E00928	September 17, 2020	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Benefits/Capacity Agreement DO Project Engagement/Consultation	I am providing a short update to set the stage for discussions to begin as soon as possible regarding a Benefits Agreement among the First Nation of the Nacho Nyak Dun (NND), the Vuntut Gwitchin First Nation (VG), Yukon Government (YG) and Chance Oil and Gas (Chance) in accordance with Section 68 of the Yukon Oil and Gas Act. Hemmera, acting on behalf of Chance, filed a project description with the Designated Office of the Yukon Environmental and Socio-Economic Assessment Board in Dawson last week concerning required work on eight suspended wells operated by Chance at Eagle Plain. The project is small scale and is anticipated to be completed in a two to three-month period during the winter of 2020-2021. The plan is to prepare for and abandon six of these wells and convert two others to be used for disposal of well bore fluids used in the abandonment procedures and/or recovered in the process. The activities are governed by YG oil and gas regulations and are routine oilfield practices. Details are provided in the submission document, but if you have any questions or comments, please feel free to contact me or any of my colleagues. The project area is mostly in the traditional territory of the VG, but one of the wells to be abandoned is located in the overlap area on the east side of the Dempster at Blackie M-59 which is also in Significant Discovery License 021. Although small scale, the project triggers the need for a benefits agreement with the First Nations who are affected by the activities, YG acting on behalf of all Yukoners and the proponent, namely Chance. Please advise who from the NND will be negotiating this Benefits Agreement so arrangements can be made to begin discussions.
E00883	September 18, 2020	Email	Out	Vuntut Gwitchin First Nation YG First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	DO Project Engagement/Consultation Meeting Coordination/Planning	I just wanted to follow up and hope everyone had a chance to review the last BA agreement. I would suggest that we set up a call sometime soon to discuss on how we want to proceed with section 68 negotiations. As I am away all next week, however I have include[redacted] so they can be available if the parties do agree to discuss next steps. We look forward to your response.
E00955	September 21, 2020	Phone Call	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	DO Project	Phone message left
E01001	September 21, 2020	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	DO Project Jobs/Contracts Education and Training	I am sending some information for opportunities to work on the service rig. The attachments are all the forms that need to be completed. There will be a need to have some training prior to being able to complete these forms (H2S Alive, WHMIS, First Aid and TDG).
E00834	November 2, 2020	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Engagement/Consultation DO Project	After further consideration of the proposed Project (Eagle Plains Well Maintenance and Winter Activities) activities and the requirements of the Yukon Oil and Gas Act, Chance Oil and Gas Ltd. (Chance) has determined that changes are required to the Project submitted to the Dawson Designated Office on September 11, 2020 (Project #2020-0151). As such, Chance has decided to withdraw its Project proposal and will be informing the Yukon Environment and Socio-Economic Assessment Board today, November 2, 2020. Chance intends to incorporate changes into a revised Project proposal. Once the revised proposal has been drafted, Chance will notify you by sharing a draft and requesting a meeting to discuss the changes further. After Chance has discussed those changes with the First Nation of Na-cho Nyäk Dun, the Project proposal will be finalized and resubmitted to the Dawson Designated Office. Chance understands and appreciates that making changes to this Project a second time is requesting additional effort and capacity of the First Nation of Na-cho Nyäk Dun. Chance looks forward to continuing to work with the First Nation of Na-cho Nyäk Dun and will do its best to ease this process.
E00905	November 2, 2020	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	DO Project Engagement/Consultation	After further consideration of the proposed Project (Eagle Plains Well Maintenance and Winter Activities) activities and the requirements of the Yukon Oil and Gas Act, Chance Oil and Gas Ltd. (Chance) has determined that changes are required to the Project submitted to the Dawson Designated Office on September 11, 2020 (Project #2020-0151). E00835	November 17, 2020	Email	In	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	DO Project Meeting Coordination/Planning	We appreciated the[redacted]. I would like to take the time to introduce you to our new FNNND representative: [redacted] will now be the primary FNNND contact person on this project. Please add him (and keep me) on the email distribution list.
E00836	November 18, 2020	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	DO Project Meeting Coordination/Planning	I'll be sure to include[redacted] on all future emails.

