facilities in Yukon, Alberta or British Columbia. Cement waste and wastewater will be collected and transported to an approved disposal facility.

2.3 Project Schedule / Temporal Scope of Activities

Construction of the winter roads and well maintenance is anticipated to occur during the winter of 2020/2021. Initial site visits would occur in late November or early December of 2020, timed to meeting the minimum snowpack, to pack the access routes with snowmobiles. Winter road construction is anticipated to occur in late December to February. Well maintenance activities are anticipated to take approximately up to 70 days to complete the work at all eight wells. It is anticipated that well maintenance activities will commence in February and be completed by mid-April.

3.0 SUMMARY OF CONSULTATION

The Proponent recognizes the importance of consulting affected First Nations governments prior to making decisions about the Project.

3.1 Potentially Affected Parties

The Project and all proposed Project activities are located within the traditional territories of the Vuntut Gwitchin First Nation and the First Nation of Na-cho Nyäk Dun, as well as the Tetlit Gwich'in Secondary Use Area of the Gwich'in Settlement Region. The proposed Project is also located to the north of Tr'ondëk Hwëch'in Traditional Territory.

Based on the location of the Project within a First Nation's Traditional Territory and/or the proximity of the Project to a First Nation's Traditional Territory (with the potential for indirect effects), the project team identified the following First Nations as potentially affected parties:

- Vuntut Gwitchin (VG)
- First Nation of Na-Cho Nyäk Dun (FNNND)
- Gwich'in Tribal Council (GTC)
    - Tetlit Gwich'in Council (TGC)
- Tr'ondëk Hwëch'in (TH)

Engagement activities were designed to inform potentially affected parties of the proposed Project, and to provide those parties with a reasonable opportunity to engage the project team, to learn about the proposed Project, and to provide input or feedback. Chance's approach to engagement was guided by existing

engagement and communications plans that Chance has with each of the potentially affected First Nations that are identified above.

3.2 Summary of Engagement Activities

The following sub-sections provide brief summaries of engagement activities with each potentially affected First Nation.

3.2.1 Initiation

Written communication was sent via email to FNNND, GTC (including TGC), and TH in order to initiate engagement. Initial communication packages for these First Nations included a high-level overview of the proposed Project (e.g., project activities, components, goals and outcomes), the regulatory submissions Chance would be making, a brief introduction to Hemmera and it's role, as well as the request to discuss any concerns the affected party may have and the offer to arrange a conference call should they so desire. Also included was a 4-page project summary and map of the Project Location.

A distinct communication package was sent via email to initiate engagement activities with VG. This package was structured in accordance with protocols outlined in the *Vuntut Gwitchin Government Oil and Gas Engagement Policy*. As such, this package included an earlier draft of the Project Description dated May 22, 2020.

3.2.1 Vuntut Gwitchin

Initial notification was sent to VG's Director of Natural Resources on May 25, 2020. VG and Chance organized a conference call July 9, 2020 wherein VG requested a high-level overview of the proposed Project. VG asked Chance questions in order to attain additional information for the First Nation to complete their review of the draft Project Description dated May 22, 2020. To assist Chance in preparing meeting materials for the July 9th meeting, VG provided an agenda and questions ahead of time. On July 10, 2020, VG provided Chance with formal information requirements related to the proposed Project. Themes raised by VG included:

- Requiring additional information on mitigation measures to avoid or minimize potential environmental effects (specifically with respect to Porcupine Caribou)
- Requiring additional information on the regulatory context
- Requiring additional details on well tests (e.g., vary tests between the wells, how would Chance address evidence of gas migration, what would be done with removed fluid) and project components (e.g., what materials would be stored on site, what materials will be incinerated, vehicles planned to be used)
- Requiring additional information on water withdrawal (e.g., sources, volume, schedule)

The additional information requested by VG was drafted and refined during the effects assessment and development of the Project Proposal. However, feedback from VG impacted the development of mitigation measures and contributed to identifying information that was previously inadequate in the earlier draft project description and the project proposal as a whole (e.g., additional information on the regulatory context, additional information on the rationale for maintaining the wells in suspended well status versus abandonment).

Chance responded to VG, in the format requested, on July 22, 2020. This document can be provided upon request.

A draft of the Project Proposal was shared with VG July 22, 2020.

In the coming weeks Chance will be initiating discussions with VG in order to meet requirements under section 68 of *YOGA* (i.e., benefits agreements).

3.2.2 First Nation of Na-cho Nyäk Dun

Initial notification was sent to FNNND May 25, 2020. Additional communications followed June 9th, June 24th, and July 20th. Chance did not receive feedback from FNNND while the Project was being refined and the Project Proposal was being drafted. A draft of the Project Proposal was shared with FNNND July 24, 2020.

Chance looks forward any feedback FNNND may provide in the future and to initiating discussions with FNNND in order to meet requirements under section 68 of *YOGA* (i.e., benefits agreements).

3.2.3 Gwich'in Tribal Council

Initial notification was to GTC and TGC May 25, 2020. On June 12, 2020, GTC provided input from its departments of Lands and Resources, Cultural Heritage, and Economic Development. Themes raised by GTC included:

- High environmental standards in the Peel River watershed and protection of scattered wetlands within the Land Management Unit 7
- Protection of wildlife and wildlife habitats
- Protection of the environment, water quality, and quantity and risks with respect to potential spills
- Protection of cultural heritage resources/values

GTC also requested that Chance share the Project Description and any other materials related to the Project that might be available. Chance was able to send a draft Project Description dated May 22, 2020 to both GTC and TGC, however no other materials (e.g., effects assessments, summaries of mitigation measures, management plans) were available at that time.

GTC's original feedback helped Chance select Valued Components, identify mitigation measures, and identify where additional detail was needed in the Project Description. Chance was able to provide a response to GTC on July 9, 2020.

Chance and GTC organized a conference call for July 22, 2020 where parties were able to further discuss the proposed Project. During this call Chance was able to update GTC on any changes that had been made to the project design since the draft Project Description dated May 22, 2020, and GTC was able to ask Chance follow-up questions about potential project impacts.

A draft of the Project Proposal was shared with GTC/TGC July 24, 2020.GTC also flagged potential services that Gwich'in businesses might be able to offer Chance and inquired as to what employment opportunities would be available as a result of the Project. Chance indicated that it welcomes the opportunity to have further discussions with GTC to identify and facilitate potential economic development opportunities.

Chance will balance these interests with requirements to source specific equipment/professions for the maintenance work and requirements under section 68 of *YOGA* (i.e., benefits agreements with Yukon First Nations).

3.2.4 Tr'ondëk Hwëch'in

Initial notification was sent to TH on May 25, 2020. A conference call was organized between Chance and TH for June 17, 2020. The purpose of that meeting was for Chance to provide an overview of the proposed Project and to provide an opportunity for TH to ask questions and/or provide any feedback with respect to the proposed Project. During the conference, TH requested that Chance ensure that TH is identified as a potentially affected First Nation. Even though Project Activities do not occur in TH Traditional Territory, TH are indirectly affected by activities (e.g., increased traffic, impacts to wildlife in the region). Themes raised by TH included:

- Requiring additional information with potential risks associated with the Project and identified mitigation measures
- Requiring additional information with respect to the Project's potential wildlife management plan and information on how Project Activities would be affected if Porcupine Caribou are in the area (possibly the 40 Mile Caribou Herd and Hart River Caribou Herd as well)

TH also recommended that Chance look in the availability of traffic data in the Project Area and surrounding region. The presence and absence of traffic data in the region could inform what baseline studies Chance may need to conduct for future project proposals.

At the time of Chance and TH's initial call, no other materials (e.g., effects assessments, summaries of mitigation measures, management plans) were available. However, when the draft Project Proposal was completed, a draft was shared TH on July 24, 2020.

3.3 Ongoing Engagement Activities

Chance continues to be committed to engaging with potentially affected First Nations, should they wish to discuss the Project in more detail, and look forward to their involvement throughout the DO evaluation process.

4.0 ENVIRONMENTAL AND SOCIO-ECONOMIC EFFECTS ASSESSMENT METHODOLOGY

The assessment methodology outlined in this section provides a structured framework that is consistently applied to all valued components. The following guidance documents were considered when developing the Project's effects assessment methodology:

- *Proponent's Guide to Project Proposal Submission to a Designated Office* (YESAB 2010)

This methodology makes use of assessment terms Valued Components (VCs), defined as elements of the environmental and socio-economic systems valued for environmental, scientific, social, aesthetic, or cultural reasons.

The assessment methodology for VCs follows the main steps described below:

- Conduct assessment scoping (i.e., identify VC subcomponents and establish assessment boundaries);
- Establish baseline and existing conditions;
- Identify Project-related interactions and potential effects;
- Apply mitigation measures to address potential effects; and,
- Conduct effects characterization and significance determination.

4.1 Assessment Scope

The scope of the effects assessment focuses the application on the Project activities with the greatest potential to cause significant adverse effects on selected VCs. The VCs selected for this assessment were based on Project relevance and importance to First Nations, government agencies, and stakeholders, as well as previous assessment documents for related oil and gas and winter road projects in Yukon. VCs selected are discussed further in **Section 5.0**.

4.2 Establishing Assessment Boundaries

Assessment boundaries have been identified to define the spatial and temporal extent of the assessment. The spatial assessment boundaries are based on the spatial characteristics of the Project and the VC, and the areas where the Project-VC interactions and effects are expected to occur. Temporal boundaries encompass periods when the Project is expected to affect VCs. The temporal boundaries were determined based on the timing and duration of the Project. The spatial and temporal boundaries for the assessment of the Project are defined in **Table 4-1**.

Table 4.1 Spatial and Temporary Boundary Definition

Boundary	Definition
Spatial Boundaries	The spatial boundaries of the Project Area are outlined in Inset A of Figure 2-1.
Temporal Boundaries	The temporal boundaries for the assessment of the Project covers the construction, operation and maintenance of the winter roads and maintenance of the wells. To include permitting and construction timelines with some contingency, the temporal scope of this assessment is 2 years.

4.3 Establishing Baseline Conditions

The first step in performing an environmental and socio-economic effects assessment is to understand the existing environmental and socio-economic conditions currently present within the assessment area. The existing environmental and socio-economic conditions within the Project Area are based on a number of sources including historic literature, recent technical reports, databases, monitoring programs, government information, and first-hand knowledge. A summary of existing conditions is provided as part of each VC assessment to establish the setting for the assessment of Project-related effects on each VC. The level of detail provided for the existing conditions is sufficient to enable potential Project–VC interactions to be identified and understood.

4.4 Identifying Project-Related Interactions and Potential Effects

A key step in performing the environmental and socio-economic effects assessment is to understand the Project-related activities that are proposed and how those activities are likely to interact with the selected VCs. The intensity of the interaction will result in the potential effect on the VC and will ultimately dictate the mitigation measures implemented to minimize the effect of that interaction. The intensity of the interaction may be “none”, “negligible”, or “potential”. All Project components/activities that will not interact with a VC and will not result in potential effects are not considered further in the assessment. Where a potential interaction is predicted, a potential effect is identified and carried forward in the assessment. Where there is potential for the effect to be significant, mitigation measures are developed.

Consistent with direction provided in *YESAA*, each VC assessment section includes descriptions of mitigation measures of relevance to the particular VC to eliminate, reduce, or control adverse Project-related effects, as well as measures contained in industry codes and standards. The effectiveness of mitigation measures in reducing the potential effect is considered in the effects characterization.

4.5 Effects Characterization and Determination of Significance

For each VC, an effects characterization is performed, which evaluates the potential Project-specific effects with the implementation of the mitigation. Each effect is characterized based on its direction, magnitude, geographic extent, timing, frequency, duration, reversibility, and probability of occurrence. Each VC assessment section provides a description of the relative context for the assessment in terms of the resiliency and sensitivity of the VC. General definitions for these characteristics are presented in **Table 4.2.**

Table 4.2 Residual Effects Characteristics

Residual Effect Characteristic	General Definition	General Rating
Direction	Identifies whether the residual effect will be adverse or positive	• Adverse • Positive
Magnitude	Size or severity of the residual effect relative to the existing condition of the VC, generally measured in terms of the proportion of the VC affected within the Project Area, relative to the range of natural variation (or historic variation in the case of human environment VCs)	• Low • Moderate • High
Geographic Extent	Geographic area where the residual effect is likely to occur	• An area within the Project Area
Timing	Occurrence of the residual effect with respect to a temporal attribute important to the VC (e.g., time of day, season, stage in life cycle, etc.)	• VC-specific
Frequency	How often the residual effect is likely to occur, taking into account VC-specific temporal characteristics	• Infrequent • Frequent • Continuous
Duration	Length of time the residual effect to the VC is likely to persist, taking into account VC-specific temporal characteristics	• Short-term • Long-term • Permanent

Residual Effect Characteristic	General Definition	General Rating
Reversibility	Degree to which the residual effect can be reversed once the causal factors cease; irreversible effects are considered to be permanent	• Fully reversible • Partially reversible • Irreversible
Context	The extent to which the VC has been affected by past and present environmental and socio-economic processes and conditions, and its potential sensitivity to the Project-related residual effect, and its ability to recover from that effect	• Undisturbed • Disturbed • Resilient • Sensitive
Probability of occurrence	Likelihood that the residual effect will occur, taking into account how probable it is that a disturbance will actually be caused by the Project or that a specific mitigation will be successful	• Likely • Unlikely

The significance of effect on the VC will be assessed based on the effects characteristics, and the likelihood of the effect. The likelihood of the effect is in part determined by the scientific certainty relative to the quantification of the effect, scientific certainty relative to the effectiveness of the proposed mitigation, and professional judgement based on prior experience in assessing effects and the known effectiveness of proven mitigation measures. The rationale for the determination of significance is provided for each VC.

5.0 VALUED COMPONENT SCOPING

Valued ecological, social, cultural, and economic components (VC) identified for the Project form the basis of the assessment conducted in **Section 6.0**. These components were selected based on the results of environmental and archaeological field studies, literature reviews, consultation with First Nations, and professional expertise. The valued components are described in **Section 5.1**, along with a rationale for their selection. The assessment in **Section 6.0** focuses on these valued components.

Potential VCs and VC subcomponents were selected based on (1) their value as ecological, social, cultural or economic factors, (2) spatial, temporal, and mechanistic ability to interact with the Project, and (3) technical feasibility of conducting an assessment. Ecological values included consideration of foundational environmental factors or processes, species of conservation concern (e.g., caribou), and more general species or processes that represent biodiversity. Social and cultural values were based primarily on current and historic human use, such as hunting, recreation, and heritage values. Economic values relate to existing or future use of resources to derive monetary benefits. Often potential VC subcomponents can include multiple value types. For example, furbearers have ecological, cultural, and economic values.

VC's and subcomponents were also screened based on their ability to interact with the Project, including the degree of spatial and temporal overlap with the Project and mechanism to be affected by the Project. For example, birds are sometimes included as a VC subcomponent for EAs for some projects because of the numerous species that contribute to biodiversity and diverse habitat associations the group has. However, for this Project the potential to interact with the VC is low because most species have migrated south during the winter when the Project will be active and the project has low potential to affect the few resident birds that are present.

Finally, technical feasibility was considered for selection of VC subcomponents. These criteria relate to technical factors that could affect the effects assessment, such as the availability of baseline data or the level of understanding of how the project could affect the VC subcomponent.

Potential VCs that were considered in the scoping exercise but were NOT carried through for assessment are described in **Section 5.2**. These issues were investigated for potential interactions with the Project and were determined to not require further assessment. **Section 5.2** provides a description of the issues, and a rationale for not including them as valued components. Mitigation measures and best practices are identified for these issues where applicable.

5.1 Valued Components Selected

The VCs selected for assessment are wildlife and wildlife habitat, vegetation and wetlands, and heritage resources. The rationale for selecting these VCs and specific subcomponents within each VC to be assessed are provided below.

5.1.1 Wildlife and Wildlife Habitat

Wildlife and wildlife habitat were selected as a VC because there is a potential for interaction between wildlife and wildlife habitat and Project activities. Wildlife and wildlife habitat are valued as important ecological components, for aesthetic and cultural reasons, and as subsistence food sources. Sensitive species and/or habitats will be given special consideration within this VC. The indicators used to describe and evaluate potential Project-related effects on wildlife and wildlife habitat include habitat, movement and distribution, and mortality or injury.

As a group, ‘wildlife’ encompasses numerous taxa with diverse habitat requirements. Effects assessments for most resource development projects include a suite of species or species groups as subcomponents to represent the diversity encompassed within the wildlife VC. The suite of species and species groups that were considered during VC selection are outlined in **Table 5.1**. Based on the selection process, caribou and moose were selected as VC subcomponents for effects assessment.

Table 5.1: Summary of selection process for wildlife valued components

Potential Subcomponent	Value (Ecological, Social, Economic)	Potential to Interact with Project (Spatial, Temporal, Mechanism)	Evaluation Outcome
Caribou	High. The Porcupine Caribou Herd is highly valued for subsistence hunting, cultural values, and ecological values.	Moderate. The Project occurs within the PCH winter range when caribou may be present; however, caribou do not use the Project area every year. If caribou do occur, the Project have the potential to affect local movements and habitat availability.	Selected as a VC subcomponent.
Moose	Moderate. Moose are valued as a secondary species for subsistence hunting, after caribou.	Moderate. The Project occurs within annual moose range and Project activities could have a localized effect on moose distribution and habitat availability.	Selected as a VC subcomponent.
Furbearers	Moderate. Marten and lynx have high cultural and moderate economic value for trapping, but the area has not been actively trapped for several years.	Low. The Project occurs within marten and lynx ranges, but these species tend to be tolerant or adaptive to low levels of industrial work, as required for this project. The project will not create new access on which snowmobiles cannot already travel.	Not selected as a VC subcomponent, but mitigations are provided
Grizzly Bears	Moderate. Grizzly bears are often a species of conservation concern because they occur at low densities and can be sensitive to human disturbance.	Very Low. Grizzly bears will be denning while the Project is active and the chance of a den occurring near work areas is very low.	Not selected as a VC subcomponent, but mitigations are provided
Wolves	Moderate. Wolves play an important role in large mammal predator-prey relationship in northern ecosystems; however, they generally have low social and economic value.	Low. Wolves occur within the project area but tend to relatively tolerant or adaptive to low levels of industrial work, such as required for this Project.	Not selected as a VC subcomponent; no specific mitigations
Birds	Moderate. Birds are often included as a VC subcomponent in effects assessments because, as a group, it includes numerous species that contribute to biodiversity and have diverse habitat associations.	Very Low. The Project has very low potential because the majority of birds in the area are migratory and will be on their wintering grounds, the timing of work is outside the breeding season, when birds may be sensitive to disturbance, and affects to bird habitat are very limited.	Not selected as a VC subcomponent; no specific mitigations

5.1.2 Vegetation and Wetlands

Vegetation and wetlands were selected as a VC because there is a potential for interactions with Project activities, and because of their role supporting biodiversity and wildlife habitat. Further, they are valued by First Nations and local residents who may use certain species as a subsistence and economic resource. Project activities may disturb, change, or remove vegetated areas, habitat containing traditional and medicinal plants, and ecological communities that may host rare plants or wetlands.

5.1.3 Heritage Resources

Heritage Resources were selected as a VC because of the value of heritage sites and historic resources rests within their context in the land in which they are located and there is potential for interactions with Project activities. Once disturbed or removed, that value cannot be restored. The term “heritage resources” is used here to refer to archaeological resources, historical resources, and paleontological resources collectively (i.e., all are considered to be types of heritage resources). In Yukon, the *Historic Resources Act* (RSY 2002, c.109) and Archaeological Sites Regulation contain legislation that mandates the management and protection of Yukon archaeological, historical, and paleontological resources. This legislation applies to heritage resources on both private and public land that are older than 45 years. Archaeological, historical, and paleontological resources are protected from unpermitted surveys, disturbances, alterations, or excavations.

5.2 Other considerations

Other valued components considered in our report but not included in the effects assessment include fish and fish habitat, permafrost, air quality, fish and wildlife harvesting, community safety and well-being of indigenous people; tourism and aesthetics; economic activity; land use and recreation; traditional land use; health and safety; and site access and traffic.

5.2.1 Fish and Fish Habitat

Fish and fish habitat are recognized as important values in the Eagle Plains area. However, Fish and fish habitat are not included as valued components because they have negligible potential to interact with the Project. No direct effects to fish and fish habitat will occur because access roads do not cross any streams and all well sites and access roads are greater than 200 m from mapped water courses or water bodies. Indirect effects, such as sedimentation or water quality are deemed to be negligible because winter roads have minimal effect on natural drainage patterns and do not expose soil for sediment transfer (i.e., there is no ditching along the winter roads and the duff layer and ground vegetation are protected).

5.2.2 Permafrost

Permafrost was considered as a potential VC for the assessment. However, the timing of the proposed activities (i.e., completed in winter) and the relatively short duration of the Project greatly limit any potential effects on permafrost in the area. Additionally, the methods proposed for winter road construction are designed to reduce ground disturbance by mulching large vegetation (trees) rather than pushing it over with a bulldozer, which could potentially pull up root systems and expose underlying sediments. Winter road construction will leave the surface organic mat (moss and peat) intact and uncompressed, minimizing effects on permafrost. Winter roads actually promote penetration of wintertime cold into the ground due to higher thermal conductivity of ice than adjacent snow, a response that will help counteract any minor reduction in cold penetration below road-edge berms. Excess accumulation or piling of snow will not occur

to avoid potential effects on local ground temperatures. Well maintenance activities will not have the opportunity to adversely affect permafrost. Therefore, permafrost was not considered further in this effects assessment.

5.2.3 Air Quality

Air quality was considered as a potential VC for the assessment. However, given the remoteness of the Project site, the relatively short duration of the Project, the air quality within the Project area will not deteriorate with the installation of the winter roads or well maintenance activities. The Project will involve burning of fossil fuels to operate the equipment to work on the winter roads as well maintenance activities. Emissions from equipment will be relatively low and localized to the areas of active construction and at each well. Additionally, the construction phase of the Project is only projected to last one winter at which point air quality will return to baseline conditions and will not have a lasting effect on local air quality. Therefore, air quality was not considered further in this effects assessment.

5.2.4 Fish and Wildlife Harvesting

Fish and wildlife harvesting were considered as a potential VC given the importance of this activity for both traditional and subsistence purposes. In this context, harvesting includes hunting, fishing, and berry picking. Harvesting is important for First Nations to maintain their connections to their traditional territories and helps to preserve and enhance their culture, identity and values. Since Project activities will be located primarily in previously established well sites and where roads had historically been constructed it is anticipated that the effects to opportunities to practice harvesting caused by the project will be minimal. If Project activities overlap spatially and temporally with Porcupine Caribou Herd migration, there could be potential interactions between Project activities and caribou hunters, specifically human health and safety. Negative effects caused by these interactions will be mitigated by the measures implemented in Section 6.1 – Wildlife and Wildlife Habitat. Therefore, fish and wildlife harvesting were not considered further as a VC in this assessment.

5.2.5 Community Safety and Well-being of Indigenous People

Community Safety and Well-being of Indigenous People was considered as a potential VC in response to the Calls for Justice for Extractive and Development Industries from the National Inquiry into Missing and Murdered Indigenous Women and Girls (MMIWG1b 2019). Resource extraction and development projects can exacerbate issues of violence against Indigenous women and girls (MMIWG1a 2019).This potential VC was not carried forward in the assessment because of the Project's approach to staffing the site; staff will not be spending time in nearby communities or along public roadways during their transit to site and instead will arrive on site via a fixed-wing aircraft directly to the Eagle Plains airstrip.

5.2.6 Tourism and Aesthetics

Tourism and aesthetics were considered as a potential VC due to the Klondike and Dempster Highway's use as a popular tourism route in the territory. Two of the wells are located immediately adjacent to the highway and already have access routes with rig matting in place. These wells will be visible to the public, however tourism and aesthetics were not carried forward in the assessment because the Project activities likely to affect tourism and aesthetics will be limited to the construction period of the winter of 2020/2021 during the tourism off season. Project activities will also be localized to the areas of active construction, and will return to baseline conditions following the end of the construction period.

5.2.7 Economic Activity

Economic activity in the area surrounding the Project site was considered as a potential VC because it was identified as an area of interest for the affected First Nations. The Project has limited interaction with local businesses aside from necessary stops (i.e., fuel stations) by resource delivery drivers during construction and is therefore not considered further in this assessment.

5.2.8 Land Use and Recreation

Land use and recreation were considered as a potential VC given the high volume of traffic along the Dempster Highway and use of the area for land use activities and recreational purposes. The Project is not likely to overlap with land use and recreation activities potentially occurring in the area. Effects will be localized to the areas where roads had previously been built and to previously established well sites and camp facilities. Furthermore, the proposed activities are anticipated to be completed in one winter (December to March). Therefore, it is not expected that Project activities will have lasting interactions with land use and recreation beyond the Project's construction schedule and is therefore not considered further in this assessment.

5.2.9 Traditional Land Use

Traditional Land use was considered as a potential VC for the project. Give the location of the Project, it is not expected that Project activities will have lasting interaction with traditional land use beyond the Project's construction schedule and is therefore not considered further in this assessment. The Project is not likely to overlap with land use and recreation activities potentially occurring in the area. Effects will be localized to the areas where winter roads had previously been built and to previously established well sites and camp facilities. Furthermore, the proposed activities are anticipated to be completed in one winter (December to March).

5.2.10 Site Access and Traffic

Site access and traffic were considered a potential VC for the assessment given the high volume of traffic along the Klondike and Dempster Highway and a potential increased level of access among travellers to the surrounding lands and site area via the winter access road that will be constructed for the Project. Due to the implementation of security measures (included a gated entrance) at the commencement of the winter access roads, this VC was not carried forward to assessment.

6.0 ENVIRONMENTAL AND SOCIO-ECONOMIC EFFECTS ASSESSMENT

6.1 Wildlife and Wildlife Habitat

6.1.1 Existing Conditions

6.1.1.1 Caribou (Rangifer tarandus)

The Project occurs exclusively within the range of the Porcupine Caribou Herd. The transport of equipment to and from the Project, likely from Alberta or northeastern British Columbia, would travel through several additional caribou herds, including the Forty Mile Herd and the Hart Herd along the Dempster Highway. However, the incremental amount of Project traffic compared to regular highway traffic is small and, as

such, the effects of travel to and from the Project are not included in this assessment. Project equipment would consist of approximately two dozen trucks which would travel to and from the Project area over a 3 to 5 day period.

The Porcupine Caribou Herd is a subpopulation of barren-ground caribou. Barren-ground subpopulations are known for their large aggregations, dramatic population fluctuations, lengthy migrations, and significant cultural and social value to northern Indigenous people and other Canadians (COSEWIC 2016). Barren-ground caribou have been assessed as "Threatened" by the Committee on the Status of Endangered Wildlife in Canada (COSEWIC 2016). Within Yukon barren-ground caribou are considered "Vulnerable/Apparently Secure" (Yukon Government 2020). Although many barren-ground caribou are declining, the Porcupine Caribou Herd has been increasing at a rate of approximately 4% from 123,000 animals in 2001 to 218,000 in 2017 (Yukon Government 2018).

The Porcupine Caribou Herd's annual range extends approximately 250,000 km² from Alaska, through Yukon, and into the western edge of Northwest Territories. The herd undertakes long distance migrations across seasonal ranges necessary for key aspects of their life cycle. Seven primary life cycle periods occur for the Porcupine Caribou Herd (**Table 6-1**) (Porcupine Caribou Technical Committee 1993). The timing of this Project (December to mid April) coincides with the *Early, Mid, and Late Winter* season and the *Spring, Spring Migration, and Pre-calving* season of the Porcupine Caribou Herd.

Winter is considered the season of lowest importance to the herd (Porcupine Caribou Technical Committee 1993). The herd is at its most dispersed stage during winter, both in terms of the extent of the range it uses and in terms of group aggregations. Average daily movement distances (2-5 km/day) (Russell and Gunn 2017) are lower than other seasons, except for cows during calving. Winter range use varies from year to year depending on snow depth and condition. In Yukon, during deep snow years, use is concentrated in the Richardson Mountains and the Ogilvie-Hart basins. In low snow years, the Whitestone River and Eagle Plains areas, which contain abundant lichen resources, are used more. Forage, primarily lichens, is generally not limiting during the winter and in shallow to normal snow years the caribou appear to maintain neutral to surplus energy balances. The Porcupine Caribou Herd are relatively tolerant to human activity during the winter (Porcupine Caribou Technical Committee 1993).

During the *Spring, Spring Migration, and Pre-calving* season caribou begin moving north towards the calving grounds. Average daily movement rates increase from approximately 6 km/day at the start of the season to approximately 24 km/day through May. Caribou, especially pregnant cows, typically enter an energy deficit during spring due to reduced forage availability, as they leave the lichen-rich taiga and before forbs have emerged, and higher energy expenditure associated with migration. Spring is rated higher importance than winter, but still relatively low overall, due to lack of association with specific habitats, relatively low threats from predators, and lack of insect harassment (Porcupine Caribou Technical Committee 1993).

No Wildlife Key Areas occur for caribou within the Project area (Environment Yukon 2016a).

Table 6.1: Key life cycle periods for the Porcupine Caribou Herd (from Porcupine Technical Committee, 1993)

Season	Dates	Characteristics	Importance
Early, Mid and Late Winter	Dec 1 to Mar 31	The herd is at its most dispersed at this time across two winter ranges: in Yukon, mostly south of the Porcupine River in boreal taiga and, in Alaska, centred in the Chandalar River/Arctic Village area. Winter range use varies from year to year depending on snow depth and condition. Caribou at this time of year are relatively tolerant to human activity. In shallow to normal snow years animals can gain weight.	4 (Lowest)
Spring, Spring Migration, and Pre-calving	Apr 1 to May 31	Distribution of the herd varies depending on snow melt; migration routes vary from year to year. Pregnant females are typically in energy deficit due to reduced forage once they leave the lichen rich taiga.	3
Calving (cows)	June 1 to 10	Calving occurs on the coastal plain of NE Alaska and, to a lesser degree, NW Yukon. This area offers reduced predators and abundant spring forage; no alternative range is available. Cows are at the lowest point of physical condition and are least tolerant to human disturbance.	1 (Highest)
Post-calving and Movement (cows)	June 11 to 30	As calves develop over the first two weeks of life the cows and calves tend to aggregate into larger groups and increase movement rates to track plant green-up. The post calving period imposes high energetic demands on lactating females and cow/calf groups are relatively intolerant of disturbance. The post-calving range is primarily in Alaska and cows that calved in Yukon tend to move west along the foothills into Arctic National Wildlife Refuge (ANWR). Insect avoidance can affect distribution by the end of June.	1 (Highest)
Calving to Movement (bulls)	June 1 to 30	Bulls, non-pregnant cows, and subadults tend to concentrate east of the calving grounds in the northern Yukon. Animals track the progression of greenup from the coastal plains to the northern foothills, to intermountain regions.	3
Early Summer	July 1-15	Cows continue to require high energy intake for milk production, but insect avoidance also drives distribution. Key areas selected for insect avoidance are the coastal plain adjacent to the Beaufort Sea (mostly cows/calves) and mountains in the Brooks and British Mountains (mostly bulls and cows without calves). Long distance movements during this period are also an insect avoidance behaviour.	2
Mid Summer	July 16 to Aug. 7	Mid summer continues to be a period of high insect harassment. Two areas are consistently used – the northern Richardson Mountains in Yukon and the southern portion of the Brooks Range in Alaska. Females with cows may be in energy deficit.	2
Late Summer and Fall Migration	Aug. 8 to Oct. 7	As insect activity declines the herd disperses widely but mostly stays north of the tree line until the latter part of the period – in Alaska south of the Brooks Range and in Yukon north of the Porcupine River. Animals exhibit high feeding rates and gaining fat for the winter.	3
Rut and Late Fall	Oct 8 to Nov 30	The region where rut occurs has no affinity from year to year; rut occurs wherever the herd happens to be along fall migration. In Yukon distribution can occur from the southern Olgilvie Mountains to the Richardson Mountains.	4 (Lowest)

6.1.1.2 Moose (Alces alces)

Moose occur throughout the Project area and are present in all seasons; however, population levels are poorly known. The Regional Biologist with Environment Yukon has suggested that the density of moose in Eagle Plains is low compared to populations in central and southern Yukon, but relatively high compared to other areas in north Yukon, and may be rising (M. Suitor, pers. comm.). Extensive wildfires within the Eagle Plains area over the last 30 years are currently in shrub-dominated successional stages that offer productive summer and winter forage for moose, which are expected to support higher numbers of moose than later successional black spruce forests. In November 2000 an aerial moose survey was conducted for a study area that mostly overlapped with the project area for this Project (Access Consulting Group and EBA Engineering Consultants Ltd. 2001). That survey observed 30 moose and estimated a total population of 60-90 based on additional tracks seen and a low sight ability factor.

Winter is normally a limiting season for moose. Reduced forage, higher energy expenditures, due to snow and cold, and higher vulnerability to predation all contribute to limit moose fitness during the winter. During winter, moose are primarily associated with shrub-dominated habitats for forage, which include regenerating burns, riparian areas, shrub-carrs, wetlands, stream valleys, and upland deciduous and mixed forest (Suring and Sterne 1998, Environment Yukon 2016b, McCulley et al. 2017). In other areas in Yukon, moose typically use higher elevation area in early winter and move to lower elevations in late winter to avoid deep snow and to utilize habitats such as riparian areas with shrubs for forage (Environment Yukon 2016b). It is unverified if this occurs in the Project area, but winter snow depths often exceed 50 cm in the Eagle Plains area (Russell and Gunn 2017), which is the threshold at which moose tend to exhibit winter movements to seek lower snow packs (Poole and Stuart-Smith 2005).

No Wildlife Key Areas for moose occur within the Project area (Environment Yukon 2016a)

6.1.2 Project Interactions and Potential Effects

Potential effects to VC subcomponents were evaluated based on the degree of spatial and temporal overlap between Project activities and the VC subcomponents and the type of interactions the Project could have on the VC subcomponents. Types of interaction include both direct affects, such as displacing animals due to sensory disturbances, and indirect effects, such as increasing mortality risk from hunters or natural predators. Project activities and interactions could result in effects to wildlife and wildlife habitat during three primary Project stages (**Table 6-2**).

Table 6.2: Potential interactions between Project activities Wildlife and Wildlife Habitat

Activity	Project Interactions	Potential Effects
Winter road construction	• Vegetation Removal • Use of heavy equipment • Human presence	• Sensory disturbance • Localized effects to movement and distribution • Direct and indirect habitat effects
Road travel (along the Dempster and winter roads)	• Vehicle travel	• Sensory disturbance • Localized effects to movement and distribution • Indirect habitat effects • Direct and indirect mortality

Well site maintenance	• Vegetation Removal • Use of heavy equipment • Human presence	• Sensory disturbance • Localized effects to movement and distribution • Mortality or injury

6.1.2.1 Caribou

A detailed assessment of potential effects of oil and gas activities in Eagle Plains on caribou was conducted by Russell and Gunn (2017). This assessment draws from their work, adapting to the limited scope of this well maintenance program.

There is increasing evidence that ungulates, including caribou, tend to respond to human presence and activities in similar manners to how they respond to predators (Frid and Dill 2002). The most common response of caribou is to avoid human activity areas or to exhibit greater vigilance behaviours. Reported response distances of caribou vary widely but are mostly in the magnitude of several hundred metres (e.g., 600 m (Murphy and Curatolo 1987). Caribou may also change their distribution relative to disturbance. In most studies, avoidance of roads is less than 4 km (Vistnes and Nellemann 2001, Cameron et al. 2005), but avoidance of the Dempster Highway varied from 18-30 km over a twenty year period depending on land use and hunting regulations (Johnson and Russell 2014). Responses by caribou to human disturbances vary widely and causal relationships are often poorly understood.

Patterns of avoidance by caribou to human disturbances are often affected by the nature of the human activity, specifically, whether caribou are directly hunted or harassed by humans, and time since disturbance began. Reduced behavioural response and apparent avoidance in distribution patterns (i.e., habituation) appear to be associated with lack of hunting and predation (Lawhead et al. 2006, Haskell and Ballard 2008). This highlights the importance of factoring hunting management into mitigations. However, effects on distribution can occur outside of hunted areas and several years after the disturbance began (Johnson et al. 2019).

Russell and Gunn (2017) frame their assessment in terms of *sensitivity* of the Porcupine Caribou Herd to potential effects and degree of *exposure* to effects. Sensitivity relates to factors such as herd size and trend, seasonal body condition, ecological life history activities, and environmental stressors, like insects. Caribou are generally more sensitive to effects when populations are low and declining, when their body condition is low or they are exposed to other stresses (e.g., insect harassment), and during critical life history periods, notably calving. In the context of the current condition of herd and the timing when the Project could interact with it, the sensitivity of the herd is low:

- The herd is at a historically high population level and showing an increasing trend.
- During winter, when the Project would occur, Porcupine Caribou are typically in good body condition and free of stressors, such as insects.
- The winter period is not associated with a critical life history stage.

Exposure relates to the degree of spatial and temporal overlap between caribou and potential human effects, as well as the mechanisms of effects (e.g., type, magnitude, and duration of effects). In terms of type of effects, the most likely effects of the Project are localized, temporary effects to distribution, which can translate to indirect habitat effects. The only potential source of direct mortality from the Project would

be vehicle collisions, and those can be effectively mitigated. Linear features can indirectly affect the rate of mortality of caribou caused by natural predators and hunters, by increasing ease of travel. However, this Project will avoid creating new linear features by re-establishing existing winter roads. The Project is aiming to have a neutral effect on hunting, to balance mitigating effects to caribou while maintaining indigenous hunting opportunities. Although hunting will not be available from the Blackie and Chance winter roads, the project will not inhibit hunting indigenous hunting opportunities in the broader area that may be accessed from the Dempster Highway.

Russell and Gunn (2017) assessed the potential spatial and temporal overlap between the Porcupine Caribou Herd and a similar, but slightly larger extent, as this Project, using thirty years of telemetry data. Their primary analysis area was a 30 km buffer around the project, based on the maximum distance that caribou avoided the Dempster Highway in another study (Johnson and Russell 2014). Russell and Gunn (2017) found that a collared caribou occurred in the 30 km buffer area during the months of January to April in 15-22% of the years. The average percentage of the herd using the 30 km buffer area ranged from 3% in January to approximately 1% in February to April. Average residency times varied from 9 to 17 days/month during the January to April period. In other words, on average, 98% of the herd's movements during the winter occur outside the 30 km buffer surrounding the Project and, for any animal that does occur in the area, they typically spend a third to half of a month there before moving out of the area.

6.1.2.2 Moose

Moose can be affected by human land use activities, although moose are generally less sensitive than caribou. As outlined below, Project activities could result in four types of effects to moose.

1. Sensory disturbance. Human presence, work activities and vehicle travel/equipment operation will generate noise and other sensory effects that moose may respond to. The most likely response of moose to sensory disturbance is to avoid areas where disturbances are occurring. This could result in localized effects to movement and distribution and indirect habitat effects (Lykkja et al. 2009) (see 2 and 3, below, respectively). When moose are unable to move away from sensory disturbances, it can result in physiological stress responses and behavioural modifications (e.g., increased vigilance). However, these responses are not anticipated to occur for this Project because moose can move away from the work areas to avoid them.
2. Localized effects to movement and distribution. Numerous studies have examined responses of moose to human activities, including roads, industrial activity, and rural residences (Andersen et al. 1996, Burson et al. 2000, Yost and Wright 2001, Lykkja et al. 2009). Most studies found avoidance of human activity areas out to approximately 300 m (EDI Environmental Dynamics Inc. 2017). However, there are also cases where moose appear to choose to be nearer to human activity to avoid natural predators (Muhly et al. 2011). Similar to caribou, responses are greatest when moose are directly harassed or hunted.
3. Indirect habitat effects. A consequence of localized avoidance of human activity areas is that the habitat within the zone of influence is temporarily not used by animals. As per the effects on movement and distribution, the zone of influence for indirect habitat effects is approximately 300 m.
4. Direct and indirect mortality. The Project has the potential to have a direct effect on moose mortality via vehicle collisions (EDI Environmental Dynamics Inc. 2015). However, mitigation measures, below, are expected to effectively eliminate the risk of vehicle collisions. The Project could have an indirect affect on mortality by improving access along the winter roads for human hunters and natural predators.

6.1.3 Mitigation Measures

6.1.3.1 General Mitigation Measures for Wildlife and Wildlife Habitat

- All Project personnel will be required to complete formal orientation and training related to wildlife mitigation measures.
- Work will be scheduled to minimize the spatial extent across which work is concurrently occurring.
- Access to the well sites will utilize existing and historic winter roads to minimize the creation of new linear features.
- Project footprints, notably the widths of winter roads, will be minimized as much as possible. On the Chance Road, the width will not exceed the existing right-of way extent.
- Firearms are not allowed on-site by Project personnel. No hunting or shooting rules will be in effect.
- A no harassment of wildlife policy applies to all personnel. This includes attempts to chase, catch, divert, follow, photograph, feed, or otherwise harass wildlife, whether on foot, in on-road or off-road vehicles, heavy equipment, or aircraft.
- The use of on-road and off-road vehicles, including snowmobiles, will be restricted to essential Project access routes.
- Personal use of unmanned aerial vehicles (UAVs or drones) is prohibited.

6.1.3.2 Road Operations

The following measures are designed to mitigate the risk of vehicle collisions and effects of road use on wildlife movements.

- The maximum speed limit along the Dempster Highway is 90 km/h.
- The maximum speed along winter roads is 30 km/h.
- Wildlife will always have the right-of-way. This requires vehicle operators to stop when wildlife are observed on or beside the road, allowing them to cross safely. If wildlife stays on the road or right-of-way for >5 minutes, drivers may resume travel and pass the animals at <10km/h.
- Special rules apply to caribou.
    - For Caribou within 100 m from the road:
        - Stop as far back as possible;
        - Alert other drivers;
        - Wait until caribou have crossed and moved beyond 500 m from the road or are lost from sight before proceeding;
        - Proceed with caution.
    - For Caribou beyond 100 m from the road:
        - Proceed with caution;
        - Alert other drivers;
        - Watch for direction of movement and change in behaviour.

- When moose and caribou are on a road they will sometimes run down the road away from a vehicle. If this happens, stop and wait at least 5 minutes to allow the animal to move off the road. If the animal remains on the road, drive forward at 10 km/h, then stop again when the animal begins to run away. Wait 2 minutes and repeat this procedure. If the animal still does not leave the road, wait 10 minutes and repeat the procedure, alternating with a 2- and 10-minute stop between driving attempts.
- Drivers are required to use two-way radio communication. The location of any wildlife observed along Project roads is to be communicated to other road users on the radio.
- Drivers will not exit the vehicle to chase, catch, divert, follow, photograph, or otherwise harass wildlife.
- Along winter roads:
    - snow banks will be maintained at heights <1 m to reduce the hinderance to wildlife crossing them;
    - where snow banks exceed 60 cm in height, regular breaks (at least every 500m) will be created to facilitate easier animal crossing and as 'escape routes' off the road.
        - Create matched breaks on either side of the road that animals can use to cross.
        - On corners, create run-outs, in each direction, that are obvious alternative routes for animals to use, instead of following the road.
        - Avoid breaks at seismic lines, which could provide human access.

6.1.3.3 Aircraft Operations

The following measures are designed to mitigate the effects of aircraft use on wildlife:

- Altitudes of greater than 300 m above ground level will be maintained at all times of the year.
- Altitudes of greater than 600 m above ground level will be maintained during sensitive times of the year.
- Areas where caribou have been observed in the past will be avoided.
- Flights paths will be designed to avoid important areas during sensitive times of the year.
- No caribou observed will be flown towards, circled, or harassed.
- If caribou are seen to be in a panic or startled the plane will ascend to a higher elevation.

6.1.3.4 Caribou

The majority of potential effects to caribou will be mitigated via measure for general wildlife, road operations and aircraft operations. Additional measure specific to caribou include:

- Packing of snow will not occur on any linear features that are not essential to Project work.
- Access to linear features off the winter roads will be minimized by avoiding creation of breaks in snow berms at junctions with linear features.
- All sightings of caribou will be reported to the Environmental Monitor.
- If more than a dozen caribou are observed, or if any number of caribou are observed in the same location for longer than a three-day period, a qualified environmental professional (QEP) will be consulted to determine if site-specific mitigations may be warranted.

Due to the variable nature of caribou occurrence and snow conditions from year to year, a pre-operations assessment will be conducted in December, prior to Project initiation, to assess local conditions (specifically including information about caribou occurrence and snow conditions) that could warrant tailored management measures. For example, if telemetry data indicated that several collared caribou were in the Project area, near work areas, additional measures may be put in place to mitigate potential effects.

6.1.4 Effects Characterization and Significance

6.1.4.1 Caribou

With the mitigation measures listed in **Section 6.1.3** applied, it is predicted that Project activities will not result in significant effects to habitat, movement and distribution, and mortality or injury to caribou. Detailed effects assessments are provided for each indicator in Table 6.3, Table 6.4 and Table 6.5 respectively. Key factors that result in this significance determination are:

- Although the timing of the Project does overlap with the potential occurrence of the Porcupine Caribou Herd in the area, the extent of the Project area, including a zone of influence, is a small proportion of the herd's total winter range. If caribou choose to avoid the work areas (i.e., due to sensory disturbance) alternative habitat is available.
- The timing of the Project, during winter, is a season of lowest importance for the ecology of the Porcupine Caribou Herd and a period when the caribou are relatively tolerant of human disturbance (Porcupine Caribou Technical Committee 1993).
- The most likely potential effect to caribou is temporary, localized avoidance of work areas due to sensory disturbance.
- The Project will be re-establishing existing winter access, not creating new access features, and will therefore not result in a change in access for human hunters and natural predators.

Table 6.3: Characterization of potential effects to caribou habitat.

Residual Effect Characteristic	General Definition	Rating
Description of Interaction	The Project will consist of work at 8 well sites plus access via 30.2 km of winter roads. This will result in direct habitat effects due to vegetation clearing along the access routes and well sites. It may also result in indirect habitat effects if caribou choose to avoid areas in proximity to the roads and well sites due to sensory disturbance or perceived predation risk.	
Direction	Effects to habitat will be adverse.	Adverse
Magnitude	The magnitude of effects is low, due to the small extent and narrow width of areas that are affected.	Low
Geographic Extent	Direct habitat will be limited to the footprint of the winter roads and well sites (approximately 60 ha). Indirect effects can extend out to 4000 m, depending on site conditions and variation in caribou behaviour. These extents are small relative to the herd's total winter range.	Low
Timing	The timing of the Project, during winter, is a season of lowest importance for the ecology of the Porcupine Caribou Herd and a period when the caribou are relatively tolerant of human disturbance	Low
Frequency	Direct effects will be continuous, though diminishing in magnitude, as vegetation regenerates. Indirect effects will be continuous when work activities are active.	Continuous

Residual Effect Characteristic	General Definition	Rating
Duration	Direct effects to the road and well site footprints will take years to regenerate (long-term). Indirect effects will cease once work activities are completed (short-term).	Short-term Long-term
Reversibility	The effects to habitat are fully reversible. Indirect effects will cease immediately upon stoppage of work activities. Direct effects along the winter roads will take several years for vegetation to regrow.	Fully reversible
Context	Work for this project will occur on previously disturbed sites. Measures to protect the duff layer and ground vegetation will maximize the resiliency of the site to regenerate to similar habitat.	Existing Disturbed/ Resilient
Probability of occurrence	Based on historic telemetry data it is likely that caribou will encounter areas affected by this Project at some point in the future. The likelihood that caribou will be present during the year the Project is active is moderate (over 24, years collared caribou occurred within 4km of the Project area in 17% of the years).	Likely

Table 6.4: Characterization of potential effects to caribou movement and distribution.

Residual Effect Characteristic	General Definition	Rating
Description of Interaction	The Project will consist of work at 8 well sites plus access via 30.2 km of winter roads. This work will result in sensory disturbance that could cause caribou to avoid the areas. Responses to sensory disturbance are mostly ≤4 km but vary in relation to site conditions and caribou behaviour. Effects are most likely to be expressed as temporary, localized avoidance of work areas. No effects to migration are expected because the extent of the Project area is small relative to the extent of winter range available for caribou to travel through.	
Direction	Effects to movement and distribution could be adverse.	Adverse
Magnitude	The magnitude of effects is low due to the limited consequence if caribou chose to avoid work areas. Alternative habitat is available, and avoidance of the area would not hinder migration or sub-regional movements within the winter range.	Low
Geographic Extent	Responses to sensory disturbance are mostly ≤4 km but vary in relation to site conditions and caribou behaviour. These extents are small relative to the herd's total winter range.	Low
Timing	The timing of the Project, during winter, is a season of lowest importance for the ecology of the Porcupine Caribou Herd and a period when the caribou are relatively tolerant of human disturbance	Low
Frequency	Potential effects to movement will occur daily, corresponding to periods when project activities are active.	Frequent
Duration	Project work will occur on a daily basis, for approximately a 12 h period, over an eight to 12-week work period in mid-January to mid-April.	Short-term
Reversibility	The potential effects to movement are fully reversible. Effects will cease immediately upon cessation of work activities.	Fully reversible
Context	Oil and gas exploration activities have occurred intermittently in the Eagle Plains area over the last 50 years. Responses of caribou have not been studied in detail, but use of the area by caribou has continued, demonstrating general resiliency to exploration activities.	Existing Disturbed/ Resilient

Residual Effect Characteristic	General Definition	Rating
Probability of occurrence	Based on historic telemetry data it is possible, but uncertain, that caribou will occur in the Project area when work is active. Over 25 years, collared caribou occurred within 4km of the Project area in 17% of the years.	Possible

Table 6.5: Characterization of potential effects to caribou mortality and injury.

Residual Effect Characteristic	General Definition	Rating
Description of Interaction	The Project will consist of work at 8 well sites plus access via 30.2 km of winter roads. Road use has the potential to cause direct mortality to caribou via vehicle collisions; however, that risk is negligible after mitigations. The project also has the potential to affect indirect mortality via packing of winter roads that could enhance travel rates by wolves or access to hunters. However, the potential for this effect is reduced by potential avoidance of work areas by both caribou and wolves due to human activity/sensory disturbance and hunter access management for safety.	
Direction	Effects to mortality or injury could be adverse.	Adverse
Magnitude	The magnitude of potential effects of direct mortality is negligible after mitigations. Effects of indirect mortality are estimated to be low due to potential avoidance of the work areas by both caribou and wolves and hunter access management.	Low
Geographic Extent	The winter roads total 30.15 km. This extent is small relative to the herd's total winter range, and the number of caribou that are likely to encounter the road is small.	Low
Timing	The timing of the Project, during winter, coincides with the potential occurrence of the Porcupine Caribou Herd in the area.	Moderate
Frequency	The potential encounter rate between caribou and wolves or hunters along or adjacent to winter roads is unknown, but is likely infrequent, due to factors listed above. Caribou would have the potential to encounter project traffic daily (i.e., frequent), but the risk of mortality is negligible after mitigation.	Infrequent
Duration	Project work will occur on a daily basis, for approximately a 12 h period, over an eight to 12-week work period in mid-January to mid-April.	Short-term
Reversibility	The potential effects to mortality are fully reversible. Potential direct effects will cease immediately upon completion of work activities. Vegetation regeneration will take several years to reach a stage that hinders travel by hunters and natural predators.	Fully reversible
Context	A network of winter roads and seismic lines exists in the area from past exploration. This work will not add new features, but it will clear some regenerating vegetation and temporarily pack snow that could temporarily enhance access by hunters and natural predators.	Existing Disturbed/ Resilient
Probability of occurrence	Based on historic telemetry data it is possible, but uncertain, that caribou will occur in the Project area when work is active. Over 24 years, collared caribou occurred within 4km of the Project area in 17% of the years. If caribou do occur in the area during the year that work occurs, there is low probability that the Project will contribute to indirect mortality.	Unlikely

6.1.4.2 Moose

With the mitigation measures listed in **Section 6.1.3** applied, it is predicted that Project activities will not result in significant effects to habitat, movement and distribution, and mortality or injury to moose. Detailed effects assessments are provided for each indicator in **Table 6-6**, **Table 6-7**, and **Table 6-8** for each indicator, respectively. Key factors that result in this significance determination are:

- Although the timing of the Project does occur during winter, which is a sensitive season for moose, the extent of the Project area, including a zone of influence, is a small proportion of winter range that is available to the species. If moose choose to avoid the work areas (i.e., due to sensory disturbance) alternative habitat is available.
- The most likely potential effect to moose is temporary, localized avoidance of work areas due to sensory disturbance.
- The Project will be reactivating existing winter access, not creating new access features, and will not result in a significant change in access for human hunters and natural predators.

Table 6.6: Characterization of potential effects to moose habitat.

Residual Effect Characteristic	General Definition	Rating
Description of Interaction	The Project will consist of work at 8 well sites plus access via 30.2 km of winter roads. This will result in direct habitat effects due to vegetation clearing along the access routes and well sites. It may also result in indirect habitat effects if moose choose to avoid areas in proximity to the roads and well sites due to sensory disturbance or perceived predation risk.	
Direction	Effects to habitat will initially be adverse but may switch to positive for several years if shrubs regenerate on the winter roads.	Adverse/Positive
Magnitude	The magnitude of effects to habitat is low, due to the small extent and narrow width of areas that are affected.	Low
Geographic Extent	Direct habitat will be limited to the footprint of the winter roads and well sites (approximately 60 ha). Indirect effects to habitat are mostly within 300 m, depending on site conditions and variation in moose behaviour. These extents are small relative to the total winter range available to moose.	Low
Timing	The timing of the Project, during winter, is a sensitive season for moose due to limited forage and higher energetic outputs due to snow and cold temperatures.	Moderate
Frequency	Direct effects will be continuous, though diminishing in magnitude, as vegetation regenerates. Indirect effects will be continuous when work activities are active.	Continuous
Duration	Direct effects to the road and well site footprints will take years to regenerate (long-term). Indirect effects will cease once work activities are completed (short-term).	Short-term Long-term
Reversibility	The effects to habitat are fully reversible. Indirect effects will cease immediately upon stoppage of work activities. Direct effects along the winter roads will take several years for vegetation to regrow.	Fully reversible

Residual Effect Characteristic	General Definition	Rating
Context	Work for this project will occur on previously disturbed sites. Measures to protect the duff layer and ground vegetation will maximize the resiliency of the site to regenerate to similar habitat. The extent of this project, and historic oil and gas disturbances, are small relative to natural disturbances (i.e., fire) that affect moose habitat. Approximately two thirds of the area along the Chance road has burnt in the last 30 years.	Existing Disturbed/ Resilient
Probability of occurrence	Moose are known to use the Project area in winter and some of the moose in the area will encounter the effects the Project has on habitat.	Likely

Table 6.7: Characterization of potential effects to moose movement and distribution.

Residual Effect Characteristic	General Definition	Rating
Description of Interaction	The Project will consist of work at 8 well sites plus access via 30.2 km of winter roads. This work will result in sensory disturbance that could cause moose to avoid the areas. Responses to sensory disturbance are mostly ≤1 km but vary in relation to site conditions and moose behaviour. Effects are most likely to be expressed as temporary, localized avoidance of work areas. Moose do not normally make seasonal movements in the Eagle Plains area.	
Direction	Effects to movement and distribution could be adverse.	Adverse
Magnitude	The magnitude of effects is low due to the limited consequence if moose chose to avoid work areas. Alternative habitat is available, and avoidance of work areas is unlikely to impair within-range movements.	Low
Geographic Extent	Responses to sensory disturbance are mostly ≤300 m but vary in relation to site conditions and moose behaviour. These extents are small relative to the total winter range available in the area.	Low
Timing	The timing of the Project, during winter, is a sensitive season for moose due to limited forage and higher energetic outputs due to snow and cold temperatures.	Moderate
Frequency	Potential effects to movement will occur daily, corresponding to periods when project activities are active.	Frequent

Existing Disturbed/ Resilient
Probability of occurrence	Moose are known to use the Project area in winter and some of the moose in the area will likely encounter the work areas. However, the probability of direct and indirect mortality associated with Project activities is low.	Unlikely

6.2 Vegetation

The Project falls within the Taiga Cordillera Ecozone and Eagle Plains Ecoregion. Descriptions of the ecoregion are drawn from the Ecological Stratification Working Group (1995) and Yukon Ecoregions Working Group (2004). The following sections describe the known baseline information for vegetation and wetlands in these regions, the likely Project interactions and potential effects resulting from Project

activities, mitigation measures to reduce or eliminate those effects, and a summary statement concluding the overall significance of the Project on vegetation and wetlands.

6.2.1 Existing Conditions

The Project falls within the Eagle Plains Ecoregion, a 20,400 km² region in north Yukon between the Richardson and Ogilvie Mountains. Most of the region is low altitude rolling topography, between 300 m and 600 m above sea level (asl), with few scattered peaks to approximately 1,000 m asl, outside the Project area. Most of the watercourses in the ecoregion drain north into the Yukon River via the Whitestone, Porcupine and Eagle rivers. The southeast corner of the region drains east to the Mackenzie River via the Peel, Wind and Ogilvie Rivers. The few lakes that exist in the region are generally oxbow or thermokarst lakes (Yukon Ecoregions Working Group 2004). The Eagle Plains Ecoregion is within the continuous permafrost zone where permafrost can be found up to 200 m thick. Several permafrost produced landforms and processes can be found across the region, including ice-wedge polygons, cryoturbation, solifluction, soil creep and active layer detachment slides on shale (Yukon Ecoregions Working Group 2004).

The Eagle Plains Ecoregion experiences a moderate amount of precipitation, with annual amounts around 400 mm. Most of the precipitation falls as rain throughout the summer months, averaging 50 to 80 mm per month, June through August. Precipitation is lighter through September to April and falls as snow. Average winter temperatures on the Eagle Plains Plateau are around -30°C and -25°C, with extremes as low as -60°C. Winter conditions usually last from October to May. Average summer temperatures are around 13°C, with extremes as high as 30°C. Due to its proximity to the Arctic Circle, this region experiences brief periods of continuous sun above and below the horizon (Yukon Ecoregions Working Group 2004).

The vegetation of the Eagle Plains Ecoregion is primarily boreal forest. The most common climax forest community is black spruce woodland associated with hummocks. Tree growth is often limited by the presence of permafrost in many areas of the Ecoregion, causing open, stunted forests and shrub-dominated communities at tall and low shrub structural stages. Upland black and white spruce forests typically have well-developed shrub communities, including Labrador tea, shrub birch, willow, alder, rose, spiraea and blueberry, with a ground cover of lichen and moss. Moderately well to well drained sites commonly have white spruce or deciduous stands with lichen ground cover. More poorly drained areas with low slope gradients and fine-textured soils are associated with overstory species such as black spruce, shrub birch, Labrador tea, and occasionally tamarack, and often have ground cover dominated by cottongrass tussocks. Deciduous or mixed stands are also often found in areas of recent anthropogenic disturbance, such as old roads, drill sites and gravel pits. Deciduous trees in the Eagle Plains Ecoregion include Alaskan paper birch, balsam poplar, trembling aspen, and willow (Yukon Ecoregions Working Group 2004).

Graminoid and shrubby fens, shrubby bogs and graminoid marshes are scattered throughout the Ecoregion. Several sedge species are dominate in both the graminoid fens and marshes, including narrow-leaf cottongrass, aquatic sedge, northern beaked sedge and mud sedge. Shrub species in fens include leatherleaf and bog rosemary. The ground cover of the shrubby bogs is dominated by sphagnum, sometimes with extensive lichen cover. Shrub species typically include low bush cranberry, bog cranberry, bog rosemary, cloudberry, Labrador tea, shrub birch, willow, black spruce and occasionally tamarack. Riparian forests of white and black spruce are found as narrow strips along most major watercourses in the Ecoregion (Yukon Ecoregions Working Group 2004).

Evidence of forest fires can be observed throughout the Project area, as fires are relatively common. Regenerating burns are dominated by shrubby vegetation, including willow, shrub birch, and alder. Alaskan paper-birch is commonly the first tree species to colonize burn areas. Occasionally, on well-drained sites trembling aspen and balsam poplar may be the first tree species to re-colonize. The extent of old burns can be recognized by the presence of the current black spruce – Alaskan paper birch woodlands (Yukon Ecoregions Working Group 2004).

Ecological and Landscape Classification (ELC) mapping was completed for the Eagle Plains Exploration Project in 2019 and 2020, which encompassed the Project area. The ELC mapping was based on manual delineation and attribution of digital ortho-imagery following the Yukon Ecological and Landscape Classification and Mapping Guidelines, Version 1.0. (Environment Yukon 2016c) and the Standard for Terrestrial Ecosystem Mapping in British Columbia (Resources Inventory Committee 1998). ELC mapping was further informed by extensive field sampling of vegetation communities across a diversity of ecosystems, slope positions, and moisture and nutrient regimes throughout the Eagle Plains Exploration Project.

Vegetation was examined at three scales to assess potential effects of the Project: Vegetation Regional Assessment Area (VRAA), Vegetation Local Assessment Area (VLAA), and the road footprint itself. The VRAA includes vegetation within a 2 km buffer on either side of the Chance and Blackie winter roads, and represents the vegetation communities surrounding the roads to provide context for more localized potential effects. The VLAA includes vegetation within a 100 m buffer on either side of the Chance and Blackie winter roads, and represents the extent where potential direct and indirect Project-related effects could occur. The footprint is the 20 m wide path of the access roads and the well sites where tree and shrub clearing will occur.

The ELC units (ecosites) comprising the VRAA and VLAA are summarized in **Table 6-9** (the footprint is not included because it is such a narrow strip that ELC mapping does not accurately reflect the previous disturbance along it at that fine a scale). Comparison of the VRAA and the VLAA indicates that the relative proportions of ecosites are similar across both study areas. Both areas are dominated by:

- Moist Spruce – Labrador Tea forest (shrub structural stage)
- Moist Spruce – Labrador Tea forest (mature forest structural stage)
- Moist Spruce – Alder – Labrador Tea forest
- Mesic White Spruce – Alaska Paper Birch – Alder

A small number of ecosites occur more frequently in the VLAA than the VRAA. These occur in two circumstances. The first are ecosites associated with prior anthropogenic disturbance along the roads and well sites: Mesic birch-willow, Anthropogenic, and Road. The second group includes sites associated with upper and crest topographic positions, where the existing winter roads were situated: Mesic black spruce – Labrador tea (conifer), Dry spruce – lichen (conifer).

One ecosite that occurs less frequently in the VLAA than in the VRAA is Moist Shrub \ Scrub Birch – Labrador Tea – Willow, which is associated with lower slope and valley bottom positions, which the Project access routes avoid.

Both the Chance and Blackie winter roads have been cleared and used for access in previous years. Their footprints are in early- to mid-seral stages and differ from the surrounding vegetation. Chance Road was last used in 2014, and is currently regenerating to low and tall shrub communities undergoing either normal or stagnated succession. Chance Road is dominated by dense shrub birch, willow, alder, and paper birch, ranging from 25% to 60% cover, and with thick herbaceous vegetation (i.e., graminoids and forbs), ranging from 40% to 75% cover (Photo 1). In burned areas, Chance Road is similar to the surrounding vegetation, while in unburnt areas, the surrounding vegetation consists of taller, more mature black spruce forest. Blackie Road has not been used in several decades and is more successionally advanced – dominated by fairly open (25% cover) black spruce and shrub birch at a tall shrub structural stage (Photo 2).This represents a similar vegetation community but a different structural stage than the surrounding vegetation, which is characterized by taller, mature black spruce forest with willow and paper birch shrub layers. There have been no rare nor invasive plants documented in the VRAA, VLAA, or footprint, although targeted rare and invasive plant surveys have not been conducted in the Project area.

As documented in the ELC mapping, wetlands and watercourses cover 49.9 ha in the RAA and include rivers and black spruce bogs. There are no wetlands nor mapped watercourses within 200 m of the road and well site footprints.

Photo 1. View of a typical section of Chance Road, regenerating to a low shrub vegetation community dominated by deciduous shrubs.

Photo 2. View of a section of Blackie Road, regenerating to a tall shrub vegetation community dominated by black spruce.

Table 6.9: Vegetation communities occurring within the Vegetation Regional Assessment Area and Vegetation Local Assessment Area.

Ecosite Code	Ecosite Name	VRAA		VLAA	
		Area (ha)	Area (%)	Area (ha)	Area (%)
02	Mesic birch-willow	66.6	0%	31.8	5%
04	Mesic White Spruce – Alaska Paper Birch - Alder	1111.0	8%	39.6	7%
05	Mesic Alaska Paper Birch (Deciduous)	654.6	5%	24.7	4%
06	Mesic Black Spruce – Labrador Tea (Conifer)	685.9	5%	40.8	7%
14	Dry Spruce-Lichen (Conifer)	138.9	1%	15.7	3%

RZ	Road	21.2	0%	3.5	1%
Total		13,638.5	100%	608.0	100%

6.2.2 Project Interactions and Potential Effects

Re-establishment and construction of the winter roads will result in alteration of up to 60.4 ha of vegetation within the road footprint. The footprint will be cleared of vegetation through mulching and manual felling. The cutters of the mulcher will be raised off the ground to minimize disturbance to hummocks, tussocks, and high spots, but will remove taller shrubs and trees to allow safe vehicle and equipment travel. Mulching will remove shrubs and trees while protecting the moss layer, soil and root systems of low-growing plants.

In addition to the direct loss of vegetation within the road footprint due to clearing, re-establishment, construction and travel within the road footprint may cause potential effects to vegetation by altering underlying soils. These potential effects include soil disturbance, soil compaction, root damage, altered soil moisture regime, and permafrost thaw. Soil disturbance and root damage would most likely be caused by physical interactions from machinery during clearing, while soil compaction, altered soil moisture, and permafrost thaw would most likely be caused by repeated travel of heavy equipment compressing underlying soils, which can lead to altered thermal and hydrological characteristics.

Vegetation clearing within the road footprint could have both direct and indirect potential effects. Potential direct effects including change to earlier successional stage, change of wildlife habitat and forage, loss of primary productivity and carbon sequestration, reduction of biodiversity, and aesthetic impacts. Potential indirect effects, which may extend into the VLAA and are generally attributable to edge effects, include altered light availability, altered temperature regimes, altered wind patterns, increased nutrient availability from cleared and mulched vegetation, altered seed dispersal, changes to vegetation composition and growth such as infiltration of early seral plants, and altered herbivory patterns.

Potential effects to rare plants include disturbance or destruction during construction if rare plants occur within the footprint, and changes to habitat characteristics caused by vegetation removal and edge effects in the VLAA. There are no tracked shrub or tree species occurring within the Eagle Plains Ecoregion, so only rare ground cover plants (e.g., forbs, graminoids, mosses, and lichens) would be at risk of physical disturbance (Yukon Conservation Data Centre 2019). Ensuring a minimum 10 cm snowpack on all areas to be cleared will greatly reduce the potential for physical disturbance or destruction of any rare plants occurring in the footprint.

Potential effects to invasive plants include introduction and spread of invasive plants via equipment or personnel brought in from infested areas.

All of the aforementioned effects have potential to effect wetlands within the footprint or VLAA, often with increased significance due to the sensitivity to wetlands (e.g., more sensitive soils, hydrological regimes, higher biodiversity and wildlife value, wetland-obligate species). However, as there are no wetlands documented within the footprint or VLAA in the ELC mapping, these effects are unlikely.

The construction phase of the Project could also result in degradation of vegetation due to spills (e.g., hydraulic fluid, fuel etc.) along the access roads.

6.2.3 Mitigation Measures

Mitigation measures related to vegetation and wetlands include:

- Existing and historic winter roads will be used as the primary access routes to minimize the amount of vegetation that is cleared.
- Winter roads will consist of packed and frozen snow and ice to maintain ground vegetation and to avoid site disturbance to the underlying duff layer, soil and permafrost. A minimum 10 cm snowpack will be required over all road surfaces.
- The extent of vegetation clearing, notably the widths of winter roads and areas at well sites, will be minimized. On the Chance Road, the width will not exceed the existing right-or way extent. This will minimize the direct loss of vegetation and reduce potential edge effects.
- Shrubby vegetation will be cut as high as possible, normally at least 30 cm above the ground. Where possible, shrubs will be pushed over instead of cut.
- The winter roads are located primarily on crest and upper slope positions which minimizes potential overlap with wetlands and riparian areas. If small wetlands or riparian areas along non-classified drainages are encountered, special efforts will be made to minimize effects by enhancing the thickness of the packed snow/ice base and minimizing the right-of-way width.
- To avoid the spread of invasive plants, equipment will be washed and inspected prior to transport to site.

6.2.4 Effects characterization and Significance Determination

With the mitigation measures listed in **Section 6.2.3** applied, it is predicted that the Project activities will not result in significant effects to vegetation and wetlands. Most of the effects are low to moderate in magnitude and considered unlikely to occur and/or reversible over the long-term.

Loss and Alteration of Vegetation

The loss and alteration of vegetation will be mitigated primarily by using existing and historic access roads to minimize the area to be disturbed, and by limiting use to winter. A maximum of 60.4 ha of vegetation will cleared within the footprint, which represents only 0.44% of the RVAA. Existing and historic winter roads in the area typically support early to mid-seral vegetation at a lower structural stage than the surrounding vegetation. Re-activating previously used roads avoids disturbance to mature forests and surrounding vegetation and the overall change in seral stage is minimized. By limiting activities to winter and maintaining a 10 cm snowpack overlying frozen ground, ground vegetation, along with its root structure and litter layer, will be protected from physical disturbance. Cutting vegetation as high as possible will similarly reduce the total amount of vegetation loss, reduce disturbance to root structure, and increase potential for regrowth from the root mass. This will accelerate regeneration after the winter roads have been decommissioned.

Overall, potential effects of loss and alteration of vegetation are low in magnitude and reversible with regeneration. The loss and alteration of vegetation will be limited to a small area that has been previously disturbed, will only remove trees and shrubs greater than 30 cm tall while leaving ground vegetation intact, and will facilitate regeneration. Potential effects are limited in geographic and temporal extent; they will only occur in the footprint of existing roads during a single winter and will start to regenerate the following spring. With mitigations applied, the potential effects of loss and alteration of vegetation are not considered significant.

Creation of Edge Effects

Creation of edge effects (e.g., light availability, temperature regime, wind patterns, vegetation composition and growth, seed dispersal) will be mitigated by using existing and historic access roads and by limiting use to winter. Using previously disturbed access roads that already experience some edge effects will minimize the creation of new edges and thus reduce overall edge effects. Limiting use to winter and minimizing disturbance to ground vegetation will preserve ground vegetation integrity, which will further reduce the potential effects of forest edges. Potential edge effects will decrease as the footprint regenerates once well maintenance activities are completed.

Overall potential effects of edge creation are low in magnitude and reversible with regeneration. The footprint and VLAA already experiences some edge effects from past disturbance along the proposed routes; the Project may reinforce pre-existing edge effects but will minimize new edge creation. Potential effects are limited in geographic and temporal extent; they will only occur in the footprint and VLAA and will diminish as regeneration progresses. With mitigations applied, the potential effects of edge creation are not considered significant.

Disturbance to Soils

The disturbance to soils will be mitigated by creating a frozen snow and ice surface on existing and historic winter roads which will avoid effects to soils and permafrost. Using previously disturbed access roads will avoid potential effects to undisturbed sites. Re-activating and using access roads during winter while the soil is frozen, and maintaining a 10 cm snowpack, will protect the duff layer, soil surface, and soil structure from disturbance, and minimize potential permafrost thaw.

Overall, potential effects of soil disturbance are low in magnitude and unlikely to occur. Potential effects are limited in geographic and temporal extent; they will only occur in the footprint, and work will only occur in a single winter. With mitigations applied, the potential effects of soil disturbance are not considered significant.

Disturbance to Rare Plants

Disturbance to rare plants will be mitigated by limiting road re-establishment and use to winter, and by minimizing ground disturbance. There are no rare shrub or tree species documented within the Eagle Plains Ecoregion; only rare ground vegetation species have the potential to be affected by the Project. Ground vegetation will be dormant in winter, and protected by a minimum 10 cm snowpack, so any rare plants occurring within the footprint will be protected. Potential changes to habitat characteristics affecting rare plants will be mitigated by minimizing the creation of edge effects and overall vegetation loss and alteration.

Overall potential effects to rare plants are low in magnitude and unlikely to occur. Potential effects are limited in geographic and temporal extent; they may only occur in the footprint and VLAA, and physical disturbance may only occur during road re-establishment and use in a single winter. With mitigations applied, the potential effects to rare plants are not considered significant.

Spread of invasive species

Spread of invasive species will be mitigated by limiting road re-establishment and use to winter and inspecting equipment for cleanliness. Vegetation will be dormant in winter, so potential for seed dispersal from plants within the footprint will be low. Potential introduction of invasive species from off-site will be minimized by inspecting equipment brought on-site for cleanliness, including any dirt wads or old vegetation that may be harbouring seeds.

Overall potential effects of invasive species are moderate in magnitude but unlikely to occur. Potential effects are limited in geographic and temporal extent; they may only occur in the footprint and VLAA, and introduction of plants may only occur during road re-establishment and use in a single winter. With mitigations applied, the potential effects of invasive species are not considered significant.

Alteration of Wetlands

Alteration of wetlands will be mitigated by using existing and historic access roads that follow upland topography such as ridges to avoid wetland areas. Although there are no wetlands or named watercourses documented within the footprint or VLAA, snowpack depth will be increased if small wetlands or riparian areas along non-classified drainages are encountered.

Overall potential effects to wetlands are low in magnitude and unlikely to occur. Potential effects are limited in geographic and temporal extent; they may only occur in the footprint and VLAA, and only during road re-establishment and use in a single winter. With mitigations applied, the potential effects to wetlands are not considered significant.

Degradation of Vegetation or Wetlands Due to Spills

Spills will be mitigated by implementing the Spill Contingency Plan which is currently in development.

Overall potential effects of spills are moderate in magnitude but unlikely to occur. Potential effects are limited in geographic and temporal extent; they can occur only in the footprint, and potential occurrence is limited to a single winter. Potential effects would be short-term and would be at least partially reversible. With mitigations applied, the potential effects of spills are not considered significant.

6.3 Heritage Resources

The human history of the Yukon, from the earliest Indigenous groups to the arrival of fur traders and prospectors in the 19th century and beyond, is preserved in the Yukon's heritage or historic resources.

Historic resources include historic sites, historic objects, and any work or assembly of works of nature or of human endeavour that is of value for its archaeological, palaeontological, pre-historic, historic, scientific, or aesthetic features (*Historic Resources Act*, RSY 2002, c 109).

Historical sites generally date to a time of written history (i.e., in the Yukon, the past 100 to 150 years) and typically contain examples of built heritage or structures (e.g., cabins, caches, graves, and brush camps) (Gotthardt and Thomas 2007). Archaeological sites are older (i.e., typically older than 150 years) and can be found on the surface (i.e., artifacts that have been exposed or were never buried) or buried in the ground (e.g., stone tools and chips, animal bone fragments, and remains of ancient hearths and campfires) (Gotthardt and Thomas 2007).

Archaeological sites and resources are culturally meaningful and connect community members to the past and represent a collective identity. These resources represent ways of knowing and generational knowledge which are passed on through the generations. Every Indigenous group manages their cultural heritage in a unique way, but always with respect for the past and future generations.

6.3.1 Existing Conditions

In 2013, a Historic Resources Overview Assessment (HROA) was conducted by Matrix Research Ltd. for the 2013 Seismic Program at Eagle Plains, on behalf of Northern Cross (Yukon) Limited. The intent of this assessment was to determine the heritage potential within the proposed development area and provide recommendations for heritage management.

The HROA determined that a "significant portion of the study area is considered to have low pre-contact heritage resources potential (Matrix Research 2013)." However, the HROA also identified several areas that are considered to have high heritage resources potential. These areas of high potential are associated with locations along streams and along the upland areas overlooking these tributaries. The HROA recommended that further heritage resources investigations, specifically a Heritage Resource Impact Assessment (HRIA), be conducted within the zones of high heritage resource potential prior to any potentially land-altering development activities (Matrix Research 2013).

An HRIA was then conducted later in 2013 by Matrix Research, in which the identified zones of high potential were further assessed (**Appendix C**). As indicated by a Letter Report dated May 15, 2014, to Northern Cross (Yukon) Limited, Matrix Research concluded that the proposed well sites and access roads do not conflict with any of the areas containing heritage values (**Appendix D**). Matrix Research did however identify areas within the study area containing heritage values, identified in **Appendix D**, as high potential areas to avoid and labeled as 'avoidance areas'. Matrix Research recommended that these areas, "be

avoided by any potential land-altering activities and that if avoidance was not possible further heritage assessment should be conducted prior to any development (Matrix Research 2014)."

6.3.2 Project Interactions and Potential Effects

Results of the 2013 HROA and HRIA, conducted by Matrix Research, indicate that no Project interactions and/or potential effects are anticipated for Heritage Resources. Should the Project development areas/locations be altered and fall outside of the currently assessed area, further Heritage Resource assessment will be undertaken.

6.3.3 Mitigation Measures

The following list describes the mitigation measures the proponent has committed to eliminate, reduce or control potential effects to Heritage Resources caused from Project activities:

- Develop and implement a Project specific Heritage Resources Chance Find Procedure to ensure that the discovery of any unanticipated Heritage Resources is addressed. In the event Heritage Resources are encountered, all development activities in the vicinity of the Heritage Resources will be suspended immediately. In such cases, the Cultural Services Branch, Department of Tourism and Culture, Government of Yukon, the Vuntut Gwitchin First Nation, and First Nation of Na-Cho Nyak Dun will be contacted immediately with information on the heritage remains and nature of the disturbance.
- The Project will avoid any land-altering activities in the avoidance areas identified in the Matrix Research 2014 Letter Report, as to protect Heritage Resources.

6.3.4 Effects characterization and Significance Determination

With the mitigation measures listed in **Section 6.4.3** applied, it is predicted that Project activities will not result in significant effects to Heritage Resources. Should the Project development areas/locations be altered and fall outside of the currently assessed area, or within areas identified as high potential and or avoidance areas, further Heritage Resource assessment should be undertaken in order to determine any potential effects to Heritage Resources.

7.0 SUMMARY OF MITIGATION MEASURES

The following sections describe the mitigation measures the proponent has committed to eliminate, reduce or control potential effects of the Project to the selected values components.

7.1 Wildlife and Wildlife Habitat

7.1.1 General Mitigation Measures for Wildlife and Wildlife Habitat

- All Project personnel will be required to complete formal orientation and training related to wildlife mitigation measures.
- Work will be scheduled to minimize the spatial extent across which work is concurrently occurring.
- Access to the well sites will utilize existing and historic winter roads to minimize the creation of new linear features.

- Project footprints, notably the widths of winter roads, will be minimized as much as possible. On the Chance Road, the width will not exceed the existing right-or way extent.
- Firearms are not allowed on-site by Project personnel.
- A no harassment of wildlife policy applies to all personnel. This includes attempts to chase, catch, divert, follow, photograph, feed, or otherwise harass wildlife, whether on foot, in on-road or off-road vehicles, heavy equipment, or aircraft.
- The use of on-road and off-road vehicles, including snowmobiles, will be restricted to essential Project access routes.
- Personal use of unmanned aerial vehicles (UAVs or drones) is prohibited.

7.1.2 Road Operations

The following measures are designed to mitigate the risk of vehicle collisions and effects of road use on wildlife movements.

- The maximum speed limit along the Dempster Highway is 90 km/h.
- The maximum speed along winter roads is 30 km/h.
- Wildlife will always have the right-of-way. This requires vehicle operators to stop when wildlife are observed on or beside the road, allowing them to cross safely. If wildlife stays on the road or right-of-way for >5 minutes, drivers may resume travel and pass the animals at <10km/h.
- Special rules apply to caribou.
    - For Caribou within 100 m from the road:
        - Stop as far back as possible;
        - Alert other drivers;
        - Wait until caribou have crossed and moved beyond 500 m from the road or are lost from sight before proceeding;
        - Proceed with caution.
    - For Caribou beyond 100 m from the road:
        - Proceed with caution;
        - Alert other drivers;
        - Watch for direction of movement and change in behaviour.
- When moose and caribou are on a road they will sometimes run down the road away from a vehicle. If this happens, stop and wait at least 5 minutes to allow the animal to move off the road. If the animal remains on the road, drive forward at 10 km/h, then stop again when the animal begins to run away. Wait 2 minutes and repeat this procedure. If the animal still does not leave the road, wait 10 minutes and repeat the procedure, alternating with a 2- and 10-minute stop between driving attempts.
- Drivers are required to use two-way radio communication. The location of any wildlife observed along Project roads is to be communicated to other road users on the radio.
- Drivers will not exit the vehicle to chase, catch, divert, follow, photograph, or otherwise harass wildlife.
- Along winter roads:

- snow banks will be maintained at heights <1 m to reduce the hinderance to wildlife crossing them;
- where snow banks exceed 60 cm in height, regular breaks (at least every 500) will be created to facilitate easier animal crossing and as 'escape routes' off the road.
    - Create matched breaks on either side of the road that animals can use to cross.
    - On corners, create run-outs, in each direction, that are obvious alternative routes for animals to use, instead of following the road.
    - Avoid breaks at seismic lines, which could provide human access.

7.1.3 Aircraft Operations

The following measures are designed to mitigate the effects of aircraft use on wildlife:

- Altitudes of greater than 300 m above ground level will be maintained at all times of the year.
- Altitudes of greater than 600 m above ground level will be maintained during sensitive times of the year.
- Areas where caribou have been observed in the past will be avoided.
- Flights paths will be designed to avoid important areas during sensitive times of the year.
- No caribou observed will be flown towards, circled, or harassed.
- If caribou are seen to be in a panic or startled the plane will ascend to a higher elevation.

7.1.4 Caribou

The majority of potential effects to caribou will be mitigated via measure for general wildlife, road operations and aircraft operations. Additional measure specific to caribou include:

- Packing of snow will not occur on any linear features that are not essential to Project work.
- Access to linear features off the winter roads will be minimized by avoiding creation of breaks in snow berms at junctions with linear features.
- All sightings of caribou will be reported to the Environmental Monitor.
- If more than a dozen caribou are observed, or if any number of caribou are observed in the same location for longer than a three-day period, a qualified environmental professional (QEP) will be consulted to determine if site-specific mitigations may be warranted.

Due to the variable nature of caribou occurrence and snow conditions from year to year, a pre-operations assessment will be conducted in December, prior to Project initiation, to assess local conditions (specifically including information about caribou occurrence and snow conditions) that could warrant tailored management measures. For example, if telemetry data indicated that several collared caribou were in the Project area, near work areas, additional measures may be put in place to mitigate potential effects.

7.2 Vegetation and Wetlands

Mitigation measures related to vegetation and wetlands include:

- Existing and historic winter roads will be used as the primary access routes to minimize the amount of vegetation that is cleared.

- Winter roads will consist of packed and frozen snow and ice to maintain ground vegetation and to avoid site disturbance to the underlying duff layer, soil and permafrost. A minimum 10 cm snowpack will be required over all road surfaces.
- The extent of vegetation clearing, notably the widths of winter roads and areas at well sites, will be minimized. On the Chance Road, the width will not exceed the existing right-or way extent. This will minimize the direct loss of vegetation and reduce potential edge effects.
- Shrubby vegetation will be cut as high as possible, normally at least 30 cm above the ground. Where possible, shrubs will be pushed over instead of cut.
- The winter roads are located primarily on crest and upper slope positions which minimizes potential overlap with wetlands and riparian areas. If small wetlands or riparian areas along non-classified drainages are encountered, special efforts will be made to minimize effects by enhancing the thickness of the packed snow/ice base and minimizing the right-of-way width.
- To avoid the spread of invasive plants, equipment will be washed and inspected prior to transport to site.

7.3 Heritage Resources

The following list describes the mitigation measures the proponent has committed to eliminate, reduce or control potential effects to Heritage Resources caused from Project activities:

- Develop and implement a Project specific Heritage Resources Chance Find Procedure to ensure that the discovery of any unanticipated Heritage Resources is addressed. In the event Heritage Resources are encountered, all development activities in the vicinity of the Heritage Resources will be suspended immediately. In such cases, the Cultural Services Branch, Department of Tourism and Culture, Government of Yukon, the Vuntut Gwitchin First Nation, and First Nation of Na-Cho Nyak Dun will be contacted immediately with information on the heritage remains and nature of the disturbance.
- The Project will avoid any land-altering activities in the avoidance areas identified in the Matrix Research 2014 Letter Report, as to protect Heritage Resources.

7.4 Fish and Fish Habitat

The Project has no direct interaction with fish and fish habitat. Potential indirect effects are also limited due to the location of winter roads and well sites at least 200 m from streams and waterbodies. The following measures are designed to further mitigate indirect effects relating to water quality.

- If non-classified drainages are encountered, special efforts will be made to minimize effects to downstream water quality and sedimentation risk. These include:
  - enhancing the thickness of the packed snow/ice base over and adjacent to the drainage area,
  - minimizing the width of the right-of-way through the area, and
  - ensuring that slash from vegetation clearing is removed from the area so it will not be transported downstream during spring run off.
- If any site disturbance occurs during winter road construction or operation (i.e., exposure of organic or mineral soil), the location and extent of the site will be documented during operations and the area will be treated for sediment control and vegetation regeneration the following summer.

- In the event of a hydrocarbon spill, follow measures described in the Spill Contingency Plan, to contain the spill and prevent the spill from affect adjacent water courses.

7.5 Regional Land Use Plans

The proposed Project is located within the boundaries of the North Yukon Planning Region and Peel Watershed Planning Region and is therefore subject to the North Yukon Land Use Plan and (NYLUP) Peel Watershed Land Use Plan (PWLUP). Locations of proposed Project activities are within Land Management Unit (LMU) 9 of the NYLUP and LMU 7 of the PWLUP. (**Table 7.1**). Both are located within the Eagle Plains basin, with the highest potential for oil and gas development. Details regarding how the Project will meet the requirements of the Northern Land Use Plan and Peel Watershed Land Use Plan is provided in **Table 7.2**.

Table 7.1 Landscape Management Units Overlapping the Project

Landscape Management Unit Number	Landscape Management Unit Name	Integrated Management Area (IMA)
9 (NYLUP)	Eagle Plains	4
7 (PWLUP)	Dalglish Creek	4

Table 7.2 Commitments and Mitigations to meet the requirements of the North Yukon Land Use Plan and Peel Watershed Land Use Plan

Topic	Recommendation		Best Management Practices		Commitment/Mitigation
	NYLUP	PWLUP	NYLUP	PWLUP	
Surface Disturbances	• Site closure/remediation plans should be developed and monitored that create significant disturbance. • To provide a benchmark for the monitoring of cumulative effects indicator levels, the status of existing surface disturbances should be documented.	• In the IMA, the amount of surface disturbance should be maintained below the cumulative effects indicator levels recommended in the plan.	• The size, intensity and duration of all surface disturbances should be reduced. • Native endemic plants should be used for active reclamation of disturbed sites	• Reduce size, intensity and duration of human-caused physical surface disturbances (e.g. utilize low impact seismic, winter roads and principle of full reclamation.	• The size, intensity, and duration of human caused physical disturbances will be mitigated primarily by using existing and historic access roads to minimize the area to be disturbed, and by limiting use to winter.
Wildlife Habitat	• Reduce size, intensity and duration of human-caused physical surface disturbances (e.g. utilize low impact seismic, winter roads and enhanced reclamation. • Reduce other human land use impacts such as noise, smell and light. • Avoid or reduce activities in significant wildlife habitats during important biological periods (e.g., utilize timing windows). • Coordinate, manage and minimize new road and trail access.	• In the IMA, the protection of Boreal caribou habitat should be given special consideration in the assessment of potential development. • Ensure adequate wildlife and habitat baseline data collection is completed prior to any development activities.	• Avoid or minimize the creation of new access roads and trails; utilize existing routes unless their use will cause additional long term environmental impacts. • Avoid or minimize the size, extent and duration and level of activities in concentrated seasonal use areas. • Use appropriate operational timing-windows in significant wildlife habitats to minimize activities wherever possible, during periods of wildlife use. • When new access creation is necessary: • Non-permanent winter access routes should be developed and utilized versus all-season access routes. • Gate or otherwise restrict hunting along new access routes. • Where possible, direct new access routes through less significant wildlife habitats.	• Coordinate, manage new road and trail access. ○ To the extent possible, avoiding routing new roads and trails through concentrated seasonal use areas and significant habitats. ○ Avoid using or crossing seasonal migration corridors. • Avoid or reduce activities in significant wildlife habitats during important biological periods (e.g. utilize timing windows). ○ Porcupine Caribou are typically in the region during winter period (December to March). ○ Avoid concentrated woodland caribou use areas. • Reduce other human land-use related disturbances such as noise, odours, light.	• The size, intensity, and duration of human caused physical disturbances will be mitigated primarily by using existing and historic access roads to minimize the area to be disturbed, and by limiting use to winter. • The timing of the Project, during winter, is a season of lowest importance for the ecology of the Porcupine Caribou Herd and a period when the caribou are relatively tolerant of human disturbance (Porcupine Caribou Technical Committee 1993). • Work will be scheduled to minimize the spatial extent across which work is concurrently occurring. • Access to linear features off the winter roads will be minimized by avoiding creation of breaks in snow berms at junctions with linear features. • Packing of snow will not occur on any linear features that are not essential to Project work. • All sightings of caribou will be reported to the Environmental Monitor. • If more than a dozen caribou are observed, or if any number of caribou are observed in the same location for longer than a three-day period, a qualified environmental professional (QEP) will be consulted to determine if site-specific mitigations may be warranted. • The use of on-road and off-road vehicles, including snowmobiles, will be restricted to essential Project access routes. • Personal use of unmanned aerial vehicles (UAVs or drones) is prohibited.
Focal Species Management – Porcupine Caribou Herd (NYLUP)	See recommendations for Wildlife Habitat.		• Avoid or minimize the size, extent, duration and level of activities in concentrated seasonal use areas. • Avoid using or crossing seasonal migration corridors with new access routes.	Not applicable	

Topic	Recommendation		Best Management Practices		Commitment/Mitigation
	NYLUP	PWLUP	NYLUP	PWLUP	

			• Define and implement safe operation distances from the herd.
			• Consider the following seasons when determining appropriate operational timing windows (seasons when Porcupine caribou occupy the region):
			  ○ Spring migration – April 1 to May 31
			  ○ Early summer – July 1 to July 15
			  ○ Mid to late summer – July 16 to August 7
			  ○ Fall migration – August 8 to October 7
			  ○ Rut – October 8 to
			  ○ Winter – December 1 to March 31		

Fish Habitat	• Water withdrawals in sensitive fish over-wintering areas should be prohibited.	• Ensure adequate fish, waterbird, aquatic habitat and water quality baseline data collection is completed prior to any development activities .	• The use of ice roads or winter roads as river/creek crossings is generally considered adequate to mitigate potential impacts to fish and fish stocks.	• Minimize surface and vegetation disturbance in riparian areas.
				• Avoid or minimize indurstrial land use activities in wetlands and riparian areas.
				• Prohibit significant levels of winter in-stream water withdrawals in sensitive over-wintering fishing habitat.
				• Avoid large scale-industrial and/or infrastructure projects within major river corridors.
				• Minimize stream crossings; if stream crossings are required ensure proper bridge and crossing structures are used, and are designed for ease of removal (i.e., temporary structure).
					The Project has no direct interaction with fish and fish habitat. Potential indirect effects are also limited due to the location of winter roads and well sites at least 200 m from streams and waterbodies. The following measures are designed to further mitigate indirect effects relating to water quality and fish habitat.
					• If non-classified drainages are encountered, special efforts will be made to minimize effects to downstream water quality and sedimentation risk. These include:
					  ▫ enhancing the thickness of the packed snow/ice base over and adjacent to the drainage area,
					  ▫ minimizing the width of the right-of-way through the area, and
					  ▫ ensuring that slash from vegetation clearing is removed from the area so it will not be transported downstream during spring run off.

8.0 CONCLUSION

The proposed Project requires an evaluation by a YESAB Designated Office because the *Assessable Activities, Exceptions and Executive Committee Projects Regulations* of YESAA identified three accessible activities:

1. The project location is in the Yukon;
2. The *Assessable Activities, Exceptions and Executive Committee Projects Regulations* identifies several triggers for the Project including:
    a. Schedule 1, Part 3, Oil and Natural Gas, Item 2:

    On other than an Indian reserve, drilling, operation, modification, decommissioning or abandonment of, or other activity in relation to, an oil or natural gas well or seismic shot hole, but not including a hole drilled to obtain geological information.

    b. Schedule 1, Part 13, Miscellaneous, Item 13:

    On Crown land or settlement land, levelling, grading, clearing cutting or snow ploughing of a route that provides access to land for the purposes of a geophysical, geological or engineering survey.

3. An authorization by a government agency is required for the activities to be undertaken.

The proponent understands that the purpose of the YESAB Designated Office evaluation process in Yukon is to inform planning and decision-making by governments to avoid or minimize significant environmental and socio-economic effects while realizing development objectives. The proponent also recognizes that the YESAB Designated Office evaluation process provides an integrated means of identifying, evaluating, and mitigating a proposed project's potential adverse environmental and socio-economic effects. Valued components for the assessment were selected based on the potential for Project activities for this proposal to interact with the identified VC and result in adverse effects. Where effects assessments indicated that adverse effects could occur to a VC, the assessment proposed technically feasible and appropriate mitigation measures to avoid or minimize those effects. With the implementation of the proposed mitigation measures, Project-related residual adverse effects to the selected VCs are likely to be not significant.

APPENDIX 2-D-27. *Emergency Spill Response Plan*

1.5.13 Spills

In any incident, the first priority is Life Safety. This includes the protection of the public and the safety of response personnel.

Life Safety will always be the top strategic priority

Public safety actions begin at the source of the release and are undertaken in a coordinated manner by Chance Oil and Gas Limited, the local authority and other responders as needed at the time of the incident.

The types of containment and recovery efforts depend on the type of spill. Containment and recovery response actions focus on minimizing the effects of the spill on the surrounding area.

Clean-up activities will be conducted after containment and recovery actions are completed. Clean-up and disposal of contaminated material and site remediation work will continue until the spill site is returned as nearly as possible to pre-spill conditions and company environmental specialists and the agencies are satisfied.

Chance Oil and Gas Limited is an active member of the Western Canadian Spill Services (WCSS). Chance Oil and Gas Limited is expected to assess the risk that its operation poses to the environment and be prepared to provide effective emergency response capability in the event of a spill.

1.5.13.1 Initial Spill Response Actions

- Follow First On-Scene Strategy (Section 1.2.1).
- Size up considerations for a spill site:
  - Is there a fire or explosion hazard? What is the ignition source?
  - Is there H_2S or other toxin present?
  - Are there any areas deemed hazardous? (Mark with flags).
  - What are the ground and weather conditions? (Snow, gravel, sand etc.)
  - Where is the location of the leak, the type of release and the volume released?
  - How long has the spill been taking place?
  - Is the spill into a watercourse, watershed or a water body?
  - Is the spill contained or migrating? Which direction? How far can it go?
  - If the spill is not contained, determine and prioritize the containment points and methods to be used.
  - What lands will be affected? (Farm, livestock, brush, drinking water, etc.)
  - How is it going to be contained and cleaned up?
  - How to access the spill site, the source of the spill and recovery points?
  - What equipment is required? Is oil spill equipment (oil spill co-op) required?
  - Where can spill responders park so as not to interfere with spill equipment? (Minimize vehicular traffic as much as possible at the spill site.)
  - Are there any residences in the area? Do they have water wells that could be affected?
  - Should the spill site be cordoned off to prevent wildlife / livestock from entering?
- Relay information to internal company contacts, government agencies and if required, landowner, spill response contractors and the designated Public Information Officer.

1.5.13.2 General Control and Containment

- If possible, immediately shut off the source of the spill ensuring your own safety.
- Prioritize and set up containment points
- Where possible, prevent a spill from entering a watercourse.
- Use safest and simplest method to get job done within resource and safety capabilities.
    - Isolate and depressurize (ESDs, manual block valves, manual valve isolation).
    - Plug and patch (e.g. fix faulty valve or hole in drum).
    - Absorb or adsorb (e.g. applying adsorbent pads to oil spill).
    - Transfer (e.g. removing product to waste truck or new container).
    - Containerize (e.g. put leaking drum into over-pack drum).
    - Reposition (e.g. upright or roll and chock leaking container).
    - Others (e.g. hot-tap, vent and burn, flaring).
- Contain the spill – containment is a priority for limiting environmental damage.
- Contain as close to source as safe and practical.
- Avoid excessive walking or driving on the spill area.
- Do not use absorbents on large spills.
- Consider ground disturbance guidelines.
- Determine where bell holes or trenches would be most effective.
- Keep trenches shallow and narrow as possible, to prevent additional clean-up.
- Use practical containment tools and equipment including shovels, dump trucks, sand bags, plastic bags, heavy earth moving equipment, "Plug and Patch", foam, salvage covers, adsorbents, booms, hose, redwood plugs, etc.
- If weirs are installed, they should be able to handle large flow rates and surges.
- Surface run off may have to be diverted from the spill site if wet conditions are present.

1.5.13.3 Recovery of product and/or clean-up of the spill

- Ensure the health and safety of the persons responding to the spill.
- Once containment has been achieved, recovery and clean-up operations begin immediately.
    - Recover as much product and saturated debris as possible.
    - Keep environmental disturbance to a minimum.

1.5.13.4 Land Spills

Land spills will spread outward from the initial spill point toward lower-lying areas. Penetration downward into the soil will also occur at a rate that is dependent on the soil type and the nature of the product spilled. During spills in winter, petroleum will spread under the snow making definition of the extent of the spill area difficult.

- attempt to restrict spills on land to as small an area as possible based on site conditions.
- prevent the spill from entering water bodies or flowing watercourses or flowing into manholes or culverts, within the bounds of safety and practicality.

The method chosen for land containment and recovery is dependent on site conditions and the equipment available. A summary of common options is presented in the following table:

Land Containment Options		
Containment Method	**Technique Description**	**Comments**
Earth or Sand Dike (All seasons)	Earth or sand at or near the site is used to contain spilled material on flat or sloped surfaces. Sandbags filled with soil or sand are used to contain spill.	Sufficient dry earth, gravel or sand must be available to contain spill. Earth may be frozen. Surface disturbance to remove earth or sand may result in erosion, especially on steep slopes. Work crews and/or earth-moving equipment are required to build dike.
Snow or Ice Dike (Winter only)	Snow or ice at or near the site is used to contain spilled material on flat or sloped surfaces.	Sufficient snow or water must be available to contain spill. Snow or ice dike will melt quickly in warm weather. Contaminated snow or ice may need to be removed or stored for treatment. Work crews and/or earth-moving equipment are required to build snow dike. Water spraying equipment may be required to construct ice dike.
Land Containment Options		
Containment Method	**Technique Description**	**Comments**
Sorbent Dike (All seasons)	Sorbent material is used to contain spill.	Useful only in small spills, as purchase of large quantities of sorbent is expensive and impractical. Contaminated sorbent may need to be replaced or squeezed out during incident. Contaminated sorbents must disposed in compliance with government legislation. Sufficient sorbent or sorbent boom, work crews and storage containers or a lined storage area for contaminated sorbents must available to build sorbent dike.
Trench or Sump (All seasons)	A trench or sump is excavated downslope on sloping terrain to limit surface or subsurface spill movement. Work crews and/or earth-moving equipment are required to build trench or sump, as well as plastic or other impermeable sheeting for a trench liner.	Clean topsoil should be removed before trench construction. Frozen soil, bedrock close to the surface or soil type (e.g. sand) may make this option impractical. Surface disturbance to remove earth or sand may result in erosion or further penetration in sandy soil.
Land Recovery Options		
Recovery Method	**Technique Description**	**Comments**
Vacuum Truck	A vacuum truck is used to recover spilled material from a dike or trench in areas accessible by trucks or heavy equipment.	The method depends on site access. Surface disturbance and soil damage may result from movement of the vacuum truck to and from the site. Topsoil may need to be stripped from the site before starting recovery activities.

Land Recovery Options		
Recovery Method	**Technique Description**	**Comments**
Pumping Spilled Material into Storage	A pump is used to recover spilled material from a dike or trench in areas not accessible by vacuum trucks.	Pumps must be safe for use at the spill site and compatible with the product to be pumped. Surface disturbance and soil damage may result from movement of the pump and storage equipment to the site. Skid tanks, tanker trucks, port-a-tanks, fuel bladders, permanent tanks, or a lined excavated area must be available to provide storage for the recovered material. A work crew and power supply for the pump must also be available.

1.5.13.5 Spills into a Watercourse

Petroleum products will spread outward from the origin of the spill, eventually achieving a stable thickness on the water. Spills on rivers, creeks, or streams will flow downstream, contaminating riverbanks and vegetation, affecting wildlife, fish and water users in the area of the spill.

The rate of spill movement will depend on the current speed of the water and the time of year. Current may flow faster in the deepest channels in the river and slower in shallower areas, due to varying volumes of water. Flow in a watercourse will also be faster in the spring, because of snowmelt entering the watercourse from the surrounding area. River currents in summer and fall will be generally slower than in the spring. Wind and wave action will also affect the rate and direction of spill travel.

Spill velocity on a watercourse may be estimated quickly by using a current velocity meter or by timing the movement of a floating object on the watercourse over a set distance.

The following table is used for estimating spill velocity based on a 30 metre (100 foot) distance:

Time Required For Object to Travel 100 meters (seconds)	Surface Current Speed		Boom Angle (degrees)
	(km/hr)	(m/s)	
720	0.5	0.14	60°
360	1.0	0.28	60°
240	1.5	0.42	60°
180	2.0	0.56	45°
143	2.5	0.69	45°
120	3.0	0.83	45°
103	3.5	0.97	15°
90	4.0	1.11	15°
80	4.5	1.25	15°
73	5.0	1.39	15°
60	6.0	1.67	15°

Note: In currents faster than 6.0 km/h, or in excessively turbulent waters, the use of containment booms may be impractical, and other containment or protection methods such as the use of diversion or exclusion booms may be required.

The velocity calculated will be an approximation only, as the watercourse velocity varies at different points across the river, due to changes in river depth and at various points upstream and downstream on the river. In the initial stages of the spill on a watercourse, lighter-end materials will tend to evaporate, especially in warm weather. Other processes that might affect spill behaviour include dispersion of the petroleum into the water, formation of stable oil/water emulsions and stranding or oil along the shoreline.

Containment of a spill on a watercourse should be completed as quickly as possible as the spilled material has the potential to travel a much greater distance and contaminate a larger area than spills on land. The Incident Commander and Incident Command System Operations personnel will implement appropriate containment actions based on the size of the watercourse and current velocity.

Watercourse Containment Options		
Containment Method	**Technique Description**	**Comments**
Containment Boom (Spring to Fall)	A containment boom is placed in the watercourse to prevent migration of the spilled material down-stream of the containment point.	The watercourse must be accessible to allow containment activities. If water is too shallow, or current is too fast, the containment boom may not be effective in containing the oil. Oil spill containment equipment, work and safety boats, and a work crew must be available to conduct this method.
Diversion Boom (Spring to Fall)	Diversion booms are used in large or swift rivers to divert spilled material to calmer water for containment and recovery. May be used in combination with containment boom.	The watercourse must be accessible to allow boom to be deployed. High current speeds or turbulence may make deployment impossible, or may cause deployed boom to fail, releasing spilled material downstream. Oil spill containment equipment, work and safety boats, and a work crew must be available to conduct this method.

Watercourse Containment Options		
Containment Method	**Technique Description**	**Comments**
Sorbent boom (Spring to Fall)	Sorbent booms may be used in narrow, low flow streams or rivers to remove small amounts of surface oil. Chicken wire or containment boom may be used to back up sorbent boom.	The watercourse must be accessible to allow boom to be deployed. Sorbent boom use is only viable in low flow watercourses, as boom is not very sturdy and breaks easily. (Chicken wire or containment boom may be used behind sorbent boom to reinforce sorbent boom and prevent breakage). Sorbent boom also has no skirt allowing large amounts of oil to easily flow under it. Sorbent boom will pick up sheen but not large amounts of oil. Sorbent boom is not very effective in cold weather. Large amounts of sorbent boom are expensive, and must be replaced in the watercourse when saturated. Used sorbent must be stored and disposed of in compliance with government legislation. Sorbent boom, work crew and possibly boats may be required.
Earth or Sand Dike (Spring to Fall)	Dikes are used across very shallow streams and intermittent creeks to contain flowing oil. Dikes can also be used to contain spilled materials along a shoreline.	Sufficient earth or sand is needed to construct the dike. Flowing may be caused if stream or creek is dammed (a containment weir may be used to alleviate this problem – see below) Damage may be caused by evacuation and construction in the watercourse and along the banks. A work crew with shovels, earth-moving equipment, earth or sand, sandbags and/or sheets of metal or wood may be required.
Containment Weir (Spring to Fall)	Containment weirs are physical dams with culverts or pipes constructed in the dam to allow free water movement from a site while containing surface oil.	Containment weirs are used in shallow streams and creeks and are suitable for maintaining a constant water level at the site and preventing flooding. Damage may be caused by excavation and construction in the watercourse and along the banks. A work crew with shovels, earthmoving equipment, earth or sand and piping or culvert material is required.

Watercourse Recovery Options		
Recovery Method	**Technique Description**	**Comments**
Vacuum Truck	A vacuum truck is used to recover free petroleum from water in areas accessible by trucks or heavy equipment.	A vacuum truck and operator are required. Use of this method is subject to site access. Surface disturbance and soil damage may result from movement of the vacuum truck to and from the site. Topsoil may need to be stripped from the site before conducting recovery activities.
Pumping of Spilled Material into Storage	A pump is used to recover free oil from the watercourse in areas not accessible by vacuum trucks.	Pumps must be safe for use at the spill site and be compatible with the product to be pumped. Surface disturbance and soil damage may result from movement of the pump and storage equipment to the site. Technique will generate large volumes of contaminated water that will require storage. Skid tanks, tankers, port-a-tanks, fuel bladders, permanent tanks or a lined excavated area must available to provide storage for the recovered material. A work crew and power supply for the pump must also be available.
Skimmers	Mechanical devices are used to skim oil from water surface or remove oil/water mixture for storage.	Skimmer will need sufficient water depth to float. Weir skimmers work best on thicker layers of oil in flowing water. Will generate large quantities of water/oil mixture. Drum or disc skimmers will pick up thinner layers of oil on slow moving water. Debris and vegetation may clog skimmer making oil pickup difficult. A suction, floating weir, disc or drum skimmer, pump and work crew are required. A secure storage facility (tanker, portable tanks, fuel bladders or excavated, lined storage site) is also required.

1.5.13.6 Spills into Water bodies

In the absence of any current or wind, spills on water bodies such as lakes will spread out in all directions from the site of the spill until a uniform stable thickness is reached. If a wind and/or current is present, the spill will move with the wind or current until it reaches the shoreline.