Reference	Date	Contact Type	In / Out	Organization	Author	Proponent/Proponent Rep	External Organization Names	Topic/Regarding	Meeting/Correspondence Summary
E00837	November 18, 2020	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	DO Project Meeting Coordination/Planning	I will definitely include Skeeter on all future emails regarding Chance's DO project (Well Maintenance and Winter Activities). Should I also include him on future emails regarding Chance's Executive Committee project (Eagle Plains Exploration)?
E00838	November 18, 2020	Email	In	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	DO Project Meeting Coordination/Planning	Yes please and thank you.
E00890	November 19, 2020	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	DO Project Engagement/Consultation Project Description/Activities	Further to my email dated November 2nd (attached), Chance Oil and Gas (Chance) has revised its Project Proposal (including updated Project Description and Effects Assessment) for Designated Office Evaluation. Below is the key project component that has changed: •Extended Flow Testing: After maintenance activities are complete and depending on wellbore integrity (as confirmed through maintenance activities), Chance proposes to conduct Extended Flow Testing (EFT) on up to three of the wells which have the highest potential for natural gas reserve. The reason for this change is to allow Chance to gather important information about the nature of the natural gas resource accumulation and its productive capability. a.Wells proposed for EFT are M-59, M-08, and J-19 (see PDF attached for Figure 2-1). Please note, Figure 2-1 is currently being updated to reflect this change. b.Revert up to three wells to suspended status (if the EFT results prove to have sufficient resource). c.Abandon three to six wells (the three remaining wells (G-08, B-73, and H-28) will be abandoned and up to additional three wells may be abandoned if wellbore integrity is not confirmed or if EFT results prove insufficient resources). •Timelines: If work cannot be completed this winter season (due to low snow pack, COVID considerations, or permitting delays), Chance will complete the project during the winter of December 2021 to March 2022. Additional detail is within the attached revised Draft Project Proposal. While revisions were made throughout the document, Section 2.1.3 is the substantive addition with respect to EFT. We've attached both a clean version and a version with tracked changes to facilitate your review. Given the very short time frame for winter work, Chance will be submitting the application to YESAB on Friday, November 20th. Hemmera anticipates FNNND requiring additional discussions with Chance to review these changes and look forward to scheduling a meeting where we can discuss these matters further to support your future submissions to the YESAA process.
E01020	November 20, 2020	Email	In	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	DO Project Project Description/Activities Engagement/Consultation	[redacted] I'm reviewing the documents as well as some of the previous work by FNNND. As a recent addition to the FNNND representatives, I'll also be conferring with others at FNNND.
E01021	November 20, 2020	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	DO Project Project Description/Activities Engagement/Consultation	I need to amend my email sent yesterday. While Chance would like to submit as soon as possible, the submission will be delayed until mid next week. If the First Nation of Na-cho Nyäk Dun has any immediate concerns, please contact us and we'll make scheduling a meeting a priority.
E01022	November 23, 2020	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]		[redacted]	DO Project Project Description/Activities Engagement/Consultation	Let me know if there is anything you need from me.
E00839	November 25, 2020	Email	In	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Engagement/Consultation DO Project	Further to the notes below, please send me the earlier YESAB submission and a list of changes in the next submission. It would allow me to do a faster review.
E00858	November 25, 2020	Email	In	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	DO Project Engagement/Consultation	Email read receipt
E00840	November 26, 2020	Email	Out	First Nation of Na-cho Nyäk Dun	Calista Morrison	Hemmera	Skeeter Wright	DO Project Engagement/Consultation Project Description/Activities	I've attached an email Hemmera sent to FNNND June 2019. It includes the draft project description for Chance's Eagle Plains Exploration Project and a presentation that Chance gave to FNNND at that time. This project will go through a YESAB Executive Committee level screening. This is the project I was referring to with respect to including you on any future emails pertaining to Chance's Executive Committee project. However, Chance (and Hemmera) haven't been actively engaging on it on this project this year... We've been focused on Chance's Eagle Plains Well Maintenance Project (or subsequently called Eagle Plains Well Maintenance and Winter Activities) which will be going through the YESAB Designated Office (DO) in Dawson City. That is the proposal we've been engaging with FNNND on for the past few months. It's this project that has changed a couple times and which Chance withdrew from YESAB a couple weeks ago. I've attached a number of emails that "tell the story" and that I hope answer your question: 1.Email with original draft of the DO submission (Eagle Plains Well Maintenance Project). 2.Email fro [redacted] an stating the submission had been delayed because Chance was considering additional changes to the proposed project. 3.Email from myself with revised DO submission, including a high level overview of the changes and Chance's reasons for those changes. a.Note: This was the draft ultimately submitted to YESAB and which Chance then withdrew. 4.Email I sent last week. Contains the current version of Chance's DO submission. The email highlighted the main change (inclusion of Extended Flow Testing). The red-line version that was attached would be the best resource for seeing/reviewing the recent changes.