Wave action in the water body may also affect the spill causing oil-in-water or water-in-oil emulsions to form, making recovery and clean-up efforts more difficult.

Response personnel should attempt to contain the spill to as small an area as possible on the water body near the spill source. Dispersion of the spill over a large area on the water body could cause widespread impacts when the spill reaches the shore. If the spill can be contained on the water body, the spilled material is moved toward shore for recovery.

Containment options for spills on water bodies use a containment boom to surround the spill. See the local Oil Spill Contingency Plan for a discussion of containment booms and for boom configurations used to contain a boom in open water. If the area that may be impinged by the spilled materials is environmentally sensitive, appropriate shoreline protection measures may be implemented as recommended by company Environmental Specialists.

1.5.13.7 Spills into Wetlands or Muskeg

Wetlands are areas with high organic content, which contain large amounts of water in the soil. Wetlands may be continuously covered in water or water levels may fluctuate throughout the year. Muskeg is a land area that contains a high moisture content and is boggy in the summer because of large quantities of peat, moss, or other vegetative material in the soil. In winter, muskeg will freeze making excavation extremely difficult.

Spills in wetlands or muskeg can be some of the most difficult spills to contain, recover and clean up because of limited site access for both manpower and equipment. Because of the sensitive nature of these ecosystems, more damage may be caused by emergency response operations than was caused by the original spill. The Incident Commander may consult with government officials or environmental specialists before conducting emergency response operations in wetlands or muskegs. This will ensure that containment, recovery, and clean-up operations represent the most viable option for the spill, based on the type of product, size of spill and site specific safety, operational or environmental concerns.

If all other options are considered unviable, natural recovery may be approved by environmental protection agencies. Natural recovery uses micro-organisms already present in the ecosystem to degrade the oil. Degradation of the oil may be enhanced by addition of other nutrients required by the micro-organisms, to ensure sufficient levels of these nutrients are present to allow degradation to continue.

Natural recovery may be preferable to recovery and clean-up depending on:

- the amount, type and persistence of the oil
- the location of the site
- the nature and uses of the area
- whether the impacts of various clean-up methods are greater than damage related to the actual spill

Natural recovery should be considered if:

- clean-up activities will cause more harm than leaving the site to recover naturally
- leaving the area to recover naturally will not cause further harm to environmentally sensitive areas

Containment operations for wetland or muskeg spills in winter are similar to those for spills on land or ice. If containment operations are conducted at the site in the summer, a combination of land containment and water containment options will be used as appropriate.

Wetland or Muskeg Containment Options		
Containment Method	**Technique Description**	**Comments**
Containment Boom	A containment boom is placed in wetland to prevent migration of oil into non-contaminated areas.	If water is too shallow, or the current is too fast, the containment boom may not be effective in containing the oil. Oil spill containment equipment, work and safety boats and a work crew must be available to use this method.
Containment Weirs	Containment weirs are physical dams with culverts constructed in the dam to allow free water movement from a site while containing surface oil. Containment weirs are used to maintain a constant water level at spill site for easy oil recovery.	Access to the site by manpower and equipment may be limited. Building of containment weirs may be labour-intensive and time-consuming if done manually. Damage may be caused by excavation and construction in the watercourse and along the banks. A work crew with shovels, earthmoving equipment, earth or sand and piping or culvert material is required to use this method.
Vacuum Truck	Muskeg or wetland areas must be accessible. A vacuum truck can recover from a trench or water surface.	Surface disturbance and soil damage may result from movement of the vacuum truck to and from the site. Topsoil may need to be stripped from the site before undertaking recovery activities.
Pumping of Spilled Material into Storage	A pump is used to recover free oil from wetlands or muskeg.	The wetland or muskeg area must be accessible for equipment. Pumps must be safe for use at the spill site and be compatible with the product to be pumped. The technique will generate large volumes of contaminated water that will require storage. Skid tanks, tanker trucks, port-a-tanks, fuel bladders, permanent tanks or a lined excavated area must be available. A work crew and power supply for the pump must also be available.
Skimmers	Used to skim oil from water surface or remove oil/water mixture for storage. Drum or disc skimmers will pick up thinner layers of oil on slow moving water.	The wetland or muskeg area must be accessible. Skimmer will need sufficient water depth to float. Debris and aquatic vegetation may clog skimmer, making oil pickup difficult. A suction, floating weir, disc or drum skimmer, pump and work crew are required to undertake method. A secure storage facility is also required.

Wetland or Muskeg Containment Options		
Containment Method	**Technique Description**	**Comments**
Fresh Water Flushing	Water is flushed through an area to push oil that is in vegetation or on the water surface toward a collection point for recovery. The method can be used in conjunction with trenches.	The wetland or muskeg area must be accessible for equipment to allow recovery activities to be conducted. The method is not suitable for areas with extensive vegetation or obstructions. Physical damage may be caused to sensitive environmental areas. Pumps, a power supply, hoses, hot or cold water, and a work crew are required. A lined, excavated area or storage tanks may be required to hold water for treatment or testing.

1.5.13.8 Spills on Ice

Spills on ice will tend to spread out from the spill source toward lower-lying areas. Surface depressions, cracks and pockets in the ice will cause the spilled material to pool. A significant volume of some oils can be absorbed into ice.

The presence of oil on or in ice increases solar heating and the rate of melting. Subsequent freezing and melting may eventually cause the oil to migrate throughout the surface of the ice. Openings in the ice may allow the spilled material to migrate into open water or allow the spill to be swept under ice, making response operations more difficult.

The information presented should be used as a guideline only in determining typical load-bearing capacity of ice. The Incident Commander and Incident Command System Operations personnel must determine whether it is safe to work on ice based on actual site conditions.

The ability for ice on a river, stream or lake to support the weight of workers and equipment is determined by effective ice thickness which is based on the thickness of clear ice and presence of white ice.

Clear ice (sometimes called blue ice) is translucent and well compressed with few air pockets. This ice is very strong and has a high load-bearing capacity.

White ice (or snow ice) is very porous, with many air pockets and is much weaker. White ice has approximately half the load-bearing capacity of clear ice. White ice is formed by constant melting and freezing of the top layer of ice due to solar heating or mild temperatures and is normally found on top of clear ice.

Holes should be drilled in the ice at the work site, before starting any on ice operations, to determine the average thickness of white and clear ice.

Effective ice thickness then can be calculated, using the formula in the following table:

Effective Ice Thickness = clear ice thickness + ½ white ice thickness
Example: The spill site has 20 inches of clear ice and 10 inches of white ice 20 inches clear ice + ½ x 10 inches white ice = 25 Effective Ice Thickness
Note: If water lies between layers, use the depth of only the top layer of white ice

Based on the effective ice thickness, a determination can be made as to the stationary and moving loads that may be supported by the ice. Normally less ice is required for continuous movement on the ice than for stationary loads as less pressure is exerted on any one point on the ice during movement.

LOAD-BEARING CAPACITY OF ICE THICKNESS FOR CONTINUOUS TRAVEL [1]		
Permissible Load	**Effective Ice Thickness inches (centimetres)**	
	Lake	**River**
One person on foot	2.0 (5.0)	2.5 (6.3)
Group, in single file	3.2 (8.0)	3.5 (8.8)
Passenger car 4,400 lbs. (2000 kg)	7.1 (17.8)	8.3 (20.8)
Light Truck 5,500 lbs (2500 kg)	7.9 (19.8)	9.1 (22.8)
Medium Truck 7,700 lbs (3500 kg)	10.2 (25.5)	11.8 (29.5)
Heavy Truck 15,000 – 17,500 lbs (6800 – 8000 kg)	13.8 (34.5)	16.1 (40.3)
20,000 lbs (9000 kg)	15.0 (37.5)	17.3 (43.3)
50,000 lbs (23,000 kg)	24.8 (62.0)	28.7 (71.8)
99,000 lbs (45,000 kg)	31.5 (78.8)	36.2 (90.5)
150,000 lbs (68,000 kg)	39.4 (98.5)	45.3 (113.3)
240,000 lbs (109,000 kg)	49.2 (123.0)	56.7 (141.8)

WEIGHT-BEARING CAPACITY FOR STATIONARY LOADS AND WORKING ON ICE		
Permissible Load	**Effective Ice Thickness inches (centimetres)**	
	Lake	**River**
2,200 lbs (1000 kg)	8.0 (20.0)	9.1 (22.8)
4,400 lbs (2000 kg)	12.0 (30.0)	14.0 (35.0)
8,800 lbs (4000 kg)	18.0 (45.0)	21.0 (52.5)
17,600 lbs (8000 kg)	24.0 (60.0)	27.0 (67.5)
50,000 lbs (23,000 kg)	44.0 (110.0)	50.0 (125.0)
99,000 lbs (45,000 kg)	59.0 (147.5)	68.0 (170.0)
150,000 lbs (68,000 kg)	71.0 (177.5)	82.90 (205.0)
240,000 lbs (109,000 kg)	91.0 (227.5)	105.0 (262.5)

Note: These tables are guidelines only for determining the typical load-bearing capacity of ice.

[1] Does not apply to parked loads, or where ice faults are evident.

Temperature may affect the load-bearing capacity of ice on a water body. Air temperatures must remain below the freezing point of water (0°C) for a sufficient period to allow the ice to adequately support a stationary or moving load. Temperature effects are dependent on ice thickness, as follows:

- less than 50 centimetres (20 inches) of ice: temperature must be constant for 3 days
- between 50 and 100 centimetres (20 and 40 inches) of ice: temperature must be constant for 4 days
- over 100 centimetres (40 inches) of ice: temperature must be constant for 5 days

Sudden drops or increases in temperature can also cause thermal stressing or cracking of ice requiring temporary load restrictions for 3 to 5 days following the change. Thawing due to warm temperatures may also significantly affect ice conditions. On-site personnel should take extreme care when evaluating ice conditions during a thaw and limit work on or near ice under these conditions.

Containment and clean-up options for spills on ice are similar to those on land and are summarized in the following tables:

On-Ice Containment Options

Containment Method	Technique Description	Comments
Earth or Sand Dike (All seasons)	Earth or sand at or near the site is used to contain spilled material on flat or sloped surfaces. Sandbags filled with earth or sand are used to contain spill.	Effective ice thickness must be sufficient to support the weight of manpower and equipment required to build dike. Sufficient dry earth, gravel or sand must be available to contain spill. Earth may be frozen. Surface disturbance to remove earth or sand may result in erosion, especially on steep slopes. Earth or sand placed on ice must be removed before spring break-up. Work crews and/or earth-moving equipment are required to build dike.
Snow or Ice Dike (Winter only)	Snow or ice at or near the site is used to contain spilled material on flat or sloped surfaces.	Effective ice thickness must be sufficient to support the weight of manpower and equipment required to build dike. Sufficient snow or water must be available to contain spill. Snow or ice dike may melt quickly in warm weather. Contaminated snow or ice may need to be removed or stored for treatment. Work crews and/or earth-moving equipment is required to build snow dike. Water spraying equipment may be required to construct and maintain an ice dike.

On-Ice Containment Options		
Containment Method	**Technique Description**	**Comments**
Sorbent Dike (All seasons)	Sorbent material is used to contain spill.	Useful only in small spills, as purchase of large quantities of sorbent is expensive and impractical. Contaminated sorbent may need to be replaced or squeezed out during incident. Contaminated sorbents must be disposed of properly to comply with government regulations. Sufficient sorbent or sorbent boom, work crews and storage containers or a lined storage area for contaminated sorbents must be available to build sorbent dike.

On-Ice Cleanup Options		
Clean-up Method	**Technique Description**	**Comments**
Manual Removal by Work Crew and/or Equipment (Winter)	A work crew or earth-moving equipment are used to remove thick oil or contaminated snow and ice.	Effective ice thickness must be sufficient to support the weight of manpower and equipment required. All necessary safety precautions should be undertaken for personnel who work near any open water. Manual removal may be a difficult and time-consuming process. A work crew with hand tools or earth-moving equipment (e.g. backhoe) and operators, as well as ice cutting equipment, may be required. Lined storage area or storage drums are required to store contaminated material before treatment or disposal. Oil present in snow may be skimmed off during spring thaw.
Steaming of Ice Surface	Steam is used to melt ice surface to aid in spill clean-up. The technique may be used in association with other clean-up and recovery techniques.	Effective ice thickness must be sufficient to support the weight of manpower and equipment required. All necessary safety precautions should be undertaken for personnel who work near any open water. A work crew with steaming equipment is required to undertake this method.

On-Ice Cleanup Options		
Clean-up Method	**Technique Description**	**Comments**
Sorbents (Spring to Fall)	The method is used in isolated areas to clean up small amounts of oil.	Clean-up is labour-intensive and time-consuming. Limited access to site may make this method difficult or impossible. Sorbents are not very effective on weathered oil or in cold weather. Sorbents may freeze to the surface. Sorbents must be disposed of properly to comply with government regulations. Sufficient sorbent, work crews and storage containers or a lined storage area for contaminated sorbents must be available.
Snow or ice melting	Snow or ice is removed from the clean-up site and melted in heated tanks to allow spilled material to be skimmed off the surface of the melt water. The technique may be used in association with other clean-up and recovery techniques.	Contaminated snow or ice must be removed from clean-up site and placed in melting tanks. The method may be labour-intensive and time-consuming, as melting is not be very efficient for clean-up of large volumes of petroleum-contaminated ice. In very cold temperatures, sufficient heat may not be available in the tanks to melt ice. A work crew, heating tanks, skimming equipment, transfer vehicles and operators are required. A lined storage facility for storage of contaminated ice or snow before melting may also be required, as well as storage tanks for storing recovered petroleum.

1.5.13.9 Spills Under Ice

Spills of petroleum under ice will spread and will travel under the ice at a velocity that is less than the current speed of the watercourse. The spill will tend to follow the path of the main current flow. The spill product may become trapped in crevices, cracks, pockets, and other irregularities under the ice and may freeze from the underside of the ice anywhere downstream or outward from the original spill. This will make recovery and clean-up operations extremely difficult.

Before conducting any response operations to contain, remove and clean up oil under ice, the Incident Commander should ensure that the response personnel have calculated the effective ice thickness to ensure it will support the weight of personnel and equipment.

For spills under ice, the Incident Commander and response personnel should attempt to determine the location of the spilled material and bring the spill to the surface of the water for containment and recovery. Spill movement under the ice is normally located by drilling holes through the ice using an ice auger downstream of the spill source on a flowing watercourse or outward from the spill source on a non-flowing water body. Alternately, aerial reconnaissance may be used to attempt to locate spilled material in cracks at the surface or under thin ice. Once the spill has been located, containment operations can be conducted to bring the spilled product to the surface.

Containment operations are normally accomplished by constructing slots in the ice. Ice slots allow petroleum products trapped under the ice to rise to the surface for recovery.

The slot is normally constructed at an angle in relation to the shore toward the area of strongest current flow in the river. If the slot is constructed correctly, the spilled material will rise into the slot and flow along it toward the shore for recovery.

The angle of slot construction in relation to the shore depends on the current velocity, similar to a containment boom placed in a flowing river. For higher currents in the river, a shallower angle is used for the ice slot, while a larger angle may be used for lower current flows.

If a slot is constructed at too great an angle to the current, turbulence may occur, sweeping the spilled material under the ice on the downstream side. Plywood or other types of sheeting may be placed on the downstream side of the slot and frozen in place to facilitate containment of the spilled material. The ice slot should be 0.5 to 1.0 metres (1.6 to 3.3 feet) wide, to aid in containment. Ice blocks may be cut using a ditch witch or backhoe if the effective ice thickness is sufficient to allow stationary equipment on the ice. [If ice is too thin for equipment but safe for personnel, crews equipped with chainsaws and proper safety gear can cut the ice.] Ice blocks can be removed to clear the slot or pushed under the ice downstream of the slot if sufficient water depth is available.

Ice blocks are extremely heavy (one cubic foot of ice weighs 24 kilograms (53 pounds). Blocks should be cut to a size that will allow the crews or equipment to remove them easily. To aid in block removal, the ones nearest the shore should be removed first and remaining blocks should be floated toward shore for removal. Plywood or other sheeting can be used upstream of the slot to divert oil into the slot for recovery. Narrow slots may be cut into the ice with a chain saw and sheeting may be wedged into the slots to channel the main current toward the ice slot in a manner similar to a diversion boom in open water.

Under-Ice Containment Options

Containment Method	Technique Description	Comments
Ice Slotting	Ice slots are cut into ice on rivers to collect oil moving under the ice. The technique is best used for rivers with current, as oil will be moved toward slot by current.	Effective ice thickness must be sufficient to support the weight of manpower and equipment required to build slot. All personnel working near any open water must take all required safety precautions. The location of the spill must be confirmed by drilling holes downstream of the spill source before constructing the ice slot. Total containment of spilled petroleum in an ice slot is unlikely, due to material trapped under ice. Snowmobiles, communications gear, and ice augers may be required to determine the location of the spill. Work crews, chain saws and/or a backhoe or ditch witch are required to construct an ice slot. A recovery device such as a heat-traced ice skimmer is required to recover spilled material. Storage tanks or a lined excavated storage area may be required to store recovered oil/water mixture.

1.5.13.10 Spills in Broken Ice

The risk to Life Safety of the personnel attempting spill response in broken ice conditions using existing technology is extreme. Emergency operations in broken ice conditions during spring thaw or winter freeze-up are extremely difficult. When oil is mixed with floating ice or covered by a very thin ice cover, ice interferes with the collection of the oil and could damage containment and recovery equipment. The presence of ice also makes the use of boats difficult.

Before authorizing any spill response operations in broken ice conditions, the Incident Commander and response personnel, along with the appropriate regulatory agencies, will evaluate whether it is safe or feasible to undertake containment and recovery operations and what methods should be used.

Containment options for spills during freeze-up or break-up are similar to those for spills on a river and on ice. If containment operations are determined to be feasible based on site conditions, response personnel will attempt to deflect ice away from the containment site.

Deflection of ice may be achieved using log booms or ice dams. A log boom consists of logs cabled together with chain, anchored upstream of a conventional containment boom. An ice dam is constructed upstream of the oil spill site and containment site, to attempt to divert upstream ice away from a containment site.

Log booms are deployed at an angle away from the containment site. Logs are spaced to allow spilled materials and water to move directly toward the containment site, while diverting the ice toward the opposite shore, allowing the ice to pass around the containment site.

1.5.13.11 Spill Control Point Descriptions

Control points are pre-identified locations on watercourses that allow for the staging and deployment of oil spill containment and recovery equipment in response to oil spills that have occurred upstream of the control point. Control point selection is critical to an effective oil spill response and part of your risk assessment and development of site-specific emergency response plan information.

Each oil spill cooperative conducts control point evaluation for the whole geographic co-op area.

Chance Oil and Gas Limited may decide to provide additional control points in the site-specific sections of this Emergency Response Plan.

An ideal control point should have:

- quick access to the watercourse in all seasons, using clear ground, a road or a trail
- adequate work space to conduct operations and to store required equipment with minimal need for clearing of brush and vegetation
- sufficient space to deploy containment and recovery equipment quickly with minimal effort or obstructions (i.e. trees, rocks, steep banks, etc.) and minimal environmental impact
- boat launch location(s) for boats assisting in containment and recovery operations.

Selection of control points with public access is preferred.

For control points on private property - landowner approval and necessary permits for emergency access should be obtained in advance.

Designated site specific control points need to be reviewed at least annually. Each control point site should be visited periodically to evaluate suitability and to ensure information is accurate and complete. Old unsuitable control points should be removed and new control points added, as a part of revisions to site specific information, as required. Control point listings should include a site description, site diagram, access description, landowner/occupant phone number, site suitability and any other information related to the site.

Disposal and Remedial Operations

The proper disposal of contaminated materials as well as site remediation options is outside the scope of this Emergency Response Plan. Site restoration will be determined by consultation among the Incident Commander, company Environmental staff, environmental protection agency personnel and any external environmental consultants that are contracted by Chance Oil and Gas Limited

Abstract

An overview of hydraulic fracturing and other formation stimulation technologies for shale gas production – Updated 2015

This report presents an update of the original study carried out in 2013 (EUR 26347). It reviews the latest trends in hydraulic fracturing and alternative fracturing technologies. For each identified technique, an overview is given along with its rationale. Potential advantages and disadvantages are identified and the technological readiness status is identified for its application to shale gas production.

The authors would like to acknowledge the following contributions. Maximilian Kuhn researched the literature and helped structuring the first version of this report (Gandossi 2013). Marcelo Masera contributed by reviewing earlier drafts and with several useful discussions. Arne Eriksson reviewed the final draft and provided many useful insights. Members of the International Association of Oil and Gas Producers (OGP) reviewed earlier drafts and provided relevant feedback and useful comments.

Executive summary

The technology of hydraulic fracturing for hydrocarbon well stimulation is not new, but only fairly recently has become a very common and widespread technique, especially in North America, due to technological advances that have allowed extracting natural gas from so-called unconventional reservoirs (tight sands, coal beds and shale formations). The conjunction of techniques such as directional drilling, high volume fracturing, micro-seismic monitoring, etc. with the development of multi-well pads has been especially successful in the last years in their application to shales, making gas production from shales technically and economically feasible.

In Europe, the potential application of this technology has led to both great worries and high expectations: worries regarding the alleged magnitude of the environmental impact, and expectations about production of indigenous hydrocarbons. Other types of formation stimulation exist that do not make use of water-based fluids (for instance, explosive fracturing, dynamic loading, etc.), or that make use of fluids other than water. These are currently not extensively applied due to performance considerations.

As for any other industrial activity, the deployment of high-volume hydraulic fracturing could potentially entail some risks to the environment. Among the concerns raised are high usage of water, methane infiltration in aquifers, aquifer contamination, extended surface footprint, induced local seismicity, etc. New technologies could help addressing these concerns (for instance by using non-toxic chemicals, by reducing or eliminating altogether the usage of water, by considerably reducing the surface footprint of a well, etc.).

This report is an update of the original study carried out in 2013 (2013). It reviews the latest trends in hydraulic fracturing and alternative fracturing technologies, by searching the open literature, patent databases and commercial websites (mainly in the English language). For each identified technique, an overview is given. The technique is then briefly explained, and its rationale (reasons for use) is identified. Potential advantages and disadvantages are identified, and some considerations on costs are given. Finally, the status of the technique (for instance, commercially applied, being developed, concept, etc.) is given for its application to shale gas production.

1. Introduction

1.1. Background

This report is an updated of the original JRC report published in 2013 (Gandossi 2013), compiled taking into account new relevant information that has been published in the course of 2014 and 2015.

The technology of hydraulic fracturing for hydrocarbon well stimulation is not new, with the first experiments done in 1947, and the first industrial use in 1949. It has been used since then for reservoir stimulation (in Europe as well) and enhanced hydrocarbon recovery.

Hydraulic fracturing has become a very common and widespread technique, especially in North America, due to technological advances that have allowed extracting natural gas from so-called unconventional reservoirs (tight sands, coal beds and shale formations). The so-called high volume hydraulic fracturing (with treatments typically an order of magnitude larger than the conventional fracturing procedures) began in 1968. This was complemented by horizontal drilling since the late 1980s, and the use of chemicals (known as "slickwater fracturing") since 1997.

The conjunction of these techniques (directional drilling, high volume fracturing, fracture divergence systems, slickwater) with the development of multi-well pads has been especially successful in North America in the last years in their application to shales, making gas production from shales technically and economically feasible. Shale gas development is considered "unconventional" when contrasted with "conventional" subterranean natural gas reservoirs.

In Europe, experience to date has been focused on low volume hydraulic fracturing in some conventional and tight gas reservoirs, mostly in vertical wells, and constituted only a small part of past EU oil and gas operations. The scale, frequency and complexity of the fracking technique necessary for shale gas extraction differ from past EU experiences, and the potential application of this technology has therefore led to both great worries and high expectations: worries regarding the alleged magnitude of the environmental impact, and expectations about production of indigenous hydrocarbons.

Other methods for fracturing (or, more broadly, formation stimulation) exist that do not make use of water-based fluids (for instance, explosive fracturing, dynamic loading, etc.), or that make use of fluids other than water. These are not extensively applied due to performance considerations.

Foam technologies, thus more expensive than water based stimulations do offer an alternative to reduce the amount of water used in shale gas stimulation. These are available across the industry.

The deployment of high-volume hydraulic fracturing could entail some risks to the environment. Among the concerns raised the following can be mentioned: high usage of water, methane infiltration in aquifers, aquifer contamination, extended surface footprint, induced local seismicity, etc.

New technologies could help addressing these concerns (for instance by using non-toxic chemicals, by reducing or eliminating altogether the usage of water, by considerably reducing the surface footprint of a well, etc.), but it is noted that hydraulic fracturing is still the preferred method by the industry (OGP 2013).

1.2. Scope and objective

This paper reviews hydraulic fracturing and alternative fracturing technologies, by searching the open literature, patent databases and commercial websites (mainly in the English language).

For each identified technique, an overview is given. The technique is then briefly explained, and its rationale (reasons for use) is identified. Potential advantages and disadvantages are identified, and some considerations on costs are given. Finally, the status of the technique (for instance, commercially applied, being developed, concept, etc.) is given for its application to shale gas production.

1.3. Method and limitations

This report was compiled by and large by accessing available literature (relevant journal and conference papers, patent databases and commercial websites), sometimes authored by individuals or organisations wishing to promote a certain technology.

The report does not include full life cycle analysis of cost or environmental impacts, nor any other measure of quantification of advantages or disadvantages of the specific technologies at hand. Thus, the inclusion of positive or negative aspects of a certain technology (economic, environmental, or otherwise) does not constitute an endorsement of the net benefits and/or costs and disadvantages of that stimulation method in comparison with other methods.

Advantages and disadvantages of any applied technology are in most cases dependent on the specific situation under which formation stimulation is performed (location, formation characteristics, etc.). In this report, no objective criteria were developed and applied to identify potential advantages and disadvantages of each technique. As an example, when it is noted that a certain technology leads to "reduced water usage", this is not a judgment to whether there is an environmental, economic or otherwise need to reduce water consumption, and whether the alternative is overall a better choice. Such a choice would typically depend on the specific condition for a given situation.

1.4. Report structure

The paper is structured as follows. The technologies are divided in four main chapters:

- **Hydraulic Fracturing** chapter 2
- **Pneumatic Fracturing** chapter 3
- **Fracturing with Dynamic Loading** chapter 4
- **Other Methods** chapter 5

Hydraulic Fracturing is herein defined as the technique that makes use of a liquid fluid to fracture the reservoir rocks. The following techniques are identified and discussed:

- Water-based fluids section 2.2
- Foam-based fluids section 2.4
- Oil-based fluids section 2.5
- Acid-based fluids section 2.6
- Alcohol-based fluids section 2.7
- Emulsion-based fluids section 2.8
- Cryogenic fluids (CO_2, N_2, etc.) section 2.9
- Fluids based on produced water section 2.10.1

Pneumatic Fracturing is the technique that makes use of a gas (typically air or nitrogen) to fracture the reservoir rock. It is a technique normally used in shallow formations.

In **Fracturing with Dynamic Loading** fluids are not used. The following techniques are identified and discussed:

- Explosive fracturing section 4.1
- Electric fracturing section 4.2

Under **Other Methods** we review all remaining fracturing techniques that do not readily fall in one of the previous categories. The following techniques are identified and discussed:

- Cryogenic fracturing section 5.1
- Mechanical cutting of the shale formation section 5.2
- Enhanced bacterial methanogenesis section 5.3
- Heating of the rock mass section 5.4
- In-situ combustion section 5.5
- Enhanced oil recovery in shale reservoirs section 5.6

Summary and conclusions are given in Chapter 6.

2. Hydraulic fracturing

The technique of hydraulic fracturing makes use of a liquid to fracture the reservoir rocks. A hydraulic fracture is formed by pumping the fracturing fluid into the wellbore at a rate sufficient to increase pressure downhole to exceed the strength of the rock.

The term "hydraulic fracturing" is nowadays widely used to mean the process of fracturing rock formations with water-based fluids. In general terms, hydraulics is a topic in applied science and engineering dealing with the mechanical properties of liquids (not just water). Though a matter of definitions, in this note we choose to categorize under "hydraulic fracturing" all techniques that make use of liquids (including foams and emulsions) as the fracturing agent.

Indeed, using water as base fluid for hydraulic fracturing is a more recent development. (Montgomery and Smith 2010) give a good account of the history of hydraulic fracturing. The first fracture treatments were initially performed with gelled crude and later with gelled kerosene. By the end of 1952, many fracturing treatments were performed with refined and crude oils. These fluids were inexpensive, permitting greater volumes at lower cost. In 1953 water started to be used as a fracturing fluid, and a number of gelling agents was developed. Surfactants were added to minimize emulsions with the formation fluid. Later, other clay-stabilizing agents were developed, permitting the use of water in a greater number of formations.

Other innovations, such as foams and the addition of alcohol, have also enhanced the use of water in more formations. Aqueous fluids such as acid, water, and brines are used now as the base fluid in approximately 96% of all fracturing treatments employing a propping agent. In the early 1970s, a major innovation in fracturing fluids was the use of metal-based crosslinking agents to enhance the viscosity of gelled water-based fracturing fluids for higher-temperature wells.

As more and more fracturing treatments have involved high-temperature wells, gel stabilizers have been developed, the first of which was the use of approximately 5% methanol. Later, chemical stabilizers were developed that could be used alone or with the methanol. Improvements in crosslinkers and gelling agents have resulted in systems that permit the fluid to reach the bottom of the hole in high-temperature wells prior to crosslinking, thus minimizing the effects of high shear (Montgomery and Smith 2010).

The fracturing fluid used is a crucial component of hydraulic fracturing, not only concerning the technical characteristics (rheology[1], formation compatibility, etc.) but its environmental impact. Indeed, several among the main environmental concerns associated with shale gas fracturing today are due to the usage of water: the high volumes of water used and lost underground, the need to process flowbacks, the potential contamination of aquifers by leaks of chemicals employed in the fracturing fluids, etc.

2.1. Hydraulic fracturing of shales

Shale formations present a great variability, and for this reason no single technique for hydraulic fracturing has universally worked. Each shale play has unique properties that need to be addressed through fracture treatment and fluid design. For example, numerous fracture technologies have been applied in the Appalachian basin alone, including the use of CO_2, N_2 and CO_2 foam, and slickwater fracturing. The composition of fracturing fluids must be altered to meet specific reservoir and operational conditions. Slickwater hydraulic fracturing, which is used extensively in Canadian and U.S. shale basins, is suited for complex reservoirs that are brittle and naturally fractured and are tolerant of large volumes of water.

[1] Rheology is the branch of physics concerned with the study of the deformation and flow of matter.

Ductile reservoirs require more effective proppant placement to achieve the desired permeability. Other fracture techniques, including CO_2 polymer and N_2 foams, are occasionally used in ductile rock (for instance, in the Montney Shale in Canada). As discussed below in Sections 2.4 and 2.9.1, CO_2 fluids eliminate the need of water while providing extra energy from the gas expansion to shorten the flowback time.

In general, a fracturing fluid can be thought as the sum of three main components:

Fracturing Fluid = **Base Fluid** + **Additives** + **Proppant**

A fracturing fluid can be "energized" with the addition of compressed gas (usually either CO_2 or N_2). This practice provide a substantial portion of the energy required to recover the fluid and places much less water on water-sensitive formations, but has the disadvantage that it reduces the amount of proppant that is possible to deposit in the fracture. Table 1 summarises a useful classification system developed to characterise different types of hydraulic fracturing fluid systems (Patel, Robart et al. 2014).

Table 1. Classification system for different types of hydraulic fracturing, from (Patel, Robart et al. 2014).

Fracturing type	***Definition***
Conventional	Treatment type that uses a gelling agent and one or more crosslinkers in order to transport proppant into a hydraulic fracture.
Water Frac	Treatment type that uses a friction reducer, a gelling agent or a viscoelastic surfactant in order to transport proppant into a hydraulic fracture.
Hybrid	Treatment type that uses a combination of a friction reducer, gelling agent, acid gelling agent, or one or more crosslinkers in order to transport proppant into a hydraulic fracture.
Energized	Treatment type that incorporates an energizer, normally nitrogen or carbon dioxide, into the base fluid in order to generate foam that transport proppant into a hydraulic fracture.
Other/Unknown	Treatment type category that includes the following less common types: acid frac, gas frac, matrix acidizing.

Typically, water-based fluids are the simplest and most cost-effective solution to fracture a rock formation. However, alternatives to water-based fluids have significantly outperformed water treatments in many reservoirs. For instance, foams have been extensively used in the seventies in depleted conventional reservoirs in which water fractures were not effective. More recently, the development of some unconventional reservoirs (tight gas, shale gas, coal bed methane) has prompted the industry to reconsider "waterless" fracturing treatments as viable alternatives to water-based fracturing fluids. In these reservoirs, the interactions between the rock formation and the fracturing fluids may be detrimental to hydrocarbon production. (Ribeiro and Sharma 2013). There are several reasons to consider fluids that contain little or no water, namely:

1. Water sensitivity of the formation. The base mineral composition of a given rock formation impacts the recovery process of water, gas, and oil. For example, oil-based fluids, LPG, C02 and high-quality foams are recommended in water-sensitive formations to prevent excessive fines migration and clay swelling. In many shales, proppant conductivity drops considerably in the presence of water because the rock-fluid interactions soften the rock leading to proppant embedment.

2. Water blocking. In under-saturated gas formations, the invasion of water from the fracturing fluid can be very detrimental to gas productivity as any additional water remains trapped because of capillary retention. The increase in water saturation (referred to as water blocking or water trapping)) significantly reduces the relative permeability to gas, sometimes by orders of magnitude (Parekh and Sharma 2004).

3. Proppant placement. Foams and other gelled non-aqueous fluids can transport proppant much more effectively than slickwater fluids. At high foam qualities (gas volume fraction typically higher than 0.5), the interactions between gas bubbles cause a large energy dissipation that results in a high effective viscosity. At low foam qualities (less than 0.5) the interactions between bubbles are minimal so the fluid viscosity resembles that of the base fluid (which is typically gelled).

4. Water availability and cost. Operators are limited by the equipment and the fluids readily available on site. In areas prone to drought fresh water can become difficult to obtain. In some regions, the local legislation even limits water usage, which has prompted some operators to use waterless fracturing treatments. Alternatively, the supply and the cost of Liquefied Petroleum Gas (LPG), $C0_2$ and N_2 are strongly site-specific. Much of the cost savings depend on the availability of the fluid. The use of large quantities of gases requires the deployment of many trucks, pressurized storage units, and specific pumping equipment. In addition, handling of LPG will require additional safety measures

Table 2 broadly summarizes the different fluids that are used for hydraulic fracturing (EPA 2004; PetroWiki - Society of Petroleum Engineers 2013). In Section 2.3, recent analyses of trends in hydraulic fracturing fluids, additives and proppants are summarised. It is also worth to mention that (Barati and Liang 2014) very recently presented a review of fracturing fluid systems used for hydraulic fracturing.

Table 2. Different fluids used for hydraulic fracturing (adapted and expanded from (EPA 2004), Appendix A and (PetroWiki - Society of Petroleum Engineers 2013)

Base Fluid	***Fluid type***	***Main Composition***	***Section***
Water-based	Slickwater	Water + sand (+ chemical additives)	2.2
	Linear fluids	Gelled water, GUAR<HPG, HEC, CMHPG	
	Cross-linked fluids	Crosslinker + GUAR, HPG, CMHPG, CMHEC	
	Viscoelastic surfactant gel fluids	Electrolite+surfactant	
Foam-based	Water based foam	Water and Foamer + N_2 or CO_2	2.4
	Acid based foam	Acid and Foamer + N_2	
	Alcohol based foam	Methanol and Foamer + N_2	
Oil-based	Linear fluids	Oil, Gelled Oil	2.5
	Cross-linked fluid	Phosphate Ester Gels	
	Water Emulsion	Water + Oil + Emulsifiers	
Acid-based	Linear	-	2.6
	Cross-linked	-	
	Oil Emulsion	-	
Alcohol-based	Methanol/water mixes or 100% methanol	Methanol + water	2.7
Emulsion-based	Water-oil emulsions	Water + Oil	2.8
	CO_2-methanol	CO_2 + water + methanol	
	Others	-	
Other fluids	Liquid CO_2	CO_2	2.9.1
	Liquid nitrogen	N_2	2.9.2
	Liquid helium	He	2.9.3
	Liquid natural gas	LPG (butane and/or propane)	2.9.4

2.2. Water-based hydraulic fracturing

Table 2, adapted from (King 2012), demonstrates how unconventional gas production is driven by the development and application of technologies, by showing the increased recovery of gas and oil from the shales. An essential element, not only from a technological point of view but also from an environmental one, is the type of fluid used to perform the fracturing of the formation. This will dictate the type of required chemical additives, the need for flowback treatment, etc.

The predominant fluids currently being used for fracture treatments in the gas shale plays are water-based fracturing fluids mixed with friction-reducing additives (called slickwater). Many other water-based fluids are used, broadly speaking: linear fluids, cross-linked fluids, and viscoelastic surfactant fluids. These are discussed in the following.

Slickwater fracturing is probably the most basic and most common form of well stimulation in unconventional gas. The fracturing fluid is composed primarily of water and sand (> 98%). Additional chemicals are added to reduce friction, corrosion, bacterial-growth, and provide other benefits during the stimulation process. Low viscosity slick-water fluids generate fractures of lesser width and therefore greater fracture length, theoretically increasing the complexity of the created fracture network for better reservoir-to-wellbore connectivity.

Unfortunately, slickwater fluid is an inherently poor proppant carrier, necessitating high pump rates to achieve flow velocities sufficient to overcome the tendency of the proppants to settle. Proppant settling within surface equipment or long horizontal laterals can result in premature treatment termination and poor productivity. Linear gel and crosslinked systems have been used to mitigate the proppant settling and placement concerns, but the high viscosity that accomplishes this objective may significantly reduce the desired fracture complexity. Also, the long fracture closure times and the lack of efficient gel delayed breakers makes the proppant placement advantage of gel systems very limited as proppant settles while gel is breaking up and fracture has not yet closed.

More than 30% of stimulation treatments in 2004 in North America have been slickwater fracturing (Schein, 2005). The most important benefits of slickwater fracturing are reduced gel damage, cost containment, higher stimulated reservoir volume, and better fracture containment. But there are concerns such as poor proppant transport, excessive usage of water, and narrower fracture widths .(Kishore K. Mohanty 2012).

Some fracturing treatments require a higher viscosity fluid, such as **linear fracturing fluids**. These are formulated by adding a wide array of different polymers to water. Such polymers are dry powders that swell when mixed with an aqueous solution and form a viscous gel. The gel-like fluid is then more able to transport the proppant than would a normal low-viscous (slickwater) fluid. Common polymer sources used with the linear gels are guar, Hydroxypropyl Guar (HPG), Hydroxyethyl Cellulose (HEC), Carboxymethyl hydroxypropyl guar (CMHPG), and Carboxymethyl Hydroxyethyl cellulose (CMHEC) (EPA 2004). In low-permeability formations, linear gels control fluid loss very well, whereas in higher-permeability formations fluid loss can be excessive. Linear gels tend to form thick filter cakes on the face of lower-permeability formations, which can adversely affect fracture conductivity. The performance of linear gels in higher-permeability formations is just the opposite, since it forms no filter cake on the formation wall. Much higher volumes of fluid are lost due to viscous invasion of the gel into the formation.

Crosslinked fluids were developed in order to improve the performance of gelling polymers without increasing their concentration. Borate crosslinked gel fracturing fluids utilize borate ions to crosslink the hydrated polymers and provide increased viscosity. The polymers most often used in these fluids are guar and HPG. The crosslink obtained by using borate is reversible and is triggered by altering the pH of the fluid system. The reversible characteristic of the crosslink in borate fluids helps them clean up more effectively, resulting in good regained permeability and conductivity.

Table 3. Increased recovery of gas and oil from shales driven by the development and application of technologies (adapted from (King 2012))

Year	*Technologies Applied*	*% Recovery of Original Gas in Place*	*Shale Play*
1980's	Vertical wells, low rate gel in fracs	1%	Devonian
1990's	Foam fracs 1st slickwater in shale	1.5 to 2%	Devonian
2001	High rate slickwater fracs	2 to 4%	Barnett
2004	Horizontal well dominant, 2 to 4 fracs	5 to 8%	Barnett
2006	Horiz, 6 to 8 fracs, stimul fracs, water recycle trial	8 to 12%	Barnett
2008	16+ fracs per well, Petrophysics increases	12 to 30%	Barnett
2010	Technology to flatten decline curve, feeling pinch for frac water	30 to 40%	Haynesville
2011	Pad development drains 5000 acres, salt water displacing fresh for fracs	45%+	Horn River
Future developments	Green chemicals, salt water fracs, low disposal volume, reduced truck traffic, pad drilling, electric rigs and pumps	45 - 55%	Numerous

Borate crosslinked fluids have proved to be highly effective in both low and high permeability formations. They offer good proppant transport, a stable fluid rheology at temperatures as high as 300°F, low fluid loss and good cleanup properties (Haliburton 2011). Organometallic crosslinked fluids are also a very popular class of fracturing fluids. Primary fluids that are widely used are zirconate and titanate complexes of Guar, Hydroxypropyl Guar (HPG) and Carboxymethyl-Hydroxypropyl Guar (CMHPG). Organometallic crosslinked fluids are routinely used to transport the proppant for treatments in tight gas sand formations that require extended fracture lengths. They provides advantages in terms of stability at high temperatures and proppant transport capabilities. According to Halliburton, they provides excellent stability at high temperatures and proppant transport capabilities and offer more predictable rheological properties (Halliburton 2011a).

Viscoelastic surfactant gel fluids (VES) have been described in the patent literature for friction reduction and as well treatment fluids since the early 80s, but their use as fracturing fluids is relatively a new phenomenon. Principally, these fluids use surfactants in combination with inorganic salts to create ordered structures, which result in increased viscosity and elasticity. These fluids have very high zero-shear viscosity and can transport proppant with lower loading and without the comparable viscosity requirements of conventional fluids (Satya Gupta in (EPA 2011).

The technology of VES systems can be broken down into several categories based on the structure the system creates: worm-like micelles, lamellar structures or vesicles. As the concentration of surfactant increases in water, micelles start to form and start interacting with each other. These interactions are based on ionic forces and can be amplified by adding electrolytes (salts) or other ionic surfactants. These fluids are operationally simple: only one or two additives are added without any need to hydrate polymers. They do not require any biocides because they do not contain any biopolymers. They do not require additional flowback surfactants because they have inherently low surface and interfacial tension. No additional clay control additives are needed.

(Stringfellow, Domen et al. 2014) is a recent, thorough analysis of the characteristics of the chemicals found in hydraulic fracturing fluids with the aim to evaluate potential environmental fate and human health impacts. In this study, eighty-one common chemical additives were identified and categorized according to their functions. Physical and chemical characteristics of these additives were determined using publicly available chemical information databases. Most of the hydraulic fracturing chemicals evaluated were identified as non-toxic or of low toxicity and only three were classified as Category 2 oral toxins according to standards in the Globally Harmonized System of Classification and Labeling of Chemicals. Toxicity information was not located for thirty of the hydraulic fracturing chemicals evaluated, suggesting a certain deficiency in the current state of knowledge.

Several interesting technologies have been recently developed. These are reviewed in the following.

2.2.1. Zipper fracturing

Zipper fracturing involves simultaneous stimulation of two parallel horizontal wells. In this technique, created fractures in each cluster propagate toward each other so that the induced stresses near the tips force fracture propagation to a direction perpendicular to the main fracture (Rafiee, Soliman et al. 2012). This technique typically makes use of slick-water as fracturing fluid, and it is applied to shale formations (Yu and Sepehrnoori 2013).

2.2.2. Cavitation Hydrovibration fracturing

Cavitation Hydrovibration is a proprietary technique developed at the Institute of Technical Mechanics in Dnipropetrovsk, Ukraine, and it is designed to fracture rock using a pressurized water pulse action. No literature sources or patent applications were found to confirm the technical details of the status of application of the system, except for an online article authored by blogger Walter Derzko (Derzko 2008).

The technique is described as a green technology that operates using pure water, without the use of any chemical. The cavitation hydrovibrator is mounted in a drilling line and inserted into a vertical or horizontal borehole at the appropriate stratum level. Pressured water is fed to the cavitation hydrovibrator inlet through the drilling line using a drill pump. Then the water passes through the hydrovibrator flow passage and enters the borehole where the gas-saturated stratum is located. Due to the pressure differential across the hydrovibrator, the regime of periodically detached cavitation is set up in its flow passage. In this regime, the steady water flow is transformed into a high-frequency pulsating flow. The pulse-repetition frequency can be varied from 100 to several thousand Hertz. The water pressure pulse acts on the gas-bearing formation and it increases its degree of fracturing.

(Derzko 2008) reports that this method has been tested and used in the Novojarovskoje sulfur deposit (in the Lviv Region of Ukraine) and that the method performed well in the recovery of old water wells in the Moscow region and in the Pskov region (Russian Federation). It appears that the technology has not been tested yet to enhance gas recovery in conventional reservoirs, nor for shale gas production.

2.2.3. Hydra-jet fracturing

Hydrajet fracturing combines hydrajetting with hydraulic fracturing. This process involves running a specialized jetting tool on conventional or coiled tubing. To initiate the hydraulic fracture, dynamic fluid energy jets form tunnels in the reservoir rock at precise locations. The hydraulic fracture is then extended from that point outward. By repeating the process, one can create multiple hydraulic fractures along the horizontal wellbore (Loyd E. East, Grieser et al. 2004; Mcdaniel and Surjaatmadja 2009; Gokdemir, Liu et al. 2013).

This technique is applied on unconventional reservoirs, including shales (McKeon 2011). It appears to offer improvements on how the fractures are initiated, but it does not offer substantial advantages regarding the usage of water and chemical additives in the fracturing fluid.

(McDaniel 2014) offers a recent and pretty comprehensive review of the use of hydrajetting deployed in conjunction with coiled tubing technology. According to this author, hydrajet perforating has been used in many new oilfield applications since the mid-1990's, and many promising variations (improved jetting nozzles, tool compositions, etc.) are being developed.

2.2.4. Exothermic hydraulic fracturing

(Al-ajwad, Abass et al. 2013) describe the idea of injecting chemicals during the hydraulic fracturing treatment that – upon reaction – generate heat and gas. The temperature and gas increase then create localized pressure that results in thermal and mechanical fracturing.

This idea was tested in laboratory specimen (cores) collected from tight reservoirs in Saudi Arabia. The permeability of tested cores showed significant increase after applying the new treatment technique. Enhanced communication between micro and macro pores was also found.

A likely shortcoming of this technique is the localized effect. Unconventional gas reservoirs, being so tight, require stimulation that reaches far into the reservoir. As shown in thermal heavy oil recovery projects, it takes substantial energy (or well count) to cover a large extension of the reservoir with relevant temperature changes.

2.2.5. Hydraulic fracturing enhanced by water pressure blasting.

(Huang, Liu et al. 2011) describe the idea of enhancing the effectiveness of hydraulic fracturing by using water blasting for fracturing coal seams.

Water pressure blasting is a method that combines the use of water with that of explosives (note that explosive fracturing is discussed in details in section 4.1). In this technology, water is used as a coupling medium to transfer the generated explosion pressure and energy as to break the rock.

According to (Huang, Liu et al. 2011), traditional hydraulic fracturing techniques generally form main hydraulic cracks and airfoil branch fissures, with the former relatively fewer in number. These authors state that experimental tests prove that the method is an effective way to increase the number and range of hydraulic cracks, as well as for improving the permeability of coal seams.

The working principles of the method are described in the following. A hole is drilled in the coal seam and is injected with a gel explosive. Water is injected into the hole to seal it (at low enough pressure to prevent cracks from forming).Water pressure blasting is carried out by detonating the explosive. The water shock waves and bubble pulsations produced by the explosion cause a high strain rate in the rock wall surrounding the hole. The rock breaks and numerous circumferential and radial fractures propagate outward. Finally, conventional hydraulic fracturing is performed. The fissures open by the detonation are further expand.

This technique has been proposed very recently (2011) and it appears an experimental idea. It has been suggested for low-permeability coal-seam gas extraction, but it is judged that it could potentially be applied to shale formations. It appears to offer improvements on how the fractures are initiated, and could potentially reduce the quantity of water required for the hydraulic fracturing stage. Without any reports on depth of stimulation away from the well, this technique does not appear to be economical.

2.3. Trends in hydraulic fracturing fluids, additives and proppants

Some excellent studies were published in 2014 and 2015, analysing trends in the deployment of hydraulic fracturing, mainly in North America where the overwhelming majority of activities has taken place: distributions, treatment fluids, additives, proppants, water volumes, etc.

(Gallegos and Varela 2015) is a report of the US Geological Survey. They noted that comprehensive and publicly available information regarding the extent, location, and character of hydraulic fracturing in the United States is scarce. They nonetheless analysed data related to nearly 1 million hydraulically fractured wells and 1.8 million fracturing treatment records from 1947 through 2010 and used such information to identify hydraulic fracturing trends in drilling methods and use of proppants, treatment fluids, additives, and water. These trends were then compared to the literature to establish a common understanding of the differences in drilling methods, treatment fluids, and chemical additives and of how the newer technology has affected the water use volumes and areal distribution of hydraulic fracturing. The analysis showed that directional drilling increased from 6 percent of new hydraulically fractured wells drilled in the United States in 2000 to 42 percent of new wells drilled in 2010. This also coincided with the emergence of water-based fracturing fluids.

(Patel, Robart et al. 2014) provided a comprehensive analysis of hydraulic fracturing fluid systems and proppant trends across major shale plays in the United States between 2011 and the first half of 2013, by categorizing and analyzing over 55000 hydraulic fracturing treatments collected from FracFocus.org, a web-based initiative established in early 2011 with a centralized database to provide hydraulic fracturing chemical disclosures across the United States. The analysis identified changes over time in fracturing type, using the broad categories reported in Table 1. It also included a study on proppant trends, including usage rates for key proppant types (sand, resin-coated sand, and ceramics) and proppant loading trends. The full results cannot be summarized here for reasons of space, and the interested reader is referred to the original source.

(Al-Muntasheri 2014) presented a review of the available water-based fracturing fluids over the last ten years for fracturing reservoirs with low permeability. The review revealed the evolution of several interesting developments, including the use of cleaner guar-based polymers, of synthetic polymers and of larger-sized crosslinker molecules. The study also concluded that nanotechnology can be a promising tool to develop better performing fluids. According to the author, guar-based polymers are still being used for fracturing oil and gas wells, mainly because of their high shear stability and better cleanup compared with other systems. When fracturing hot reservoirs, synthetic polyacrylamide-based polymers can be used. The use of larger-sized boronic-based crosslinkers is helping reducing the concentration of polymers used in preparing fracturing fluids, even if no field application data have been reported yet for this system. Nanoparticles are being used to improve leak-off of viscoelastic-surfactant-based fluids, but an optimal employment of such materials still requires further research. Produced water can present an opportunity to address environmental concerns about water preservation. However, not all produced waters are compatible with fracturing fluids.

A review of fracturing fluid systems used for hydraulic fracturing was also very recently presented by (Barati and Liang 2014).

We conclude this brief section by mentioning an investigation by (Lee and Sohn 2014), who studied the current development status of shale gas technology in China as compared to that in the US by analysing patents registered in the two countries.

2.4. Foam-based fluids

Overview

For water-sensitive formations and environments where water is scarce, foams have long been considered as one of the best fracturing fluids (Neill, Dobbs et al. 1964; Komar, Yost II et al. 1979; Gupta 2009). In particular, **foams** are believed to be an appropriate means for fracturing shale gas reservoirs. They require lower (or no) water consumption, cause less damage in water sensitive formations and there is less liquid to recover and handle after the fracturing process. Expansion of the gas phase after the treatment also helps recover the liquid phase introduced into the formation with foams (Edrisi and Kam 2012).

Foams are being used in a number of petroleum industry applications that exploit their high viscosity and low liquid content. Some of the earliest applications for foam dealt with its use as a displacing agent in porous media and as a drilling fluid. In the mid-1970's, N_2-based foams became popular for both hydraulic fracturing and fracture acidizing stimulation treatments.

Most recently, CO_2 foams have been found to exhibit their usefulness in hydraulic fracturing stimulation. Different foam-based fluids can be used, as summarized in the table below (adapted from (EPA 2004). The liquid CO_2-based fluid consists of a foam of N_2 gas in liquid CO_2 as the external phase stabilized by a special foamer soluble in liquid or supercritical CO_2 (Gupta 2003). The main advantage of this fluid is the additional viscosity gained by the foam over liquid CO_2. The use of 75% volume of N_2 makes the fluid very cost-effective. The fluid has also found niche application in coalbed fracturing in Canada on dry coalbeds where any water introduced into the formation damages the cleats (Gupta in (EPA 2004)). Table 4 gives a broad summary of the types of foams used as fracturing fluids.

Table 4. Types of foams used as fracturing fluids.

Type of foam	***Main composition***
Water-based foams	Water and Foamer + N_2 or CO_2
Acid-based foams	Acid and Foamer + N_2
Alcohol-based foams	Methanol and Foamer + N_2
CO_2-based foams	Liquid CO_2 + N_2

The influence of foam quality on effectiveness of hydraulic fracturing in shales was recently studied by (Gu and Mohanty 2014)

Description

A foam is used as the fracturing fluid. Foams are structured, two-phase fluids that are formed when a large internal phase volume (typically 55 to 95%) is dispersed as small discrete entities through a continuous liquid phase (Reidenbach, Harris et al. 1986).

Foams are very unique and versatile because of low-density and high-viscosity characteristics. Previous studies show that foam viscosity strongly depends on foam quality (the gas fraction in the total gas and liquid mixture) and foam texture (the number of bubbles in unit mixture volume) (Edrisi and Kam 2012).

Rationale

It is claimed (Edrisi and Kam 2012) that for shale gas development in environmentally sensitive regions, foam fracturing appears to be advantageous over the conventional water-based hydraulic fracturing because less amount of water usage can be translated into fewer amounts of health-hazardous chemical additives in fracturing liquid. Expansion of the gas phase after the treatment also helps recover the liquid phase introduced into the formation with foams.

The most common application for high-quality foams is in water-sensitive gas-bearing formations, typically an under-saturated gas reservoir where water blockage is a major concern. Foams are beneficial when used for liquids-rich gas wells, such as in the Alberta Deep Basin and work in certain oil-bearing formations, such as the Cardium. Lastly, in areas where water is in short supply or hard to source, foams can present a very obvious advantage.

Potential advantages and disadvantages

Potential advantages

- Water usage reduced (or completely eliminated in case of CO_2-based foams).
- Reduced amount of chemical additives.
- Reduction of formation damage.
- Better cleanup of the residual fluid.

Potential disadvantages

- Low proppant concentration in fluid, hence decreased fracture conductivity.
- Higher costs.
- Difficult rheological characterization of foams, i.e. flow behaviour difficult to predict.
- Higher surface pumping pressure required.

Status of technique application for unconventional reservoirs

Foams are commercially used to fracture shale formations. For instance, (Rowan 2009) reports the use of foams to stimulate gas wells in the Lower Huron Shale in the Appalachian Basin. (Brannon, Kendrick et al. 2009) discuss the application of foams in the Big Sandy (a productive field of more than 25,000 wells, located in the eastern USA), characterized by ultra-low permeability, the Berea tight gas sands and Devonian Ohio shales such as the Huron formation.

NETL has an ongoing project[2] (2013 to 2016) on the development of nanoparticle-stabilized foams to improve performance of water-less hydraulic fracturing. One of the objectives of the project is to develop nanoparticle-stabilized foams that have a very low water content (< 25 vol. %) yet exhibit high apparent viscosity, so that they can be used as nearly water-less fracturing fluids. The latest quarterly report available (Bryant and Huh 2014) reports on the examination of the effects of polymer addition upon increasing the foam quality (reducing water content) without breaking the foam and on the development of a mechanistic foam dynamics model.

2.5. Oil-based fluids

Oil-based fracturing fluids were the first high-viscosity fluids used in hydraulic fracturing operations. A major advantage to this type of fluid is its compatibility with almost any formation type. Disadvantages are associated with potential high costs and greater concerns regarding personnel safety and environmental impact as compared to most water-based fluids. There are several oil-based fluids, for instance based on diesel, but a

[2] http://www.netl.doe.gov/research/oil-and-gas/project-summaries/enhanced-oil-recovery/fe0013723-UTA

promising technique, which has been developed especially for shale gas production, makes use of liquefied petroleum gas (LPG[3]). This is analysed in details in the following section.

2.5.1. LPG

Overview

Liquefied petroleum gas has been used as stimulation fluid for fifty years. It was developed for conventional reservoirs before being adapted to unconventional reservoirs. For instance, it was used to stimulate (or re-stimulate) oil wells. It has also been used to stimulate tight sands because of recovery improvements in reservoirs exhibiting high capillary pressures by eliminating phase trapping.

In 2007, the Canadian company GasFrac, based in Calgary (Alberta), started to use LPG gel to stimulate shale rocks. Since then, over 1500 operations of stimulation have been performed using this gellified propane technique both in Canada and United-States. The LPG used in the GASFRAC system is primarily propane (C3H8) (GasFrac 2013).

The technology is also developed by ecorpStim, based in Houston (Texas). In 2012, ecorpStim was at the origin of several technological developments: (1) removal of chemicals, by developing a new formula for the stimulation fluid (now composed exclusively of pure propane and sand, with no chemicals additives) and (2) reduced volumes of propane to meet stricter safety requirements. Pure propane is used (with the possibility of using butane and/or pentane for some rock types) (ecorpStim 2013a).

A recent analysis of effective fracture lengths and clean-up behaviour is presented by (Soni 2014). This paper also discusses major advantages and disadvantages of this technique along with some considerations on economics.

A fracturing fluid based on LPG as base fluid is proposed by (Xiangqian, Yongjun et al. 2013). The developed fracturing fluid system uses dialkyl phosphate ester as the gelling agent and a ferric complex as the cross-linking agent, and it is shown to have a very good crosslinking performance which makes it suitable for unconventional reservoirs.

According to a report commissioned by Arnaud Montebourg, French Minister of the Economy, Industrial Recovery and Digital Development (Montebourg 2015), the Ministry identified the LPG technology implemented by eCorp as very promising to address the environmental concerns raised by water-based hydraulic fracturing. The Ministry was concerned about the high flammability of LPG, and toward the end of 2012 asked eCorp to perfect a technology that would eliminate such risk. eCorp is thus developing a fracturing technology based on non-flammable propane (NFP), i.e. heptafluoropropane, combined with and a proppant (mesoporous silica), described more in detail below (ecorpStim 2013b).

In 2015 ecorpStim has announced a non-flammable, non-toxic shale stimulation fluid based on light alkanes (ecorpStim 2015). This technology makes use of naturally occurring components in conventional and shale hydrocarbon production , i.e. a selection of low molecular weight alkanes ("light alkanes"). These alkanes are non-flammable are approved by the U.S. Food and Drug Administration for human ingestion and exposure. They also have no adverse impacts on the environment: they are non-ozone depleting and have zero global warming potential.

Description of the technique

LPG is used as the fracturing fluid (Taylor, Lestz et al. 2006; Lestz, Wilson et al. 2007). In the GasFrac system, LPG is gelled before the fracturing to allow better transport of

[3] Liquefied petroleum gas (LPG) is a flammable mixture of hydrocarbon gases normally used as a fuel in heating appliances and vehicles. Varieties of commercial LPG include mixes that are primarily propane (C_3H_8), primarily butane (C_4H_{10}) or mixtures including both propane and butane.

proppant into the fracture. In the ecorpStim system, LPG is not gelled. Buoyant proppants such as fine sand and carbon fullerenes are used, but it still needs to be proven that they are strong enough for widespread application.

When fracturing, the LPG remains liquid, but after completing the process it goes into solution with the reservoir gas.

Rationale

Liquid propane is particularly suitable for use as fracturing fluid because it is less viscous than water. Many shale formations are water-sensitive, and using LPG would avoid this problem.

The GasFrac LPG gel properties include: low surface tension, low viscosity, low density, and solubility within naturally occurring reservoir hydrocarbons. These properties are suggested to lead to more effective fracture lengths are created and thus enable higher production of the well. Another reported advantage is the ability to evenly distribute proppant. The fracturing fluids are totally recovered within days of stimulation, creating economic and environmental advantages by reducing clean-up, waste disposal and post-job truck traffic (GasFrac 2013).

The ecorpStim system completely avoids the use of chemical additives. The company reports that, while in hydraulic fracturing 30-80% of water is recovered, propane stimulation allows a recovery of 95-100% of injected gas. The recovered propane can be sold as such (i.e. directly inserted in the pipelines) or used for another stimulation operation. The seismic risk related to the injection of waste water in the subsoil is suppressed as well (ecorpStim 2013a).

When gelled, LPG provides a consistent viscosity, does not require the costly use of CO_2 or N_2, nor does it require any special cool down or venting of equipment. LPG is an abundant by-product of the natural gas industry and is stored at ambient temperature. Using LPG also reduces the need to flare production to clean up the traditional fracturing fluids, reducing CO_2 emissions. Because propane liquid is half the specific gravity of water, there is reduced trucking to the site and no trucking to transport post stimulation - which can reduce truck traffic by up to 90%.

The main drawback of this technology is that it involves the manipulation of large amounts (several hundred tons) of flammable propane (and the associated risks/safety hazards). It is therefore a more suitable solution in environments with low population density, provided of course that the workers safety can be strictly guaranteed.

As described above, to mitigate the risk of flammability, ecorpStim is currently developing and testing a technology that makes using of non-flammable propane (NFP), i.e. heptafluoropropane. Non-flammable propane is a well-known gas, used in products including fire extinguishers and medical inhalers. NFP stimulation is reported to have all the advantage of pure propane stimulation (no water, no chemical additives), and to eliminate the risks of flammability associated with propane (Montebourg 2015). Other advantages are associated with non-flammable propane, as replacing water with propane leads to a reduction of the footprint on the surface, the equipment needed, the number of heavy vehicles and the volumes of fluids required. The time needed to stimulate the rock is also reported to be between one third and one tenth shorter. The reduction of the volume of fluid necessary to carry out a stimulation operation (estimated at between 1/10th to 1/30th when compared to water) means that an extra layer of tubing can be added to the well, reinforcing the protection of the well and thus reducing the risk of breaching the well integrity during the stimulation phase.

Light alkanes stimulation is based on the idea that – just like in pure propane stimulation – these alkanes are a component of natural hydrocarbon production from shales and conventional reservoirs. Thus, their use as the stimulation fluid does not damage the reservoir rock and therefore should allow increased production from the well compared with traditional hydraulic fracturing. Likewise, light alkanes can also be self-supplied

from the reservoir being stimulated. Finally, they can be recycled through the reservoir and recovered for further use, in the same way as for propane and heptafluoropropane (ecorpStim 2015). According to the developers, light alkanes stimulation provides a greater flexibility (broad range of viscosity / density) which enables this new method to be used in different shale formations and under varied operating conditions.

Potential advantages and disadvantages

Potential advantages

- Water usage much reduced or completely eliminated.
- Fewer (or no) chemical additives are required.
- Flaring reduced.
- Truck traffic reduced.
- Abundant by-product of the natural gas industry.
- Increased the productivity of the well.
- Lower viscosity, density and surface tension of the fluid, which results in lower energy consumption during fracturing.
- Full fluid compatibility with shale reservoirs (phase trapping virtually eliminated).
- No fluid loss. Recovery rates (up to 100%) possible.
- Very rapid clean up (often within 24 hours).

Potential disadvantages

- Involves the manipulation of large amounts of flammable propane, hence potentially riskier than other fluids and more suitable in environments with low population density. This disadvantage completely disappears if using heptafluoropropane.
- Higher investment costs.
- Success relies on the formation ability to return most of the propane back to surface to reduce the overall cost.
- Heptafluoropropane is a very stable hydrocarbon, and as such presents a global warming potential.

Costs

Investment costs are estimated to be higher than for hydraulic fracturing, because LPG is pumped into well at a very high pressure, and after each fracturing it has to be liquefied again (Rogala, Krzysiek et al. 2013). In addition, propane costs more than water both initially and as an ongoing cost, to make up for the portion that is not returned to the surface after each operation.

Status of technique application

The LPG-based fracturing techniques reviewed (GasFrac and ecorpStim) are both commercially applied in unconventional reservoirs in North America. (Lenoir and Bataille 2013) report that between 2008 and 2013, 2000 fracturing operations were carried out by the GasFrac company in North America (primarily in Canada and, since 2010, in Texas). In 2013 ecorpStim announced the successful field application of the technique employing pure liquid propane, by stimulating the Eagle Ford Shale at a depth of 5950 feet. The test took place in Frio County, Texas, and was completed in late December 2012. No chemical additives of any kind were used.

Heptafluoropropane stimulation is being tested in field experiments by ecorpStim at the time of writing (November 2015).

Light Alkanes Stimulation is being patented by ecorpStim and the company was conducting further testing and experimentation of this technology in several basins in the United States during the course of 2015.

2.6. Acid-based fluids

Overview

The main difference between acid fracturing and proppant fracturing is the way fracture conductivity is created. In proppant fracturing, a propping agent is used to prop open the fracture after the treatment is completed. In acid fracturing, acid is used to "etch" channels in the rock that comprise the walls of the fracture. Thus, the rock must be partially soluble in acid so that channels can be etched in the fracture walls.

In shale formations, although many have a significant amount of dissolvable carbonate and limestone, the content in the rock is not a continuous phase. Hence, it is difficult to use acid-based fluids even in the few high carbonate reservoirs such as the Eagle Ford in the USA. Without a continuous carbonate/limestone phase it is very difficult to etch the required "continuous" channel. Also, flow-back needs to manage the disposal of significant calcium carbonate/limestone volumes that come dissolved in the spent acid. Long etched fractures are difficult to obtain, because of high leakoff and rapid acid reaction with the formation (PetroWiki - Society of Petroleum Engineers 2012). However, (Burgos, Buijse et al. 2005) have recently reported on how better acid fracturing mixtures have improved penetration even at higher temperatures.

More recently (Sanchez Bernal, Tate et al. 2015) have discussed acid fracturing in tight gas carbonates reservoirs using CO_2 to assist stimulation fluids. This paper outlines the fact that there are very limited applications for low permeable tight carbonate reservoirs due to complexities associated with the physical and mechanical properties of carbonate rocks and its interaction with fracturing fluid. Nevertheless the advantages of using assisted CO_2 stimulation fluids are noteworthy, because of the elimination of potential formation damage normally associated with fracturing fluids and the very rapid clean-up. The study presents one of the first acid fracturing jobs assisted with CO_2 conducted on a tight gas well reservoir in Saudi Arabia, and concluded that CO_2 used to energized fracturing fluids can increase the productivity of the well while using less water and less acid than conventional acid fracturing.

(Gensheng, Mao et al. 2012) presents an acid fracturing methodology, called "hydraulic jet acid fracturing technique", for deep carbonate reservoirs, where high temperature, high fracture pressure (>2.0 MPa/m), high flow friction, and strong reservoir heterogeneity present severe challenges.

Status of technique application

For the reasons highlighted above, the application of acid fracturing is confined to carbonate reservoirs and is never used to stimulate sandstone, shale, or coal-seam reservoirs.

2.7. Alcohol-based fluids

Overview

In the 1990s and up until 2001, some companies (for instance BJ Services, now part of Barker Hughes) used methanol as a base fluid in fracturing applications in Canada and Argentina (Antoci, Briggiler et al. 2001). In those cases, the fractured formations either had low permeability with high clay content, low bottom-hole pressure, and/or minimal load fluid recovery.

However, a recent report prepared for Methanol Institute in 2012 ("White Paper - Methanol Use in Hydraulic Fracturing Fluids") reviewed the literature and concluded that methanol was used infrequently as a base fluid (Saba, Mohsen et al. 2012). The main reason given was the problem of safe handling issues and additional expenses to ensure that all personnel involved with methanol treatments are thoroughly trained in the proper procedures for handling flammable materials. This study also concluded that,

compared to water-based fracture fluids, methanol-based fluids are 3 to 4 times as expensive. In summary, concerns about safety and associated costs to use methanol has led to shifting away from methanol as a base fluid and limiting its use to being only an additive.

Nonetheless, in formations with severe liquid (aqueous and hydrocarbon) trapping problems, non-aqueous methanol fluids may be a solution (Gupta 2010). Over the years, several authors have identified the advantages of alcohol-based fluids, including low freezing point, low surface tension, high water solubility, high vapor pressure and formation compatibility. Methanol is also the fluid of choice for formations with irreducible water and/or hydrocarbon saturation (Bennion, Thomas et al. 1996; Bennion, Thomas et al. 2000).

Methanol-based fluids have been used on low permeability reservoirs, but it is not clear if their application has been extended to shales.

Description of the technique

A methanol-based fluid is used as the fracturing fluid.

Several methods to increasing the viscosity of methanol have been described in the literature, ranging from foaming methanol to gelling it with synthetic polymers and guar. Attempts have also been made to crosslink gelled methanol with metal crosslinkers. The most recent development (Gupta, Pierce et al. 1997) describes a modified guar dissolved in anhydrous methanol crosslinked and has been successfully used in the field. In underpressured wells, it has been energized with N_2. Methanol-based fluids can also be energized with CO_2 for formations with severely under-pressured wells.

These fluids should be selectively used with special safety considerations due to the flammability of methanol. The flash point (i.e. the lowest temperature at which it can vaporize to form an ignitable mixture in air.) of methanol is 53°F (11.6°C) and its density is greater than that of air, which presents a safety hazard to field personnel. Oxygen contact must be avoided and therefore a "blanket" of CO_2 vapor is used to separate methanol vapor from any oxygen source. Personnel must wear fire-resistant coveralls.

Rationale

For formations with severe liquid trapping problems or irreducible water and/or hydrocarbon saturation, non-aqueous methanol fracturing fluids may be the best (or the only viable) a solution.

Methanol has excellent properties such as high solubility in water, low surface tension and high vapor pressure. These are favorable for the recovery of the fracture and formation fluids, hence increasing the permeability of the gas in the treated zone (Hernandez, Fernandez et al. 1994).

Potential advantages and disadvantages

Potential advantages

- Water usage much reduced or completely eliminated.
- Methanol is not persistent in the environment (biodegrades readily and quickly under both anaerobic and aerobic conditions and photo-degrades relatively quickly).
- Excellent fluid properties: high solubility in water, low surface tension and high vapor pressure.
- Very good fluid for water-sensitive formations.

Potential disadvantages

- Methanol is a dangerous substance to handle:
    a. Low flash point, hence easier to ignite.
    b. Large range of explosive limits.
    c. High vapor density.
    d. Invisibility of the flame.

Costs

(Saba, Mohsen et al. 2012) indicate that, because of its low viscosity compared to water, methanol reduces the pumping pressure required to deliver the fracturing fluids to the formation. Because lower piping friction requires less hydraulic power, this can have a significant impact on reducing costs.

(Antoci, Briggiler et al. 2001) describe a study where more than 200 hydraulic fracturing jobs using crosslinked anhydrous methanol as fracture fluid were performed in Argentina. These treatments were carried out in conventional (sandstone) reservoirs. The introduction of crosslinked methanol was aimed at reducing treatment cost while maintaining better stimulation results associated with CO_2 foam. This was accomplished: crosslinked methanol cost was less than 50% compared to using CO_2 foam. Other cost-reducing advantages were given by the nature of the completion procedure, for instance by allowing fracturing in as many intervals as considered necessary without killing the well or without having to invade the zones with water base completion fluids.

Status of technique application

Methanol-based fluids have been used on low permeability reservoirs, but it is not clear if their application has been extended to shales.

Methanol as an additive is widely used in hydraulic fracturing, for instance as a corrosion or scale inhibitor, friction reducer, formation water flowback enhancer and fracturing fluid flowback enhancer (Saba, Mohsen et al. 2012).

2.8. Emulsion-based fluids

Overview

There are many different emulsion-based fluids that have been developed and used as fracturing fluids. Many of such fluids use emulsions of oil and water, and could therefore be classified under the oil-based fluids (section 2.5). A comprehensive review of these fluids is beyond the scope of this review. Broadly speaking, emulsion-based fluids reduce or completely eliminate the use of water.

A high-quality emulsion of $C0_2$ in aqueous alcohol-based gel was used in the western Canadian sedimentary basin as a fracturing fluid in 1981. Since then, the use of such fluid has been very successful, particularly in low-pressure, tight gas applications. The fluid has the same advantages as conventional high-quality $C0_2$ foams, with the added advantage of minimizing the amount of water introduced into the well (Gupta, Hlidek et al. 2007).

(Liu, Fan et al. 2010) describe a new fracturing fluid (called SPME-Gel) obtained with the combination of a single phase micro-emulsion and a gellable polymer system. A microemulsion is defined as a dispersion consisting of oil, surfactant and aqueous phase, which is a single optically isotropic liquid solution with a droplet diameter usually within the range of 10–100 nm. This formulation was prepared by adding a microemulsion into a gelable polymer system at various concentrations obtaining the characteristics of high viscosity, low fluid loss and low friction. It was also shown that the broken SPME-Gel systems have low residues remaining in formation, low surface tension, low pressure to initiate cleanup and high core permeability maintaining, thus offering promising characteristics.

Description of the technique

An emulsion, i.e. a mixture of two or more liquids that are normally immiscible (i.e. non-mixable), is used as the fracturing fluid.

Rationale

Certain formations have potential to retain even the small amounts of water contained in foams. These fluids may damage these sensitive formations because of irreducible water saturation and liquid trapping. In these formations, replacing 40% of the water phase used in conventional CO_2 foams with methanol can minimize the amount of water. (Gupta, Hlidek et al. 2007) showed that a 40% methanol aqueous system yielded gave very good production results in several Canadian gas formations (Gupta et al., 2007).

Potential advantages and disadvantages

Potential advantages

- Depending on the type of components used to formulate the emulsion, these fluids can have potential advantages such as:
    a. Water usage much reduced or completely eliminated.
    b. Fewer (or no) chemical additives are required.
- Increased the productivity of the well.
- Better rheological properties.
- Fluid compatibility with shale reservoirs.

Potential disadvantages

- Potentially higher costs.

Costs

Costs could potentially be higher when compared to water-based hydraulic fracturing, depending on the type of emulsion formulation.

Status of technique application

Emulsion-based fluids have been used on several unconventional (low permeability) formations, but no direct usage for shale gas stimulation could be found as a part of the present study.

2.9. Cryogenic fluids

2.9.1. Liquid CO_2

Overview

It appears that CO_2 is (or can be) used in different ways:

- Liquid CO_2 for hydraulically fracturing the reservoir (commercially used).
- Super-critical CO_2 for hydraulically fracturing the reservoir (concept stage).
- CO_2 foams. These are described more in detail in section 2.4.
- CO_2 thermal hydraulic fracturing, a method that combines conventional hydraulic fracturing with fractures caused by the thermal stresses that are generated when the cold fluid enters the hotter reservoir). This method is described more in detail in section 2.9 (concept stage).
- Hybrid systems: CO_2 in conjunction with other fluids.

Description of the technique

Liquid (or super-critical) CO_2 is used instead of water as the fracturing fluid. The family of these fluids consists of pure liquid CO_2 and a binary fluid consisting of a mixture of liquid CO_2 and N_2 to reduce costs.). In these systems, the proppant is placed in the formation without causing damage of any kind, and without adding any other carrier fluid, viscosifier or other chemicals.

Liquid CO_2 has been used in fracture operation since the early 1960's. In the beginning it was used as an additive to hydraulic fracturing and acid treatments to improve recovery of treating fluid. (Mueller, Amro et al. 2012). The concept of fracturing with 100% CO_2 as the sole carrying fluid was first introduced in 1981.(Sinal and Lancaster 1987)

The use of supercritical CO_2 for fracturing has been recently suggested ((Gupta, Gupta et al. 2005; Gupta 2006), (Al-Adwani, Langlinais et al. 2008)). Two recent papers discussing opportunity and challenges for supercritical CO_2 fracturing are (Middleton, Viswanathan et al. 2014) and (Middleton, Carey et al. 2015).

The physical properties of liquid CO_2 make it a unique fluid. CO_2 is relatively inert compound that, depending on the temperature and pressure, exists as a solid, liquid, gas or super critical fluid. Above the critical point, it is considered to be a super critical fluid. In field operations, liquid C02 is at 2.0 MPa and -35°C in the storage vessel. After the addition of proppants, high pressure pumps increase the pressure (example 35 to 40 MPa). As the fluid enters the formation, the temperature increases toward bottom-hole temperature. During flow back, the pressure decreases and CO_2 comes to the surface as a gas.

Supercritical CO_2 is a fluid state where CO_2 is held at or above its critical temperature (31.1°C) and critical pressure (72.9 atm or 7.39 MPa). Owing to its unique physical and chemical properties, supercritical CO_2 can obtain a higher penetration rate in shale formation and adds no damage to the reservoir.

A 2014 review of application status and development trends of CO_2 fracturing is offered in (He, Feng et al. 2014). (Godec, Koperna et al. 2014) reports on research sponsored by the U.S. Department of Energy to assess factors influencing enhanced gas recovery and CO_2 storage in selected shale basins in the Eastern USA. Other very recent studies are given by (Song, Su et al. 2015)

Hybrid systems making use of CO_2 in conjunctions with other fluids have been recently proposed (Ribeiro, Li et al. 2015).

Rationale

According to D.V. Satya Gupta (quoted in (EPA 2011), fluids based on liquid CO_2 are at the technological cutting edge. These fluids have been very successfully used in tight gas applications in Canada and several US formations.

During hydraulic stimulation using conventional fracturing fluid, water-based fracturing fluids can get trapped as liquid phase in rock pores next to the fractures due to very low permeability in tight gas and shale formations. This phenomenon is called water-phase trapping and can significantly damage the region near the wellbore. Water blocking may plague the success of hydraulic fracturing in low permeability gas reservoirs, and resulted significant loss of relative permeability due to the capillary effects between the treatment fluid and reservoir fluids. Another problem could be the swelling of clays which reduce the permeability as well. The injected fluid during hydraulic fracturing should be compatible with the formations to avoid swelling. CO_2 has the necessary properties that may support such requirements (Mueller, Amro et al. 2012).

An important feature is the fact that the CO_2 adsorption capacity with shale is stronger than that of methane (CH4). Thus, it can replace CH4 in the shale formation, enhancing gas production and at the same time remaining locked underground. At reservoir

conditions, CO_2 adsorption exceeded CH4 adsorption by a factor of five, suggesting that CO_2 enhanced gas recovery from shale could serve as a promising mean to reduce life cycle CO_2 emission for shale gas. On a strictly volumetric basis, gas shales have the potential to sequester large amounts of CO_2, provided that CO_2 can diffuse deep into the matrix (Nuttall, Eble et al. 2005).

When taken into fracturing, it can cause much more complicated fractures for its lower viscosity property, which has a benefit to shale gas exploitation (Al-Adwani et al., 2008; Wang, 2008; Gupta et al., 2005).

After the treatment, the evaluation of a fractured zone can take place almost immediately because of rapid clean-up. The energy provided by CO_2 results in the elimination of all residual liquid left in the formation from the fracturing fluid. The gaseous CO_2 also aids in lifting formation fluids that are produced back during the clean-up operation.

The biggest advantage is that the CO_2 adds no pollution to the environment, and it can have a positive net effect when considering the greenhouse gas emissions issue. An article in New Scientist has recently discussed the possibility that fracturing with CO_2 could spur the development of large-scale carbon sequestration (McKenna 2012).

(He, Feng et al. 2014) conclude that liquid CO_2 fracturing offers unique advantages but their analysis also shows that there are still existing disadvantages. These authors identify the high friction of liquid CO_2; the lack of suitable drag reducer; the very low viscosity of the fluid and its poor proppant carrying capacity; and the high fluid loss in fracturing. They also conclude that the CO_2 phase behaviour change is very complicated, and precise prediction methods are lacking. Finally, they identify supercritical CO_2 fracturing, because of better stimulation capability, reduced fracturing pressure and hence lesser requirements on equipment, as representing the development trend within the field of CO_2 fracturing.

Some researchers are proposing the use of supercritical CO_2 as a fracturing fluid for shale gas production in conjunction with gas turbines using the same fluid (Contri 2015; Giacomazzi and Messina 2015).

(Ribeiro, Li et al. 2015) have very recently introduced a new CO_2-hybrid fracturing design, consisting of (1) injecting pure CO_2 to generate a complex fracture network and (2) injecting a gelled slurry to generate near-wellbore conductivity. According to the authors, the motivation behind this concept is that while current aqueous fluids provide sufficient primary hydraulic fracture conductivity back to the wellbore, they under-stimulate the reservoir and/or leave behind damaged stimulated regions deeper in the fracture network. The proposed design is indicated as particularly attractive for brittle reservoirs, capable of sustaining substantial production from unpropped fractures. The concept is based on experimental and numerical studies and has not been applied as yet in the field.

Potential advantages and disadvantages

Potential advantages

- Potential environmental advantages:
    a. Water usage much reduced or completely eliminated.
    b. Few or no chemical additives are required.
    c. Some level of CO_2 sequestration achieved.
- Reduction of formation damage (reduction of permeability and capillary pressure damage by reverting to a gaseous phase; no swelling induced).
- Form more complex micro-fractures, which can connect many more natural fractures greatly, increasing maximally the fractures conductivity. (Wang, Li et al. 2012).

- Enhance gas recovery by displacing the methane adsorbed in the shale formations (Wang, Li et al. 2012).
- Evaluation of a fracture zone is almost immediate because of rapid clean-up. The energy provided by CO_2 results in the elimination of all residual liquid left in the formation from the fracturing fluid.
- Better cleanup of the residual fluid, so smaller mesh proppant can be used and supply adequate fracture conductivity in low permeability formations.
- The use of low viscosity fluid results in more controlled proppant placement and higher proppant placement within the created fracture width.

Potential disadvantages

- The main disadvantages follow from the fluids' low viscosity. Proppant concentration must necessarily be lower and proppant sizes smaller, hence decreased fracture conductivity.
- CO_2 must be transported and stored under pressure (typically 2 MPa, -30°C).
- Corrosive nature of CO_2 in presence of H_2O.
- Unclear (potentially high) treatment costs.

Costs

Some sources indicate that one of the major limitations of this technology has been their high treatment cost. Although stimulation treatments using the low-viscosity liquid CO_2 system have been successful, the high pumping rates required to place these jobs and the associated frictional losses raised horsepower requirements. [D.V. Satya Gupta, quoted in (EPA 2011)]

Other authors state that fracturing with CO_2 can be economical. For instance, Sinal and Lancaster 1987) state that the costs for fracturing fluid clean-up and associated rig time are considerably less than with conventional fracturing fluids. These advantages are reported: swabbing of the well is completely eliminated as a post-fracturing treatment; no disposal of recovered fracturing fluid is required; and evaluation of the well takes less time.

(Wang, Li et al. 2012) state that fracturing with supercritical CO_2 can offer a reduction of costs, mainly because of an enhancement of gas.

Status of technique application

Liquid CO_2 as fracturing fluid is already commercially used in many unconventional applications (most notably, tight gas) in Canada and the US (EPA 2011). (Yost II, Mazza et al. 1993) reports that wells in Devonian shale formations (Kentucky, USA) were stimulated with liquid CO_2 and sand as early as 1993.

Super-critical CO_2 use appears to be at the concept stage. Studies have analysed its potential use to fracturing shale formation, with positive conclusions. (Ishida, Niwa et al. 2012; Wang, Li et al. 2012). According to (Ishida, Niwa et al. 2012), "*combining the characteristics of SC-CO_2 fluid and shale gas reservoir exploitation, the feasibility of shale gas exploitation with SC-CO_2 is demonstrated in detail*". Another 2study (2015) is (Fang, Chen et al. 2014).

2.9.2. Liquid Nitrogen (N_2)

Overview

Generally, fracturing using nitrogen tend to use the gas mixed with other fluids: mists (mixtures composed of over 95% nitrogen carrying a liquid phase), foams (mixture composed of approximately 50% to 95% of nitrogen formed within a continuous liquid phase), or energized fluids (mixtures composed of approximately 5% to 50% nitrogen).

Liquid nitrogen used as a hydraulic fracturing fluid is a technology that is still fairly new, but it has been applied for fracturing shale formations (Grundmann, Rodvelt et al. 1998; Rowan 2009).

The extremely low temperature of the fluid (-184°C to -195°C) will induce thermal tensile stresses in the fracture face. These stresses exceed the tensile strength of the rock, causing the fracture face to fragment. Theoretically, self-propping fractures can be created by the thermal shock of an extremely cold liquid contacting a warm formation. As the fluid warms to reservoir temperature, its expansion from a liquid to a gas results in an approximate eightfold flow-rate increase (Grundmann, Rodvelt et al. 1998). Recently, (Cai, Li et al. 2014) have carried out an experimental study on the effect of liquid nitrogen cooling on rock pore structure.

Description of the technique

Liquid nitrogen is used as the fracturing fluid.

For nitrogen to be pumped safely into a well, the entire surface manifold and wellhead must be made of stainless steel. In some cases, operators may use special fiberglass tubing to protect the casing from the extremely low temperatures.

Rationale

The two main reasons for using pure nitrogen as fracturing fluid in shale formations are (1) when the formation is under pressured and (2) because shale can be sensitive to fluids. The nitrogen helps fluid recovery by adding energy to help push any fluid from the fracturing process or the reservoir out of the wellbore. These fluids can accumulate and create enough hydrostatic pressure that the reservoir cannot overcome.

Potential advantages and disadvantages

Potential advantages

- Potential environmental advantages:
    a. Water usage completely eliminated.
    b. No chemical additives are required.
- Reduction of formation damage.
- Self-propping fractures can be created by the thermal shock, hence need for proppant reduced or eliminated.

Potential disadvantages

- Special equipment required to safely handle liquid N2, due to the very low temperature of the fluid.
- Higher costs.
- Difficult to implement as liquid nitrogen travelling down the well will heat up and become a gas thus not able to transport proppant. Even if well temperature insulation is applied successfully, the nitrogen will become a gas very soon after entering the formation thus losing all ability to place proppant.

Costs

Nitrogen is a very common component of the atmosphere (~78% in volume) so it is assessed that liquid nitrogen can be manufactured anywhere and will still be relatively cheap. The need to use special pumping and handling equipment will increase costs.

Status of technique application

Using nitrogen as a component (in mists, foams or other energised fluids) of the fracturing medium is very common in the petroleum industry. The use of gaseous nitrogen in pneumatic fracturing is discussed in Chapter3. On the other hand, the use of

liquid nitrogen is less typical. The technique is commercially available, and it has been applied for fracturing shale formations (Grundmann, Rodvelt et al. 1998), but its usage appears to be limited. This is probably due to its higher costs.

2.9.3. Liquid Helium

The use of liquid helium as fracturing fluid is mentioned in very few sources, notably in a study prepared for the Parliamentary Office for the Evaluation of Scientific and Technological Choices of the French Republic[4] (Lenoir and Bataille 2013). No further details or references were given therein, except for a passing mention.

Chimera Enery Corp announced in 2012 the development of a fracturing technique that makes use of liquid helium. No literature sources or patent applications were found to confirm the technical details of the status of application of the system at the time of publication of (Gandossi 2013).

On 25 October 2012, Chimera Energy Corporation was suspended from trading by the US Securities and Exchange Commission because of questions regarding the accuracy of its statements in press releases to investors concerning, among other things, the company's business prospects and agreements. Its website (http://www.chimeraenergyusa.com/) did not appear to be working.

It now appears that the company run a fraudulent scheme in which media hype was created by issuing news releases about a fracturing technology touted as an environmentally friendly alternative to hydraulic fracturing, with the aim of increasing the company's stock price. After an investigation whose results were published in 2014, the Securities and Exchange Commission (a US Federal regulatory agency) concluded that Chimera never had any significant assets and that the technology was fictitious. The owners of the company were charged with securities fraud (http://fuelfix.com/blog/2014/08/15/sec-charges-houston-energy-firm-in-stock-pump-and-dump-scheme/).

2.9.4. Other cryogenic fluids

Overview

Other cryogenic fluids can be used. For instance, Expansion Energy has patented a technique that makes use of **cryogenically processed natural gas** extracted from nearby wells or from the targeted hydrocarbon formation itself (Vandor 2012; Expansion Energy 2013). According to the developers, this technique has been developed especially to target shale formations. The invention is called VRGETM (also called "dry fracturing", US Patent N. 8342246).

VRGETM creates cold compressed natural gas (CCNG) at the well site. This fluid is then pumped to high pressure before expanding it and blending it with a proprietary, foam-based proppant delivery system. This "gas-energized" fluid is then sent down-hole where it fractures the formation and holds open the fissures in the formation with proppant delivered by the foam system.

Expansion Energy claims that VRGE virtually eliminates the use of chemical additives because VRGE uses little or no water. Further, natural gas used by VRGE for fracturing eventually resurfaces and can be sold to the market or used for additional VRGE fracturing. As a result, there is no economic loss from using natural gas as the fracturing medium. After fracturing is complete, the CCNG plant can either be moved to the next well site for fracturing or it can remain at the original well site to produce LNG for the market.

[4] Office parlementaire d'évaluation des choix scientifiques et technologiques (OPECST).

Status of technique application

According to the developers, the method is "available for license". It is not clear if it has been already commercially deployed.

2.10. Potential new developments

Gupta (in (EPA 2011) suggests the following potential new developments in the area of unconventional fluids:

- High-temperature viscoelastic fluids;
- Polymers that associate with surfactants that can be used as straight fluid or foams (Gupta and Carman 2011);
- Fluids based on produced water (also based on associative polymers). These fluids are described more in detail in the following sub-section.

2.10.1. Fluids based on produced water

With the increasing demands and rising cost of fresh water for oilfield operations, there is a drive to use produced water in place of fresh water in stimulation operations (Li, Sun et al. 2014). Produced water in the oil industry usually refers to water that is produced along with oil and/or gas from hydrocarbon wells, whereas flowback water usually refers to the fraction of the original fracturing fluid that flows back through the well after the treatment is performed. Flowback water can be considered as a subcategory of produced water.

Produced water often contains high levels of salinity. For instance, produced water from shale formations such as the Marcellus and Bakken basins has high total dissolved solids (TDS) content and high hardness. TDS are the total amount of mobile charged ions, including minerals, salts or metals dissolved in a given volume of water, whereas hardness is defined as the amount of dissolved calcium and magnesium in the water. High levels of TDS and hardness in produced water can pose challenges for a wide spectrum of fracturing fluids that are commonly formulated with clean water. Many fracturing fluids that are originally prepared with clean water may show significantly lower performance or even completely fail if salty produced water is used instead.

Some companies treat produced water to obtain a water quality suitable for formulating a suitable fracturing fluid. However, it is often cost-prohibitive to treat high-TDS produced water enough that it can be stably used to formulate fracturing fluids. At the same time, it can also be expensive to dispose of produced water by underground deep well injection or to transport it to a suitable disposal facility. Fluid systems that can be formulated directly with salty produced water without compromising the performance are therefore very desirable.

To be considered practical and successful, a fracturing fluid prepared with treated high-TDS and hard produced water should deliver a comparable performance as the fluid formulated with fresh water. For example, the fluid should possess sufficient viscosity to transmit the high pumping pressure exceeding the rock strength to create fractures in the formation and to transport proppant into the created fractures.

Untreated produced water has been used directly to formulate a number of fracturing fluid systems. For example, zirconium -crosslinked CMHPG fluids have been reported to work with produced water with some water having TDS above 300k mg/L (Kakadjian, Hamlat et al. 2013). Borate-crosslinked guar fluids were successfully made with produced water for bottom hole temperature up to about 212°F (Fedorov, Carrasquilla et al. 2014). Several other examples are available (Li, Sun et al. 2014)

3. Pneumatic fracturing

Overview

Pneumatic fractures can be generated in geologic formations when air or any other gas is injected at a pressure that exceeds the natural strength as well as the in situ stresses present in the formation (Suthersan 1999). It is a technique normally used in shallow formations, and it has emerged as one of the most cost effective methods for enhanced remediation of contaminated soil and groundwater.

Nitrogen gas fracturing is used primarily for water-sensitive, brittle, and shallow unconventional oil and gas formations. The use of nitrogen prevents clay swelling that would otherwise be caused by slickwater. Pure gaseous nitrogen produces best results in brittle formations that have natural fractures and stay self-propped once pressure pumping is completed. This is because nitrogen is an inert and compressible gas with low viscosity, which makes it a poor proppant carrier. In addition, due to the low density of gaseous nitrogen, the main applications for nitrogen gas fracturing are shallow unconventional plays, namely coal bed methane, tight sands, and shale formations up to 5000 ft (1524 meters) in depth. Formations best suited for nitrogen gas fracturing also tend to have low permeability (less than 0.1 md) and low porosity (less than 4%) (Air Products 2013).

Description of the technique

In pneumatic fracturing, a gas (air, nitrogen, etc.) is injected into the subsurface at pressures exceeding the natural in-situ pressures present in the formation interface and at flow volumes exceeding the natural permeability of the rock.

The pneumatic fracturing procedure typically does not include the intentional deposition of foreign propping agents to maintain fracture stability. The created fractures are thought to be self-propping, a circumstance which is attributed to both the asperities present along the fracture plane as well as the block shifting which takes place during injection.

There is no theoretical maximum depth limit for initiating a fracture in a geologic formation as long as sufficient pressure and flow can be delivered to the fracture zone. In pneumatic fracturing the injection pressure required to lift the formation is typically two to three times higher than for hydraulic fracturing on account of gas compressibility effects in the system.

To date, the target depths of most pneumatic fracturing projects have ranged from 3 to 15 meters. The deepest applications of pneumatic fracturing for site remediation purposes have been 60 meters. For fracturing applications below a depth of around 25 to 30 meters, it may be advisable to use proppants since elevated overburden pressures can inhibit self-propping.

Rationale

Without the carrier fluids used in hydraulic fracturing, there are no concerns with fluid breakdown characteristics for pneumatic fracturing. There is also the potential for higher permeabilities within the fractures formed pneumatically, in comparison to hydraulic fractures, as these are essentially air space and are devoid of propping agents. The open, self-propped fractures resulting from pneumatic fracturing are capable of transmitting significant amounts of fluid flow. Pneumatic fractures, in particular, may propagate along existing fracture patterns. Hydraulic fractures have been found to be less influenced by existing fractures.

Gaseous nitrogen is widely available and non-expensive. It is an inert gas and hence does not damage rock formation. The gas can be removed easily after the treatment and hence the clean-up process is fast (Rogala, Krzysiek et al. 2013).

(Rogala, Krzysiek et al. 2013) conclude that the many advantages offered by nitrogen would suggest nitrogen fracturing as a very good technical solution. However, they also conclude that placing the proppant in high velocity gas stream is problematic, as well as resulting in erosion, and that the technology is limited to shallow wells or geologies that can fail the rock in a self-propping manner. It is nonetheless questionable if such geologies are widespread.

Potential advantages and disadvantages

Potential advantages

- Potential environmental advantages:
    a. Water usage completely eliminated.
    b. No chemical additives are required.
- Potential for higher permeabilities due to open, self-propped fractures that are capable of transmitting significant amounts of fluid flow.

Potential disadvantages

- Limited possibility to operate at depth.
- Limited capability to transport proppants.

Status of technique application

Shallow shale formations have been fractured with pneumatic fracturing (EPA 1993) with the purpose of facilitating the removal of volatile organic contaminants.

Pneumatic fracturing with gaseous nitrogen is applied to shale gas production (Rogala, Krzysiek et al. 2013). (Gottschling and Royce 1985) report that as early as 1985 a technology was developed, using nitrogen for the extraction of gas from Devonian shale formations in Ohio (USA). In this system, gaseous nitrogen was injected at a pressure of 24 MPa in shallow wells. Approximately 60% of the volume used was a pure nitrogen gas without proppant, designed to produce fractures in the stimulated formation. The remaining 40% carried sand.

The Canadian company Canyon has patented a process called Grand Canyon™. This uses a high-pressure pumping unit that accurately meters a proprietary light-weight proppant into a stream of pure nitrogen. This allows creating a very thin fracture held open by a partial monolayer (i.e. a proppant pack that is literally "one particle thick"). Canyon reports that the technique has been used to perform thousands of fracturing jobs (delivering hundreds of successful wells) in water-sensitive Cretaceous shales and silts. Their proprietary proppant is being tested for deeper applications, specifically in the Montney and Cardium plays (Canyon 2013).

4. Fracturing with dynamic loading

In this section we review fracturing techniques that do not make use of fluids, but rather by inducing a dynamic loading by detonating explosives placed at the bottom of the well or by applying electrical impulses.

4.1. Explosive fracturing

Overview

Using explosives to fracture rock formations and hence stimulate production is a very old technique. From the 1860s until the late 1940s, explosives were commonly used in wells to increase production ("well shooting"). Liquid nitroglycerin in a tin cylinder was lowered down the well and detonated. The technique was both effective and dangerous (Hyne 2001).

In the late 1960s nuclear devices were tested as a mean to fracture rock formations in order to enhance the recovery of natural gas. In the United States, Project Gasbuggy (Lemon and Patel 1972; American Oil & Gas Historical Society 2012) tested a 29-kiloton nuclear device lowered at a depth of 1288 meters underground. The detonation created a molten glass-lined cavern about 160 feet in diameter and 333 feet tall, which collapsed within seconds. Subsequent measurements indicated that fractures extended more than 200 feet in all directions – and significantly increased natural gas production. Two further nuclear explosions (Project Rulison and Project Rio Blanco) were also carried out in Colorado. The natural gas proved to be too radioactive to be commercially viable. It is also reported that similar test where conducted in Russia to fracture oil and gas wells. The Soviet Union had a similar program: "Peaceful Nuclear Explosions for the National Economy", also referred to as "Program 7," involved testing of industrial nuclear charges for use in peaceful activities. (Nordyke 2000) reports that nuclear detonations were conducted with the stated purpose of searching for useful mineral resources with reflection seismology, breaking up ore bodies, stimulating the production of oil and gas, and forming underground cavities for storing the recovered oil and gas. All together, the Program 7 conducted 115 nuclear explosions, among them 12 explosions for oil stimulation and 9 explosions for gas stimulation (Nordyke 2000).

In the 1970s many different explosive-based fracturing techniques were studied, for instance: (1) displacing and detonating nitro-glycerine in natural or hydraulically induced fracture systems, (2) displacing and detonating nitro-glycerine in induced fractures followed by wellbore shots using pelletized TNT, and (3) detonating wellbore charges using pelletized TNT. These techniques were for instance applied to oil shale formations. (Miller and Johansen 1976).

Problems of wellbore damage, safety hazards, and unpredictable results reduced the relative number of wells stimulated by high-strength explosives. More recently, studies have shown that propellants have strong advantages over explosives. Propellants are substances which deflagrate rather than detonate. (Schmidt, Warpinski et al. 1980). The propellant techniques seem to offer a potential use for shale gas extraction and are reviewed more in details in the following. They are known by several generic names, such as Dynamic Gas Pulse Loading (Servo-Dynamics), High Energy Gas Frac (Sandia National Laboratories), Controlled Pulse Fracturing (Mobil Research and Development Corporation), and others.

(Boyun Guo 2014) presents an analysis of well productivity of different types of well architectures to be completed with the explosive fracturing in liquid-rich shale gas formations. The analysis is based on numerical modelling but case studies indicate a good agreement between the result given by the models and field observation. Sensitivity analyses indicate that the initial productivity of fractured wells increases non-linearly with the number of radial fractures and fracture penetration, but the benefits of increasing fracture depth reaches a plateau as the amount of explosives increases.

Description of the technique

Substances (**solid propellants**) are deflagrated at appropriate locations in the rock formation. These generate high pressure gases at a rate that creates a fracturing behaviour dramatically different from either hydraulic fracturing or explosives.

The time to peak pressure is approximately 10,000 times slower than explosives and 10,000 times faster than hydraulic fracturing. Unlike explosives, the burn front in these materials travels slower than the speed of sound. The pressure-time behaviour of propellants differs from explosives in that peak pressures are lower, and burn times are longer.

The solid propellant does not detonate, but deflagrates. Deflagration is a burning process that takes place without any outside source of oxygen. Gas pressures in the range of 20,000 psi are produced that last approximately 10 milliseconds. No shock wave is produced, the rock is split rather than compacted, and multiple fractures are created (GasGun 2013).

Depending on the tools used, the reservoir lithology and the depth, propellant fracture lengths are generally in the range from a few feet to a maximum, under the very best of conditions, of a few tens of feet (Schatz 2012).

Different commercial techniques have been identified. Some may simply be the same technique with a different company name.

A significant disadvantage to propellant fracturing is that it does not carry proppant into the fracture. Instead, propellant fracturing relies upon shear slippage to prevent the fracture from fully closing back on itself, leaving a conductive path back to the wellbore. (Page and Miskimins 2009)

GasGun

The Gas Gun uses solid propellant to generate high pressure gas at a rapid rate. The rate is tailored to the formation characteristics to be rapid enough to create multiple fractures radiating 10 to 50 feet from the wellbore, but not so rapid as to pulverize and compact the rock as is experienced with classic high explosives such as nitroglycerine. The star-shaped pattern of multiple fractures removes wellbore damage or blockage and increases the formation permeability near the wellbore (GasGun 2013).

High Energy Gas Fracturing

This technology (Servo-Dynamics 2013) consists of a perforating with propellants, which are transported to the area of interest by wireline, coiled tubing or tubing. The propellant is an oxidizing agent consisting of potassium perchlorate particles and epoxy resin. Once ignited the propellant deflagrates, releasing gas (contained in a column of fluid in the face of the well), which in tum produces the pressure pulse and by the expansion is responsible for generating multiple fractures of short length (up to 50 feet in shale), in all radial directions in the well where the perforating was oriented. Successful stimulations are reported to have been achieved in many lithologies, including shale (Plata, Castillo et al. 2012).

Dynamic Gas Pulse Loading

Dynamic Gas Pulse Loading (DGPL) is a the commercial name of a technique for inducing multiple, radial fractures in a wellbore, using rapid gas-pressure loading of the rock during the deflagration (burning) of downhole gas generators (Servo-Dynamics 1998). By controlling the energy release during this process, the in situ stresses can be exceeded by a substantial amount while pressures remain significantly below the level which deforms and crushes the rock.

StimGun

StimGun is a propellant-assisted perforating system, developed by a group of industries that includes among others Marathon Oil Company and Weatherford. The propellant releases a controlled-dynamic pulse of high-pressure gas at the time of perforating. The tool simultaneously perforates and stimulates the well. A cylindrical sleeve of propellant is placed over a specially configured perforating carrier. The pressure wave generated by the perforating charge ignites the propellant. Gas from the propellant enters the newly created perforations, breaking them down and stimulating the formation (StimGun 2012).

Dry Fracturing EPS

This technique is at the concept stage, and is being developed by Prof. J. Krzysiek of Gdansk University of Technology to target the fracturing of shale formations. It is designed to combine feature from StimGun and GasGun. StimGun is classic perforator with external sleeve as elastic propellant in combined perforation and stimulation. GasGun has two type propellant loaded with staged ignition system used for stimulation of already perforated intervals. Dry Fracturing EPS intends to extend the traditionally limited perforation range of propellant fracturing systems and to offer controllable fracturing geometry, regardless of formation stress direction and shale water sensitivity. Both the energy of perforation and stimulation are concentrated in perforation tunnels for optimal fracture propagation (Krzysiek 2013; Rogala, Krzysiek et al. 2013).

Rationale

The use of propellants and other so-called tailored-pulse techniques depend on a controlled pressure-time behaviour to minimize wellbore damage and maximize fracture growth by gas penetration.

High explosives, such as nitroglycerine or gelatin, detonate and create a shock wave. Pressures created are extremely high but last only a few microseconds. Extensive research has shown that the pressure pulse created by high explosives enlarges the wellbore by crushing and compacting the rock. The enlarged wellbore is left with a zone of residual compressive stress. These residual stresses and compacted rock can actually reduce permeability near the wellbore. Extensive cavings often fill the wellbore with debris that require days, even weeks, to clean up (GasGun 2013).

The problems commonly associated with hydraulic fracturing are avoided. No water is used (and hence no chemical additives). The energy released underground, albeit relatively low, could potentially induce seismic events.

Potential advantages and disadvantages

Potential advantages

- Potential environmental advantages:
    a. Water usage completely eliminated.
    b. No chemical additives are required.
- Minimal vertical growth outside the producing formation.
- Multiple fractures.
- Selected zones stimulated without the need to activate packers[5].
- Minimal formation damage from incompatible fluids.
- Homogeneous permeability for injection wells.
- Minimal on-site equipment needed.
- Lower cost when compared to hydraulic fracturing.

[5] Packers are special equipment used to isolate zones of the well where hydraulic fracturing is carried out.

- Can be used as a pre-fracturing treatment (to reduce pressure losses by friction in the near wellbore).

Potential disadvantages

- Can replace hydraulic fracturing only for small to medium treatments, i.e. the fracture penetration is somewhat limited.
- Proppant is not carried into the fracture. Instead, propellant fracturing relies upon shear slippage to prevent the fracture from fully closing back on itself.
- The GasGun website explicitly admits that "*the GasGun will never replace hydraulic fracturing. Large hydraulic fracture treatments can create a fracture hundreds, if not thousands, of feet in length. But many small pay zones in marginal wells cannot justify the expense of these treatments*". (GasGun 2013)
- The energy released underground, albeit relatively low, could potentially induce seismic events.

Costs

Costs are impossible to assess given the scarce experience.

Status of technique application

Techniques based on explosive fracturing seem to have been largely superseded. On the other hand, techniques based on propellant fracturing are commercially available, have been used on shale formations and they appear to be a potential alternative to high-volume hydraulic fracturing in some situations.

Laboratory and field experiments were conducted to compare hydraulic and propellant fracturing techniques in the Mancos Shale in Colorado (a Cretaceous shale approximately 2,000 feet thick) (Page and Miskimins 2009). This study concluded that both propellant and hydraulic fracturing can provide stimulation benefits, but only when applied in appropriate situations.

Dry Fracturing EPS is at the concept stage, but it is reported that a pilot study will be conducted in the near future on wells operated by PGNiG in Poland (Krzysiek 2013).

4.2. Electric fracturing

Overview

In electric fracturing, electricity is used to induce mechanical loads into the rock. If high enough, this loading will fracture the rock.

Laboratory studies to evaluate the use of electricity for fracturing various grades of Colorado oil shale were started in 1964, the rationale being that it was necessary to develop techniques to increase the permeability of the oil shale formation in order to carry out an in-situ retorting[6] process (Melton and Cross 1968).

NOVAS Energy, a US company based in Houston, currently offers a technology that makes uses plasma pulses to enhanced oil recovery in conventional reservoirs (NOVAS Energy 2014).

A technique that could be especially applied for shale gas stimulation is being developed and tested at the University of Pau and Pays de l'Adour (Chen 2012; Martin, Reess et al.

[6] Retorting is the oldest and the most common extraction method for oil shale. In this process oil shale is heated in the absence of oxygen (pyrolysis) until its kerogen decomposes into condensable shale oil vapours and non-condensable combustible oil shale gas. Oil vapours and oil shale gas are then collected and cooled, causing the shale oil to condense.

2012a; Martin, Reess et al. 2012b). This makes use of pulsed arc electrohydraulic discharges, and it is described in Section 4.3.1.

Another experimental technique has been identified, called Plasma Stimulation & Fracturing (Awal 2013). This is described in Section 4.3.2.

4.3.1. Pulsed Arc Electrohydraulic Discharges (PAED)

Description of the technique

The method proposed by the researchers at the University of Pau and Pays de l'Adour is based on generating a pressure wave by an electrical discharge between two electrodes placed in a wellbore filled with water. The amplitude of this wave of pressure can reach up to 200 MPa (2000 times the atmospheric pressure) while its duration is around one hundredth of microsecond. This pressure wave is transmitted to the rock by the fluid inside the wellbore, and will create micro-cracks of decreasing density, according to the distance from the well (Chen 2012; Martin, Reess et al. 2012a; Martin, Reess et al. 2012b).

Rationale

This technique would allow fracturing of the rock without any use of fracturing fluids (and hence no chemical additives).

(Kalaydjian and Goffé 2012) report that in 2011 Total commissioned research on this technique, and concluded that the technology is not a currently viable alternative to hydraulic fracturing. One major problem seems to be that rock permeability is increased only up to several meters from the wellbore, but no further. The authors also conclude that the technique would require management of electrical installations on the surface and that the environmental consequences of this remain to be studied.

Potential advantages and disadvantages

Potential advantages

- Potential environmental advantages:
    a. Water usage much reduced or completely eliminated.
    b. Few or no chemical additives are required.

Potential disadvantages

- Limited capability of increase rock permeability away from the wellbore.
- Proppant not carried into the fracture.
- Can only replace hydraulic fracturing only for small to medium treatments, i.e. the fracture penetration is somewhat limited.

Costs

Costs are impossible to assess given the current knowledge.

Status of technique application

The technique is at the concept stage, and it is being developed as a potential alternative to hydraulic fracturing.

One journal article (Chen, Maurel et al. 2012), two patents applications (Martin, Reess et al. 2012a; Martin, Reess et al. 2012b) and two doctoral theses (Chen 2012; Martin 2013) documenting the ongoing research at the University of Pau and Pays de l'Adour were found. The authors have announced that the main results of their research will be published in the near future in different international journals (Reess 2013).

4.3.2. Plasma Stimulation & Fracturing Technology (PSF)

Description of the technique

The method has been recently proposed by Dr. M. R. Awal at the Texas Tech University (Department of Petroleum Engineering). Development was started in February 2010 (Awal 2013).

According to the inventor, PSF creates multiple radial fractures of self-propped type fractures by fast-expanding plasma generated using a proprietary, high-energy pulsed-power electrical discharge technique. While the plasma tool alone can create 5-20 ft (1.5-6 meters) long multiple radial fractures of self-propped type, the implementation of the pulse stepping algorithm can extend these fractures over 50 ft (15.2 meters).

PSF employs multiple cycles of extremely fast (in the micro-second range) dynamic pressurization in the wellbore. The multiple radial fractures created by PSF are self-propped because of shear displacement. This phenomenon occurs by virtue of emergence of shear stresses along the newly created fracture planes aligned in the directions of non-principal in-situ stresses. Hydraulic fracturing never generates such shear stresses along the bi-wing fractures, which are aligned in the direction of principal stress.

Rationale

This technique would allow fracturing of the rock without any use of fracturing fluids (and hence no chemical additives).

According to the inventor, "*PAED employs a 1st generation, very low efficiency (~10%) electric-to-shockwave conversion (ESC) process, compared to Texas Tech's 3rd generation highly energy efficient (70-80%) process. Besides, PFS continues its lead by growing into a full scale prototype for field demonstration*" (Awal 2013).

Potential advantages and disadvantages

Potential advantages

- Potentially more environmentally friendly than high-volume water fracturing:
    a. Water usage much reduced or completely eliminated.
    b. Few or no chemical additives are required.
    c. Technique deployable with a very limited number of trucks, hence much reduced traffic.

Potential disadvantages

- Limited capability of increase rock permeability away from the wellbore.
- Proppant is not carried into the fracture.

Costs

Costs are impossible to assess given the current knowledge. The inventor claims that "*the estimated revenue from PSF job is approx. $1,000 per foot of depth*" (Awal 2013).

Status of technique application

According to the inventor, PSF can be custom-designed for use in both conventional and unconventional oil and gas reservoirs (Awal 2013).

The technique appears to be at the concept stage, but the inventor reports that the design parameters for an up-scaled field prototype have been established, and hence that a pilot project can be undertaken. The pilot would entail fabricating the PSF hardware for demonstration in a 10,000 ft vertical or horizontal well.

5. Other methods

In this section we review some other formation stimulation techniques that do not fall directly under the previous categories

5.1. Cryogenic fracturing

Overview

Fracturing can be achieved by using a fluid colder than the reservoir. This will create thermal stresses that could fracture the rock. Even if a fluid is used this is not strictly speaking hydraulic fracturing in the traditional sense, because it is not the elevated pressure of the fluid and high injection rates that breaks the rock.

Several authors (Svendson, Wright et al. 1991; Charlez, Lemonnier et al. 1996) have shown that thermally induced fractures may take place in oil and gas reservoir stimulation applications. They investigated different cases where cold water was injected into deep hot reservoirs with a constant injection rate (below the formation collapse pressure). After a certain time a sharp increase in injectivity was observed, as if the formation were fractured.

Recently an interesting fracturing technique has been proposed, based on the injection of large quantities of cold C02 to create thermal stresses that lead to fractures in significant magnitude. (Mueller, Amro et al. 2012). This technique, discussed more in details below, is at the concept stage and it has been proposed for tight reservoirs.

(Cha, Yin et al. 2014) report a very recent laboratory study of cryogenic fracturing. It was shown that the injection of liquid nitrogen in laboratory specimen created cracks and altered rock properties. Fractures were created by generating a strong thermal gradient. Several topics requiing further investigation were identified, for instance the poorly understood effect of borehole pressurization, the effects of stress level and stress anisotropy the characteristics of material properties.

An ongoing study funded by RPSEA is concerned with the study, testing and development of a cryogenic fracturing technology to obtain a significant reduction of flow resistance near the well and to increase mobile gas volume in unconventional gas reservoirs (http://www.rpsea.org/projects/10122-20/). The study is expected for completion in July 2016. The first year report is available (Yu-Shu Wu 2013).

Description of the technique

(Mueller, Amro et al. 2012) have proposed a technique called "CO_2 thermal hydraulic fracturing". It combines conventional hydraulic fracturing and fractures which are caused by thermal stresses, due to the injection of cold C02.

To create thermal stresses that lead to fractures in significant magnitude, a large quantity of liquid CO_2 is needed to be injected. During high pressure injection the CO_2 will stay in liquid state. Due to its low temperature and the high quantity of CO_2 a large area around the wellbore will cool down. Depending on the injection rate a temperature reduction of 50-100°C might be achieved in this way. This effect should lead to large thermal stresses in the ground which cause fracturing along with the hydraulic pressure of the injection pump.

According to (Mueller, Amro et al. 2012), the temperature reduction would not be high enough to achieve the necessary thermal stresses to induce fractures in the first months of the process. During this initial period, the injection would take place in the so-called "frac" regime, i.e. injection at high pressure. CO_2 injection would continue for several years, and gas production would only start after two years from the beginning of the treatment. Through the continuous injection, the temperature front propagates, inducing an ongoing fracturing process in reservoir regions farther away from the well. The cap

rock above the formation should guarantee the sealing of the reservoir and prevent seismic impact on the overburden layers.

Rationale

As discussed in Section 2.9.1, using CO_2 as fracturing fluid offers many advantages.

Large quantities of liquid CO_2 would be needed for injection. One promising sources could be power plants which have a CO_2 emission up to 1 million tons/ year. Transport could be realized by pipelines from the plant site to the injection site.

Potential advantages and disadvantages

Potential advantages

- Potentially more environmentally friendly than high-volume water fracturing:
    a. Water usage much reduced or completely eliminated.
    b. No chemical additives are required.
- Could be used in conjunction with CO_2 sequestration schemes.
- Reduction of formation damage (reduction of permeability and capillary pressure damage by reverting to a gaseous phase; no swelling induced).
- Enhance gas recovery by displacing the methane adsorbed in the shale formations (Wang, Li et al. 2012).

Potential disadvantages

- Large quantities of liquid CO_2 would be needed.
- Long times required: CO_2 injection would need to occur for several years, and gas production would only start after 2 years from the beginning of the treatment.

Costs

Costs associated with this technique are impossible to evaluate with the current status of knowledge.

Status of technique application

The concept idea has been proposed for tight formations (Mueller, Amro et al. 2012). No specific information relating to its application to shales could be found.

5.2. Mechanical cutting of the shale formation

Overview

A patent from 2010 (Coleman and Hester 2010) presented a method to remove mass from a formation between two connected wellbores using a flexible cutting cable. According to this idea, two wellbores are drilled and connected; a cutting cable is inserted into the first well and fished out from the second; finally, the cable is repeatedly pulled back and forth. This sawing action removes formation material between the wellbores to form an opening in the shape of a plane. Earlier patents were filed proposing methods to remove minerals such as coal from seams using a chain cutter that is pulled through the seam, for instance from a tunnel drilled in a U shape (Hurd 1980; Farrar, Mayercheck et al. 1991). Other patents presenting similar ideas can be found, for instance (Carter 2009).

Drawing on these ideas, an interesting project ("Novel Concepts for Unconventional Gas Development in Shales, Tight Sands and Coalbeds") was launched and funded by the

National Energy Technology Laboratory (NETL)[7] and performed by Carter Technologies between 2008 and 2009 (Carter 2009).

The project objective was to develop an alternative method of stimulation to increase the net production of gas from shale while reducing the amount of water required. Over a dozen new concepts (from rotating mills to high-pressure water jets) were evaluated including one promising method (called Slot Drill) that appears to be able to cut 100 foot deep slots all along a 2500 foot long horizontal well. According to the project's final report (Carter 2009), the method appears to have a low capital cost and be sufficiently robust to withstand the rigors of the down hole drilling environment.

Description of the technique

The Slot-Drill is an advanced cable saw method that operates like a down-hole hacksaw, and it is hence mechanically simple. A well is drilled to depth in the target formation and a casing cemented. The hole is then directionally drilled to curve back upward in the shape of a "J" within the producing formation. The drill string is retrieved back to the surface and an abrasive cable is attached to the tip of the drill pipe. A winch on the rig holds a specific tension on the cable as the pipe is lowered back into the hole under its own weight. Such tension causes the cable to hug the inside radius of the curved hole. The cable is moved back and forth, and this motion cuts a pathway upward from the hole on each downward stroke. The cutting force at any point is a function of local cable tension and radius of curvature so the shape of the cut may be tailored to some extent. The cut is nominally upward along a vertical path but can also be made to turn horizontally.

An operation may last for 2 to 5 days, depending on the desired depth of cut and the hardness of the rock. Drilling fluid is circulated through the drill pipe to flush the cuttings back to the surface. The abraded cuttings are very small particles and circulate out easily. A special tool is also used to allow a standard blow out preventer to seal on the cable and drill pipe.

The system should be able to cut a 100 foot deep vertical slot upward from the horizontal lateral in a shale formation, and the cut length could exceed 2500 feet. This system would operate in a blind hole from a conventional drilling rig and is powered by the drilling rig. The only special equipment required is a constant tension winch and a downhole tool that connect the abrasive cable to the drill pipe.

Rationale

Successful development of the proposed Slot Drill concept could provide an alternative stimulation method comparable to high-volume hydraulic fracturing but at a lower cost and without the very high water resource requirements.

Fully developed Slot-Drilled wells could result in much greater total recovery from a given lease acreage, thus increasing the total proven reserves. These slots may also reduce production decline, reduce the effects of formation damage, and allow a larger percentage of the in-place gas to be recovered.

According to the project results, reservoir simulations indicated that the slot alone may increase well flow rates significantly compared to current state of the art fracturing treatments. Unlike hydraulic fracturing, the location of a slot can be selected and precisely placed, is much thicker, and has near unlimited conductivity (Carter 2009).

[7] NETL is part of the U.S. Department of Energy (DOE) national laboratory system. NETL supports DOE's mission is to advance the national, economic, and energy security of the United States.

Potential advantages and disadvantages

Potential advantages

- Potentially more environmentally friendly than high-volume water fracturing:
    a. Water usage much reduced or completely eliminated.
    b. No chemical additives are required.
- Possibly enhanced recovery of total gas in place, accelerated rates of unconventional gas production, and development of reserves in fields that would not otherwise be produced.

Potential disadvantages

- None identified.

Costs

The primary costs of the method are the rig time, the winch, and the consumable abrasive cable materials. The total cost for comparable stimulation benefit is estimated to be less than half the cost of current fracturing technology.

Status of technique application

This is a technique specifically developed for shale formations. The technique is at the concept stage, and the project was currently awaiting funding to perform a demonstration in a test well in 2009 (Carter 2009).

5.3. Enhanced bacterial methanogenesis

Overview

A significant part of organic-rich shales have not undergone a sufficient burial to generate the pressure and temperature conditions necessary for the complete transformation of the organic matter into oil or coal. These immature source rocks may represent a huge fossil carbon resource.

Microbiologically assisted methanization of the organic matter is a promising technologies being considered. Methanization is known to occur in shales from field data showing the natural accumulation of biogenic methane in several sedimentary basins (Meslé, Charlotte Périot et al. 2012).

Research projects have been carried out very recently, in both the Antrim shale formation in the Michigan Basin and in the western Canadian sedimentary basin.

RPSEA conducted a seed study on Antrim Shale (Michigan) and the Forest City Basin (Kansas) formations (Martini, Nüsslein et al. 2004). The results of this project indicated that microbial methane generation in sedimentary basins is an active process, with a high potential for stimulation. The project's final report concluded that the research may contribute towards development of technologies to enhance methane production in shale gas plays, and thus to help secure natural gas resources from the extensive occurrence of fractured black shales and coal beds found throughout the USA (Salehi and RPSEA 2012).

Schlumberger-Doll Research funded a project ("Toward microbially-enhanced shale gas production.") to genetically profile the bacterial communities present in formation water of three gas-producing Antrim shale wells. Incubation experiments were established by adding different substrates to aliquots of these waters in an effort to stimulate the microbial methane generation. Increases in direct methane production were obtained. (Coolen 2013; Wuchter, Banning et al. 2013).

(Cokar, Ford et al. 2013) reported a study conducted on shales from the Abbey Field in Western Canada, in which the reaction rate kinetics for methane production were

determined from experimental data using produced water and core samples from a shallow shale gas reservoir. The results showed that biogenic shale gas generation accounted for about 12% of the total gas produced. According to the authors, this is a significant percentage of the total gas production and hence there is great potential to enhance methanogenesis within these reservoirs.

Description of the technique

Naturally-occurring microorganisms (methanogens) are stimulated within the shale formations to enhance the production of methane as by-product of their normal metabolic processes.

Rationale

It is reported that shallow biogenic shale gas reservoirs generate gas by microbial activity, implying that current production to the surface consists of ancient adsorbed gas as well as recent biogenerated gas. Approximately 20% of all of the methane generated is generally thought to be of microbial origin. Most shallow shale gas reservoirs are at temperatures of less than 80 °C, and given the supply of carbon, water, and minerals, they can be thought of as multi-kilometer-scale bioreactors. (Cokar, Ford et al. 2013)

Enhanced bacterial methanogenesis may have a large impact, especially in shallow reservoirs. Methanogens can produce a significant amount of methane without any stimulation. As shown in preliminary modelling by (Cokar, Ford et al. 2013), microbial methane generation can account for 12% of the total gas production.

Potential advantages and disadvantages

Potential advantages

- Potential to tap into hydrocarbon resources of immature source rock (which would otherwise be unusable).
- Potential environmental advantages: no usage of water nor chemical additives, etc.

Potential disadvantages

- None identified.

Costs

Costs are impossible to assess given the current knowledge.

Status of technique application

Enhanced bacterial methanogenesis appears to be at the concept stage for what it concerns in-situ application. The technique has been successfully applied in laboratory. Further work is required to determine how to stimulate the microorganisms within the reservoir to consume more of the organic carbon and thus increase gas production rates.

5.4. Heating of the rock mass

Overview

Technologies based on heating the underground formations exist and have been used by the oil industry for many applications, in particular to increase the recovery of oil or to increase the thermal maturity of organic material. These processes can for instance use steam (without fracturing) in porous rocks or electric heaters.

A very interesting discussion on the possibilities of this technology and its application to unconventional hydrocarbon production is given in (Kalaydjian and Goffé 2012).

A conceptual study of thermal stimulation in shale gas formations was more recently published by (Han Yi Wang 2014) to understand the effects of fracture heating on the shale gas adsorption and desorption characteristics, and how these can be exploited to enhance shale gas recovery from hydraulically fractured reservoirs.

Description of the technique

The rock is heated, for instance by injecting steam or by other suitable methods. This enhances the permeability of the reservoir and/or increase the thermal maturity of the organic matter (kerogen) in the formation, as discussed in the next section.

Rationale

(Kalaydjian and Goffé 2012) identify three principal mechanisms by which the effects of heating the rock mass could have beneficial effects:

- Mineralogical changes;
- Changes in the chemical decomposition of kerogen;
- Evolution of the carbon structure of kerogen.

The first possible beneficial effect of heat is to induce mineralogical changes. A relevant effect when considering rock types containing clay (such as shales) is dehydration. (Vidal and Dubacq 2009) demonstrated that dehydration may indeed produce up to 150 liters of water per cubic meter of clay in place. The space vacated by removing water increases the porosity and therefore the permeability. Also, the thermal expansion of the rock can result in beneficial changes in permeability.

The second desired effect of heating is the chemical decomposition of kerogen heavy hydrocarbons to light hydrocarbons. The increase in temperature makes it possible to degrade certain kerogen molecules (in the case of incomplete maturation), and to promote the conversion of heavier hydrocarbons to lighter compounds. These techniques are especially applicable in the case of oil shales. Fluids and gases increase local pressures and either allow the use of existing microcracks or create new ones (Kobchenko, Panahi et al. 2011). The increase in permeability is achieved by induced microcracks in the rock.

The third effect is the possible evolution of the carbon structure of kerogen. The increased temperature may have the effect to open up porosity of micro-scale and nano-scale carbon structures in the kerogen.

These effects, combined, could have the effect to significantly enhancing the permeability of the shale formations, without the need to perform any hydraulic fracturing.

Potential advantages and disadvantages

Potential advantages

- Water usage much reduced.
- No chemical additives are required.

Potential disadvantages

- None identified.

Costs

(Kalaydjian and Goffé 2012) argue that one of the main challenges of this technology (if using electrical heating) would be its economic profitability, which in turn would be strongly dependent on the cost of electricity consumed and the efficiency of the gas production.

Status of technique application

The technique is applied for producing oil shale. It is at the concept stage concerning application for other unconventional hydrocarbons such as shale gas. (Kalaydjian and Goffé 2012) present a very good discussion on the possibilities and challenges offered by the technique.

5.5. In-situ combustion

(Chapiro and Bruining 2015) have recently presented a conceptual study on the possibility of using in-situ combustion to stimulate production in shale gas formations. The main goal of this paper was to understand under which conditions this is feasible. Two possibilities for the in-situ fuel source were considered: methane or kerogen.

The authors concluded that possibility of using this method for recovery of shale gas needs to consider a number of mechanisms such as gas production from kerogen, initial permeability of the reservoir, compression costs and the coupling of the method to existing fracturing techniques. In summary, more research is needed.

5.6. Enhanced oil recovery in shale reservoirs

(Sheng 2015) recently provided a review of the current status of enhanced oil recovery (EOR) methods in shale oil and gas condensate reservoirs that have already a network of fractures (for instance created by one of the fracturing methods described elsewhere in this report. The focus of the study is on gas injection, but other possible methods are also considered, such as thermal recovery, chemical methods (by water injection) and microbial methods. The data presented show that gas injection is more feasible in shale reservoirs than water flooding and any other EOR methods, but the study also concludes that enhanced oil recovery in shale reservoirs is a new topic and more research is needed.

6. Summary and conclusions

In this report we reviewed hydraulic fracturing and other formation stimulation technologies, by searching the open literature, patent databases and commercial websites (mainly in the English language). This is an updated version of the original JRC report published in 2013 (Gandossi 2013), compiled taking into account new relevant information that became available during 2014 and 2015.

Several techniques were identified and described, at various level of technological readiness: some are commercially available, whilst many others are currently being developed or are at the concept stage.

Table 5, below, present an overall summary of the information gathered, showing in particular some of the potential advantages and disadvantages that each technique could offer.

Table 5. Summary of potential advantages and disadvantages for identified fracturing techniques

Technique		Potential advantages	Potential disadvantages	Status of application for shale gas production
Hydraulic Fracturing	**Foam-based fracturing fluids**	- Water usage reduced (or completely eliminated in case of CO2-based foams). - Reduced amount of chemical additives. - Reduction of formation damage. - Better clean-up of the residual fluid.	- Low proppant concentration in fluid, hence decreased fracture conductivity. - Higher costs. - Difficult rheological characterization of foams, i.e. flow behaviour difficult to predict. - Higher surface pumping pressure required.	Commercially applied to fracture shale formations.
	Oil-based fracturing fluids **(→ LPG)**	- Water usage much reduced or completely eliminated. - Fewer (or no) chemical additives are required. - Flaring reduced. - Truck traffic reduced. - Abundant by-product of the natural gas industry. Increased the productivity of the well. - Lower viscosity, density and surface tension of the fluid, which results in lower energy consumption during fracturing. - Full fluid compatibility with shale reservoirs (phase trapping virtually eliminated). - No fluid loss. - Recovery rates (up to 100%) possible. - Very rapid clean up (often within 24 hours).	- Involves the manipulation of large amounts of flammable propane, hence potentially riskier than other fluids and more suitable in environments with low population density. This disadvantage disappears if using heptafluoropropane. - Higher investment costs. - Success relies on the formation ability to return most of the propane back to surface to reduce the overall cost. - Heptafluoropropane is a very stable hydrocarbon, and as such presents a global warming potential.	Commercially applied to fracture unconventional reservoirs (not clear if this include shales).
	Acid-based fracturing fluids	The application of acid fracturing seems to be confined to carbonate reservoirs. Not used to stimulate sandstone, shale, or coal-seam reservoirs.		
	Alcohol-based fracturing fluids **(→ Methanol)**	- Water usage much reduced or completely eliminated. - Methanol is not persistent in the environment. - Excellent fluid properties: high solubility in water, low surface tension and high vapour pressure. - Very good fluid for water-sensitive formations.	- Methanol is a dangerous substance to handle: a. Low flash point, hence easier to ignite. b. Large range of explosive limits. c. High vapour density. d. Invisibility of the flame.	Methanol-based fluids have been used on low permeability reservoirs, but it is not clear if their application has been extended to shales.

Table 5 (cont.) Summary of potential advantages and disadvantages for identified fracturing techniques

Technique		Potential advantages	Potential disadvantages	Status of application for shale gas production
Hydraulic Fracturing	Emulsion-based fluids	- Depending on the type of components used to formulate the emulsion, these fluids can have potential advantages such as: a. Water usage much reduced or completely eliminated. b. Fewer (or no) chemical additives are required. - Increased the productivity of the well; better rheological properties (i.e. better flow behaviour); fluid compatibility with shale reservoirs.	- Potentially higher costs.	Emulsion-based fluids have been used on unconventional (low permeability) formations, but no direct usage for shale gas stimulation could be found as a part of the present study.
	Cryogenic fluids: Liquid CO_2	- Potential environmental advantages: a. Water usage much reduced or completely eliminated. b. Fewer (or no) chemical additives are required. c. Some level of CO_2 sequestration achieved. - Reduction of formation damage. - Form more complex micro-fractures. - Enhance gas recovery by displacing the methane adsorbed in the shale formations. - Evaluation of a fracture zone is almost immediate because of rapid clean-up. Better clean-up of the residual fluid, so smaller mesh proppant can be used. More controlled proppant placement and higher proppant placement within the created fracture width.	- Proppant concentration must necessarily be lower and proppant sizes smaller, hence decreased fracture conductivity. - CO_2 must be transported and stored under pressure (typically 2 MPa, -30°C). - Corrosive nature of CO_2 in presence of H_2O. - Unclear (potentially high) treatment costs.	Liquid CO_2 as fracturing fluid is commercially used in unconventional applications (most notably, tight gas) in Canada and the US. Devonian shale formations in Kentucky (USA) have been stimulated with liquid CO_2 as early as 1993. Super-critical CO_2 usage appears to be at the concept stage.
	Cryogenic fluids: Liquid N_2	- Potential environmental advantages: a. Water usage much reduced or completely eliminated. b. Fewer (or no) chemical additives are required. - Reduction of formation damage. - Self-propping fractures can be created by the thermal shock, hence need for proppant reduced or eliminated.	- Special equipment required to safely handle liquid N_2, due to the very low temperature of the fluid. - Higher costs.	Nitrogen as a component (in mists, foams or other energised fluids) of the fracturing medium is common. The use of liquid nitrogen is less typical. The technique is commercially available and has been applied for fracturing shale formations but its usage appears limited.

Table 5 (cont.) Summary of potential advantages and disadvantages for identified fracturing techniques

Technique		Potential advantages	Potential disadvantages	Status of application for shale gas production
Hydraulic Fracturing	Cryogenic fluids: Liquid He	N/A	N/A	See Section 2.9.3
	Cryogenic fluids: Liquid LPG	N/A	N/A	Very little information available. See section 2.9.4
Pneumatic Fracturing	(→Air) (→N_2)	- Potential environmental advantages: — Water usage completely eliminated. — No chemical additives are required. - Potential for higher permeabilities due to open, self-propped fractures that are capable of transmitting significant amounts of fluid flow.	- Limited possibility to operate at depth. - Limited capability to transport proppants.	Shallow shale formations have been fractured with pneumatic fracturing (EPA 1993) with the purpose of facilitating the removal of volatile organic contaminants. Pneumatic fracturing with gaseous nitrogen is applied to shale gas production, but limited information on the scale is available.
Dynamic loading	Explosive fracturing (→ solid propellants)	- Potential environmental advantages: — Water usage completely eliminated. — No chemical additives are required. - Minimal vertical growth outside the producing formation. - Multiple fractures. - Selected zones stimulated without the need to activate packers . - Minimal formation damage from incompatible fluids. - Homogeneous permeability for injection wells. - Minimal on-site equipment needed. - Lower cost when compared to hydraulic fracturing. - Can be used as a pre-fracturing treatment (to reduce pressure losses by friction in the near wellbore).	- Can replace hydraulic fracturing only for small to medium treatments, i.e. the fracture penetration is somewhat limited. - Proppant is not carried into the fracture. Instead, propellant fracturing relies upon shear slippage to prevent the fracture from fully closing back on itself. - The energy released underground, albeit relatively low, could potentially induce seismic events.	Techniques based on explosive fracturing seem to have been largely superseded. On the other hand, techniques based on propellant fracturing are commercially available and have been used on shale formations, but very limited information on the scale is available. New techniques are currently being developed (for instance, Dry Fracturing EPS).

Table 5 (cont.) Summary of potential advantages and disadvantages for identified fracturing techniques

Technique		Potential advantages	Potential disadvantages	Status of application for shale gas production
Dynamic loading	**Electric fracturing**	- Potential environmental advantages: – Water usage much reduced or completely eliminated. – Few or no chemical additives are required.	- Limited capability of increase rock permeability away from the wellbore. - Proppant not carried into the fracture. - Can only replace hydraulic fracturing only for small to medium treatments, i.e. the fracture penetration is somewhat limited.	Both identified technologies (see section 4.2.1 and 4.2.2) are at the concept stage. Plasma stimulation (4.2.2) is reported as ready for being tested in the field.
Other methods	**Thermal (cryogenic) fracturing**	- Potential environmental advantages: a. Water usage much reduced or completely eliminated. b. No chemical additives are required. - Could be used in conjunction with CO_2 sequestration schemes. - Reduction of formation damage. - Enhance gas recovery by displacing the methane adsorbed in the shale formations.	- Large quantities of liquid CO_2 would be needed. - Long times required: CO_2 injection would need to occur for several years, and gas production would only start after two years from the beginning of the treatment.	The concept idea has been proposed for tight formations.
	Mechanical cutting of the shale formation	- Potential environmental advantages: – Water usage much reduced or completely eliminated. – No chemical additives are required. - Possibly enhanced recovery of total gas in place, accelerated rates of production, and development of reserves in fields that would not otherwise be produced.	- None identified.	This is a technique specifically thought for shale formations. The technique is at the concept stage.
	Enhanced bacterial methanogenesis	- Potential to tap into vast hydrocarbon resources of immature source rock. - Potential environmental advantages: no usage of water nor chemical additives, etc.	- None identified.	Enhanced bacterial methanogenesis appears to be at the concept stage. The technique has been successfully applied in laboratory specimen.
	Heating of the rock mass	- Water usage much reduced or completely eliminated. - No chemical additives are required.	- None identified.	The technique is applied for producing oil shale. No information on the extent of the use. It is at the concept stage concerning application for other unconventional hydrocarbons such as shale gas.

APPENDIX 2-D-29. *Eagle Plains Exploration Project Proposal Schedule for Engagement*

MEMORANDUM

Date:	May 12, 2021
To:	Tr'ondëk Hwëch'in (TH)
From:	Chance Oil and Gas Limited (Chance)
File:	103505-01
Re:	Eagle Plains Exploration Project Proposal Schedule for Engagement

1.0 INTRODUCTION

In order to clarify the process for completing Chance's Eagle Plains Exploration Project (Project) Proposal for the Executive Committee of Yukon Environmental and Socio-economic Assessment Board (YESAB), Hemmera has drafted the schedule below.

Hemmera is proposing in-person engagement activities in the Yukon in accordance with all COVID-19 precautions and preferences of affected First Nations. Activities with affected First Nations in the Northwest Territories will be conducted via video conference until such time as we are sharing a 'travel bubble'. This memo may be amended depending on feedback from affected First Nations and the evolution of COVID-19 and associated orders of the Chief Medical Officer of the Yukon.

2.0 BACKGROUND

In the spring and summer 2018, Chance and TH developed the *Engagement and Communication Plan* (Plan). Since that time both parties have made progress in the implementation of the Plan.

3.0 SCHEDULE

The schedule below indicates the order and timing of engagement sessions that Chance is proposing in order to prepare its Project Proposal for submission to YESAB. This is a high-level schedule and timeframes may change due to a number of factors such as:

- Availability of necessary information from Chance's technical consultants.
- Changes in COVID-19 restrictions and associated orders of the Chief Medical Officer of the Yukon.
- Evolution in the engagement preferences of the Tr'ondëk Hwëch'in.
- Unforeseen events in the community.

4.0 GENERAL APPROACH

At this time Chance is proposing five engagement events between June and September 2021. Each event will entail Chance and technical consultants going to Dawson or providing information in a virtual format, if preferred. The goal of each event will be to hold an open house / information session for TH Citizens and,

where schedules allow, hold meetings with the First Nation government, Renewable Resource Council, and/or other key entities based in the community.

Each event is intended to have a pre-determined theme. Identifying themes in advance, as well as scheduling approximately one event every month, enables each of Chance's consultants to prepare the necessary materials required in order to deliver effective and informative engagement events. Chance is proposing the follow themes:

1. Project Description and Candidate Valued Components (June)
2. Baseline Findings (July)
3. Caribou and Land Use (August)
4. Permafrost, Water, and Terrain (September)
5. Effects Assessment and Mitigation Measures (October)

There is little flexibility in the themes of the first and second events. While Chance has previously shared and presented a description of the Project, those activities took place in 2019. Not only did that take place approximately two years ago, but since that time Chance has engaged on another project (i.e., Eagle Plains Well Maintenance and Winter Activities project for Designated Office evaluation). Chance believes providing a re-fresher on the Project Description will be key.

The themes selected for events number three and four have been informed by feedback raised to date. However, these themes are flexible and can be adjusted. Additional details pertaining to specific issues and/or content for discussion will be developed prior to each session. Chance intends for its fifth event to prioritize a discussion of the Project's draft effects assessment, as well as proposed mitigation measures (e.g., draft management plans).

For each open house / information session Chance and Hemmera will produce a PowerPoint presentation, information sheets, and posters for the anticipated theme. Copies of engagements materials will be shared with the TH approximately one week in advance.

APPENDIX 2-D-30. *Eagle Plains Oil and Gas Exploration Planning: Surficial Geology/Permafrost and Exploration Development Suitability Mapping*

Re: Eagle Plains Oil and Gas Exploration Planning: Surficial Geology/Permafrost and Exploration Development Suitability Mapping

---

1. Introduction

Palmer is pleased to submit this report to Chance Oil and Gas Limited (Chance) to accompany and explain the interpretive surficial geology/permafrost and exploration development suitability mapping in a priority area of its Eagle Plains property in northern Yukon. Our work provides a basis for Chance to effectively plan upcoming maintenance programs for its abandoned wells and the next phase of its exploration, by distinguishing areas well and poorly suited to road and well pad construction, and mix-bury-cover (MBC) drill cuttings disposal. It also aims to help streamline Chance's exploration permitting process by proactively characterizing the distribution and relative ice content of permafrost in anticipation of related information requests from the Yukon Environmental and Socio-economic Assessment Board (YESAB).

Following provision of important background information (Section 1), we provide an overview of the physical setting (Section 2) and describe the methods used to produce the interpretive mapping and derivative products (Section 3). Key results portrayed by the maps, including the areal distribution of distinct areas and implications for exploration development, are highlighted in Section 4. Recommended follow-up investigations are highlighted in Section 5.

1.1 Background

Chance is interested in expanding its exploration for oil and gas reserves within its property near Eagle Plains. Exploration is planned in phases across a 2,400 km^2 area within its property. To support exploration planning and associated permitting, Chance is seeking insight into the distribution, characteristics, and sensitivity of permafrost terrain within its exploration area as a basis for optimizing initial ground testing and ultimate site selection for its exploration wellpads, access roads and MBC disposal sites. A number of key characteristics are particularly important for assessing site-specific sensitivities to disturbance, including: permafrost extent (laterally) and depth (active layer thickness) with consideration of potential talik (unfrozen) zones; relative ice content (e.g., ice-rich or ice-poor); and past or present instabilities expressed by

thermokarst, gullying, shallow landslides and ice-wedge polygons. Indicators of concentrated and seasonally prolonged shallow groundwater flow, such as slopewash runnels and the margins of existing or recently abandoned water bodies, are also important considerations for site selection and land management as these may increase construction costs and maintenance requirements.

Palmer previously completed surficial geology/permafrost and derivative suitability mapping for a 440 km^2 subset of the Chance Eagle Plains property, located approximately 40 km southwest of Eagle Plains. This study builds on and refines the previous work to complete seamless mapping expanding from the 440 km^2 subset into the surrounding area. In addition, this study takes advantage of the previous reporting by Palmer (2015a), which has been adapted for the current objectives, updated based on limited field observations, and revised where necessary.

1.2 Study Area

The study area is located approximately 20 km southwest of Eagle Plains, and measures approximately 2,400 km^2, inclusive of the 440 km^2 subset mapped in 2015 (Figure 1). The Dempster Highway diagonally crosses the southern half of the study area between kilometres 300 and 347. The northern edge of the study area roughly coincides with the Arctic Circle at 66°30’00” N, while the southern edge is approximately 8 km north of the Peel River valley at 65°55’00” N.

1.3 Objectives

The overall objective of this study is to expand the existing understanding of terrain and permafrost distribution and will ultimately provide Chance with advance knowledge of permafrost sensitivity and development suitability across its 2,400 km^2 Eagle Plains study area. To accomplish this main objective, Palmer completed the following:

- A field reconnaissance program to calibrate the terrain and permafrost characteristics with limited helicopter- and ground-based observations;
- Surficial geology mapping for the study area, including delineation of terrain features through the newly added 1,960 km^2 expansion area and review and refinement of the original 440 km^2 subset;
- Classification of permafrost conditions across the study area, with a focus on describing relative active layer thickness and permafrost ice content; and
- Derivation of an Exploration Development Suitability map with a focus on highlighting regions where constraints related to terrain and permafrost conditions are most likely to affect road routing and design, wellpad siting and layout, and future construction and maintenance activities. The Exploration Development Suitability map also draws attention to areas potentially suitable for MBC disposal of drill cuttings.

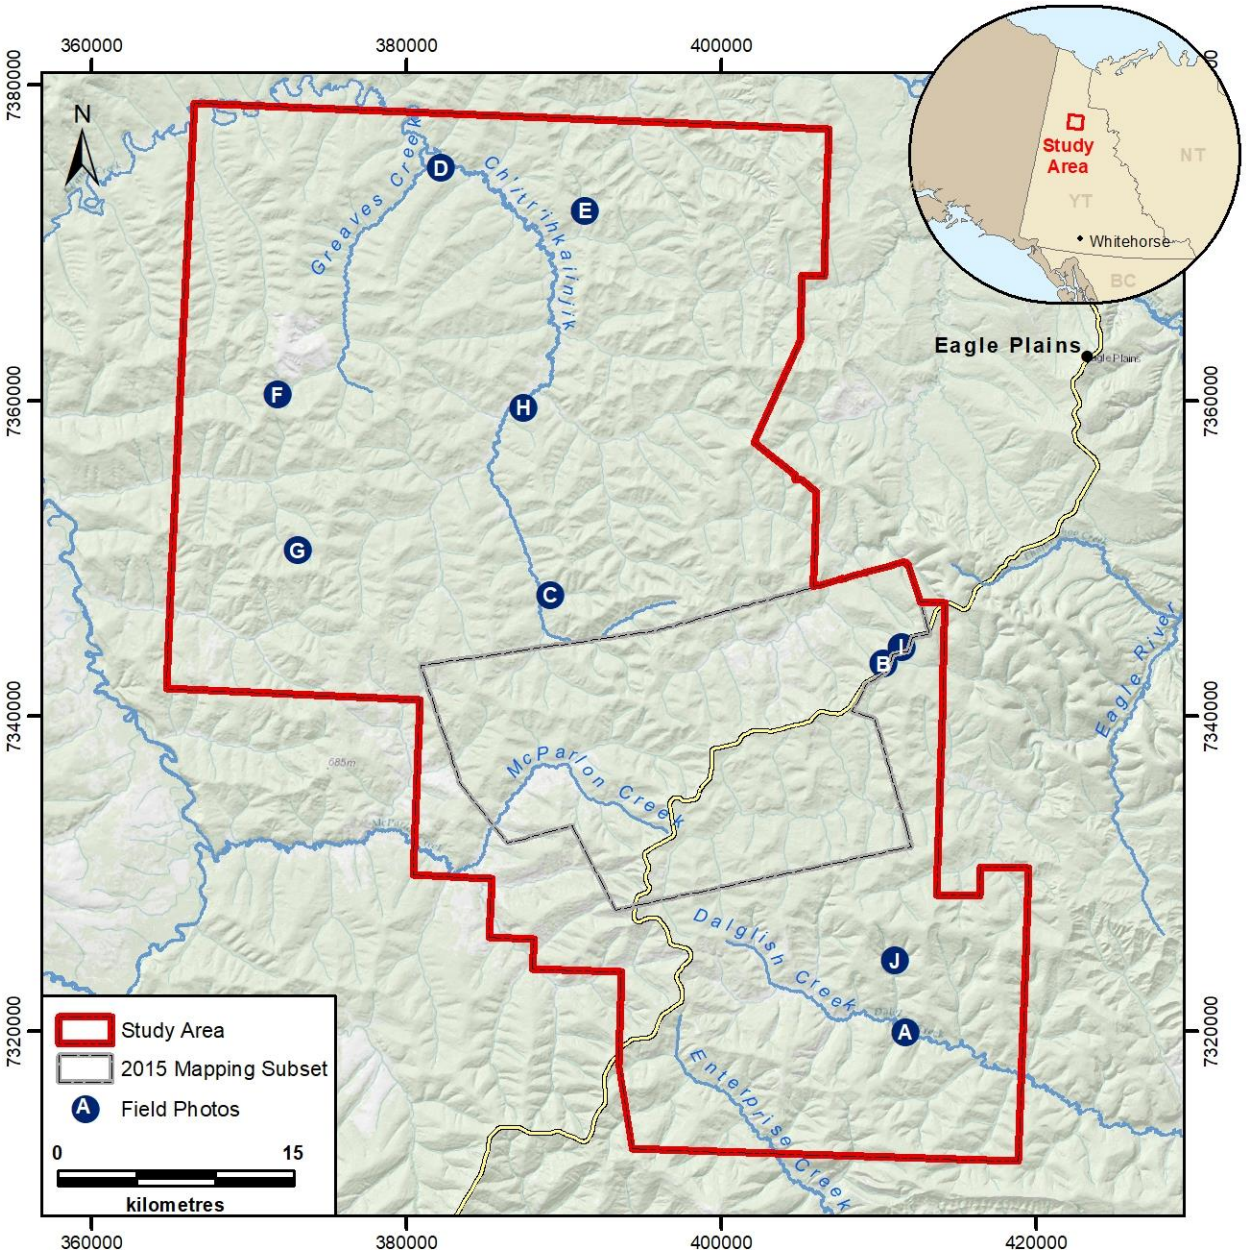

Figure 1. Eagle Plains study area and locations of representative field photos included below.

2. Physical Setting

The study area lies within the Eagle Plains Ecoregion, an area of modest relief in the lowlands between the North Ogilvie and Richardson mountain ranges (Yukon Ecoregions Working Group, 2004). Elevation ranges between 350 m asl at the base of the northernmost river valleys to 750 m asl at high points along the broad ridge system followed by the Dempster Highway. Climate is characterized by prolonged winter conditions which persist up to eight months of the year. Mean annual temperature is near -7.5°C, with mean July temperatures around 13°C and mean January temperatures slightly colder on the valley floors (-31°C) than over higher terrain (-25°C) due to strong temperature inversions associated with Arctic high pressure.

Annual precipitation is approximately 400 mm, falling mostly as rain during the summer months (Yukon Ecoregions Working Group, 2004). Most surface water drains into the northern-flowing Porcupine River, via major tributaries such as the Eagle River and Whitestone River; in the southeastern corner, Dalglish Creek and Enterprise Creek drain into the Peel River, which flows east to the Mackenzie River.

2.1 Bedrock Geology

The bedrock geology of the study area is dominated by the Upper Cretaceous rocks of the Cody Creek, Burnthill Creek, and Eagle Plain formations (Yukon Geological Survey, 2020). These rocks comprise fine- to medium-grained sedimentary sequences including sandstone, shale, siltstone, bituminous shale, mudstone, and coal. The easternmost edges of the study area intersect the mixed carbonate and clastic rocks of the Hart River and Ford Lake formations.

Differential weathering of these lithologies has contributed to the unique landscape in the study area. Broad ridges are formed by comparatively erosion-resistant sandstone beds. The Dempster Highway and Chance Road generally follow a network of these more resistant ridges. Isolated knolls along the ridge crests are likely remnants of the more competent bedrock in the area.

2.2 Landscape Evolution

Much of Yukon has been repeatedly glaciated during the Pleistocene, causing multiple episodes of erosion and deposition of thick and extensive glacial sediments. Beyond the maximum limit of glaciation, however, surficial deposits generally comprise deeply weathered bedrock and soils on plateaux and slopes, organic-rich soils and peat in depressions, and fluvial silts, sands, and gravels along river valleys (Hughes, 1972). During the last glaciation, the Laurentide Ice Sheet reached its all-time limit occupying the region surrounding the lower Mackenzie River Valley and reaching as far west as parts of the Richardson and Mackenzie Mountains. The study area lies within an unglaciated region to the west of this limit (Duk-Rodkin, 1999), and is generally unaltered by glacial processes. However, Laurentide ice obstructing the Peel River valley and impounding Glacial Lake Hughes diverted meltwater flow northward through the Eagle River valley (Duk-Rodkin and Hughes, 1995). Thus, glacial processes may have had an indirect effect on the study area by lowering the base level of the Eagle River and increasing the rate of incision of its upstream tributaries.

The lack of glacial erosion has resulted in broad, rolling uplands that are typically covered by veneers of relatively fine-grained colluvium or weathered bedrock and commonly bounded by well-drained scarps where more resistant bedrock transitions into fluvially incised, V-shaped valleys. The valley sides are covered by thick, fine-grained colluvium, locally overlain by organics. Thick, fine-grained to gravelly fluvial deposits occupy the valley bottoms. Remnant terraces perched above the floodplains within some of the larger valleys are composed of peat overlying fine sands and silts (Thomas and Rampton, 1982). The lower permeability and valley bottom position of these thicker sediments results in the preservation of ice-rich permafrost, which can introduce challenges for exploration and infrastructure development in these areas.

2.3 Permafrost and Periglacial Processes

Permafrost is ground, including both unconsolidated sediments and bedrock, that remains below 0°C for more than one year. Chance's Eagle Plains property is entirely within the zone of continuous permafrost,

based on property-specific geological and geophysical field data, ground surface expression visible in aerial photography, and regional-scale permafrost mapping compiled by Heginbottom et al. (1995) (Palmer, 2015b).

The depth to permafrost (or active layer thickness) varies spatially at regional and local scales, and temporally with changing seasons. The active layer is generally <1 m thick in the study area, even at its late summer maximum, although it may reach around 2 m in particularly well drained, elevated sites. Active layers may be even thicker, locally reaching bedrock at a depth of 3-4 m, following wildfire (Coates, 2008; Kryotek Arctic Innovation, 2015). At a local scale, active layer thickness primarily depends on elevation, aspect, slope position and shape, soil texture and drainage, snow pack and vegetation cover (Williams and Burn, 1996; Bonnaventure et al., 2012; McKillop et al., 2013). Well drained soils insulated by thick annual snow cover tend to have thicker active layers (deeper permafrost table) than wind-swept, poorly drained areas (shallower permafrost table). In areas of thick, mossy organic cover, permafrost may be encountered at depths as shallow as just a few tens of centimetres even at the end of summer. Active layer thickness increases following snowmelt in spring, and typically peaks in late summer.

Permafrost may or may not contain ice, depending primarily on the material within which it exists and its hydro-geomorphic setting. Most commonly, ice is restricted to the pores or fractures within surficial materials or bedrock, respectively. Such ‘ice-poor’ permafrost is widespread in the study area and most common in areas of exposed or shallow bedrock, along ridges of weathered bedrock, and on relatively well drained colluvial slopes. Where soil textures and drainage conditions permit, thin seams or small lenses of ice may form, representing a more moderate volumetric content of ice. Broad valley bottoms, which have been infilled with mixtures of fine-grained colluvium, fluvial deposits and organic matter, may contain ‘ice-rich’ permafrost. In addition to pore and lens ice, massive bodies of ice may exist within the unconsolidated material. Such bodies grow and shrink in response to changing climatic conditions and ground thermal regime (e.g., organic cover thickness, local drainage conditions). They may form ice wedges, which commonly form geometric networks well expressed at surface by interconnected, linear furrows. Ice-wedge polygons also occur on some gentle slopes, including broad ridge crests and shoulders within portions of the study area.

The sensitivity of permafrost to disturbance depends on a variety of factors, including its temperature, ice content, insulating ground cover (e.g., organics) and the material within which it is held. Relatively warm permafrost (i.e., warmer than -2°C) is more susceptible to thaw due to localized and even minor disturbances to the ground surface, whereas cooler permafrost is able to withstand minor disturbances without appreciable effect. Permafrost that is decoupled from current climatic conditions and only persists in areas of thick, mossy organic cover is more sensitive to disturbance through ground disturbance (e.g., stripping or compaction of organics). Permafrost within fine-grained materials is more likely to contain discrete bodies of ice and, thus, is more sensitive than that within weathered bedrock or coarse-grained colluvium.

Permafrost has a strong influence on soil and drainage conditions, the rates and mechanisms of colluvial (mass movement) processes, and overall hillslope and valley bottom morphology. An appreciation for periglacial processes is important to exploration planning. Permafrost acts as a barrier to water flow, in the absence of any taliks (unfrozen areas bounded by permafrost), so unconsolidated materials within the

active layer commonly become saturated during the summer. On level ground, differential frost heave may occur in the snow-free season, resulting in frost (mud) boils, irregular micro-topography and the formation of earth hummocks. Ice-wedge polygons may form under certain conditions. In areas of ice-rich permafrost, even minor ground disturbances may trigger thermokarst activity (e.g., natural windthrow ripping the surface organic mat and exposing underlying sediments), through which the ground subsides and slumps in response to the melting of buried ice bodies. Thermokarst commonly continues for extended periods of time (i.e., years to decades), once initiated, through a positive feedback cycle between increases in thaw and increases in water ponding. Retrogressive slumping is common along the shores of thaw ponds and along the banks of thermokarst gullies, which incrementally enlarges the area of subsidence.

On slopes, summertime saturation reduces the shear strength of the soil and promotes solifluction, the gradual, downslope creep of material on the permafrost table; or active-layer detachment, the rapid, downslope slide and/or flow of material on the permafrost table. Both processes increase in frequency and magnitude shortly after wildfire (Coates, 2008), mainly due to the loss of rooting strength and insulating organic cover (thaw rate and depth increase). Solifluction is best recognized at surface by conspicuous ‘lobes’ of organics and sediment, defined by a steep, rounded front and a gradual tail. Areas of active solifluction can destabilize roads through irregular settlement and mounding. Certain slopes are commonly prone to active-layer detachments; their histories of landslides are commonly indicated by conspicuous fall line-oriented ‘stripes’ of deciduous trees.

Slopewash is another widespread and important process on slopes underlain by permafrost, through which material is transported downslope through a combination of sheetwash (entrainment in surface runoff) and piping (entrainment in water percolating through the active layer). Shallow ‘runnels’ (also known as ‘water tracks’) are a surface manifestation of slopewash, formed by the repeated and preferential downslope transport of sediments along natural drainage paths. As slopewash runnels deepen, they concentrate and prolong the conveyance of surface runoff and shallow groundwater, resulting in a local depression in the permafrost table (thickening of the active layer). The interception of slopewash runnels by roads necessitates cross-ditching or drainage culvert installation; still, such sites may form ‘icings’ during the winter and spring months, which increase maintenance requirements on road surfaces and embankments.

3. Methods

3.1 Field Reconnaissance

A one-week field reconnaissance program was completed between July 1 to 7, 2019. Weather conditions were generally clear and sunny with brief periods of light rainfall. The program was undertaken with the support of a helicopter and included reconnaissance flights over much of the study area as well as ground-based assessments. The program was completed with a focus on characterizing a diversity of landforms, surficial materials, and permafrost conditions across the study area. Ground-based field observations were made through a series of foot traverses to document changes across the landscape. Field assessment involved examining sediments and visible ice in hand-dug soil pits and natural exposures (e.g., landslide scarps, gullies, stream cut-banks); measuring depth to frost (which may not have represented the true depth to permafrost at the start of the summer); determining material textures, origins, and expressions; and describing geomorphological processes. The program was completed in parallel with an ecological field program undertaken by Environmental Dynamics Inc. (EDI). Where possible, terrain interpretations were

supplemented by opportunistic field observations made and shared by EDI's ecologists as part of their field program.

3.2 Terrain Mapping

Palmer completed surficial geology/permafrost mapping for the 2,400 km^2 study area as a basis for communicating the distribution of distinct ground conditions. The mapping represents the seamless integration of the previously mapped 440 km^2 area (Palmer, 2015a) with the expanded interpretations within the surrounding 1,960 km^2. The 440 km^2 subset was reviewed and standardized for consistency with the surrounding area. Terrain interpretations were completed using a combination of multiple stereo-imagery sources in combination with high-resolution LiDAR-derived elevation data. Aerial photographs were acquired by Chance over the northern and southern regions of the study area, but smoke from wildfires precluded acquisition within the central portion of the study area. Satellite imagery acquired between 2014 and 2019 were overlain onto a digital elevation model to generate pseudo-stereo imagery and were used as a substitute for stereo aerial photographs in this region. Terrain interpretations were refined based on LiDAR-derived elevation data, available across the study area at a resolution of 2 m. Surficial mapping was digitized directly into a geographic information system (GIS) using DAT/EM's Summit 3D mapping software in conjunction with Esri's ArcMap.

Surficial geology/permafrost mapping was completed at a view scale of 1:20,000 using the standardized Yukon surficial geology mapping protocols (Lipovsky and Bond, 2014), which are an adaptation of the *Terrain Classification System for British Columbia* (Howes and Kenk, 1997), with modifications to accommodate project-specific objectives. Terrain polygons were delineated based on internally homogenous combinations of surficial materials, textures, surface expressions, drainage classes, and geomorphological processes. Under this system, up to two surficial materials were identified in each polygon as either a primary or secondary material, or in stratigraphic relation to each other. Relative depth to, and relative ice content of, permafrost were estimated for each map polygon using the terrain characteristics and calibrated based on ground observations made during the field reconnaissance program. Relative depth to permafrost refers to the approximate maximum (end of summer) depth of the permafrost table (active layer thickness) and is an inferred average value for the polygon (Table 1). Relative ice content is an inference of the amount of pore ice, segregated ice, massive ice, and/or excess ice (Table 2). Terrain and permafrost interpretations are limited by the mapped scale, and represent the average conditions within each map unit (polygon). It is possible that ground ice is more or less extensive than its mapped representation due to a necessary generalization of the terrain characteristics or geomorphological processes of the map unit. Polygons have been symbolized based on the primary surficial material. Discrete terrain features and geomorphic processes too small to be mapped as individual polygons, such as thermokarst subsidence and active-layer detachments, have been identified using on-site point and line features. All codes used in the mapping are defined in the legend.

3.3 Exploration Development Suitability

The Exploration Development Suitability maps represent the general suitability of distinct areas for the establishment and maintenance of access roads and wellpads, and for disposal of drill cuttings using MBC techniques. The general characteristics of terrain suitable for wellpads and access roads were assumed to be similar in the study area, so these suitabilities have been considered together.

Table 1. Inferred relative depth to permafrost.

Depth Classification	Definition	Description
Near-surface	Permafrost table located less than 0.4 m from the ground surface.	Permafrost is typically found within or at the base of surface organics. Includes map units overlain by organic blankets and veneers; very poorly to imperfectly drained fluvial fans, terraces, veneers; and inactive floodplains.
Shallow	Permafrost table located between 0.4 and 1.0 m from the ground surface.	Applies to relatively fine-grained and matrix-supported sediments and is considered the typical permafrost depth class through the study area. Includes most imperfectly to moderately well drained deposits, active floodplains and most deposits with mapped ice-wedge polygons or thermokarst subsidence.
Deep	Permafrost table located more than 1 m from the ground surface.	Typically applies to relatively coarse-grained and clast-supported deposits. Includes bedrock and most moderately to well drained colluvium and weathered bedrock along convex ridges and scarps.

Table 2. Inferred relative ice content of permafrost.

Ice Content Classification	Pore Ice	Segregated Ice	Massive Ice	Excess Ice[1]	Description
Ice-rich	Continuous	Extensive	Indicated (Xw), Inferred (Xt), or likely; widespread	Major	Typically includes sediments overlain by organic blankets and veneers; poorly to very poorly drained, mostly inactive fluvial deposits; and map units affected by ice-wedge polygons or thermokarst subsidence.
Ice-moderate	Continuous	Widespread, in seams and lenses	Possible, locally	Moderate	Includes fluvial deposits not previously classified as ice-rich; fine-grained colluvial aprons and blankets; imperfectly to poorly drained matrix-supported colluvial blankets; and map units affected by sheetwash or solifluction.
Ice-poor	Discontinuous to Continuous	Local, mostly in seams	Unlikely, except in isolated areas	None to minor	Applies to most moderately to well drained terrain throughout the rolling uplands and colluvial slopes and is considered the typical ice content class in the study area.

[1] Excess ice refers to the volume of ice that exceeds the total voids (e.g., pore space) that would be present under natural, unfrozen conditions.

The road and wellpad suitability and MBC disposal suitability classifications were derived from the 1:20,000-scale surficial geology interpretations and are specific to (and relative within) the project area. Map units (polygons) were categorized into five road and wellpad suitability classes (ranging from Very High to Very Low) and two MBC disposal suitability classes (Potentially Suitable and Probably Unsuitable) based on terrain characteristics, site drainage, and permafrost conditions, also considering field observations and professional experience in unglaciated Yukon (e.g., McKillop et al., 2013; McKillop et al., 2016). Definitions, explanations and implications of each class are outlined in Section 4.3 in association with the presentation of results. A lower suitability rating does not necessarily mean suitable terrain is not present in the map unit; localized portions of these polygons may be suitable for exploration development or MBC disposal based on site-specific terrain characteristics. Similarly, a higher rating does not necessarily mean the entire polygon is suitable for exploration development or MBC disposal. Field investigations remain warranted to evaluate suitability classifications at a site-specific level.

4. Results and Discussion

4.1 Key Field Observations

Ground observations were made at 103 field reconnaissance sites and supplemented by opportunistic observations and photographs taken along foot traverses and helicopter flights. An overview of representative photograph locations is shown in Figure 1, and examples of common terrain units and processes are presented in Figure 2. Most of the study area consists of gently sloping uplands dissected by stream valleys punctuated by bluffs at the crests of slopes (Photos A to C). Geomorphological processes related to ice-rich permafrost are visible by surface expressions including ice-wedge polygons (Photo D) and thermokarst subsidence (Photo E). Mass movements such as active-layer detachments were observed on gentle to moderate gradients along valley walls (Photo F).

Representative photographs of permafrost conditions and sediments in the study area are presented in Figure 3. Measurements of the active layer thickness at the time of site inspection (July 1 to 7, 2019) are estimated to be slightly thinner than the late summer maximum. In general, depth to frost was less than 1 m throughout the study area. Measurements were generally deeper near active streams and were assumed to be relatively deep on well drained, weathered bedrock ridges where high clast content typically restricted measurements using a frost probe. Permafrost was near-surface (<0.4 m) beneath areas of thick organic cover, such as fluvial terraces and inactive floodplains. Typically, ice content increases toward lower valley positions, and was noticeably higher within inactive floodplains. In one such environment, an eroding stream bank exposed massive ground ice in wedges >2 m high (Photo G). Excess ice was also observed within thick, fine-grained colluvial deposits (Photo H).

Competent bedrock rarely outcrops at surface through most of the study area, but several conspicuous outcrops of sandstone and conglomerate were observed near the Dempster Highway (e.g., Figure 3 Photo I). Most ridge crests appear as weathered bedrock and consist largely of well drained sands and angular clasts (Photo J).

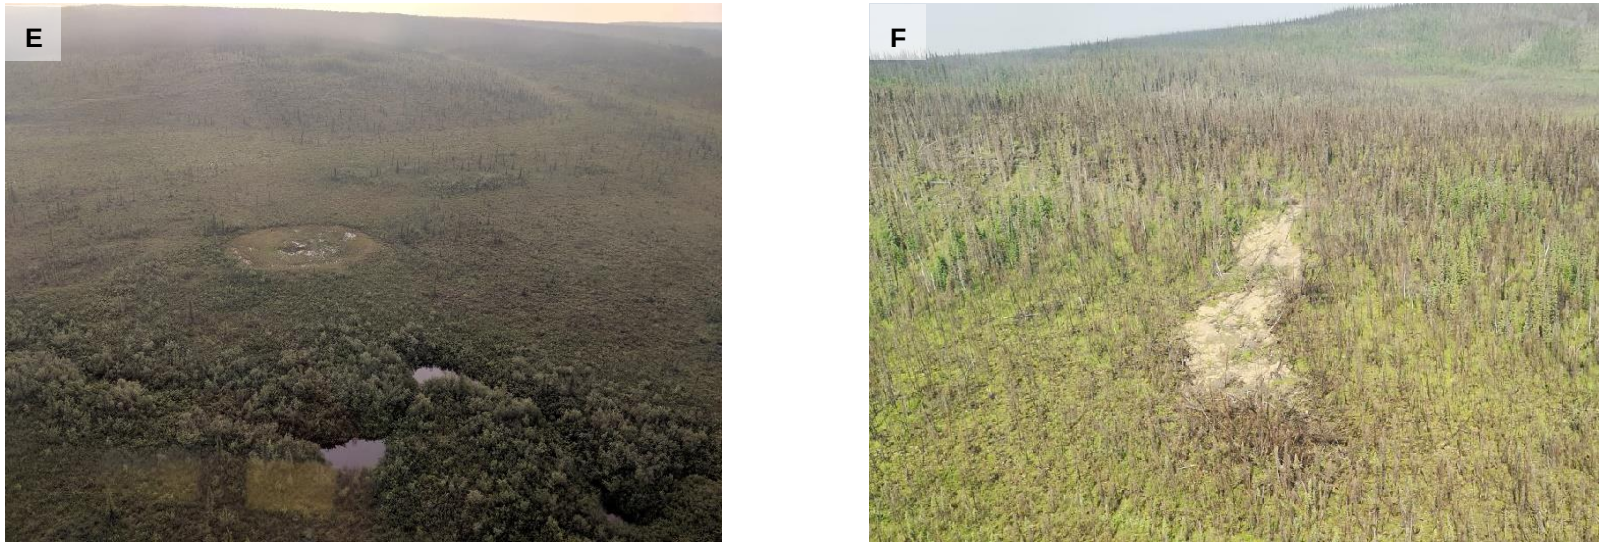

Figure 2. Field photographs representative of common landforms and geomorphological processes within the study area: A) View of the Dalglish creek valley, showing an irregularly meandering channel and several areas of lateral erosion where the creek has cut into the valley walls; B) Convex, mid-slope composed of more-resistant bedrock mantled by a veneer of weathered bedrock and colluvium; C) Gentle fluvial fan exhibiting a triangular- or wedge-shape, transitioning into a modern stream valley (lower right); D) Geometric surface expression of ice-wedge polygons over an inactive region of the floodplain; E) Thermokarst depression in an inactive region of the floodplain; and F) Recent active-layer detachment initiated at the crest of a gentle colluvial slope.

Figure 3. Field photographs representative of typical surficial material characteristics: G) Ice wedge exposed in freshly eroded stream bank (1.9 m-tall person for scale); H) Ice lens within fine-grained, colluvial sediment; I) Outcrop of more-resistant conglomerate exposed in a bluff near the Dempster Highway; J) Sandy, clast-supported veneer of weathered bedrock, typical of deposits found in weathered bedrock bluffs and knolls.

4.2 Surficial Geology and Permafrost

The results of the surficial geology/permafrost mapping are presented in the series of maps shown in **Appendix A**. Most landforms and materials in the study area are interpreted to have originated prior to the last glaciation. Apart from organics, recent fluvial deposits, and areas recently affected by active geomorphological processes, the landscape is dominated by deeply weathered sediments that have developed on slopes and ridges over many millennia.

Colluvial deposits (aprons, veneers, blankets, and mantles of variable thickness) are the most extensive surficial material, located ubiquitously on slopes and ridges and comprising 71.8% of the study area (Table 3). Fluvial deposits comprise 8.4% of the study area and are generally identified along the bottoms of broad valleys, although fans and veneers of fluvial sediments are mapped at confluences and within narrow ravines, respectively. Organic material accumulates on most imperfectly to very poorly drained deposits throughout the study area, but it is only identified in the terrain code when its thickness exceeds about 0.5 m. Organic veneers and blankets are generally mapped in low valley positions near active streams, and comprise 1.6% of the study area. Bedrock within the study area is commonly fissile and deeply weathered, located along ridge tops and convex slope-breaks along the crests of valley walls. Weathered veneers of bedrock cover 17.3% of the study area. Intact bedrock is rare at surface and is limited to exposures in steep scarps lining the broad ridge tops, covering 0.9% of the study area. Areas significantly disturbed by human activity (excluding road networks) have been mapped as anthropogenic landforms, and cover <0.1% of the study area

Table 3. Areal distribution of surficial materials and landforms by primary surface material.

Surficial Material and Landform	Terrain Code	Areal Extent	Areal Percentage
Anthropogenic	A	1.41 km^2	< 0.1%
Organic Veneer	Ov	10.24 km^2	0.4%
Organic Blanket	Ob	28.85 km^2	1.2%
Colluvial Apron	Ca	188.77 km^2	7.9%
Colluvial Veneer	Cv	816.12 km^2	34.0%
Colluvial Blanket	Cb	401.01 km^2	16.7%
Colluvial Mantle of Variable Thickness	Cw	315.50 km^2	13.2%
Weathered Bedrock Veneer	Dv	414.07 km^2	17.3%
Fluvial Plain (active and inactive)	FAp; Fp	111.80 km^2	4.7%
Fluvial Veneer (active)	FAv	49.53 km^2	2.1%
Fluvial Fan (active and inactive)	FAf; Ff	36.29 km^2	1.5%
Fluvial Terrace	Ft	2.87 km^2	0.1%
Bedrock	R	20.47 km^2	0.9%
Total		**2,396.93 km^2**	**100%**

Relative depth to permafrost is estimated to be shallow (0.4-1 m) across the majority of the study area (86.2%), and is found on most broad ridges, colluvial slopes, and around active floodplains (Table 4). Relative depth to permafrost is estimated to be near-surface within poorly drained valley bottoms and beneath organic deposits, comprising 3.6% of the study area. Relative depth to permafrost is estimated to be deep (> 1 m) across 10.2% of the study area and is commonly mapped in association with coarse colluvial or weathered bedrock deposits typically found along convex ridges and bluffs, and bedrock scarps.

Permafrost is estimated to be ice-rich across 12.9% of the study area, and is commonly found below poorly drained, inactive fluvial deposits and below organic cover (Table 4). Ice-rich permafrost may also be found along fine-grained colluvial slopes and even along some ridges where the surface expression of ice-wedge polygons is visible in LiDAR data or aerial imagery. Ice-moderate permafrost comprises 40.8% of the study area, and is commonly found below imperfectly drained fluvial deposits and thick, fine-grained colluvial deposits. Ice-moderate permafrost is also inferred in regions affected by sheetwash or solifluction. Nearly half the study area has been estimated to contain ice-poor permafrost (46.3%), which applies to most moderately to well drained terrain along ridges and upper valley slopes.

Table 4. Area distribution of permafrost conditions by relative depth and relative ice content.

Permafrost Condition Classification		**Estimated Relative Ice Content**			
		Ice-poor	**Ice-moderate**	**Ice-rich**	**Total**
Estimated Relative Depth	**Near-surface (<0.4 m)**	0% *(0 km²)*	0.1% *(2.2 km²)*	3.5% *(84.1 km²)*	**3.6% *(86.3 km²)***
	Shallow (0.4 – 1 m)	37.0% *(885.8 km²)*	39.9% *(955.6 km²)*	9.4% *(224.7 km²)*	**86.2% *(2,066.1 km²)***
	Deep (>1 m)	9.4% *(224.3 km²)*	0.8% *(20.2 km²)*	0% *(0 km²)*	**10.2% *(244.5 km²)***
	Total	**46.3% *(1,110.2 km²)***	**40.8% *(977.9 km²)***	**12.9% *(308.8 km²)***	**100% *(2396.9 km²)***

4.3 Exploration Development Suitability and Associated Implications

The series of Exploration Development Suitability maps is provided in **Appendix B**. The maps combine the results of the road and wellpad suitability classifications with the MBC disposal suitability classifications.

Road and wellpad suitability are presented as a five-class system (Table 5). A total of 17.4% of the study area has been classified as Very High or High suitability. These areas comprise ice-poor, isolated topographic highs and moderately to well drained ridge systems, which form sinuous networks through the landscape. Conversely, lower valley terrain such as floodplains and fine-grained colluvial aprons are generally prone to higher ice contents, and active permafrost and periglacial processes, including active-layer detachments, solifluction, thermokarst, and sheetwash. A total of 54.2% of the study area was classified as Low to Very Low suitability, due to one or more development constraints. The remaining 28.4% of terrain was considered moderately suitable for development and may be reasonable for road and wellpad establishment by employing proactive mitigation measures where necessary.

Table 5. Road and wellpad suitability classification and implications for construction and maintenance.

Road and Wellpad Suitability	Description	Implications for Construction and Maintenance	Percent of Study Area
Very High	Moderately well to well drained, isolated topographic highs with deep or shallow, ice-poor permafrost. Generally considered to be stable terrain, and typically located along wide, rounded ridge crests.	Favourable conditions for access road and wellpad establishment through standard best management practices. Minimal expectation for maintenance requirements.	8.1%
High	Generally, moderately well to well drained areas with deep or shallow, ice-poor permafrost. Typically associated with ridges of weathered bedrock or shallow colluvium over convex topography.	Generally favourable conditions for access road and wellpad establishment through standard best management practices. Low to moderate expectation for maintenance requirements.	9.3%
Moderate	Imperfectly to moderately well drained colluvial slopes with deep to shallow permafrost, commonly with poor to moderate ice content; Convex weathered bedrock bluffs, typically at moderate slope gradients; and fluvial terraces above the influence of modern stream processes.	Generally reasonable conditions for access road and wellpad establishment. Where necessary, employment of mitigations may be to proactively manage natural concentrations of surface runoff and to protect thaw-sensitive permafrost. Moderate expectation for maintenance requirements. Field reconnaissance would help inform route/site selection and mitigation requirements.	28.4%
Low	Poorly to imperfectly drained, thick colluvial slopes with shallow permafrost, commonly with moderate to rich ice content; imperfectly drained fluvial fans and veneers. Regions affected by sheetwash, gully erosion, and ice-wedge polygons are typically included in this category. Surface runoff becomes concentrated.	Generally unfavourable conditions for access road and wellpad establishment, except through mitigations to proactively manage natural concentrations of surface runoff and to protect thaw-sensitive permafrost. Moderate to high expectation for maintenance requirements. Field reconnaissance is necessary to inform route/site selection and mitigation requirements.	32.8%
Very Low	Very poorly to imperfectly drained areas with shallow or near-surface permafrost, commonly with rich to moderate ice content. Includes most floodplains and steep bedrock scarps. Thermokarst subsidence and ice-wedge polygons are common on level to gently sloping ground, and slopes may be subjected to mass movements including solifluction and active-layer detachments.	Unfavourable conditions for access road and wellpad establishment. Any necessary crossings will require comprehensive mitigations to protect thaw-sensitive permafrost and manage surface runoff and compressible, fine grained sediments. Road construction through steep bedrock scarps would require earthworks and potentially localized blasting. Maintenance expectations are high. Field reconnaissance is critical to inform route/site selection and mitigation requirements.	21.4%

Most moderate terrain can be found over mid- to upper-valley slopes and is mantled by imperfectly drained colluvial veneers and convex, moderately sloping weathered bedrock ridge crests. A summary of the implications for construction has been presented in association with typical constraints expected within each class (Table 5). Design, construction and maintenance of exploration infrastructure generally require greater effort and more complex mitigative solutions as road and wellpad suitability decreases.

The MBC disposal suitability serves to highlight ice-poor, gently-sloping, and relatively stable regions of the landscape set back from significant watercourses as potentially suitable for MBC disposal (Table 6). These criteria were generally met along broad ridge systems and isolated knolls. A total of 13.2% of the study area has been classified as potentially suitable for MBC drill cuttings disposal, most commonly in association with areas classified as High or Very High suitability for road and wellpad suitability. Runoff may be variable at the mapped scale such that different areas within a polygon may have less or more interaction with surface water. For example, polygons affected by slopewash may show discrete runnels where runoff is concentrated. As a result, field investigations are suggested to refine the MBC disposal suitability classifications at a site-specific scale which would better determine target areas for cuttings disposal within each map unit (polygon).

Table 6. Mix-bury-cover (MBC) disposal suitability classification.

MBC Disposal Suitability	Description	Percent of Study Area
Potentially Suitable	Generally geomorphologically isolated regions on level or near-level, elevated areas with minimal or no receipt of surface runoff (i.e., 'shedding sites'). Areas are typically located along broad to rounded ridge crests and knolls that are set back from significant watercourses.	13.2%
Probably Unsuitable	Includes moderate to steeply sloping regions; areas with ice-rich permafrost; and areas exhibiting evidence of geomorphological instability such as fluvial erosion, thermokarst subsidence, solifluction, and active-layer detachments.	86.8%

5. Recommendations

Palmer recommends Chance consider a number of logical follow-up initiatives based on the results of this mapping project to help optimize its upcoming multi-year, multi-well drilling program:

- **GIS-based road routing optimization analysis** – To minimize design, construction, maintenance, and rehabilitation costs, project elements and infrastructure should be site to minimize exposure to low Exploration Development Suitability terrain to the extent possible. This may be accomplished through a collaborative GIS-based road routing analysis between Palmer and the Chance project team, whereby effort and cost are attributed to distinct terrain units, and optimized for development.

- **Incorporation of environmental discipline perspectives into suitability** – The Exploration Development Suitability classification was prepared with a focus on terrain and permafrost constraints. Combining this with the perspectives of other environmental disciplines would yield a more robust suitability classification by accounting for additional environmental values (e.g., vegetation, wildlife habitat, First Nations land uses, archaeological resource potential, etc.).
- **Road alignment delineation** – Following determination of an approximate road route at the polygon-scale (two bullets above), more precise delineation of an actual road alignment would help enable avoidance of local terrain and permafrost constraints (e.g., drainage runnels, thermokarst).
- **Targeted field investigations of complex terrain and areas for MBC disposal** – Complete avoidance of terrain with low or very low Exploration Development Suitability may not be feasible given its abundance in lower valley and floodplain positions. Targeted field investigations in these locations would serve to fine-tune the alignment and confirm the interpretations, site conditions, and cost implications. As local permafrost and runoff conditions may show slight variability at the mapped scale, targeted field investigations would also benefit the selection of specific sites for MBC disposal within polygons identified as Potentially Suitable for MBC disposal.
- **Proactive identification of rehabilitation plans** – It may be productive for Chance to proactively identify its planned approaches for site, road, and wellpad rehabilitation following the completion of work, in anticipation of comments by YESAB, First Nations, and other stakeholders. Rehabilitation plans are best tailored to existing ground and runoff conditions.

6. Statement of Limitations

This report has been prepared by Palmer for Chance in accordance with the agreement between Consultant and Client, including the scope of work detailed therein (the “Master Service and Supply Agreement”). The report and the information it contains may be used and relied upon only by Client, except (1) as agreed to in writing by Consultant and Client, (2) as required by-law.

The extent of this study was limited to the specific scope of work for which Palmer was retained and is described in this report. Palmer has assumed that the information and data provided by the client or any secondary sources of information are factual and accurate. Palmer accepts no responsibility for any deficiency, misstatement or inaccuracy contained in this report as a result of omissions, misinterpretations or negligent acts from relied-upon data. Judgement has been used by Palmer in interpreting surficial geology, geomorphological processes, and exploration development susceptibility based on desktop analysis and limited field reconnaissance. Interpretations of subsurface conditions have been made based on surface observations and limited subsurface exposures and may not fully capture the variability in the study area or within a given map unit (polygon).

Palmer is not a guarantor of site conditions or potential hazards or risks but warrants only that our work was undertaken and our report prepared in a manner consistent with the level of skill and diligence normally exercised by competent geoscience professionals practicing in Yukon. Our findings, conclusions and recommendations should be evaluated in light of the limited scope of our work.

7. Certification

APPENDIX 2-D-31. *Land Tenure Extension Request for Exploration Permits 0008-0017, 0019 and 0020 ("Permits")* Letter

Chance
OIL AND GAS LIMITED

December 15, 2021

Government of Yukon
Department of Energy, Mines and Resources
P.O. Box 2703
Whitehorse, YT
Y1A 1B2

sent via emai [redacted]

Attention: Hon. [redacted] **Minister of Energy, Mines and Resources**
Dear Sir:

Re: Land Tenure Extension Request for Exploration Permits 0008-0017, 0019 and 0020 ("Permits")

Chance Oil and Gas Limited ("Chance", the "Company") hereby requests that the referenced Permits be extended for an additional five years pursuant to Sections 27(b), 28(1)(c) and (d) and 31.01 of the Yukon *Oil and Gas Act* (the "Act"). The basis for this extension request is described in the following paragraphs and has not materially changed since the last request for tenure extension was made on March 11, 2020 for one of the Exploration Permits. Timelines to be able to exercise exploration rights in Yukon are long and growing.

The actions of Chance and its predecessor, Northern Cross (Yukon) Limited, in respect of the rights under the Permits have been consistent with the Act by diligently trying to conduct an exploration program at Eagle Plains to evaluate the crude oil and natural gas resource potential. These efforts are substantially documented in the records of a variety of government departments, including Energy Mines and Resources. The Company has only been partially successful accomplishing its exploration objectives.

Unfortunately, Chance has been subjected to external influences beyond the control of the Company. These include the indefinite, perhaps permanent, moratorium on hydraulic fracture

stimulation ("Moratorium") in the Eagle Plain Sedimentary Basin, the impact of the Peel Watershed Land Use Planning exercise which challenged access, and the inconsistent, unpredictable and expanded time and information requirements of environmental impact assessment processes with the Yukon Environmental and Socio-economic Assessment Board ("YESAB"). Timelines and conditions related to the conduct of exploration activities are further increased by the requirement under Ministerial Orders whereby Chance has established Engagement and Communication Plans ("Plans") with four First Nations, including designated organizations. The Company is using its best efforts to actively implement these Plans in respect of a significant exploration project, but the pace of this implementation is slow and uneven and has been dramatically affected by Covid 19. The collective impact of these influences was not reasonably foreseen at the time Chance was awarded the Permits nor after exploration activities commenced, but they have adversely affected the ability of the Company to exercise its exploration rights either in a timely way or at all.

Since the Permits were originally awarded during the period between 2007 and 2010, Chance has demonstrated its commitment to oil and gas exploration in Yukon by diligently undergoing several YESAB assessments, obtaining regulatory approvals, and executing drilling and seismic data acquisition programs within the area of the Permits. This work was conducted in an environmentally and corporately responsible manner and in full compliance with various permits and licenses issued to undertake this exploration work. The efforts of the Company have advanced the geological understanding of the Eagle Plain Sedimentary Basin while providing very significant benefits to Yukon in the form of employment, training, and business opportunities. Well over $100 million has been spent, which is about five times the amount that was committed at the time these Permits were originally awarded. Most of this investment is now stranded in view of the Moratorium.

Chance has undertaken or consultants acting on behalf of Chance have undertaken the following activities related to the proposed multi-well exploration and seismic data acquisition program:

1. Geological field program to sample rocks at various outcrops at Eagle Plain to help mature new prospects,
2. Purchased under license vintage 2D seismic data in the Eagle Plain area,
3. Bird survey,
4. Fish and other aquatic surveys,
5. Site investigations of vintage and modern seismic lines to understand use by wildlife and humans and regeneration patterns,
6. Field studies covering a range of permafrost processes;
7. Water sampling at various locations in the proposed area of exploration interest;
8. Porcupine Caribou studies in collaboration with the Porcupine Caribou Management Board,
9. LiDAR and aerial photography surveys; and

10. Meetings with affected First Nations in Old Crow, Inuvik, Tsiigehtchic, Ft. McPherson, Aklavik, Dawson City, Mayo and Whitehorse in respect of a proposed multi-well exploration and seismic data acquisition plan.

More field work is planned for the winter of 2022-2023 to evaluate the condition of 8 suspended wells operated by Chance with the objective of remediating any problems so the wells can remain suspended until used in future operations, converting two wells to become deep zone injectors or disposal wells, extended flow testing of three natural gas formations in three vintage wells and abandoning at least 3 of the suspended wells. Where possible, Chance hires First Nation citizens to participate in these field programs. In the past three years, the approximate expenses incurred to undertake these activities was $6.7 million. Spending at this level or higher is anticipated to continue for additional exploration work and related activities as described above for well maintenance and continuance. Preserving suspended status of wells that are sound and secure supports the request for tenure extension as well.

Chance is hopeful that it will be in a position to submit to the Executive Committee of YESAB under new processes expected to commence in the first quarter of 2022 to begin the assessment of the multi-well exploration drilling and seismic data acquisition project, but First Nation engagement under the Plans may be a rate determining step.

The maintenance program planned for the winter of 2022-2023 offers a great opportunity to measure the depth of permafrost and Chance plans to run a temperature survey in a number of the suspended wells to determine the geographic extent of permafrost and any variability of its depth.

Notwithstanding very limited oil field service and supply capacity resident in Yukon, the historical exploration drilling and seismic data gathering programs operated by the Company were organized and executed in a way that responded to concerns expressed by many Yukon stakeholders to maximize Yukon participation and mitigate the historical experience of intensive, short term projects punctuated by lengthy periods of inactivity that collectively had the effect of restricting local participation in employment, training and business opportunities. For almost two years, Chance's drilling and seismic programs provided reasonably steady employment for many Yukon citizens working directly or indirectly on the projects. Going forward, to overcome the frustration of starting and stopping, future activities are expected to be small scale and be undertaken over longer time periods. This style of operation has the objective of providing opportunities for Yukon citizens and businesses to invest in training and equipment to be able to assume growing roles in any activities that Chance might propose while benefitting from learning curve efficiency and economy of scale arising from steady, predictable operations. Environmental impacts are expected to be significantly reduced by operating on a small scale over longer periods of time, too.

Future exploration activities will require maximum allowable tenure extensions in order to satisfy commitments anticipated to be made under the Plans as they are implemented, undergo higher level YESAB impact assessments, obtain required regulatory approvals and ultimately undertake any planned activities. For example, in several meetings with your officials, Chance has outlined an exploration plan to drill up to thirty (30) exploration and appraisal wells, acquire up to fifteen hundred (1,500) square kilometres of new 3-D seismic data and acquire up to two thousand (2,000) kilometres of new 2-D seismic data. This plan will take years to complete especially if the scale of operations is small in order to minimize environmental impacts and maximize participation of Yukon citizens and businesses. Prior to undertaking this program, environmental impact assessments are required which are expected to take at least a couple of years to complete with more time needed to execute on approved activities.

Developing Yukon energy resources will also have a beneficial impact on greenhouse gas emissions by displacing imported fuels extracted and processed thousands of kilometres away from Yukon. In addition, as the energy market transitions to a lower or no carbon condition, the hydrocarbons in Yukon offer a great source of hydrogen and the geological formations at Eagle Plains provide opportunities to sequester CO2.

This letter has been prepared on a "Without Prejudice" basis given the unresolved legal claim that the Company has made against Yukon in respect of the damages caused by the Moratorium. Tenure extension is needed to continue implementing the Plans and advance the proposed exploration project through the YESAB process to execution.

In conclusion, Chance believes that it has diligently acted and continues to act in a manner that is consistent with the Act, that the exercise of its exploration rights has been significantly impaired by circumstances that were neither foreseen nor within the Company's control. Throughout the evolving landscape of procedural changes, political sensitivity and growing obligations to engage with aboriginal communities, Chance has taken numerous and costly measures to mitigate the impediments where it can.

Chance trusts that you will consider this tenure request in the face of expanding timelines and complexities associated with the undertaking of exploration projects.

Yours truly,
Chance Oil and Gas Limited

1.0 INTRODUCTION

This report demonstrates implementation of the *Tr'ondëk Hwëch'in and Chance Oil and Gas Limited Engagement and Communication Plan* (Plan) (see **Appendix A**) finalized on August 28, 2018. It summarizes discussions held between Tr'ondëk Hwëch'in (TH) and Chance Oil and Gas Limited (Chance) between June 1, 2021 and May 31, 2022. The purpose, objectives, and outcomes of each discussion are described below in order to fulfill the requirements of Ministerial Order (MO) 2018/42 (see **Appendix B**) issued to Chance on August 30, 2018.

2.0 BACKGROUND

The development of communications and engagement plans began with Order in Council (OIC) 2016/169. OIC 2016/169 required Chance to file a First Nations communication and engagement plan with the Minister of Energy, Mines and Resources in order to extend tenure on their northern permits: 0005, 0006, 0007, 0008, 0009, 0010, and 0011. Chance complied with OIC 2016/169 and received their tenure extension.

Chance subsequently received MO 2017/37 when applying for tenure extension on six of eight southern permits: 0012, 0013, 0014, 0015, 0016, and 0017. MO 2017/37 required Chance to revise, in consultation with affected First Nations, the consultation and engagement plan filed under OIC 2016/169. The affected First Nations listed in MO 2017/37 were Vuntut Gwitchin First Nation, Tr'ondëk Hwëch'in, First Nation of Na-Cho Nyäk Dun, Gwich'in Tribal Council, and Tetlit Gwich'in Council.

TH and Chance collaboratively developed their Plan through a series of in-person meetings and conference calls. Hemmera was retained by Chance in November 2017 to facilitate the development and completion of the communications and engagement plans with the affected First Nations and facilitated all discussions between TH and Chance.

TH and Chance submitted their finalized Plan to Minister Ranj Pillai on August 28, 2018. To satisfy its obligations under MO 2017/37, Chance filed a total of four communications and engagement plans. All four plans were approved by the Minister and Chance received a five-year tenure extension on the six southern permits.

A condition of the five-year tenure extension, issued via MO 2018/42, required that Chance submit annual reports summarizing actions taken to implement each communications and engagement plan.

See **Appendix C** for a map of Chance's current permits.

3.0 ENGAGEMENT AND COMMUNICATION PLAN IMPLEMENTATION SUMMARY

3.1 Overview

Between June 1, 2021 and May 31, 2022, TH and Chance had one meeting on the Eagle Plains Exploration Project. Their meeting frequency over the past year was impacted by Chance's internal work to advance its project description. Additionally, the COVID pandemic posed challenges to safely conducting engagement activities. Preventing the transmission of COVID and adhering to public health measures were

a priority. While TH and Chance did not substantially advance discussions related to the Eagles Plains Exploration Project, have maintained their relationship.

No additional engagement activities occurred for Chance's Well Maintenance and Extended Flow Testing Project while it underwent YESAB review.

3.2 June 8, 2021 - Meeting

Chance hosted a virtual meeting with TH Chief Roberta Joseph and TH Technical Staff, Palmer, and Hemmera. The purpose of this meeting was for Chance and Palmer to present baseline information on Permafrost studies and to provide an opportunity for parties to discuss engagement preferences, planning, and upcoming engagement reports. During the meeting TH requested additional information around Chance's consultation with other First Nations, probed around topics including subsurface geology work, hydrogeology, sampling methodologies, climate change and inquired about progress on the Information Request for the Designated Office project (i.e., Chance's Well Maintenance and Extended Flow Testing Project).. Chief Roberta Joseph shared her sentiments about the communication difficulties between Chance and with the Vuntut Gwitchin and expressed the importance of the Porcupine Caribou for cultural and spiritual wellbeing, and protection of water.

Chance has shared baseline information for wildlife studies.

3.3 Communication Log

The correspondence between Chance and TH is documented in the Engagement Log (see **Appendix D**).

4.0 PLANS FOR ONGOING ENGAGEMENT AND NEXT STEPS

On July 27th, 2022, there was correspondence from Chance to TH about how a planning meeting went with Yukon Government and a brief summary of current activities was given. Although this meeting is outside of the scope of this 2022 implementation report, it is important to mention that there was a discussion about developing a comprehensive submission to go into the Executive Committee Screening Process. Also in the correspondence about the meeting, Chance stated to Yukon Government that Consultation will be a priority during this process and other things also discussed was the baseline data gathering, including terrestrial and water, and adding an affects assessment. For the update component of current works, Chance stated that Heritage work is underway in Eagle Plains and that Chance is also working on the valued components for the project and is going to proceed with a referral to the Executive Committee.

TH and Chance will be re-engaging on the Eagle Plains Exploration Project during summer and fall of 2022.

5.0 APPROVAL OF IMPLEMENTATION SUMMARY

TH and Chance have reviewed this report and agree to its contents as an accurate summary of the engagement activities carried out between June 1, 2021 and May 31, 2022.

APPENDIX A

Tr'ondëk Hwëch'in and Chance Oil and Gas Limited Engagement and Communication Plan

Tr'ondëk Hwëch'in and Chance Oil and Gas Limited Engagement and Communication Plan

1.0 Introduction

Chance Oil and Gas Limited (Chance) is an oil and gas exploration company that holds permits to perform oil and gas exploration activities in the Eagle Plain basin of Yukon Territory, Canada. As part of Chance's exploration program, Chance seeks to develop engagement and communication plans with all the First Nations that are potentially affected by Chance's exploration program activities. Permits 15 and 17 fall partially within Tr'ondëk Hwëch'in Traditional Territory and Chance is seeking to engage Tr'ondëk Hwëch'in (TH) on its activities within these permits.

2.0 Purpose

This document serves as an Engagement and Communication Plan (Plan) to provide a mutually agreed upon framework to support collaborative and effective engagement and communication between Chance and TH now and into the future.

3.0 Relationship

Chance and TH will execute this Plan according to the following principles:

- Transparency and openness;
- Timeliness;
- Integrity;
- Adaptive Management;
- Mutual respect; and
- Working towards trust and understanding of one another.

4.0 Key Tr'ondëk Hwëch'in and Chance Connections

Engagement and communication between Chance and TH will be generally associated with the proposed work and potential effects associated with Chance's oil and gas exploration program and potential opportunities (via training, employment, contracting, and other community investments), as well as any topics or issues identified through engagement and communication associated with Chance's proposed activities. This section of the Plan identifies the key contacts related to these overarching engagement and communication themes. Key representatives involved in engagement and communication are expected to be as follows:

- Chief and Council;
- TH Government department officials and advisors;
- TH Business Development agencies;
- TH Citizens and communities at large; and
- Proponent Management and designated staff and advisors.

The table in the Schedule to this Plan lays out the key engagement and communication topics, in no particular order, and associated key contacts for both Chance and TH.

5.0 Engagement and Communication Methods

Chance and TH will employ the following engagement and communication methods for specific correspondence:

- In person meetings;
- Email;
- Letters;
- Sharing Power Point Presentations (to support in person meetings);
- Sharing reports and other documents (as requested and as required); and
- Telephone (teleconferences and less formal phone calls).

Engagement and communication methods that support general communication of Chance's activities are as follows:

- Chance newsletters; and
- The website for Chance Oil and Gas Limited.

Engagement and communication meetings will be executed in the following manner:

1. Chance or TH will request a meeting in writing to the other party according to the connections iterated in Table 1;
2. The parties to meet will develop the agenda collaboratively;
3. The party requesting the meeting will develop supporting materials (collaboratively, where possible), and share those in advance of the meeting; and
4. The meeting will take place in a mutually agreeable location.

The above general process applies to meetings with subject matter leads (Table 1) as well as meetings with Citizens and communities at large.

Through engagement with North Yukon First Nations, Chance understands that there are existing agreements between Tr'ondëk Hwëch'in, the First Nation of Na-Cho Nyäk Dun, and Vuntut Gwitchin First Nation. In keeping with the relationship principle of mutual respect, Chance will work within any communications protocols or provisions existing or developed pursuant to these agreements, where applicable and as directed by TH.

The following documentation sharing and review protocols support the methods described above:

- Chance and TH will discuss and establish the confidentiality of meeting minutes in advance of each meeting; i.e. if a meeting is to not be included in the record that will be submitted to regulators and assessors, it is the responsibility of both parties to discuss and agree to this prior to the meeting beginning;
- Chance will take meeting minutes and send these to TH within two weeks via email. Within 30 days of receiving the minutes TH will review and make changes through tracked changes or another method agreed to by both parties. Should TH require more time to review the meeting minutes, TH will notify Chance by email within two weeks of receiving the minutes. The parties will agree on meeting minutes before such minutes become part of the record. No response by TH to Chance's email providing meeting minutes within the 30 days will be interpreted as general acceptance of the meeting minutes by TH, and no response by Chance to TH's email providing amended meeting minutes within 30 days will be interpreted as general acceptance of the amended meeting minutes by Chance;
- Action items and meeting outcomes will be logged during meetings and reviewed by both parties at the end of the meeting to ensure that there is general agreement on the list of actions and parties responsible for those actions. Chance will include the list of action items and meeting outcomes with the meeting minutes;
- Chance and TH will agree upon and use a password-protected file sharing platform to facilitate sharing of large files, such as Power Point presentations and reports; and,
- Should Chance or TH employ a third party for records development and management, the third party will follow the process iterated above for recording and providing meeting minutes.

6.0 Records Management

All information exchanged by Chance and TH is subject to a confidentiality agreement to be agreed upon in the future by Chance and TH.

Subject to collaborative review and the written agreement of both parties, Chance and TH consent to the disclosure of the following information to regulators and assessors for review if and when a potential project is assessed in the future:

- Meeting agendas;
- Non-confidential meeting minutes (finalized versions as described in section **5.0 Engagement and Communication Methods);**
- Invitee/Attendees lists and/or meeting sign-in sheets;
- Records log, which will include summaries of the following:
    - In person meetings;
    - Phone calls and teleconferences;
    - Incoming and outgoing emails between Chance and Chance's representatives and TH representatives;
    - Attachments to the above noted incoming and outgoing emails;

- Reports provided to TH by Chance and reports provided to Chance by TH for review and consideration for engagement and communication purposes; and
- Copies of Power Point presentations delivered by Chance to TH for engagement and communication purposes.

7.0 Adaptive Management of the Engagement and Communication Plan

Chance and TH will review and assess the effectiveness and success of this Plan on at least a 6-month basis.

Within 3 months of the Plan first being agreed to and implemented, Chance and TH will:

- as a first step, sign a confidentiality agreement as contemplated by Section 6.0 above;
- meet to check in on the progress made by both parties in implementing the Plan;
- develop a schedule for review of the Plan; and
- discuss the need for a long-term budget and a comprehensive formal capacity funding agreement to enable TH to participate in future engagement.

Schedule

Key Engagement and Communication Topics and Leads

Role or Subject Matter	TH Key Contact	Chance Key Contact
Project Lead	[redacted]	[redacted]

Engineering and Geology	[redacted]	[redacted]
Environmental (includes water, aquatic environment, fish, wildlife, forest resources and other plants, and other environmental subjects)	[redacted]	[redacted]
Opportunities (includes community investment, training, education, contracting, employment, and other business opportunities)	[redacted]	[redacted]
Agreements and Capacity Funding	[redacted]	[redacted]

APPENDIX B

Ministerial Order 2018/42

YUKON

CANADA

MINISTERIAL ORDER 2018/ 42

OIL AND GAS ACT

Pursuant to the *Oil and Gas Act*, the Minister of Energy, Mines and Resources orders

1 In this Order

"subject permit" means each of the following oil and gas permits held by Chance Oil and Gas Limited:

(a) oil and gas permit No. 0012,

(b) oil and gas permit No. 0013,

(c) oil and gas permit No. 0014,

(d) oil and gas permit No. 0015,

(e) oil and gas permit No. 0016,

(f) oil and gas permit No. 0017. « *permis visé* »

2 The renewal term of each subject permit is extended by five years (so that it ends on August 30, 2023).

3 The resulting total length of the initial term and the renewal term of a subject permit is 16 years.

YUKON

CANADA

ARRÊTÉ MINISTÉRIEL 2018/42

LOI SUR LE PÉTROLE ET LE GAZ

Le ministre de l'Énergie, des Mines et des Ressources, conformément à la *Loi sur le pétrole et le gaz*, arrête :

1 La définition suivante s'applique au présent arrêté.

« permis visé » Les permis suivants de pétrole et de gaz détenus par Chance Oil and Gas Limited :

a) permis de pétrole et de gaz nº 0012;

b) permis de pétrole et de gaz nº 0013;

c) permis de pétrole et de gaz nº 0014;

d) permis de pétrole et de gaz nº 0015;

e) permis de pétrole et de gaz nº 0016;

f) permis de pétrole et de gaz nº 0017. "*subject permit*"

2 La durée du renouvellement de chaque permis visé est prolongée de cinq ans, de façon à ce qu'elle se termine le 30 août 2023.

3 La durée totale d'un permis visé, y compris la durée initiale et la durée du renouvellement, est de 16 ans.

4(1) In this section

"first nations communications and engagement plan" means the plan filed under O.I.C. 2016/169 and revised in accordance with M.O. 2017/37. *« plan de participation et de communication avec les premières nations »*

(2) It is a condition of this Order that Chance Oil and Gas Limited must file annual reports with the Division Head, in accordance with subsection (3) and to the satisfaction of the Division Head, about the implementation of the first nations communications and engagement plan.

(3) For the purposes of subsection (2), Chance Oil and Gas Limited must file

(a) the first annual report on or before July 31, 2019, in respect of the period beginning on September 1, 2018, and ending on May 31, 2019; and

(b) each subsequent annual report on or before July 31 of each year in respect of the period beginning on June 1 of the preceding year and ending on May 31 of the year in which the report is to be filed.

4(1) La définition suivante s'applique au présent article.

« plan de participation et de communication avec les premières nations » Le plan déposé en vertu du Décret 2016/169 et révisé en conformité avec l'Arrêté 2017/37. *"first nations communications and engagement plan"*

(2) À titre de condition du présent arrêté, Chance Oil and Gas Limited dépose des rapports annuels auprès du chef de division, en conformité avec le paragraphe (3) et à la satisfaction du chef de division, concernant la mise en œuvre du plan de participation et de communication avec les premières nations.

(3) Pour l'application du paragraphe (2), Chance Oil and Gas Limited dépose :

a) le premier rapport annuel au plus tard le 31 juillet 2019, pour la période débutant le 1er septembre 2018 et se terminant le 31 mai 2019;

b) chaque rapport annuel subséquent, au plus tard le 31 juillet de chaque année pour la période débutant le 1er juin de l'année précédente et se terminant le 31 mai de l'année au cours de laquelle le rapport doit être déposé.

Dated at Whitehorse, Yukon,
~~Dc~~ August 30th 2018.

Fait à Whitehorse, au Yukon,
le August 30th 2018.

E00331	July 15, 2019	Email	Out	Tr'ondëk Hwëch'in	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	Would you and your colleagues be able to meet with us and our Hemmera advisors either August 12 or 13? My party will be returning south from the GA in Old Crow on Aug 10/11 and could stop in Dawson if you are able to meet. We are also trying to set up a meeting with the Na-Cho Nyäk Dun in Mayo around those dates as well. For now, if you can offer some flexibility on those two dates until we can confirm the interest of the NND for a meeting that would be appreciated. I am thinking that we would allow two or three hours for the meeting to cover the material.		E00331_Meeting on either Aug 12 or 13_5
E00486	July 15, 2019	Email	Out	Tr'ondëk Hwëch'in	[redacted]	[redacted]	[redacted]	Engagement Reports/OIC Requirements	Hemmera has prepared draft reports on the implementation of the Communications and Engagement Plan for both VGG and Chance to review. This report summarizes meeting we have had since completing the plan. Please make any desired revisions to the document in tracked changes and send back to me to finalize. Once I have incorporated the changes, I will send final versions to both parties to sign. Please have revisions in by July 26, then I will finalize, get them signed and submit to Yukon Government for July 31.	Attached: 190715_DRAFT Plan Implementation Report_TH.docx	E00486_Draft Plan Implementation Report for Review_2
E00332	July 18, 2019	Email	In	Tr'ondëk Hwëch'in	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	We can set up a meeting August 12. Would you please be able to send me an agenda we can work on?		E00333_RE_ Meeting on either Aug 12 or 13_4
E00333	July 18, 2019	Email	Out	Tr'ondëk Hwëch'in	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	It is great that TH can meet. I will start to prepare the agenda. Chance would like to cover are project updates, capacity funding, and the development of a draft cooperation agreement. I will put these items in a draft agenda and send it to you early next week. Inquiring who from TH will attend. What time? Morning would make sure we have enough time to cover all the material. Please advise a time that works best ad I will book a conference room accordingly.		E00334_RE_ Meeting on either Aug 12 or 13_3
E00334	July 22, 2019	Email	In	Tr'ondëk Hwëch'in	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	From TH, myself, NR Director [redacted], and [redacted] (by phone) will be in attendance. When possible, could you please send through the meeting invite and initial agenda for discussion.		E00334_RE_ Meeting on either Aug 12 or 13_3
E00335	July 24, 2019	Email	Out	Tr'ondëk Hwëch'in	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	Sent along meeting invite and the agenda. Thinking this visit to Dawson would be a great opportunity to host a dinner for TH citizens as well. Do you think that a dinner from 5:30 -8:00 pm would work on Aug 12? If so, could you suggest a typical venue for community dinners and who I could talk to about advertising and catering?		E00336_RE_ Meeting on either Aug 12 or 13_2
E00336	July 24, 2019	Email	In	Tr'ondëk Hwëch'in	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	We at TH are ok with discussing our implementation plan and next steps, but a community consult is not a good idea at this time. We can put this topic as an item on our agenda for the future.		E00336_RE_ Meeting on either Aug 12 or 13_2
E00337	July 24, 2019	Email	Out	Tr'ondëk Hwëch'in	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning Engagement Reports/OIC Requirements	Thanks for advising on the community dinner. We will leave our plans at just meeting with yourself and your colleagues. Would TH like to provide feedback on the Draft Engagement and Communications Plan Implementation Report? I am looking for feedback this week so I have time to finalize the reports next week and submit to YG.		E00331_RE_ Meeting on either Aug 12 or 13_1
E00490	July 24, 2019	Email	Out	Tr'ondëk Hwëch'in	[redacted]	[redacted]	[redacted]	Engagement/Consultation Meeting Coordination/Planning	Meeting invitation. E00551	August 7, 2019	Email	In	Tr'ondëk Hwëch'in	Sidney Schafrik	[redacted]	[redacted]	[redacted]ent	Can you please send the Draft Template that you have generated for the Cooperation Agreement? We would like to be able to review for our discussions Monday.		E00551_RE_ Meeting on either Aug 12 or 13_4
E00552	August 8, 2019	Email	Out	Tr'ondëk Hwëch'in	Hemmera	[redacted]	[redacted]	[redacted]	We don't have a Draft Template to send at this time. Instead we are hoping to use the time for that agenda item to discuss and draft an outline for the cooperation's. The help facilitate the discussion, Hemmera would like to propose the following sections for the agreement: Recitals (or Whereas), Purpose and/or Objectives of the Parties, Term and Termination, Cooperation Commitments, General. Using these as well as any other proposed by Chance or TH, can have high level discussion about the outline and contents of cooperation agreement. Let me know what you think of this approach, happy to adapt or change.		E00551_RE_ Meeting on either Aug 12 or 13_4
E00554	August 9, 2019	Email	Out	Tr'ondëk Hwëch'in	Hemmera	[redacted]	[redacted]	[redacted]	In our meeting Monday, we are going to go through the proposed Cooperation Agreement sections listed below and fill in content that is suggested during the meeting. To do this, we want to share our screen using Skype. I wanted to confirm this could work for you. We can do a trial Monday morning before the meeting if you are available. If this doesn't work, we'll send a word doc with proposed headers for you to follow along during the meeting. We have a better meeting speaker with us for this meeting, so audio will be much better than last time.		E00554_RE_ Meeting on either Aug 12 or 13_5
E00555	August 9, 2019	Email	In	Tr'ondëk Hwëch'in	Ewa Holender	[redacted]	[redacted]	[redacted]	I appreciate your efforts to ensure I can participate from down south. I am happy to do a trial Monday morning if that would work for you. I'm on Skype already.		E00555_RE_ Meeting on either Aug 12 or 13_6
E00556	August 12, 2019	Email	Out	Tr'ondëk Hwëch'in	Hemmera	[redacted]	[redacted]	[redacted]	We are just waiting for the conference phone to be set up. Are you able to access the skype meeting through the link in the meeting invite? In my experience personal skype and business skype do no work together.		E00555_RE_ Meeting on either Aug 12 or 13_6
E00557	August 12, 2019	Email	Out	Tr'ondëk Hwëch'in	Hemmera	[redacted]	[redacted]	[redacted]	We are set up. I am sharing my screen, and we have a speaker in the middle of the table that is picking up all voices. We are still waiting on TH folks. If you are not able to access Skype I've attached the final agenda, the presentation from our last meeting for reference, and the cooperation agreement discussion. E00601	January 28, 2020	Email	Out	Tr'ondëk Hwëch'in	[redacted]	[redacted]	[redacted]	Tenures/Dispositions/Permits DO Project Engagement/Consultation	Chance will be applying to the Yukon Government very shortly to extend the tenure of Exploration Permit 20. Application will be for maximum allowable under the Oil and Gas Act of 5 years. This permit has one suspended well at McParlon A-25 which we hope to use for fluid disposal of any produced water associated with the proposed exploration project. We are at an intermediate stage of discussions with the Manager of Oil and Gas Operations with Yukon to extend the suspended well status on the suspended wells at Eagle Plain. Manager has indicated hat Chance will need to do some physical assessments of the legacy wells to confirm the integrity of the wells before granting an extension. Assessments will require access to 3 suspended wells at SDL M-08, G-08, and J-19 and well as M-59 in order to do the work. A service rig, cement pumping equipment, and wireline services are expected to be used to conduct the assessments. Anticipate taking temperature measurements in wells to evaluate permafrost depth. The program is expended to take 1-2 months. This is a winter operation and will be done during the winter of 2020-2021 and may require Designated Office screening b y YESAB. We will provide more information as soon as we can.		E00601_FW_ Suspended wells and Exploration Permit 20_3
E00647	March 23, 2020	Email	Out	Tr'ondëk Hwëch'in	[redacted]	[redacted]	[redacted]	Information Sharing	Chance Oil and Gas (COG) has several initiatives on the go, some of which are time sensitive and all require engagement with the affected First Nations. The following is a summary of these initiatives: 1.Application to the Yukon Government to get tenure extension on Exploration Permit 0020 which is set to expire on August 30, unless extended. This permit is located mostly in the Traditional Territory of the Vuntut Gwitchin, but a portion is in the Secondary Use Area of the Tetlit Gwich'in and in the overlap area with the Na-cho Nyak Dun Traditional Territory. There is a suspended well in this Permit at McParlon A-25 which has ongoing value to COG. 2.There are several suspended wells at the Chance Significant Discovery License (SDL 022) and one at the Blackie SDL 021 which the Yukon Government requires COG to undertake some maintenance work. This activity will require an impact assessment by the Designated Office (DO) of YESAB in Dawson prior to permissions being granted by Yukon to undertake the work. The plan is to submit to the DO the program in the next month or so with the objective of being able to do the work over approximately a 6 week to two month period in the winter of 2020-2021. This is a regulatory requirement made by the Manager of Oil and Gas Operations with the Yukon Government. Importantly for your knowledge, there is no indication that these suspended wells have any problems, but they are wells that were drilled in the 1960's so the regulator has asked for work to be done in order to be able to continue the suspended status of these wells. 3.Continuing engagement with respect to the multi-well drilling and seismic data acquisition project that has been descr bed to you in the past couple of years. A current map of COG landholdings is attached for your reference. In view of the COVID 19 outbreak, travel and face to face get [redacted]	Attachment:Chance_Permits_geoscience_9Sept2019.pdf	E00647_Chance Oil and Gas Update_TH

E00708	July 13, 2020	Email	Out	Tr'ondëk Hwëch'in	[redacted]	[redacted]	[redacted]	Engagement Reports/OIC Requirements	Hemmera has prepared a draft report on implementation of TH and Chance Engagement and Communication Plan for TH and Chance to review. This report summarizes meetings/correspondance that have occurred between TH and Chance since completing the 2019 Annual Report. I have attached the draft as a Word Document, If both TH and Chance could make revisions to that document in tracked changes, that would assist me in creating a final version. If there are any issues that arise between parties' revistion, we can address them via e-mail or a quick call. Once revisions have been incorporated and the document is considered final by TH and Chance, I will send the final version to both parties to sign. I have also attached, as a pdf, a draft of TH and Chance's Engagement Log which functions as Appendix D for the report. Please complete revelws by Friday, July 24th. Reminder that reports need to be signed and submitted to YG on July 31st.	Attachments: 200713_Plan Implementation Report_TH_DRAFTv0.3.docx, 200713_AppendixD_TH_EngagementLog_DRAFT.pdf	E00708_DRAFT 2020 Annual Report of Tr'ondëk Hwëch'in and Chance Engagement Activities - For Review(0)
E00728	July 15, 2020	Email	In	Tr'ondëk Hwëch'in	[redacted]	[redacted]	[redacted]	Engagement Reports/OIC Requirements	Thank you for the information and we shall have any comments by July 24th.		E00728_RE_ DRAFT 2020 Annual Report of Tr'ondëk Hwëch'in and Chance Engagement Activities - For Review
E00729	July 15, 2020	Email	Out	Tr'ondëk Hwëch'in	[redacted]	[redacted]	[redacted]	Engagement Reports/OIC Requirements	Thanks[redacted] much appreciated! I ought to acknowledge my typo below. The reports are due to YG on July 31, 2020 not 2019. No time travel is involved.		E00729_RE_ DRAFT 2020 Annual Report of Tr'ondëk Hwëch'in and Chance Engagement Activities - For Review (1)
E00730	July 24, 2020	Email	Out	Tr'ondëk Hwëch'in	[redacted]	[redacted]	[redacted]	Engagement Reports/OIC Requirements	I thought I would check in and see how the review of the draft engagement report is fairing? My apologies, I meant to send this reminder earlier in the week.		E00730_RE_ DRAFT 2020 Annual Report of Tr'ondëk Hwëch'in and Chance Engagement Activities - For Review (2)
E00731	July 24, 2020	Email	In	Tr'ondëk Hwëch'in	[redacted]	[redacted]	[redacted]	Engagement Reports/OIC Requirements	Thanks for the reminder as I was thinking about this as well. I have limited office access today, but I will send in any comments on Monday. I understand your deadline so I will try to get it in the morning.		E00731_Re_ DRAFT 2020 Annual Report of Tr'ondëk Hwëch'in and Chance Engagement Activities - For Review (3)
E00732	July 24, 2020	Email	Out	Tr'ondëk Hwëch'in	[redacted]	[redacted]	[redacted]	Engagement Reports/OIC Requirements	Much appreciated[redacted]		E00732_RE_ DRAFT 2020 Annual Report of Tr'ondëk Hwëch'in and Chance Engagement Activities - For Review (4)
E00764	July 24, 2020	Email	Out	Tr'ondëk Hwëch'in	[redacted]	[redacted]	[redacted]	Engagement/Consultation DO Project	Attached is a draft copy of Chance Oil and Gas (Chance)'s YESAB Project Proposal for the Eagle Plains Well Maintenance Project. In order for Chance to get all its approvals in hand before thw winter season, Chance's application will need to be submitted very shortly after sending this draft to you. At this time, our goal is to submit the Project Proposal middle of next week. I remember from our June phone call that[redacted] had inquired about a Wildlife Management Plan. As it happens, all mitigation measures with respect to wildlife and caribou is located within the body of the proposal. I wanted to flag that for your attention. As this document has not gone through Hemmera's formatting procedure, it is absent of some of the figures and appendices. However, I also remembered your interest in the Spill Response Plan, so I've made sure it is attached. Chance continues to be committed to engaging with Tr'ondëk Hwëch'in. Should you wish to discuss the proposed Project in more detail, please don't hesitate to contact Chance or Hemmera.	Attachment: 200724_Chance_YESAB_PP_DRAFT.docx.; Spill Response Plan.docx	E00764_Chance Eagle Plains Well Maintenance Project - Draft YESAB Project Proposal (3).msg
E00733	July 27, 2020	Email	In	Tr'ondëk Hwëch'in	[redacted]	[redacted]	[redacted]	Engagement Reports/OIC Requirements	I have reviewed the document and the only correction is in the Engagement Plan[redacted] now replaces[redacted] When do you believe the official YESAB submission will be filed? We can then set up the next meeting to review. We can then talk about the next steps going forward.		E00733_RE_ DRAFT 2020 Annual Report of Tr'ondëk Hwëch'in and Chance Engagement Activities - For Review (5)
E00734	July 27, 2020	Email	Out	Tr'ondëk Hwëch'in	[redacted]	[redacted]	[redacted]	Engagement Reports/OIC Requirements	Okay. In the Schedule ("Key Engagement and Communication Topics and Leads") to the Engagement Plan, I will change the TH Key Contact for Agreements and Capacity Funding to [redacted] and delete[redacted] . I was wondering, would you be able to send a JPEG of the logo for Tr'ondëk Hwëch'in? I could add that to the Engagement Plan. It seems like it's always been missing. With respect to your question below. Are you referring to Chance's YESAB DO submission for the proposed Well Maintenance Project? When Chance hopes to file it? I'm fairly certain Chance and my colleagues are aiming for middle of this week.		E00734_RE_ DRAFT 2020 Annual Report of Tr'ondëk Hwëch'in and Chance Engagement Activities - For Review (6)
E00735	July 28, 2020	Email	In	Tr'ondëk Hwëch'in	[redacted]	[redacted]	[redacted]	Engagement Reports/OIC Requirements	Thanks for the information about when the well program will be submitted and you are correct about the change to the Key Contacts. I think that it is best to use the Chance logo only at this time since it will take approval and we are in an election cycle and time is an issue. Once prepared I can sign off of the document and we can talk about scheduling a meeting once the project is submitted.		E00735_RE_ DRAFT 2020 Annual Report of Tr'ondëk Hwëch'in and Chance Engagement Activities - For Review (7)

E00736	July 28, 2020	Email	Out	Tr'ondëk Hwëch'in	[redacted]	[redacted]	[redacted]	Engagement Reports/OIC Requirements	Attached is the revised version of the Tr'ondëk Hwëch'in and Chance 2020 Annual Report of the Engagement Plan. Sidney asked me to make the following change: In the Schedule of the Engagement and Communication Plan (Appendix A), change the TH Key Contact for Agreements and Capacity Funding to [redacted] and delete [redacted] Sidney, if you could print page 5, scan, and send it back. Then Greg can sign. Once the signing sheet is complete, I'll put that into the PDF and send the Final version to both TH and Chance. E00817	August 7, 2020	Email	Out	Tr'ondëk Hwëch'in	[redacted]	[redacted]	[redacted]	DO Project Engagement/Consultation Meeting Coordination/Planning	This email is intended to give you early notice that Chance Oil and Gas has not yet submitted our Well Maintenance Program Project Proposal to YESAB due to evolving discussions with the regulator. The amendments are being incorporated into the Project Description and effects assessment over the next week or two as we manage vacation absences. Once updated, we will share the updated YESAB submission with you to review. I suggest that a follow up conference call or Microsoft Teams meeting be arranged to address your questions or respond to your comments to the amendments.		E00817_Well Maintenance Program amendments

E00912	August 28, 2020	Email	Out	Tr'ondëk Hwëch'in	[redacted]	[redacted]	[redacted]	DO Project Project Description/Activities	Further to [redacted] email dated August 7th (attached), Chance Oil and Gas (Chance) has made a few revisions to their Project Description for the Designated Office Evaluation of their proposed Well Maintenance Program. As a result of those changes, Hemmera has also revised the effects assessment sections of the Project Proposal. Below are the reasons for the revision that have been provided to us by Chance and a brief summary of the amendment itself: 1.Ongoing conversations between Chance and Yukon Government, Oil and Gas Branch (YG) have necessitated changes. While Chance was previously of the impression wells could continue to be suspended, YG is now directing Chance to conduct inspection and maintenance activities for all eight suspended wells and then abandon those wells or bring them into active status (i.e., end the period of well suspension). Chance is now proposing to abandon six wells (i.e., M-59, M-08, J-19, G-08, B-73, and H, 28) and to bring the remaining two wells (i.e., A-25 and E-78) into active status as deep-injection wells. Waste fluid produced during the abandonment of the six wells can then be disposed of via injection into the deep-injection wells. No oil or gas is expected to be produced from the two wells proposed to be activated; they would specifically be used for disposal of waste fluid from activities associated with these maintenance activities. (See sections 2.1.4 and 2.1.5 for further description) 2.At this time, Chance cannot confirm whether it will use the Eagle Plains Hotel or the existing Chance Camp for housing workers over the duration of the Project. The decision to utilize the Eagle Plains Hotel or the Chance Camp will be made when the Project schedule is finalized. It will also have to take into consideration the Hotel's ability to accommodate Chance workers over the full duration of the Project as well as COVID-19 related self-isolation requirements at that time. As a result both options are considered in the effects assessment for the housing of the project workforce. (See sections 2.2 and 2.3 for further description)	Attachments: Fwd: Well Maintenance Program amendments.msg, 200828_Chance_YESAB-DO_ProjectProposal_REVISED.pdf	E00912_Chance Eagle Plains Well Maintenance - Draft YESAB Project Proposal REVISED

E00901	September 15, 2020	Email	Out	Tr'ondëk Hwëch'in	[redacted]	[redacted]	[redacted]	DO Project Engagement/Consultation Project Description/Activities	Since my email dated August 28th, Hemmera has been in the final stages of concluding the revised DO Project Proposal for Chance's Well Maintenance program. We have appreciated your feedback and worked to include that into the application. As you know, Chance's timeline for completing this work was tied to compliance with regulations, so in an effort to ensure that the maintenance activities could occur this winter Chance needed to submit the application last week. It was submitted late Friday evening and today Hemmera received confirmation that the project was on the YESAB registry. We acknowledge that you may have future comments on the project as it progresses through the YESAB process. We continue to look forward to hearing your views and are happy to hold additional meetings to discuss and answer any questions you may have. Please see the link to the registry here: Project 2020-0151 Eagle Plains Well Maintenance and Winter Activities	E00901_Chance DO Project (Well Maintenance) - YESAB Registry Information (50)

E00907	November 2, 2020	Email	Out	Tr'ondëk Hwëch'in	[redacted]	[redacted]	[redacted]	DO Project Engagement/Consultation	After further consideration of the proposed Project (Eagle Plains Well Maintenance and Winter Activities) activities and the requirements of the Yukon Oil and Gas Act, Chance Oil and Gas Ltd. (Chance) has determined that changes are required to the Project submitted to the Dawson Designated Office on September 11, 2020 (Project #2020-0151). As such, Chance has decided to withdraw its Project proposal and will be informing the Yukon Environment and Socio-Economic Assessment Board today, November 2, 2020. Chance intends to incorporate changes into a revised Project proposal. Once the revised proposal has been drafted, Chance will notify you by sharing a draft and requesting a meeting to discuss the changes further. After Chance has discussed those changes with the Tr'ondëk Hwëch'in, the Project proposal will be finalized and resubmitted to the Dawson Designated Office. Chance understands and appreciates that making changes to this Project a second time is requesting additional effort and capacity of the Tr'ondëk Hwëch'in. Chance looks forward to continuing to work with the Tr'ondëk Hwëch'in and will do its best to ease this process	E00907_Chance DO Proposal Withdrawal - Tr'ondëk Hwëch'in Notification

E00892	November 19, 2020	Email	Out	Tr'ondëk Hwëch'in	[redacted]	[redacted]	[redacted]	DO Project Engagement/Consultation Project Description/Activities	Further to my email dated November 2nd (attached), Chance Oil and Gas (Chance) has revised its Project Proposal (including updated Project Description and Effects Assessment) for Designated Office Evaluation. Below is the key project component that has changed: •Extended Flow Testing: After maintenance activities are complete and depending on wellbore integrity (as confirmed through maintenance activities), Chance proposes to conduct Extended Flow Testing (EFT) on up to three of the wells which have the highest potential for natural gas reserve. The reason for this change is to allow Chance to gather important information about the nature of the natural gas resource accumulation and its productive capability. a.Wells proposed for EFT are M-59, M-08, and J-19 (see PDF attached for Figure 2-1). Please note, Figure 2-1 is currently being updated to reflect this change. b.Revert up to three wells to suspended status (if the EFT results prove to have sufficient resource). c.Abandon three to six wells (the three remaining wells (G-08, B-73, and H-28) will be abandoned and up to additional three wells may be abandoned if wel bore integrity is not confirmed or if EFT results prove insufficient resources). •Timelines: If work cannot be completed this winter season (due to low snow pack, COVID considerations, or permitting delays), Chance will complete the project during the winter of December 2021 to March 2022. Additional detail is within the attached revised Draft Project Proposal. While revisions were made throughout the document, Section 2.1.3 is the substantive addition with respect to EFT. We've attached both a clean version and a version with tracked changes to facilitate your review. Given the very short time frame for winter work, Chance will be submitting the application to YESAB on Friday, November 20th. Hemmera anticipates Tr'ondëk Hwëch'in requiring additional discussions with Chance to review these changes and look forward to scheduling a meeting where we can	Attachments: Chance DO Proposal Withdrawal - Tr'ondek Hwech'in Notification.msg, 102229_Chance_YESAB_PP_Revised_v2.0.docx, 201119_Chance_YESAB_PPRevised_v2.0_redline.docx, Fig2_1_104709_01_Overview_200828.pdf	E00892_Chance Designated Office Project Proposal - Revised Draft for Sharing with Tr'ondëk Hwëch'in
E00898	January 19, 2021	Email	Out	Tr'ondëk Hwëch'in	[redacted]	[redacted]	[redacted]	DO Project Engagement/Consultation	A brief update on Chance's proposed Eagle Plains Well Maintenance and Extended Flow Testing project is provided below: •Project was submitted to the Dawson District Office (DO) December 24, 2020. •Adequacy Review started December 29, 2020 and was extended January 11, 2021. oThe Adequacy Review period was extended for 21 days due to the complexity of the Project. •Dawson DO issued an Information Request on January 15, 2021 Chance is currently working on its response to Information Request 1 which you can find here. Additionally, here is the link to the project's page on the YESAB registry: 2020-0197. E01212	July 16, 2021	Email	Out	Tr'ondëk Hwëch'in	[redacted]	Engagement Reports/OIC Requirements	Hemmera has prepared a draft report on the implementation of the Tr'ondëk Hwëch'in and Chance Oil and Gas Engagement and Communication Plan for Tr'ondëk Hwëch'in (TH) and Chance to review. This report summarizes meetings/correspondence that have occurred between TH and Chance since completing the 2020 Annual Report. I have attached the draft as a word document. If both TH and Chance could make revisions to that document in tracked changes, that would assist me in creating a final version. If there are any issues that arise between the parties' revisions, we can address them via email and/or a quick call. Once revisions have been incorporated and the document is considered final by TH and Chance, I will send the final version to both parties to sign. Either later today, or Monday, I will send a follow-up email with a draft of TH and Chance's Engagement Log which will serve as Appendix D.	210716_EngagementPlan_2021ImplementationReports_TH_v0.5.docx	E01212_DRAFT 2020 Annual Report of Tr'ondëk Hwëch'in and Chance Engagement Activities - For Review.msg

APPENDIX 2-D-33. Project Update Letter

Chance
OIL AND GAS LIMITED

June 27, 2023.

Chief [redacted]
Tr'ondek Hwech'in First Nation
P.O Box 599
Dawson, YT
Y0B 1G0

sent via email: [redacted]

Dear Chief [redacted]

I am writing to congratulate you on your recent election success to become Chief of the Tr'ondek Hwech'in First Nation ("TH"). My colleagues and I look forward to working with you, your council members, and the TH Government.

As you will recall from previous meetings, Chance Oil and Gas Limited ("Chance") is planning to undertake a small scale, multi-year exploration project at Eagle Plain. The project could involve the drilling of up to 30 new exploration wells, acquiring up to 1,500 sq kms of new 3D seismic data, and acquiring up to 2,000 kms of new 2D seismic data. These activities are going to be undertaken for the most part during the winter months and done in a logical sequence based on information gathered as the program unfolds. Because of the seasonal restrictions, the overall project will be broken down into smaller pieces to reduce overall environmental impacts and that can be largely completed during the winter seasons. In addition to this work, significant discoveries of crude oil and/or natural gas would undergo extended flow testing to help understand the nature of the deposit and provide valuable information to help plan for development. Modern industry practices have significantly reduced the footprint of this work and are done in an environmentally responsible manner. It is our objective to file a submission with the Executive Committee of YESAB on or about December 14, 2023.

Chance has undertaken a number of baseline environmental studies using expert consultants such as EDI, Palmer, Tetratech, Peer Solutions, and drilling engineer [redacted]. In addition to these technical consultants, Chance has retained the services of Two Worlds Consulting, an aboriginal owned service provider based in BC. Two Worlds is assisting Chance with communication and engagement practices with First Nations.

CHANCE OIL AND GAS LIMITED

☐ **Whitehorse Office:**

A project description is being finalized to provide more complete information about the activities that are planned. Chance is interested in sharing this information with the affected First Nations to get advice and comments to help develop plans needed to undertake the program.
In closing, my colleagues in Whitehorse, [redacted] and [redacted], will be in contact with you and members of the TH Government to share information and arrange meetings in the coming weeks and months. We look forward to working with you and the TH in a cooperative and collaborative way to advance exploration activities at Eagle Plain.

Once again, congratulations on being elected to be Chief of the TH.

Yours truly,
Chance Oil and Gas Ltd.

Dear Chief [redacted]

RE: Proposed Eagle Plains Exploration Project Engagement and Consultation Update

Chance Oil and Gas Limited (Chance) is in the process of developing a Project Proposal for the proposed Eagle Plains Exploration Project (the proposed Project) for submission to the Yukon Environmental and Socio-economic Board (YESAB) Executive Committee. The Project Proposal is scheduled to be submitted for assessment in February 2024.

Chance is committed to engaging and consulting with potentially affected First Nations and communities about the proposed Project. It values open communication and receiving feedback, concerns, and questions. Chance will consider and address comments received throughout all stages of the proposed Project.

Chance is committed to meet consultation requirements under sections 3 and 50(3) of the *Yukon Environmental and Socio-economic Assessment Act* (YESAA) and section 14 of the Yukon *Oil and Gas Act* (YOGA). Under YOGA, Chance is required to consult with First Nations whose Traditional Territories overlap with oil and gas permitted land during the Government of Yukon's permit extension process.

In preparation for the Project Proposal submission, Chance is requesting feedback from Tr'ondëk Hwëch'in regarding your interest in being further consulted about the Project. Chance is also requesting feedback from Tr'ondëk Hwëch'in First Nation regarding your interest in being consulted about the draft Project Proposal. Chance is requesting written direction from Tr'ondëk Hwëch'in First Nation about this prior to the Project Proposal submission to the YESAB Executive Committee.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

If, at any time, Tr'ondëk Hwëch'in First Nation wishes to be consulted regarding the proposed Project or the Project Proposal, please let me know and Chance will follow-up and provide relevant documentation. Until then, Chance will continue to provide Project updates and share important information by email and/or letter.

Sincerely,

[redacted]

APPENDIX 2-D-36. Chance Oil and Gas Limited June 2019 Presentation

Chance Oil and Gas Limited
June 2019

Table of Contents

- General Project Description
- Project Location
- Exploration Drilling
- Flow Testing
- Seismic Exploration Program
- Workforce Requirements
- Closure and Reclamation
- YESAB – Executive Committee Process
- Timelines
- Engagement Plans – Annual Reports

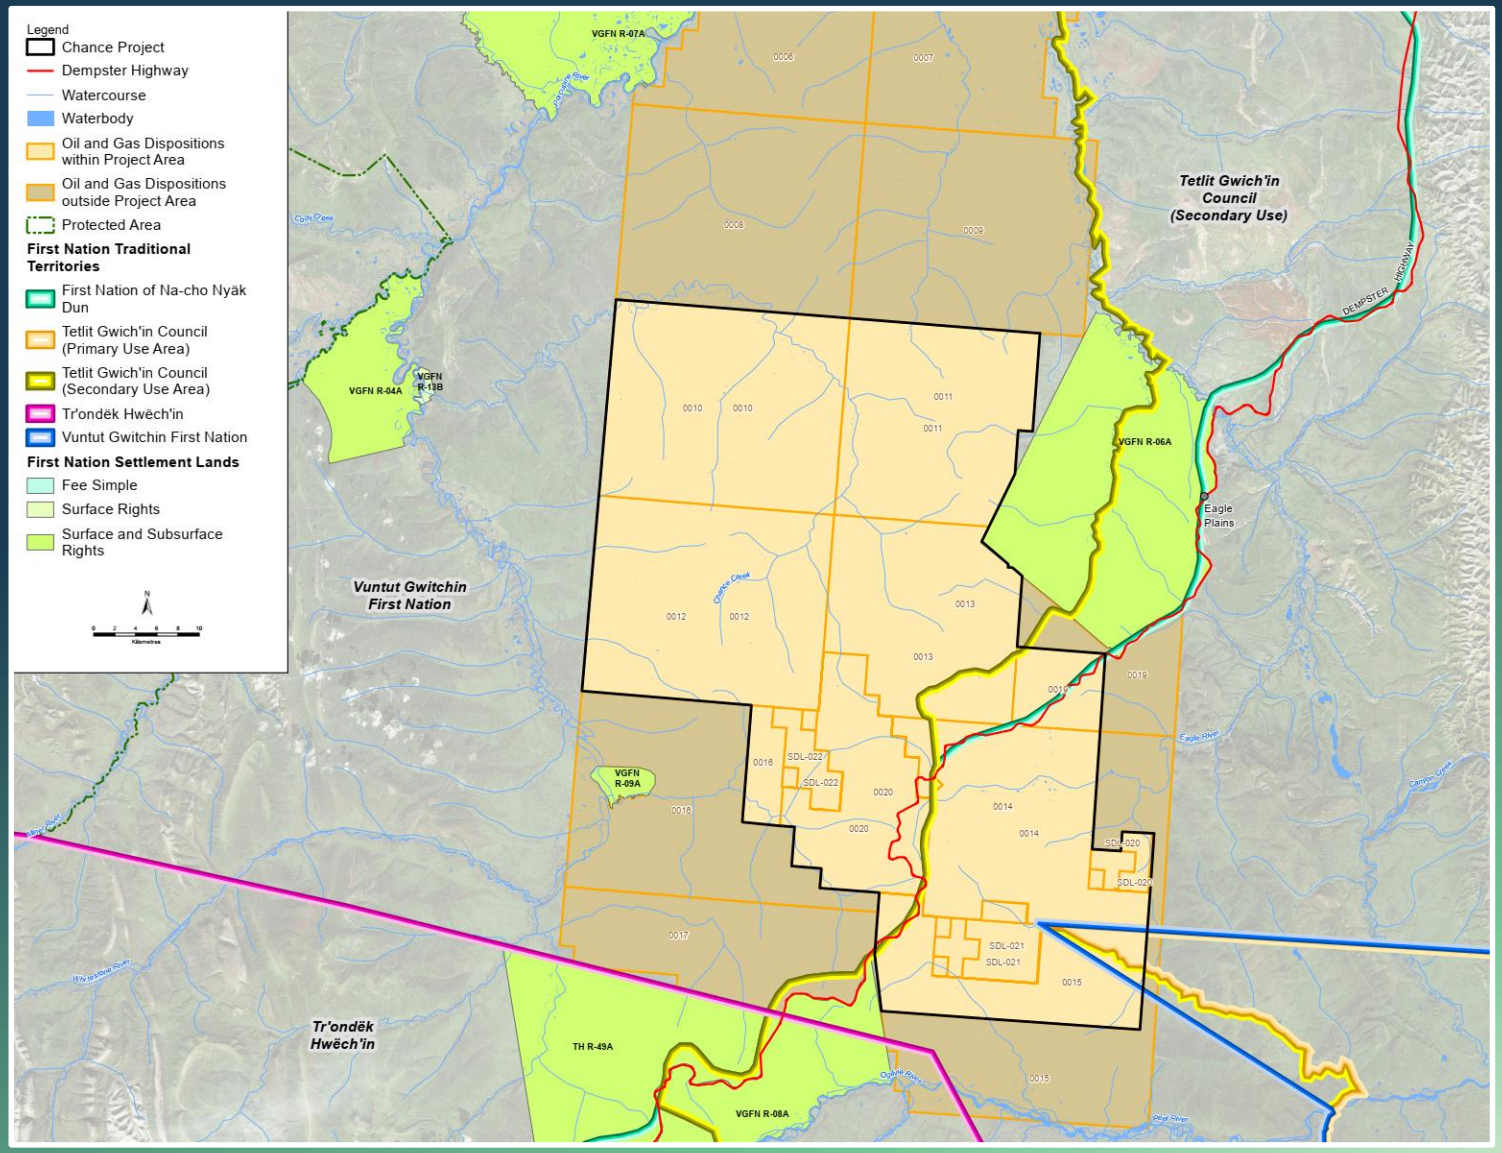
Chance
OIL AND GAS LIMITED

General Project Description

- Drilling over an exploration permit area of 2,400 km²
- Flow testing
- Construction of Mix Bury Cover Sump
- Seismic exploration program
- Construction of access roads for proposed well locations

Chance
OIL AND GAS LIMITED

Project Location



Chance
OIL AND GAS LIMITED

Exploration Drilling

- Drilling up to 30 exploratory wells over a period of up to10 years (up to 5 wells per year)
- Well sites approximately 1.44 Ha in area
- Located generally on heights of land:
  - Avoiding permafrost conditions and ecologically sensitive areas
  - Avoiding areas identified with heritage values
  - No drilling within 45 m of a perennial watercourse
  - In accordance with *Yukon Oil and Gas Act* and *Oil and Gas Drilling and Production Regulations*

Chance
OIL AND GAS LIMITED

Well Drilling Diagram

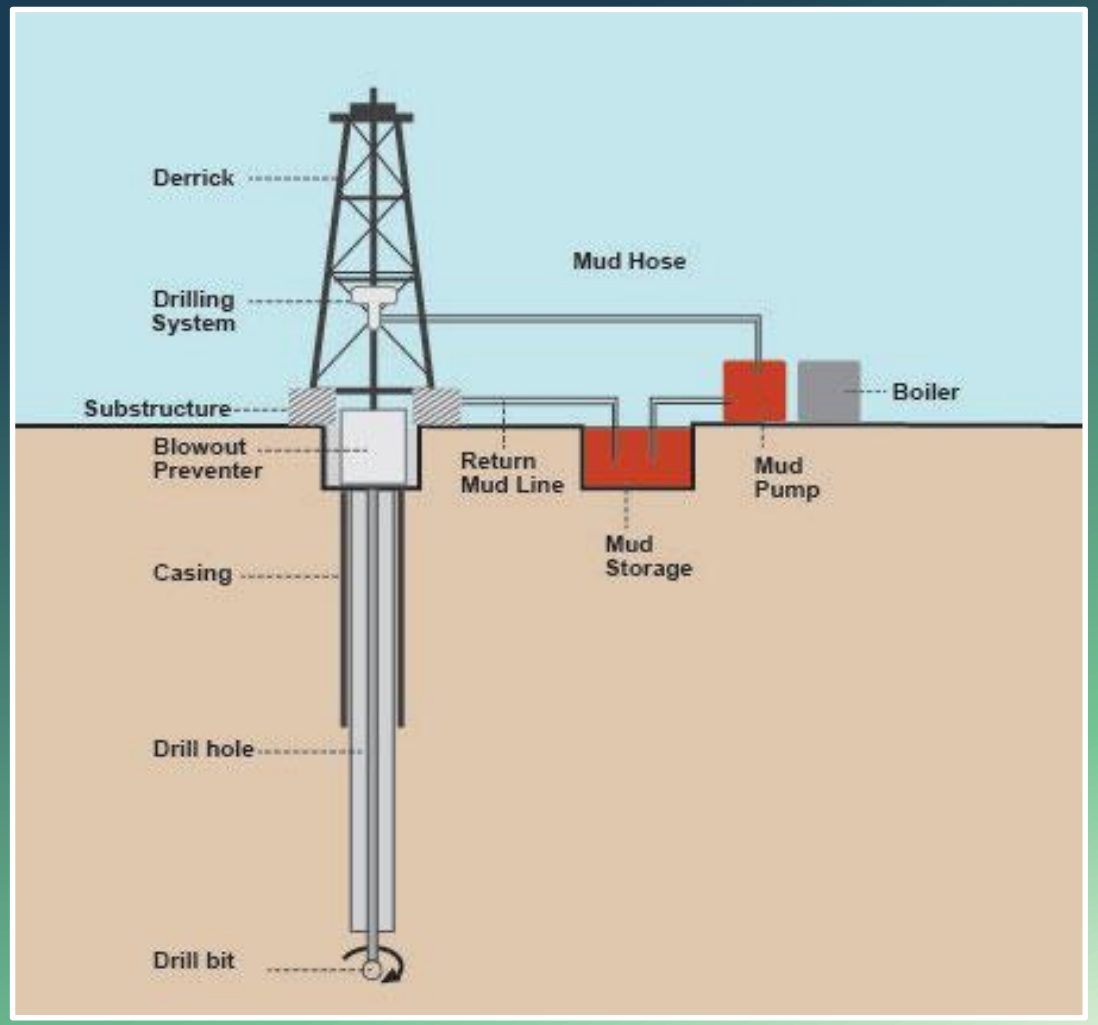
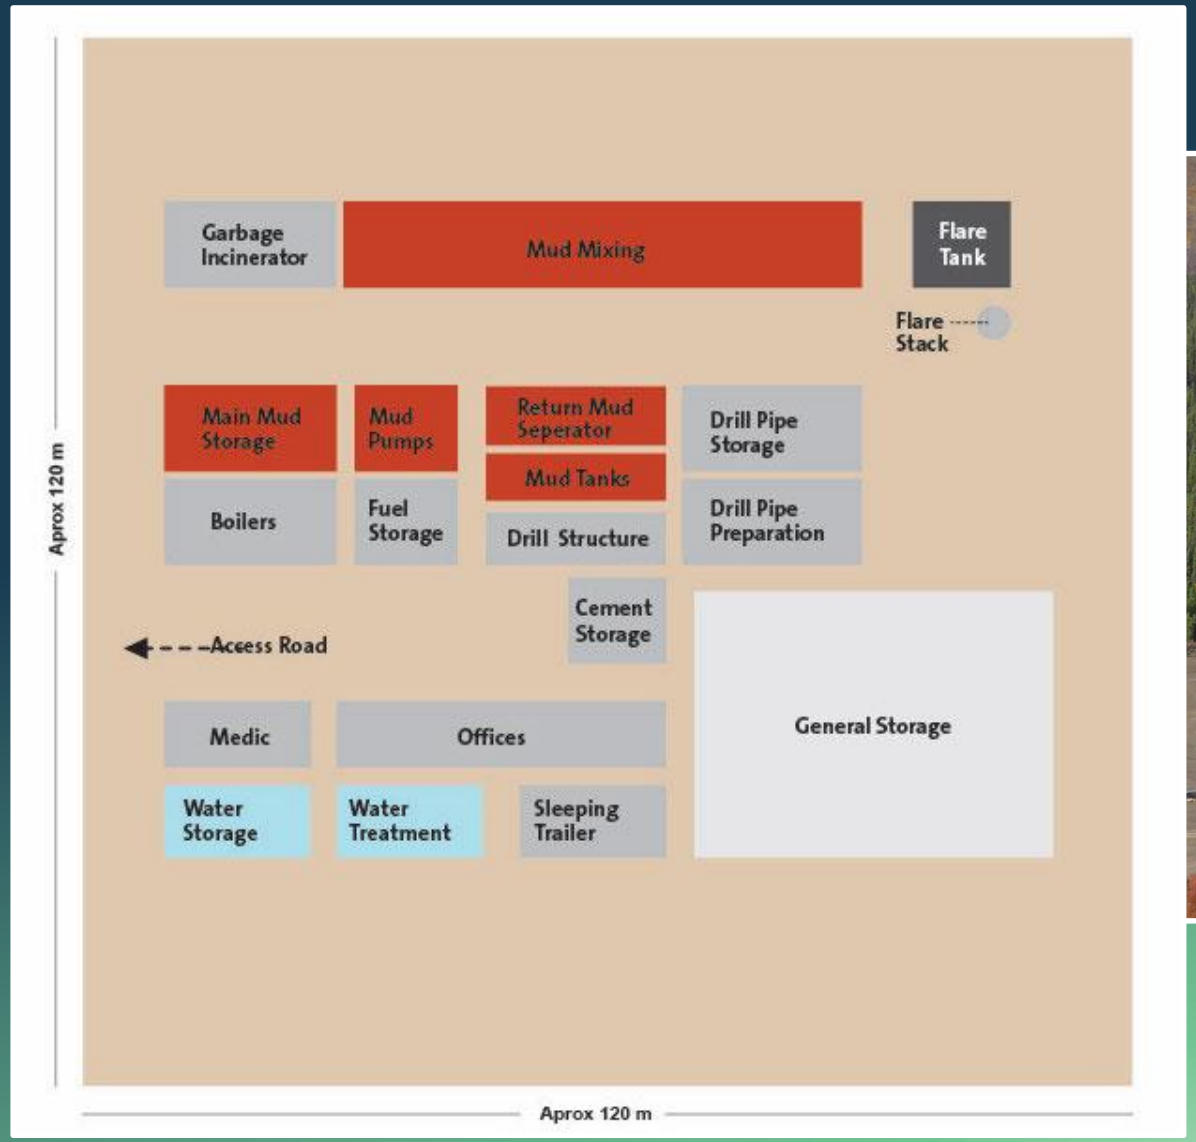
Chance
OIL AND GAS LIMITED

Well Drilling



Chance
OIL AND GAS LIMITED

Examples of Well Sites



Chance
OIL AND GAS LIMITED

Extended Flow Testing

- Drill Stem Testing on each well
- Extended Flow Tests on up to 20 wells
  - May occur for up to 2 years
  - Could result in up to 10 Extended Flow Tests occurring at the same time
- Extended Flow Tests will require additional surface infrastructure

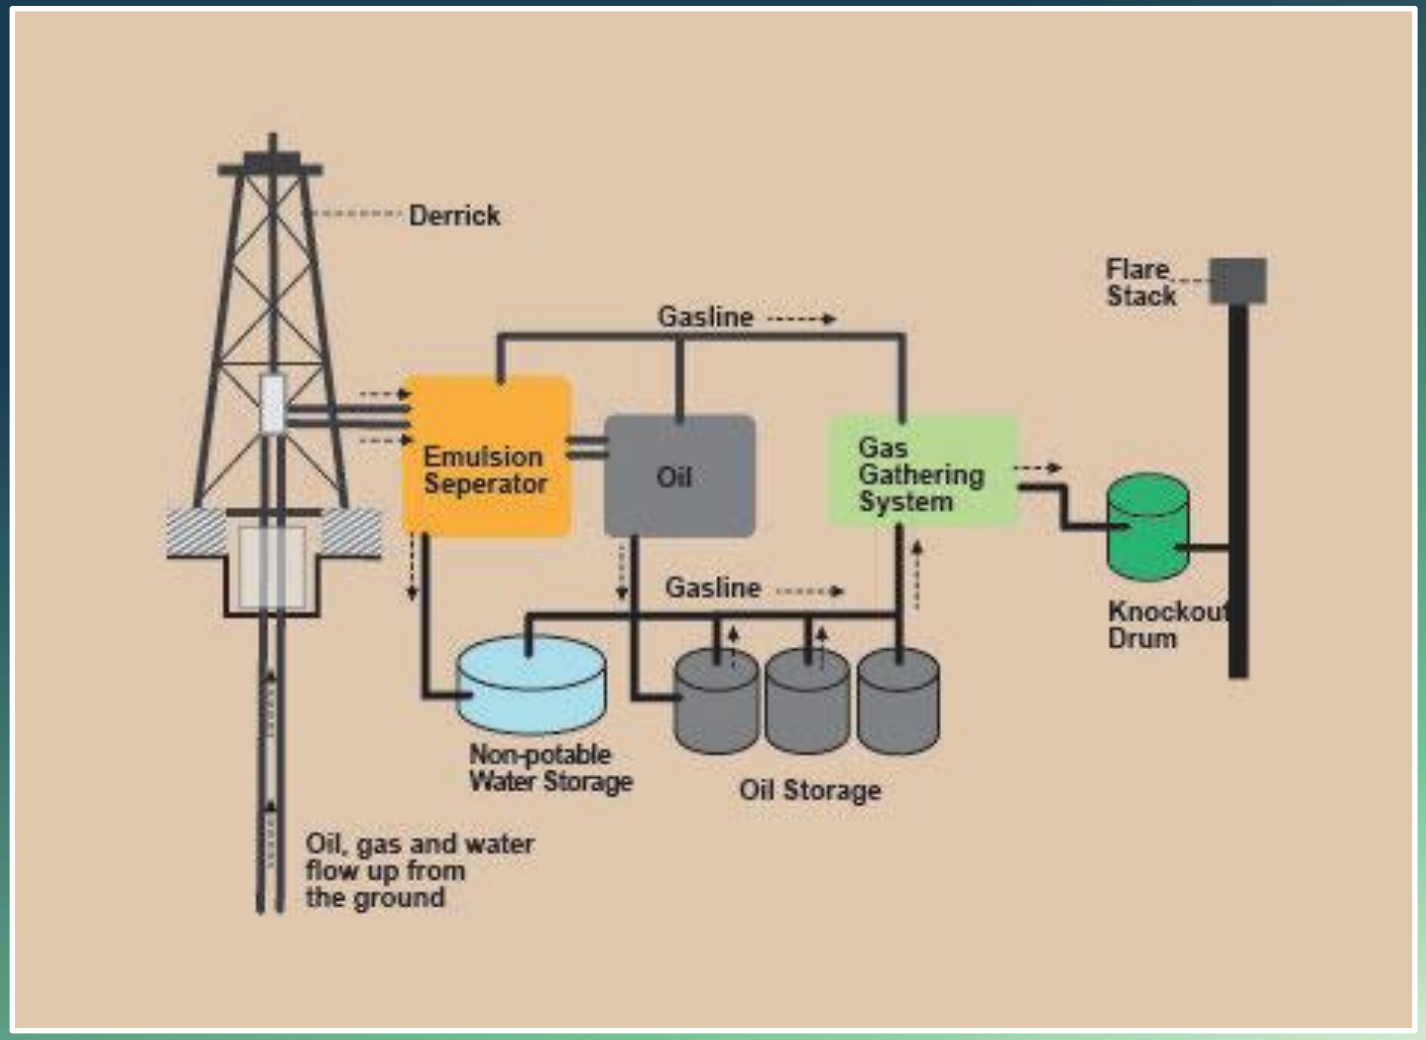
Chance
OIL AND GAS LIMITED

Extended Flow Testing: Infrastructure

- Construction of all-season access road to well site
- Drilling, followed by:
  - Abandoning (reclamation) of well site; or
  - Casing of well bore and installation of wellhead
- Well completion: Installing service rig
- Installation of surface equipment and facilities
- Measurement, treatment, and separation of natural gas, crude oil, and formation water

Chance
OIL AND GAS LIMITED

Extended Flow Testing: Diagram



Chance
OIL AND GAS LIMITED

Drill Cuttings and Flow Testing Products

- Drill Cuttings and Waste Drilling Fluid: Disposed of in Mix Bury Cover Sumps
- Natural Gas: Flared, used for on-site for heating/power, re-injected into wells
- Crude Oil: Up to 4,000 barrels per day stabilized and transported from site to markets outside of Yukon
- Formation Water: Disposed of underground into injection wells

Chance
OIL AND GAS LIMITED

Seismic Exploration Program

- Used to identify and map oil and gas geological structures in the area
- Up to 1500 km² of 3D seismic
- Up to 2000 km² of 2D seismic

Chance
OIL AND GAS LIMITED

Workforce Requirements

- Workforce of approximately 75-85 people during all phases of the project
- Continued use of existing camp
  - Permitted 75-person camp
  - Located KM 325 of the Dempster Highway
- Use of Eagle Plains Hotel
- Potential use of Remote Shelters
- Objective to provide all available work and contracts to First Nation and Yukon partners.

Chance
OIL AND GAS LIMITED

Closure and Reclamation

- Progressive abandonment (reclamation) of un-successful wells
- Progressive decommissioning and reclamation of borrow source and quarry areas
- Progressive decommissioning and reclamation of access roads
- Closure of the Mix Bury Cover Sump areas

Chance
OIL AND GAS LIMITED

YESAB Executive Committee Screenings

- Similar to Designated Office Evaluations
  - Adequacy Review
  - Opportunity to provide comments and input
  - Assessment and Recommendation to Decision Bodies
- Key differences:
  - Requirement for proponents to consult with potentially affected First Nations and residents of communities **before** submitting a Project proposal.
  - Adequacy Review of Consultation and Adequacy Review of Project Proposal
  - Longer periods for stages of screening
  - Additional opportunities to provide comments and input into screening
  - Opportunity to provide input on Draft Screening Report and Recommendation

Chance
OIL AND GAS LIMITED

Pre-submission Consultation YESAA S. 50(3)	Chance Oil and Gas is required to consult with First Nations and Residents of communities before submitting a Project Proposal to the Executive Committee (EC)
Project Proposal submitted to Executive Committee	Chance Oil and Gas finalizes their Project Proposal and submits it. This initiates the formal EC Screening process.
Executive Committee Conducts Adequacy Review	EC reviews the Project Proposal to determine if the Chance has conducted consultation and if the Project Proposal is adequate. In the past, the EC has invited First Nation input at this stage.
Seeking Views and Information on Project Proposal	Opportunity to provide comments and input on the Project Proposal to the EC. Minimum of 30 days. Maximum of 60 days.
Executive Committee develops and issues Draft Screening Report	EC reviews comments and then develops and issues the Draft Screening Report for comments.
Seeking Views and Information on Draft Screening Report	Opportunity to provide comments and input on the Draft Screening Report to the EC. Minimum of 30 days. Maximum of 60 days.
Executive Committee issues Final Screening Report and Recommendation	EC reviews comments and finalizes the Screening Report and Recommendation. Then issues both to Decision Bodies.

TH0096	18-Jun-14	Meeting - In Person	N/A	Tr'ondëk Hwëch'in	Not available	Not available	Not available	Open House	Chance Oil and Gas Limited (Chance) held an open house in Dawson City at the YOOP Hall, from 4:00PM - 6:00PM. Chance provided information that was obtained from the recently concluded 3D seismic program. The next phase of exploration activity was planned to be a targeted exploration drilling program. The format of the Open House was a formal presentation by representatives of Northern Cross followed by a period of questions and answers.	N/A	N/A
TH0099	18-Jun-14	Community Event	N/A	Tr'ondëk Hwëch'in	N/A	N/A	N/A	Community Open House	Chance held a community open house event in Dawson City at the YOOP Hall from 4:00PM - 6:00PM. Chance shared Project information by presentation and had a question-and-answer period after.	N/A	Dawson City Open House Notice for June 18 2014
TH0101	26-Sep-16	Email	Outgoing	Tr'ondëk Hwëch'in	Richard Wyman (Chance)	Richard Wyman (Chance)	Chief Bruce Charlie (Vuntut Gwitchin First Nation), Chief Simon Mervyn (First Nation of Na-cho Nyäk Dun), Chief Joseph, Albert Peter (First Nation of Na-cho Nyäk Dun)	Draft Engagement and Communication Strategy	Richard (Chance) emailed Chief Bruce Charlie (Vuntut Gwitchin First Nation), Chief Simon Mervyn (First Nation of Na-cho Nyäk Dun), and Chief Roberta Joseph (Tr'ondëk Hwëch'in) and cc'd Cindy (Chance), Greg (Chance), and Albert (First Nation of Na-Cho Nyäk Dun). attaching a Draft Engagement and Communication Strategy. Richard (Chance) requested they review and share comments. Richard (Chance) requested a meeting to go over the document and advance their relationship.	N/A	N/A
TH0001	1-Dec-17	Letter	Outgoing	Tr'ondëk Hwëch'in	Richard Wyman (Chance)	Richard Wyman (Chance)	Chief Roberta Joseph (Tr'ondëk Hwëch'in)	Engagement Plan	Richard (Chance) sent a letter to Tr'ondëk Hwëch'in about the Communications and Engagement Plan that Chance wishes to develop in partnership with Tr'ondëk Hwëch'in and an introduction of Hemmera as Chance's support on developing this engagement strategy.	N/A	N/A
TH0002	9-Jan-18	Phone call	Outgoing	Tr'ondëk Hwëch'in	Richard Wyman (Chance)	Richard Wyman (Chance)	Chief Roberta Joseph (Tr'ondëk Hwëch'in)	Engagement Plan	Richard (Chance) attempted to call the Chief of Tr'ondëk Hwëch'in at 11:05AM to follow up on the December 1, 2017 letter. He left a message on her voicemail to call back.	N/A	N/A
TH0003	27-Feb-18	Email	Outgoing	Tr'ondëk Hwëch'in	Richard Wyman (Chance)	Richard Wyman (Chance)	Chief Roberta Joseph (Tr'ondëk Hwëch'in)	Engagement Plan	Richard (Chance) sent an email with a letter attached requesting a meeting with Tr'ondëk Hwëch'in on developing a Communication and Engagement Plan. The letter was a follow up to the letter sent December 1, 2017.	N/A	N/A
TH0004	15-Mar-18	Phone call	Outgoing	Tr'ondëk Hwëch'in	Richard Wyman (Chance)	Richard Wyman (Chance)	Chief Roberta Joseph (Tr'ondëk Hwëch'in)	Engagement	Richard (Chance) had a phone call with the Chief of Tr'ondëk Hwëch'in to follow up the December 1st and February 27, 2018 letters. She acknowledged receiving them and thought an original was to come in the mail so did not forward letters on to anyone. She will now act upon the letters, discuss with other members of her government and have someone get back to Chance. Chance suggested a meeting in April.	N/A	N/A
TH0005	28-Mar-18	Email	Outgoing	Tr'ondëk Hwëch'in	Richard Wyman (Chance)	Richard Wyman (Chance)	Sidney Schafrik (Tr'ondëk Hwëch'in)	Meeting	Richard (Chance) sent Tr'ondëk Hwëch'in a Draft agenda and a map showing the settlement lands, traditional territories and the location of the exploration permits and significant discovery licenses owned by Chance.	N/A	N/A
TH0006	9-Apr-18	Email	Incoming	Tr'ondëk Hwëch'in	Sidney Schafrik (Tr'ondëk Hwëch'in)	Richard Wyman (Chance)	Sidney Schafrik (Tr'ondëk Hwëch'in), Pat Titus (Tr'ondëk Hwëch'in), Darren Taylor (Tr'ondëk Hwëch'in), Margaret Rosling	Meeting	Sidney (Tr'ondëk Hwëch'in) emailed Chance with an attached revised agenda for the meeting the next day.	N/A	N/A
TH0007	10-Apr-18	Meeting		Tr'ondëk Hwëch'in	Richard Wyman (Chance)	Richard Wyman (Chance), Greg Charlie (Chance), Rick Nielson, Cindy Dickson (Chance)	Executive Director Pat Titus (Tr'ondëk Hwëch'in), Darren Taylor (Tr'ondëk Hwëch'in), Land and Resources Manager Kay Linley, Manager of Legislation and Policy Monina Wittfoth, and Senior Advisor, Mining and Strategic Initiatives, Dr. Sidney Schafrik (Tr'ondëk Hwëch'in), Kelly Constable (Hemmera), Emily Mann (Hemmera)	Engagement Plan	Chance meeting with Tr'ondëk Hwëch'in to discuss Chance as a company, to re-set the relationship with Tr'ondëk Hwëch'in, and to discuss collaborative development of a Communications and Engagement Plan per OIC 2017/037.	Tr'ondëk Hwëch'in identified and Chance confirmed that the Tr'ondëk Hwëch'in Executive Director and Tr'ondëk Hwëch'in Advisor for Mining and Strategic Initiatives will be the main contacts for Chance to communicate with Tr'ondëk Hwëch'in moving forward.	N/A
TH0008	23-Apr-18	Email	Outgoing	Tr'ondëk Hwëch'in	Kelly Constable (Hemmera)	Richard Wyman (Chance), Rick Nielsen, Greg Charlie (Chance), Cindy Dickson (Chance)	Pat Titus (Tr'ondëk Hwëch'in), Sidney Schafrik (Tr'ondëk Hwëch'in)	Engagement	Kelly (Hemmera) sent the Draft meeting notes for review and comment, for the meeting held April 10th, 2018. Kelly (Hemmera) also noted that Tr'ondëk Hwëch'in would review information presented by Chance with Chief and Council and get back to Chance with next steps, including Tr'ondëk Hwëch'in's interest in Chance providing a Draft Engagement and Communication Plan to Tr'ondëk Hwëch'in as a starting point. Hemmera asked Tr'ondëk Hwëch'in's representatives if they had met with Chief and Council and had an update.	N/A	N/A
TH0009	24-Apr-18	Email	Outgoing	Tr'ondëk Hwëch'in	Kelly Constable (Hemmera)	Greg Charlie (Chance), Cindy Dickson (Chance), Richard Wyman (Chance), Rick Nielsen (Chance)	Pat Titus (Tr'ondëk Hwëch'in), Sidney Schafrik (Tr'ondëk Hwëch'in), Kelly Constable (Hemmera)	Engagement	Kelly (Hemmera) sent a copy of the Tr'ondëk Hwëch'in meeting notes with Chance's edits incorporated. She said that there was a notable decimal place error in the first version; on page 3, well sites are 1.5 hectares, not 1500 like she had incorrectly written.	N/A	N/A
TH0010	1-May-18	Email	Incoming	Tr'ondëk Hwëch'in	Sidney Schafrik (Tr'ondëk Hwëch'in)	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance)	Sidney Schafrik (Tr'ondëk Hwëch'in)	Engagement	Sidney (Tr'ondëk Hwëch'in) sent in their addition to the meeting notes of April 10th, 2018 between Chance and Tr'ondëk Hwëch'in.	N/A	N/A
TH0011	8-May-18	Email	Outgoing	Tr'ondëk Hwëch'in	Kelly Constable (Hemmera)	Richard Wyman (Chance), Rick Nielsen, Greg Charlie (Chance), Cindy Dickson (Chance)	Sidney Schafrik (Tr'ondëk Hwëch'in), Pat Titus (Tr'ondëk Hwëch'in)	Engagement Plan	Kelly (Hemmera) sent an attachment with the most recent version of the notes with the edits from both Tr'ondëk Hwëch'in and Chance. Hemmera also extended the offer once again for Hemmera to provide a Draft document or annotated table of contents for an Engagement and Communications Plan for Tr'ondëk Hwëch'in and Chance. Hemmera would like to know their thoughts on this. As well, Hemmera asked if they were able to discuss the meeting with Chief and Council of Tr'ondëk Hwëch'in. Chance would welcome a short teleconference to touch base.	N/A	N/A
TH0012	8-May-18	Email	Outgoing	Tr'ondëk Hwëch'in	Richard Wyman (Chance)	Richard Wyman (Chance)	Chief Roberta Joseph (Tr'ondëk Hwëch'in), Pat Titus (Tr'ondëk Hwëch'in)	Tenure Extension	A representative from Chance sent a letter to Tr'ondëk Hwëch'in to provide notification that Chance will be submitting a request to extend the tenure of the exploration permits numbered 0012-117, which are about to expire in August if not extended. Chance said if there are any questions or comments please contact Chance.	N/A	N/A
TH0013	8-May-18	Email	Outgoing	Tr'ondëk Hwëch'in	Kelly Constable (Hemmera)	Richard Wyman (Chance), Rick Nielsen, Greg Charlie (Chance), Cindy Dickson (Chance)	Sidney Schafrik (Tr'ondëk Hwëch'in), Pat Titus (Tr'ondëk Hwëch'in)	Engagement Plan	Hemmera sent an attachment with the most recent version of the notes with the edits from both Tr'ondëk Hwëch'in and Chance. Hemmera also extended the offer once again for Hemmera to provide a Draft document or annotated table of contents for an Engagement and Communications Plan for Tr'ondëk Hwëch'in and Chance. Hemmera would like to know their thoughts on this. As well, Hemmera asked if they were able to discuss the meeting with Tr'ondëk Hwëch'in Chief and Council. Chance would also welcome a short teleconference to touch base.	N/A	N/A
TH0014	8-May-18	Email	Outgoing	Tr'ondëk Hwëch'in	Richard Wyman (Chance)	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance)	Chief Roberta Joseph (Tr'ondëk Hwëch'in), Pat Titus (Tr'ondëk Hwëch'in)	Tenure Extension	A representative from Chance sent a letter to Tr'ondëk Hwëch'in to provide notification that Chance will be submitting a request to extend the tenure of the exploration permits numbered 0012-117, which are about to expire in August if not extended. Chance said if there are any questions or comments please contact Chance.	N/A	N/A
TH0015	17-May-18	Email	Outgoing	Tr'ondëk Hwëch'in	Kelly Constable (Hemmera)	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance)	Pat Titus (Tr'ondëk Hwëch'in), Sidney Schafrik (Tr'ondëk Hwëch'in)	Engagement Plan	Hemmera sent an attached "without prejudice" Draft Engagement and Communications Plan for Tr'ondëk Hwëch'in to review and consider. Hemmera also said as we quickly approach summer and the August 1st deadline as described in Ministerial Order 2017/037, Chance would like to set up a meeting or teleconference with Tr'ondëk Hwëch'in to provide an update on its progress in developing Engagement and Communications planed with other First nations. Hemmera asked that they please let Hemmera know at their earliest convenience a date and time that works for Tr'ondëk Hwëch'in.	N/A	N/A
TH0016	17-May-18	Email	Outgoing	Tr'ondëk Hwëch'in	Kelly Constable (Hemmera)	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance)	Pat Titus (Tr'ondëk Hwëch'in), Sidney Schafrik (Tr'ondëk Hwëch'in)	Engagement Plan	Hemmera sent Tr'ondëk Hwëch'in an email further to the conversation Hemmera and Sidney had earlier in the day. Attached is a "without prejudice" Draft Engagement and Communications Plan for Tr'ondëk Hwëch'in to review and consider. As was communicated in the April 10th, 2018 meeting between Chance and Tr'ondëk Hwëch'in, Tr'ondëk Hwëch'in is interested in seeing a Draft Engagement and Communications Plan as a starting point. Chance is open to a framework that suits Tr'ondëk Hwëch'in's engagement and communications preferences and welcomes feedback on this Draft, or alternatively an original Tr'ondëk Hwëch'in Draft of an Engagement and Communication Plan for Chance to review and consider should the attached not serve as an appropriate starting point.	N/A	N/A

TH0017	28-May-18	Email	Outgoing	Tr'ondëk Hwëch'in	Kelly Constable (Hemmera)	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance)	Pat Titus (Tr'ondëk Hwëch'in), Sidney Schafrik (Tr'ondëk Hwëch'in)	Engagement Plan	A representative from Hemmera sent an email to Tr'ondëk Hwëch'in to follow up on their email just over a week ago. Hemmera seeks Tr'ondëk Hwëch'in's availability for a teleconference to discuss the attachment (Draft TH_Chance_ Engagement and Communication Plan). She asked them to let her know what dates and times work for them.	N/A	Draft TH_Chance_Engagement and Communication Plan
TH0018	13-Jun-18	Email	Outgoing	Tr'ondëk Hwëch'in	Kelly Constable (Hemmera)	N/A	Sidney Schafrik (Tr'ondëk Hwëch'in), Pat Titus (Tr'ondëk Hwëch'in)	Meeting	A representative from Hemmera sent representatives from Tr'ondëk Hwëch'in an email, to check in with them regarding setting up a call either June 22, 25, or 26. Hemmera asked if there was a one-hour window on one of those days to connect.	N/A	N/A
TH0019	18-Jun-18	Email	Outgoing	Tr'ondëk Hwëch'in	Kelly Constable (Hemmera)	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance)	Sidney Schafrik (Tr'ondëk Hwëch'in), Pat Titus (Tr'ondëk Hwëch'in), Shena Shaw (Hemmera) Emily Mann (Hemmera)	Engagement Plan	A representative from Hemmera sent Tr'ondëk Hwëch'in an email with a Draft agenda as an attachment. Hemmera said this agenda has been developed with the assumption that they had received direction from Chief and Council to pursue engagement and developing an Communications and Engagement Plan with Chance and requested confirmation if the assumption is incorrect.	N/A	N/A
TH0020	29-Jun-18	Email	Outgoing	Tr'ondëk Hwëch'in	Emily Mann (Hemmera)	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance)	Shena Shaw (Hemmera), Pat Titus (Tr'ondëk Hwëch'in), Sidney Schafrik (Tr'ondëk Hwëch'in), Ewa Holender (Tr'ondëk Hwëch'in)	Engagement Plan	A representative from Hemmera thanked everyone for their time on yesterday's afternoon teleconference. As discussed, Hemmera is to follow up with scheduling the next teleconference meeting and gave a suggested date and timeframe: • July 13th, any time • July 16th, in the morning • July 17th, in the afternoon • July 18th, any time	N/A	N/A
TH0021	5-Jul-18	Email	Outgoing	Tr'ondëk Hwëch'in	Greg Charlie (Chance)	Greg Charlie (Chance)	Ewa Holender (Tr'ondëk Hwëch'in)	Engagement Plan	A representative from Chance sent Tr'ondëk Hwëch'in an email, thanking them for their response and documents for review. Capacity funding details were discussed.	N/A	N/A
TH0022	12-Jul-18	Email	Incoming	Tr'ondëk Hwëch'in	Emily Mann (Hemmera)	Greg Charlie (Chance), Cindy Dickson (Chance), Richard Wyman (Chance)	Pat Titus (Tr'ondëk Hwëch'in), Sidney Schafrik (Tr'ondëk Hwëch'in), Ewa Holender (Tr'ondëk Hwëch'in)	Meeting	Emily (Hemmera) sent out the meeting minutes from the June 28 meeting and sent to Tr'ondëk Hwëch'in and Chance at the same time. Hemmera also wanted to add the meeting minutes as an agenda item.	A representative from Hemmera emailed First Nation of Na-Cho Nyäk on July 13th, 2018 and carbon copied Representatives from Hemmera, Chance Oil & Gas and First Nation of Na-Cho Nyäk, to thank First Nation of Na-Cho Nyäk for getting back to everyone. Hemmera then asked First Nation of Na-Cho Nyäk if they had a phone number that First Nation of Na-Cho Nyäk could be reached at and if they could send a few dates and times within the next week to that they might be able to have a quick conference call.	N/A
TH0023	19-Jul-18	Email	Outgoing	Tr'ondëk Hwëch'in	Shena Shaw (Hemmera)	N/A	Pat Titus (Tr'ondëk Hwëch'in), Sidney Schafrik (Tr'ondëk Hwëch'in), Ewa Holender (Tr'ondëk Hwëch'in)	Engagement Plan	Shena (Hemmera) sent Tr'ondëk Hwëch'in the latest version of the Engagement and Communication Plan, the map of Chance's permits issued by Yukon Government for reference purposes, and meeting notes from the July 13th meeting. Chance also suggested agenda items for the next meeting.	N/A	N/A
TH0024	19-Jul-18	Email	Incoming	Tr'ondëk Hwëch'in	Ewa Holender (Tr'ondëk Hwëch'in)	N/A	Ewa Holender (Tr'ondëk Hwëch'in), Pat Titus (Tr'ondëk Hwëch'in), Sidney Schafrik (Tr'ondëk Hwëch'in), Shena Shaw (Hemmera)	Engagement Plan	Ewa (Tr'ondëk Hwëch'in) sent Chance comments from the June 28th meeting minutes. Tr'ondëk Hwëch'in committed to reviewing the July 13th meeting minutes and sending comments in due course.	N/A	N/A
TH0025	19-Jul-18	Email	Outgoing	Tr'ondëk Hwëch'in	Emily Mann (Hemmera)	N/A	Pat Titus (Tr'ondëk Hwëch'in), Sidney Schafrik (Tr'ondëk Hwëch'in), Ewa Holender (Tr'ondëk Hwëch'in), Emily Mann (Hemmera)	Meeting	Meeting invitation for July 23rd sent by Emily (Hemmera) to Tr'ondëk Hwëch'in.	N/A	N/A
TH0026	20-Jul-18	Email	Outgoing	Tr'ondëk Hwëch'in	Emily Mann (Hemmera)	N/A	Pat Titus (Tr'ondëk Hwëch'in), Sidney Schafrik (Tr'ondëk Hwëch'in), Ewa Holender (Tr'ondëk Hwëch'in), Emily Mann (Hemmera)	Engagement Plan	Emily (Hemmera) sent Tr'ondëk Hwëch'in the latest Draft of the Engagement and Communication Plan. This Draft incorporated changes that were discussed in the meeting the previous day and suggested that comments and further changes be discussed in the meeting , July 23rd. The email also included an agenda for the meeting on July 23.	N/A	N/A
TH0027	23-Jul-18	Email	Outgoing	Tr'ondëk Hwëch'in	Shena Shaw (Hemmera)	N/A	Ewa Holender (Tr'ondëk Hwëch'in)	Engagement Plan	Shena (Hemmera) replied to an email from Tr'ondëk Hwëch'in saying they would use the latest Engagement and Communication Plan sent via email.	N/A	N/A
TH0028	23-Jul-18	Email	Incoming	Tr'ondëk Hwëch'in	Ewa Holender (Tr'ondëk Hwëch'in)	Chance	Ewa Holender (Tr'ondëk Hwëch'in)	Engagement Plan	Ewa (Tr'ondëk Hwëch'in) sent Chance the Tr'ondëk Hwëch'in Traditional Territory Shape files. Tr'ondëk Hwëch'in also asked that Chance please share the shapefiles for the permits once they have received them from Yukon Government to better understand the overlap area.	N/A	N/A
TH0029	23-Jul-18	Meeting	Outgoing	Tr'ondëk Hwëch'in	Richard Wyman (Chance)	Richard Wyman (Chance)	Ewa Holender (Tr'ondëk Hwëch'in), Pat Titus (Tr'ondëk Hwëch'in), Sidney Schafrik (Tr'ondëk Hwëch'in)	Engagement Plan	This meeting was used to go over final edits to the Engagement and Communications Plan. According to Tr'ondëk Hwëch'in internal protocol, the final Draft of the Engagement and Communications Plan would be submitted to Tr'ondëk Hwëch'in Chief and Council with a letter for final approval.	N/A	N/A
TH0030	26-Jul-18	Email	Outgoing	Tr'ondëk Hwëch'in	Emily Mann (Hemmera)	N/A	Sidney Schafrik (Tr'ondëk Hwëch'in), Pat Titus (Tr'ondëk Hwëch'in), Ewa Holender (Tr'ondëk Hwëch'in), Emily Mann (Hemmera)	Engagement Plan	Emily (Hemmera) sent Tr'ondëk Hwëch'in an email with the final Draft of the Tr'ondëk Hwëch'in and Chance Engagement and Communication Plan that is meant to be reviewed by Tr'ondëk Hwëch'in Chief and Council.	N/A	N/A
TH0031	26-Jul-18	Email	Outgoing	Tr'ondëk Hwëch'in	Richard Wyman (Chance)	Richard Wyman (Chance)	Pat Titus (Tr'ondëk Hwëch'in), Sidney Schafrik (Tr'ondëk Hwëch'in)	Engagement Plan	Richard (Chance) contacted Tr'ondëk Hwëch'in to provide them with a letter for Tr'ondëk Hwëch'in to provide to Chief and Council to update them on the work that Chance and Tr'ondëk Hwëch'in have done to design an Engagement and Communications Plan in a cooperative and collaborative manner. Chance asked VGG to include this letter in the package that Tr'ondëk Hwëch'in will be presenting to Chief and Council for the Council meeting. Chance also noted that the final version of the Plan was sent to Tr'ondëk Hwëch'in earlier that day.	N/A	N/A
TH0032	26-Jul-18	Email	Outgoing	Tr'ondëk Hwëch'in	Emily Mann (Hemmera)	N/A	Ewa Holender (Tr'ondëk Hwëch'in), Pat Titus (Tr'ondëk Hwëch'in), Sidney Schafrik (Tr'ondëk Hwëch'in), Emily Mann (Hemmera)	Engagement Plan	Emily (Hemmera) sent Tr'ondëk Hwëch'in and Chance staff an email asking if anyone had any more edits to the July 13th meeting summary between Chance and Tr'ondëk Hwëch'in.	N/A	N/A
TH0033	26-Jul-18	Email	Outgoing	Tr'ondëk Hwëch'in	Emily Mann (Hemmera)	N/A	Ewa Holender (Tr'ondëk Hwëch'in), Pat Titus (Tr'ondëk Hwëch'in), Sidney Schafrik (Tr'ondëk Hwëch'in), Emily Mann (Hemmera)	Engagement Plan	Emily (Hemmera) sent Tr'ondëk Hwëch'in an email asking if anyone had further comments or changes to make to the July 13th meeting notes.	N/A	N/A
TH0034	31-Jul-18	Email	Incoming	Tr'ondëk Hwëch'in	Sidney Schafrik (Tr'ondëk Hwëch'in)	Richard Wyman (Chance)	Sidney Schafrik (Tr'ondëk Hwëch'in)	Engagement Plan	Sidney (Tr'ondëk Hwëch'in) emailed Yukon Government Energy Mines and Resources to let them know that that Tr'ondëk Hwëch'in should be ratifying the Plan at the next Council Meeting during the week of August 6th through August 10th. Tr'ondëk Hwëch'in said that if Yukon Government Energy Mines and Resources has any questions, to feel free to ask.	N/A	N/A
TH0035	2-Aug-18	Email	Outgoing	Tr'ondëk Hwëch'in	Emily Mann (Hemmera)	N/A	Sidney Schafrik (Tr'ondëk Hwëch'in), Pat Titus (Tr'ondëk Hwëch'in), Ewa Holender (Tr'ondëk Hwëch'in), Emily Mann (Hemmera)	Engagement Plan	Emily (Hemmera) sent out meeting summary of the July 23rd teleconference. If Tr'ondëk Hwëch'in has revisions it was asked that they made them in tracked changes and return to sender to finalize. Meeting summary was attached.	N/A	N/A
TH0036	10-Aug-18	Email	Incoming	Tr'ondëk Hwëch'in	Sidney Schafrik (Tr'ondëk Hwëch'in)	Richard Wyman (Chance)	Sidney Schafrik (Tr'ondëk Hwëch'in)	Engagement Plan	Sidney (Tr'ondëk Hwëch'in) informed Yukon Government that Tr'ondëk Hwëch'in Chief and Council had asked for continuation of approval until the next Chief and Council meeting on August 23rd. Tr'ondëk Hwëch'in Chief and Council was reviewing the plan but was unable to pass the item due to the bulk of items required for the upcoming General Assembly.	N/A	N/A
TH0037	23-Aug-18	Email	Incoming	Tr'ondëk Hwëch'in	Ewa Holender (Tr'ondëk Hwëch'in)	N/A	Ewa Holender (Tr'ondëk Hwëch'in), Emily Mann (Hemmera)	Engagement Plan	Ewa (Tr'ondëk Hwëch'in) said Chief and Council asked that the table of the key contacts in the Plan be moved to a Schedule to the Plan and sent along a tracked changes Draft. Tr'ondëk Hwëch'in asked that Chance confirm that the change is acceptable in order to move forward with putting the Plan to Chief and Council for approval.	N/A	N/A
TH0038	23-Aug-18	Email	Incoming	Tr'ondëk Hwëch'in	Ewa Holender (Tr'ondëk Hwëch'in)	N/A	Ewa Holender (Tr'ondëk Hwëch'in), Emily Mann (Hemmera)	Engagement Plan	Ewa (Tr'ondëk Hwëch'in) representative thanked Emily (Hemmera) for sending along a version of the Plan with tracked changes accepted. The Tr'ondëk Hwëch'in representative confirmed that they would move forward with sending the Plan to Chief and Council for approval. Chance was asked to let Tr'ondëk Hwëch'in know when Richard gave official approval or if there was any other feedback.	N/A	N/A
TH0039	23-Aug-18	Email	Incoming	Tr'ondëk Hwëch'in	Ewa Holender (Tr'ondëk Hwëch'in)	N/A	Ewa Holender (Tr'ondëk Hwëch'in), Emily Mann (Hemmera)	Engagement Plan	Ewa (Tr'ondëk Hwëch'in) thanked Chance for confirming their approval of the changes to the Plan. Tr'ondëk Hwëch'in said that they would be in touch as soon as the Plan goes through the Chief and Council process and to arrange how the Plan will be submitted to Yukon Government.	N/A	N/A

TH0040	23-Aug-18	Email	Outgoing	Tr'ondëk Hwëch'in	Emily Mann (Hemmera)	N/A	Ewa Holender (Tr'ondëk Hwëch'in), Emily Mann (Hemmera)	Engagement Plan	Emily (Hemmera) thanked Tr'ondëk Hwëch'in for sending the updated Plan and said that they could move forward to submit the Plan for Chief and council for approval. One member of the chance team was not in the office to provide feedback. Given the small change, Tr'ondëk Hwëch'in was told to move forward and Chance would let Tr'ondëk Hwëch'in know if there was additional feedback as soon as they could.	N/A	N/A
TH0041	23-Aug-18	Email	Outgoing	Tr'ondëk Hwëch'in	Emily Mann (Hemmera)	N/A	Ewa Holender (Tr'ondëk Hwëch'in), Emily Mann (Hemmera)	Engagement Plan	Emily (Hemmera) confirmed with Tr'ondëk Hwëch'in that all members were fine with the Plan. Chance asked that Tr'ondëk Hwëch'in send any updates on the approval of the Plan and also to talk about the submission of the Plan to Yukon Government.	N/A	N/A
TH0043	28-Aug-18	Email	Incoming	Tr'ondëk Hwëch'in	Sidney Schafrik (Tr'ondëk Hwëch'in)	N/A	Sidney Schafrik (Tr'ondëk Hwëch'in), Emily Mann (Hemmera)	Engagement Plan	Sidney (Tr'ondëk Hwëch'in) emailed their Engagement and Communications Plan to Yukon Government as agreed to by Tr'ondëk Hwëch'in Chief and Council and Chance.	N/A	N/A
TH0044	2-Oct-18	Email	Outgoing	Tr'ondëk Hwëch'in	Richard Wyman (Chance)	Richard Wyman (Chance)	Pat Titus (Tr'ondëk Hwëch'in) and Sidney Schafrik (Tr'ondëk Hwëch'in)	Meeting	Richard (Chance) wrote to representatives of Tr'ondëk Hwëch'in: "Now that we have established an Engagement and Communications Plan, I am writing to initiate the process of implementation. The plan calls for a number of things to be at least started in the first three months following the approval of the plan: 1) a confidentiality agreement; 2) capacity funding and associated budget; and 3) plan implementation discussion. It might be helpful to include some discussion about the exploration project to be able to complete some of the objectives cited above. Using August 28 as the approval date for the engagement plan, the three month initial period will conclude November 28. Asked to please let Chance know some dates that you can meet either by conference call or in person to advance the objectives of the plan."	N/A	N/A
TH0045	5-Oct-18	Email	Incoming	Tr'ondëk Hwëch'in	Sidney Schafrik (Tr'ondëk Hwëch'in)	Richard Wyman (Chance)	Sidney Schafrik (Tr'ondëk Hwëch'in)	Meeting	Sidney (Tr'ondëk Hwëch'in) suggested a teleconference meeting on October 23rd to initiate the implementation of the Engagement and Communications Plan.	N/A	N/A
TH0046	11-Oct-18	Email	Outgoing	Tr'ondëk Hwëch'in	Shena Shaw (Hemmera)	N/A	Sidney Schafrik (Tr'ondëk Hwëch'in)	Meeting	Shena (Hemmera) told Tr'ondëk Hwëch'in that they would send a scheduler and sought to confirm attendees for the meeting.	N/A	N/A
TH0047	11-Oct-18	Email	Incoming	Tr'ondëk Hwëch'in	Sidney Schafrik (Tr'ondëk Hwëch'in)	N/A	Shena Shaw (Hemmera)	Meeting	Sidney (Tr'ondëk Hwëch'in) confirmed that the meeting attendees and Chance sending out a scheduler were fine.	N/A	N/A
TH0048	17-Oct-18	Email	Outgoing	Tr'ondëk Hwëch'in	Richard Wyman (Chance)	Richard Wyman (Chance)	Sidney Schafrik (Tr'ondëk Hwëch'in), Pat Titus (Tr'ondëk Hwëch'in)	Agreements	Richard (Chance) forwarded a Draft Confidentiality Agreement that was prepared by their counsel for Tr'ondëk Hwëch'in to consider and advise of any amendments. Notwithstanding the efforts of Ewa Holender (Tr'ondëk Hwëch'in), Chance prefers to use their own form of agreement since there are five First Nation groups that the company has to engage. For reasons of fairness and consistency, Chance is proposing that the attached form of agreement be used by each of the parties having interests in the Eagle Plain project area. Tr'ondëk Hwëch'in will see that the attached Draft is already marked up with a correction and with Notes to Draft that Chance did. Please mark up this one so there is continuity as the Drafting progresses. Please review and perhaps this can be part of the meeting agenda for next week.	N/A	N/A
TH0050	23-Oct-18	Meeting		Tr'ondëk Hwëch'in	Richard Wyman (Chance)	Richard Wyman (Chance)	Sidney Schafrik (Tr'ondëk Hwëch'in)	Engagement	Chance and Tr'ondëk Hwëch'in met to discuss the implementation of the Communications and Engagement Plan.	A Chance representative explained Chance's plans for the next 12-months, beginning by saying that not much will happen in the next year. Chance is planning a small geological field study in permits 9, 11, and 13. This will involve helicopter time to perform the local geological field sample and take place 30km to 50km North of Tr'ondëk Hwëch'in Territory. Looking at Chance's longer-term exploration plans, they would also occur north of Tr'ondëk Hwëch'in Territory in permits 12, 13, 14, 19, and 20, and perhaps in permits 10 and 11. This would be where the 3D seismic program would take place. The program would involve small-scale activity and have 1-2 drilling rigs operating at a time. The camp is not large enough to do drilling and seismic at the same time because of limited occupancy.	N/A
TH0051	23-Oct-18	Meeting		Tr'ondëk Hwëch'in	Richard Wyman (Chance)	Richard Wyman (Chance)	Sidney Schafrik (Tr'ondëk Hwëch'in)	Camp	Chance and Tr'ondëk Hwëch'in met to discuss the implementation of the Communications and Engagement Plan.	Chance responded that they were, but most of the activity they are looking at would require additional YESAB assessment and permitting.	N/A
TH0052	23-Oct-18	Meeting		Tr'ondëk Hwëch'in	Richard Wyman (Chance)	Richard Wyman (Chance)	Sidney Schafrik (Tr'ondëk Hwëch'in)	Economic Effects or Benefits	Chance and Tr'ondëk Hwëch'in met to discuss the implementation of the Communications and Engagement Plan.	Chance responded that the Project would only use public highways up to the winter road access off the Dempster Highway. Employment is hard to gauge. The drilling program would involve approximately 40 jobs including camp maintenance, catering, construction, and maintenance of access roads. There would be four to six people working at a time, but the work would be shift work. Chance would look to Vuntut Gwitchin first to offer positions because they would be operating in Vuntut Gwitchin Traditional Territory, and then expand hiring when more positions were available. A Chance representative added that historically Chance has hired employees from Vuntut Gwitchin First Nation, First Nation of Na-Cho Nyäk, and the Dawson area. They would look at candidates with oil and gas experience.	2018.10.23 Chance and TH Meeting Summary
TH0053	23-Oct-18	Meeting		Tr'ondëk Hwëch'in	Richard Wyman (Chance)	Richard Wyman (Chance)	Sidney Schafrik (Tr'ondëk Hwëch'in)	Economic Effects or Benefits	Chance and Tr'ondëk Hwëch'in met to discuss the implementation of the Communications and Engagement Plan.	Chance agreed and added that there are cycles in the exploration that require different skills and services, Chance will go to where these skills and services are available.	2018.10.23 Chance and TH Meeting Summary
TH0054	23-Oct-18	Meeting		Tr'ondëk Hwëch'in	Richard Wyman (Chance)	Richard Wyman (Chance)	Sidney Schafrik (Tr'ondëk Hwëch'in)	Project Design	Chance and Tr'ondëk Hwëch'in met to discuss the implementation of the Communications and Engagement Plan.	A Chance representative said that this is correct and added that Chance will usually do drilling in the winter months, then move to a year-round operation.	2018.10.23 Chance and TH Meeting Summary
TH0055	23-Oct-18	Meeting		Tr'ondëk Hwëch'in	Richard Wyman (Chance)	Richard Wyman (Chance)	Sidney Schafrik (Tr'ondëk Hwëch'in)	Project Design	Chance and Tr'ondëk Hwëch'in met to discuss the implementation of the Communications and Engagement Plan.	Chance said that they have undertaken 3D seismic survey already and have identified prospects. They may choose to drill using old data and then evaluate. Chance would keep Tr'ondëk Hwëch'in in the loop. A Chance representative added that once Chance is drafting a formal submission to YESAB, Chance will meet with communities as part of the consultation process.	2018.10.23 Chance and TH Meeting Summary

TH0058	23-Oct-18	Meeting		Tr'ondëk Hwëch'in	Richard Wyman (Chance)	Richard Wyman (Chance)	Sidney Schafrik (Tr'ondëk Hwëch'in)	Agreements	Chance and Tr'ondëk Hwëch'in met to discuss the implementation of the Communications and Engagement Plan.	Chance responded that they were okay with having the terms of the Confidentiality Agreement linked to the length of land tenure or duration of activity and subject to extension when both parties agree. A Chance representative suggested 5 years might be most appropriate because that is the longest length of tenure that Chance currently holds on any exploration permits. Tr'ondëk Hwëch'in said that five years is preferable for Tr'ondëk Hwëch'in. Chance followed and said that the next step was to get a mark-up of the Confidentiality Agreement from Tr'ondëk Hwëch'in.	2018.10.23 Chance and TH Meeting Summary

TH0070	23-Nov-18	Email	Outgoing	Tr'ondëk Hwëch'in	Emily Mann (Hemmera)	N/A	Sidney Schafrik (Tr'ondëk Hwëch'in), Emily Mann (Hemmera)	Meeting	As mentioned in the Chance and Tr'ondëk Hwëch'in meeting this morning, Chance is interested in planning an All-Party Meeting for February 1st, 2019, and would like to invite Tr'ondëk Hwëch'in. An All-Party Meeting is meant to bring together Tr'ondëk Hwëch'in, Vuntut Gwitchin, Gwich'in Tribal Council, Tetlit Gwich'in Council, First Nation of Na-cho Nyak Dun, and Yukon Government to discuss matters related to Chance's upcoming exploration project. Shared the proposed agenda. Noted Chance would like to host the meeting in Vancouver on February 1st, 2019, the day after AME Roundup (BC's Annual Mining Conference). Details around capacity funding were discussed. Chance is still in the early stages of planning this event, but wanted to let Tr'ondëk Hwëch'in know in advance so that the date could be reserved. Chance is happy to have further conversations regarding your attendance and meeting logistics. Chance can give Emily at Hemmera a call at any time if you have questions. Her contact information is below. Chance is looking to know if this date works for the above mentioned representatives to attend. Please respond to Emily (Hemmera) if you are available to attend the meeting and we will send a meeting scheduler to specific attendees shortly.	N/A	N/A
TH0071	27-Nov-18	Email	Incoming	Tr'ondëk Hwëch'in	Sidney Schafrik (Tr'ondëk Hwëch'in)	N/A	Sidney Schafrik (Tr'ondëk Hwëch'in), Emily Mann (Hemmera)	Meeting	Sidney (Tr'ondëk Hwëch'in) asked if Ministers for Yukon Government would be attending the All-Party Meeting, or just representatives like Deputies.	N/A	N/A

Chance was currently planning to have the ADM of Oil and Gas and Mineral Resources, and the Director Oil, Gas and Mineral Resources.	N/A	N/A
TH0073	27-Nov-18	Email	Outgoing	Tr'ondëk Hwëch'in	Emily Mann (Hemmera)	N/A	Sidney Schafrik (Tr'ondëk Hwëch'in), Emily Mann (Hemmera)	Meeting	Emily (Hemmera) informed Tr'ondëk Hwëch'in that in addition to having the ADM and Director of Oil and gas and Mineral Resources, Chance was looking to bring the Minister or Deputy to the meeting as well.	N/A	N/A
TH0074	4-Dec-18	Email	Incoming	Tr'ondëk Hwëch'in	Ewa Holender (Tr'ondëk Hwëch'in)	N/A	Ewa Holender (Tr'ondëk Hwëch'in), Emily Mann (Hemmera)	Agreements	Ewa (Tr'ondëk Hwëch'in) thanked a Chance representative for their time on the phone. As discussed, Tr'ondëk Hwëch'in attached the final version of the initial capacity funding letter, which they hoped to get to Council that week. They asked to please arrange for Chance to sign the letter and send it to Tr'ondëk Hwëch'in at their earliest convenience. Tr'ondëk Hwëch'in would then arrange for this to be countersigned on behalf of Tr'ondëk Hwëch'in. Capacity funding details were discussed. Tr'ondëk Hwëch'in hoped that Council could also approve the Confidentiality Agreement that week. Tr'ondëk Hwëch'in would send Chance a copy signed by Tr'ondëk Hwëch'in as soon as possible, for countersignature by Chance. Tr'ondëk Hwëch'in stated to please let Tr'ondëk Hwëch'in know if Chance had any questions or required further information.	N/A	N/A

TH0075	6-Dec-18	Email	Outgoing	Tr'ondëk Hwëch'in	Calista Morrison (Hemmera)	N/A	Sidney Schafrik (Tr'ondëk Hwëch'in), Ewa Holender (Tr'ondëk Hwëch'in), Calista Morrison (Hemmera)	Meeting	Calista (Hemmera) sent out Draft summary of the November 23rd, 2018 meeting for comments and review. (Attachment Title: 2018.11.23Chance and TH Meeting Summary). The purpose of this meeting was to discuss the implementation of the Tr'ondëk Hwëch'in and Chance Engagement and Communications Plan. Items also on the agenda were discussing the Confidentiality Agreement, and Letter of Agreement for Capacity Funding sent from Tr'ondëk Hwëch'in to Chance on November 5, 2018. Chance also wished to discuss their proposal for an All-Party Meeting where the Five First Nations, Yukon Government, and Chance would meet to discuss key project items and areas for collaboration. Emily (Hemmera) began the meeting by introducing meeting attendees and reviewing the agenda. Sidney (Tr'ondëk Hwëch'in) informed attendees that Pat Titus (Tr'ondëk Hwëch'in) was no longer working for Tr'ondëk Hwëch'in. Hemmera initiated discussion of the Confidentiality Agreement. Richard (Chance) expressed that the Confidentiality Agreement was good to go, and that he would clean up the document and send it to Tr'ondëk Hwëch'in for signing. Sidney (Tr'ondëk Hwëch'in) stated that because of the staffing change an Acting-Executive Director would likely have to sign the agreement. He stated that he would get direction from Council and that the process might take a couple weeks. Details around capacity funding were discussed. Transition to the new Chief and Council is expected to take place Jan 2019 and that there would likely be a series of information sessions over the coming months to bring them up to speed with respect to Chance. Richard (Chance) mentioned that there appears to be interest in the other First Nations for an All-Party Meeting in the new year. They are tentatively scheduling this for February 1, 2019. Because of the change with VGFN, it's possible the Northern Chiefs would want to meet ahead of time. Tr'ondëk Hwëch'in confirmed that a private meeting of the Northern Chiefs is desired. Chance stated that could be arranged either before the All-Party Meeting or during it.Tr'ondëk Hwëch'in will have to seek internal instructions and confirm schedules and availability for the date proposed. Sidney (Tr'ondëk Hwëch'in) stated that Roundup is very busy for Tr'ondëk Hwëch'in. Sidney (Tr'ondëk Hwëch'in) mentioned that he would work internally to check availability and will try to confirm dates and availability over email by December 13. Hememra informed Tr'ondëk Hwëch'in that Chance/Hemmera were hoping to include an In-Camera session in the agenda for the All-Party Meeting. It was also mentioned that Yukon Government is assisting with booking a room for the meeting. Hemmera offered to send a brief summary of the All-Party meeting to Tr'ondëk Hwëch'in to aid in their internal discussions and planning. Chance asked who the Letter of Agreement for the Capacity Funding should be addressed to. Sidney (Tr'ondëk Hwëch'in) said to send the clean Draft to himself and that he would follow up internally as to next steps and signatures. Similar to the direction required for the Confidentiality Agreement. Sidney will also check in with the Tr'ondëk Hwëch'in Finance Department on payment instructions (i.e., who to send the letter to and who it should be addressed to).	N/A	N/A
TH0076	13-Dec-18	Email	Outgoing	Tr'ondëk Hwëch'in	Emily Mann (Hemmera)	N/A	Sidney Schafrik (Tr'ondëk Hwëch'in), Emily Mann (Hemmera)	Meeting	Emily (Hemmera) responded to Tr'ondëk Hwëch'in's question regarding if there was an update on the attendance of the Minister or Deputy Minister at the Chance All-party Meeting. Chance said unfortunately not. A Yukon Government representative had been in touch with them to try and schedule their attendance, and at that point, it was still too early for them to commit. The Yukon Government representative said they would probably find out if a Yukon Government representative would attend in early January. They did have confirmed attendance from multiple government officials from the other First Nations, however, many were waiting to learn if an elected official would be attending as well. Chance asked Tr'ondëk Hwëch'in about how the Chief and Council meeting went. They asked how Chief and Council's review went pertaining to the Confidentiality Agreement, Capacity Funding Letter, and the All-party Meeting. Chance asked if there were any action items for Chance. E00551	7-Aug-19	Email	Incoming	Tr'ondëk Hwëch'in	Sidney Schafrik (Tr'ondëk Hwëch'in)	Greg Charlie (Chance), Cindy Dickson (Chance), Lynn O'Neil, Richard Wyman (Chance)	Sidney Schafrik (Tr'ondëk Hwëch'in), Ewa Holender (Tr'ondëk Hwëch'in), Hemmera	Meeting Coordination/Planning Cooperation Agreement	Sidney (Tr'ondëk Hwëch'in) asked Hemmera to please send the Draft Template that you have generated for the Cooperation Agreement. Tr'ondëk Hwëch'in stated they would like to be able to review for our discussions .	N/A	E00551_RE_ Meeting on either August 12 or 13_4
E00552	8-Aug-19	Email	Outgoing	Tr'ondëk Hwëch'in	Hemmera	Greg Charlie (Chance), Cindy Dickson (Chance), Lynn O'Neil (Chance), Richard Wyman (Chance)	Sidney Schafrik (Tr'ondëk Hwëch'in), Ewa Holender (Tr'ondëk Hwëch'in)	Meeting Coordination/Planning Cooperation Agreement	Hemmera stated that they didn't have a Draft Template for the Cooperation Agreement to send at this time. Hemmera said that instead, at that time they were hoping to use the time for that agenda item to discuss and Draft an outline for the Cooperation Agreement. The help facilitate the discussion, Hemmera would like to propose the following sections for the agreement: Recitals (or Whereas), Purpose and/or Objectives of the Parties, Term and Termination, Cooperation Commitments, General. Hemmera stated that using these sections as well as any other proposed by Chance or Tr'ondëk Hwëch'in, can have high level discussion about the outline and contents of cooperation agreement. Let me know what you think of this approach, happy to adapt or change.	N/A	E00551_RE_ Meeting on either August 12 or 13_4
E00554	9-Aug-19	Email	Outgoing	Tr'ondëk Hwëch'in	Hemmera	Richard Wyman (Chance)	Ewa Holender (Tr'ondëk Hwëch'in) , Sidney Schafrik (Tr'ondëk Hwëch'in)	Meeting Coordination/Planning Cooperation Agreement	Hemmera stated that in their meeting August 12, they would be going through the proposed Cooperation Agreement sections listed in the thread below and to fill in content that is suggested during the meeting. Hemmera said that in order to do this, they wanted to share their screen using Skype. Hemmera wanted to confirm if this could work for Tr'ondëk Hwëch'in. Hemmera also said they could do a trial morning before the meeting if Tr'ondëk Hwëch'in representatives were available. Hemmera said that if this approach didn't work, they could send a word doc with proposed headers for Tr'ondëk Hwëch'in to follow along during the meeting. Hemmera said that they would have a better meeting speaker with them for this meeting, so audio would be much better than last time.	N/A	E00554_RE_ Meeting on either August 12 or 13_5
E00555	9-Aug-19	Email	Incoming	Tr'ondëk Hwëch'in	Ewa Holender (Tr'ondëk Hwëch'in)	Richard Wyman (Chance)	Ewa Holender (Tr'ondëk Hwëch'in), Sidney Schafrik (Tr'ondëk Hwëch'in)	Engagement Benefits/Capacity Agreement Meeting Coordination/Planning	Ewa (Tr'ondëk Hwëch'in) stated that they appreciated Hemmera's efforts to ensure that they could participate from down south. Ewa said they were happy to do a trial morning if that would work for Hemmera, and that they had Skype already.	N/A	E00555_RE_ Meeting on either August 12 or 13_6
E00556	12-Aug-19	Email	Outgoing	Tr'ondëk Hwëch'in	Hemmera	N/A	Ewa Holender (Tr'ondëk Hwëch'in)	Meeting Coordination/Planning	Hemmera said to Ewa (Tr'ondëk Hwëch'in) that they were just waiting for the conference phone to be set up. Hemmera asked if Ewa was able to access the Skype meeting through the link in the meeting invitation. Hemmera stated that in their experience personal Skype and Business Skype do no work well together.	N/A	E00555_RE_ Meeting on either August 12 or 13_6
E00557	12-Aug-19	Email	Outgoing	Tr'ondëk Hwëch'in	Hemmera	Richard Wyman (Chance)	Ewa Holender (Tr'ondëk Hwëch'in) , Sidney Schafrik (Tr'ondëk Hwëch'in)	Meeting Coordination/Planning Cooperation Agreement	Hemmera said to Tr'ondëk Hwëch'in that they were set up for the meeting. Hemmera said they were sharing their screen, and that they had a speaker in the middle of the table that was picking up all voices. Hemmera said they were still waiting for some Tr'ondëk Hwëch'in folks. Hemmera said that if they were not able to access Skype they had attached the final agenda, the presentation from their last meeting for reference, and the Cooperation Agreement discussion.	attached: 190811_TH-Chance_MeetingAgenda_August12_FINAL, 190812_Chance and TH Cooperation Brainstorming, 190604_Chance_Presentation_ProjectDescription+ExCom_Gwich'in Tribal CouncilInuvik_First Nation of Na-cho Nyäk DunMayo_THDawson_v0.4	E00557_RE_ Meeting on either August 12 or 13_7

N/A	E00559_RE_ TH and Chance August 12 Meeting summary for Review
E00601	28-Jan-20	Email	Outgoing	Tr'ondëk Hwëch'in	Richard Wyman (Chance)	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance)	Sidney Scharfrik cc: Chief Roberta Joseph (Tr'ondëk Hwëch'in) (Tr'ondëk Hwëch'in)	Tenures/Dispositions/Permits DO Project Engagement/Consultation	Richard (Chance) sent Tr'ondëk Hwëch'in an email describing that Chance would be applying to the Yukon Government very shortly to extend the tenure of Exploration Permit 20. They said that the Application would be for maximum allowable under the Oil and Gas Act of 5 years. This permit had one suspended well at McParlon A-25 which Chance hoped to use for fluid disposal of any produced water associated with the proposed exploration Project. Chance was at an intermediate stage of discussions with the Manager of Oil and Gas Operations with Yukon to extend the suspended well status on the suspended wells at Eagle Plains. The Manager had indicated that Chance would need to do some physical assessments of the legacy wells to confirm the integrity of the wells before granting an extension. The assessments would require access to 3 suspended wells at SDL M-08, G-08, and J-19 and well as M-59 in order to do the work. A service rig, cement pumping equipment, and wireline services were expected to be used to conduct the assessments. Chance anticipated taking temperature measurements in wells to evaluate permafrost depth. The program was expected to take 1-2 months. This was a winter operation and would be done during the winter of 2020-2021 and may require Designated Office screening by YESAB. Chance stated that they would provide more information as soon as possible.	N/A	E00601_FW_ Suspended wells and Exploration Permit 20_3

E00647	23-Mar-20	Email	Outgoing	Tr'ondëk Hwëch'in	Richard Wyman (Chance)	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance)	Sidney Schafrik (Tr'ondëk Hwëch'in), Darren Taylor	Information Sharing	Richard (Chance) stated that Chance had several initiatives on the go, some of which are time sensitive and all required engagement with the affected First Nations. They provided a summary of these initiatives below: 1. Application to the Yukon Government to get tenure extension on Exploration Permit 0020 which was set to expire on August 30, unless extended. This permit was located mostly in the Traditional Territory of the VGFN, but a portion is in the Secondary Use Area of the Tetlit Gwich'in and in the overlap area with the First Nation of Na-Cho Nyäk Dun Traditional Territory. There is a suspended well in this Permit at McParlon A-25 which had ongoing value to Chance. 2. There were several suspended wells at the Chance Significant Discovery License (SDL 022) and one at the Blackie SDL 021 which the Yukon Government required Chance to undertake some maintenance work. This activity would require an impact assessment by the Designated Office (DO) of YESAB in Dawson prior to permissions being granted by Yukon to undertake the work. The plan was to submit to the DO the program in the next month or so with the objective of being able to do the work over approximately a 6 week to two month period in the winter of 2020-2021. This was a regulatory requirement made by the Manager of Oil and Gas Operations with the Yukon Government. Importantly, for Tr'ondëk Hwëch'in's knowledge, there was no indication that these suspended wells had any problems, but they were wells that were drilled in the 1960's so the regulator had asked for work to be done in order to be able to continue the suspended status of these wells. 3. Continuing engagement with respect to the multi-well drilling and seismic data acquisition Project that has been described to you in the past couple of years. a current map of Chance's landholdings was attached for your reference. In view of the COVID-19 outbreak, travel and face to face get togethers were not appropriate, if not prohibited, so they would have to make arrangements to exchange information in writing, electronically and by conference call. Chance noted there was quite a geographic spread for everyone to manage and that they looked forward to hearing Tr'ondëk Hwëch'in's preferences for engagement. Chance also asked Tr'ondëk Hwëch'in to please forward this email to anyone they may have missed who is working on the Chance file. E00708	13-Jul-20	Email	Outgoing	Tr'ondëk Hwëch'in	Hemmera	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance)	Sidney Schafrik (Tr'ondëk Hwëch'in), Deputy Chief Chief Simon Nagano (Tr'ondëk Hwëch'in) (Tr'ondëk Hwëch'in)	Engagement Reports/OIC Requirements	Hemmera prepared a Draft report on Implementation of Tr'ondëk Hwëch'in and Chance Engagement and Communications Plan for Tr'ondëk Hwëch'in and Chance to review. This report summarized meetings/correspondence that occurred between Tr'ondëk Hwëch'in and Chance since completing the 2019 Annual Report. Hemmera attached the Draft as a Word Document, and stated that both Tr'ondëk Hwëch'in and Chance could make revisions to that document in tracked changes, that would assist them in creating a final version. Hemmera said that if any issues arose between parties' revisions, those could be addressed via email or a quick call. Once revisions have been incorporated and the document was considered final by Tr'ondëk Hwëch'in and Chance, Hemmera would send the final version to both parties to sign. Hemmera also attached, as a pdf, a Draft of Tr'ondëk Hwëch'in and Chance's Engagement Log which would function as Appendix D for the report. Hemmera asked the parties to please complete reviews by July 24, and also sent a reminder that reports needed to be signed and submitted to Yukon Government on July 31, 2019. E00764	24-Jul-20	Email	Outgoing	Tr'ondëk Hwëch'in	Hemmera	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance)	Sidney Schafrik (Tr'ondëk Hwëch'in), Deputy Chief Chief Simon Nagano (Tr'ondëk Hwëch'in) (Tr'ondëk Hwëch'in), Hemmera	Engagement/Consultation DO Project	Hemmera sent an attached Draft copy of Chance's YESAB Project Proposal for the Eagle Plains Well Maintenance Project. Hemmera explained that in order for Chance to get all of its approvals in hand before the winter season, Chance's application would need to be submitted very shortly after the Draft was sent to Tr'ondëk Hwëch'in. Hemmera stated that at that time, their goal was to submit the Project Proposal by the middle of the following week. Hemmera recalled that from their June phone call, Kristen (Tr'ondëk Hwëch'in) had inquired about a Wildlife Management Plan. Hemmera stated that all mitigation measures with respect to wildlife and caribou was located within the body of the proposal, and so they wanted to flag that for Tr'ondëk Hwëch'in's attention. Hemmera indicated that since the document had not yet gone through Hemmera's formatting procedure, some of the figures and appendices were absent. Hemmera also said that they recalled Tr'ondëk Hwëch'in's interest in the Spill Response Plan, so they had made sure it was attached. Hemmera stated that Chance continues to be committed to engaging with Tr'ondëk Hwëch'in. Hemmera indicated that if Tr'ondëk Hwëch'in wished to discuss the proposed Project in more detail, to please contact Chance or Hemmera. E00912	28-Aug-20	Email	Outgoing	Tr'ondëk Hwëch'in	Hemmera	Richard Wyman (Chance), Cindy Dickson (Chance), Greg Charlie (Chance)	Sidney Schafrik (Tr'ondëk Hwëch'in), Deputy Chief Chief Simon Nagano (Tr'ondëk Hwëch'in)	DO Project Project Description/Activities	Further to Richard's email dated August 7 (attached), Hemmera explained that Chance had made a few revisions to their Project Description for the Designated Office Evaluation of their proposed Well Maintenance Program. As a result of those changes, Hemmera had also revised the effects assessment sections of the Project Proposal. Hemmera provided a summary of the reasons for the revision that had been provided to us by Chance and a brief summary of the amendment itself: 1. Ongoing conversations betwee Chance and Yukon Government, Oil and Gas Branch (Yukon Government) had necessitated changes. While Chance was previously of the impression wells could continue to be suspended, Yukon Government was now directing Chance to conduct inspection and maintenance activities for all eight suspended wells and then abandon those wells or bring them into active status (i.e., end the period of well suspension). Chance was now proposing to abandon six wells (i.e., M-59, M-08, J-19, G-08, B-73, and H, 28) and to bring the remaining two wells (i.e., A-25 and E-78) into active status as deep-injection wells. Waste fluid produced during the abandonment of the six wells could then be disposed of via injection into the deep-injection wells. No oil or gas was expected to be produced from the two wells proposed to be activated; they would specifically be used for disposal of waste fluid from activities associated with these maintenance activities. (Sections 2.1.4 and 2.1.5 had further description). 2. At that time, Chance could not confirm whether they would use the Eagle Plains Hotel or the existing Chance Camp for housing workers over the duration of the Project. The decision to utilize the Eagle Plains Hotel or the Chance Camp was to be made when the Project schedule was finalized. It would also have to tak into consideration the Hotel's ability to accommodate Chance workers over the full duration of the Project as well as COVID-19 relate self-isolation requirements at that time. As a result, both options were considered in the effects assessment for the housing of the Project workforce. (Sections 2.2 and 2.3 had further description). 3. When the Chance field team were at Eagle Plains early August, they observed that the route used to access M-59 would require realignment of the final portion of Blackie Winter Road. The section o the original route that proceeded north for the final kilometer was not ideal for traffic due to steeper terrain. The steeper route would result in a significant risk to the trucks bearing heavy loads, fuel supply, and other fluid handling shipments. Chance was proposing shifting the final portion of Blackie Winter Road east of the original route in order to attain a much gentler gradient. (Section 2.1.1 and Figure 2-1 had further description). E00901	15-Sep-20	Email	Outgoing	Tr'ondëk Hwëch'in	Hemmera	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance)	Sidney Schafrik (Tr'ondëk Hwëch'in), Deputy Chief Chief Simon Nagano (Tr'ondëk Hwëch'in)	DO Project Engagement/Consultation Project Description/Activities	Since my email dated August 28, Hemmera had been in the final stages of concluding the revised DO Project Proposal for Chance's Well Maintenance program. They had appreciated Tr'ondëk Hwëch'in's feedback and worked to include that into the application. Hemmera explained that Chance's timeline for completing the work was tied to compliance with regulations, so in an effort to ensure that the maintenance activities could occur that winter Chance needed to submit the application last week. Hemmera stated that it wa submitted late evening and today Hemmera received confirmation that the Project was on the YESAB registry. Hemmera indicated that they acknowledged that Tr'ondëk Hwëch'in may have future comments on the Project as it progressed through the YESAB process. They continued to look forward to hearing Tr'ondëk Hwëch'in's views and were happy to hold additional meetings to discuss and answer any questions Tr'ondëk Hwëch'in may have. E00907	2-Nov-20	Email	Outgoing	Tr'ondëk Hwëch'in	Hemmera	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance)	Sidney Schafrik (Tr'ondëk Hwëch'in), Chief Roberta Joseph (Tr'ondëk Hwëch'in) (Tr'ondëk Hwëch'in), Hemmera	DO Project Engagement/Consultation	Hemmera stated that after further consideration of the proposed Project (Eagle Plains Well Maintenance and Winter Activities activities and the requirements of the Yukon Oil and Gas Act, Chance had determined that changes were required to the Project submitted to the Dawson Designated Office on September 11, 2020 (Project #2020-0151). Hemmera explained that as such, Chance had decided to withdraw its Project Proposal and would be informing YESAB today, November 2, 2020. Hemmera indicated that Chance intended to incorporate changes into a revised Project Proposal. Once the revised proposal had been Drafted, Chance would notify Tr'ondëk Hwëch'in by sharing a Draft and requesting a meeting to discuss the changes further. After Chance had discussed those changes with Tr'ondëk Hwëch'in, the Project Proposal would be finalized and resubmitted to the Dawson Designated Office. Hemmera noted that Chance understood and appreciated that making changes to this Project a second time was requesting additional effort and capacity from Tr'ondëk Hwëch'in. Chance looked forward to continuing to work with Tr'ondëk Hwëch'in and would do its best to ease this process	N/A	E00907_Chance DO Proposal Withdrawal - Tr'ondëk Hwëch'in Notification

E00892	19-Nov-20	Email	Outgoing	Tr'ondëk Hwëch'in	Hemmera	Greg Charlie (Chance) , Richard Wyman (Chance), Cindy Dickson (Chance)	Sidney Schafrik (Tr'ondëk Hwëch'in), Chief Roberta Joseph (Tr'ondëk Hwëch'in) (Tr'ondëk Hwëch'in), Hemmera	DO Project Engagement/Consultation Project Description/Activities	Further to Hemmera's email dated November 2nd (attached), Chance revised its Project Proposal (including updated Project Description and Effects Assessment) for Designated Office Evaluation. Below were the key Project components that changed: • Extended Flow Testing: After maintenance activities are complete and depending on wellbore integrity (as confirmed through maintenance activities), Chance proposes to conduct Extended Flow Testing (EFT) on up to three of the wells which have the highest potential for natural gas reserve. The reason for this change is to allow Chance to gather important information about the nature of the natural gas resource accumulation and its productive capability. a. Wells proposed for EFT are M-59, M-08, and J-19 (see PDF attached for Figure 2-1). Please note, Figure 2-1 is currently being updated to reflect this change. b. Revert up to three wells to suspended status (if the EFT results prove to have sufficient resource). c. Abandon three to six wells (the three remaining wells (G-08, B-73, and H-28) will be abandoned and up to additional three wells may be abandoned if wellbore integrity is not confirmed or if EFT results prove insufficient resources). • Timelines: If work cannot be completed this winter season (due to low snow pack, COVID considerations, or permitting delays), Chance will complete the Project during the winter of December 2021 to March 2022. Additional detail is within the attached revised Draft Project Proposal. While revisions were made throughout the document, Section 2.1.3 is the substantive addition with respect to EFT. We've attached both a clean version and a version with tracked changes to facilitate your review. Given the very short time frame for winter work, Chance will be submitting the application to YESAB on November 20. Hemmera anticipates Tr'ondëk Hwëch'in requiring additional discussions with Chance to review these changes and look forward to scheduling a Meeting where we can discuss these matters further to support your future submissions to the YESAA process. E01307	27-Jul-21	Email	Outgoing	Tr'ondëk Hwëch'in	Hemmera	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance)	Sidney Schafrik (Tr'ondëk Hwëch'in), Chief Roberta Joseph (Tr'ondëk Hwëch'in) (Tr'ondëk Hwëch'in), Shena Shaw (Hemmera)	Engagement Reports/OIC Requirements	Hemmera thanked Tr'ondëk Hwëch'in for their review of the Draft 2021 Annual Report on the Implementation of the Tr'ondëk Hwëch'in and Chance Engagement and Communications Plan. Hemmera attached an updated version with the revision you've provided below. They also removed Draft from the title of the document and the Draft watermark. Hemmera asked if Sidney (Tr'ondëk Hwëch'in) could sign on their end (once they had finished Tr'ondëk Hwëch'in's approval process) and send a copy to Hemmera. Hemmera noted that Greg (Chance) and Richard (Chance) were actually in Eagle Plains right now, but that Greg (Chance) was scheduled to stop by the Hemmera Office to sign on once he's returned. Hemmera confirmed with Derek (Yukon Government) that submitting the report on August 2 was acceptable.	E01304_210727_EngagementPlan_2021ImplementationReport_TH_v0.6	E01304_FW_ DRAFT 2020 Annual Report of Tr'ondëk Hwëch'in and Chance Engagement Activities - For Review.msg
E01282	2-Aug-21	Email	Outgoing	Tr'ondëk Hwëch'in	Hemmera	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance)	Derek Fraser (Yukon Government) (Yukon Government), Sidney Schafrik (Tr'ondëk Hwëch'in) (TH), Chief Roberta Joseph (Tr'ondëk Hwëch'in) (Tr'ondëk Hwëch'in) (TH)	Engagement Reports/OIC Requirements	Hemmera sent Derek (Yukon Government) the attached Draft 2021 Annual Report on the Implementation of the Tr'ondëk Hwëch'i and Chance Engagement and Communications Plan. Hemmera noted that this report was prepared using meeting agendas and summaries Drafted by Hemmera and subsequently reviewed and agreed to by the parties. This report had been reviewed and approved by Chance. Tr'ondëk Hwëch'in reviewed the report and provided revisions to Hemmera. Hemmera noted that those revisions were incorporated into the report attached, however, Hemmera was unable to secure approval and a signature from Tr'ondëk Hwëch'in. To that end, the signature lines had been removed and the Draft watermark remained in place. Hemmera stated that if Tr'ondëk Hwëch'in provided a signature at a date, Hemmera would be happy to prepare a final version of the report for submission to Yukon Government.