E00841	November 26, 2020	Email	In	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	DO Project Engagement/Consultation DO Project Engagement/Consultation Project Description/Activities	I'll review the material and get back to you if I've any questions.
E01002	November 26, 2020	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	DO Project Meeting Coordination/Planning	It's been awhile since I last seen you and worked with you! I think it was the implementation reviews we last where at the table. Anyway, welcome back and look forward working with you and if you would like an update please give me a call anytime.
E01003	November 26, 2020	Email	In	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	DO Project Engagement/Consultation	It's also been quite a while since I had any contact with Chance (was Northern Cross at that time). I don't remember if I called them or they called me while we were working on Final Agreement chapter 12 implementation.
E00895	December 15, 2020	Email	In	Vuntut Gwitchin First Nation YG First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	DO Project Engagement/Consultation Meeting Coordination/Planning	As was communicated in numerous emails over the last month from COGL, I wanted to send a follow up email to see if COGL still plans to host a meeting to discuss the revised proposal this Thursday?
E00986	January 1, 2021	Email	Out	Vuntut Gwitchin First Nation First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Benefits/Capacity Agreement DO Project	Please call anytime on my cell or phone if need any information or an update. If you are in Whitehorse please stop by my office and I can provide you with more details and photos of the area we are talking about.Look forward working with you on this project.
E00985	January 11, 2021	Email	In	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Benefits/Capacity Agreement DO Project	Wow, it has certainly been a while since we last spoke. I'm writing about two things. FNNND is also to be involved in the discussions you propose. I[redacted] are the two main FNNND contacts. Your proposed January 14 at 10:30 AM does not work for FNNND. I'll leave it to VGFN to suggest a time/date and see if FNNND can manage their proposed schedule.
E00897	January 19, 2021	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	DO Project Engagement/Consultation	A brief update on Chance's proposed Eagle Plains Well Maintenance and Extended Flow Testing project is provided below: •Project was submitted to the Dawson District Office (DO) December 24, 2020. •Adequacy Review started December 29, 2020 and was extended January 11, 2021. oThe Adequacy Review period was extended for 21 days due to the complexity of the Project. •Dawson DO issued an Information Request on January 15, 2021 Chance is currently working on its response to Information Request 1 which you can find here. Additionally, here is the link to the project's page on the YESAB registry: 2020-0197.
E01065	April 7, 2021	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning Engagement/Consultation	Hemmera is currently resuming work on Chance's Executive Committee project titled Eagle Plains Exploration Program. Seeing as it's been quite some time since Chance and the First Nation of Na-cho Nyäk Dun (FNNND) have discussed this particular project, Chance was hoping to schedule a meeting. Some items that Chance would like to discuss are: •a refresher of the draft project description •update of events since Chance last engaged on the ExCom project •anticipated timeline for submission to YESAB, and •FNNND's preferences/guidance for engagement with its government and its citizens over the coming months. Do you have any availability the week of April 26th – 30th?
E01107	April 7, 2021	Email	In	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	I can rearrange my schedule for that week to meet other's needs, except I'm booked for the morning of Thursday April 29.
E01108	April 7, 2021	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	I sent this to yourself and[redacted] anyone else from FNNND whose schedule we need to consider?
E01109	April 7, 2021	Email	In	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	[redacted] on the NND contact list just so she can document information. I'm the functioning NND contact.
E01110	April 7, 2021	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	I am tied up all day on April 26 and between 10:00 and 12:00 (MT) on April 27. The rest of the week is open though I will be in Ontario and will be 3 hours ahead of Yukon time.
E01111	April 7, 2021	Email	In	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	Thanks everyone!
E01052	April 8, 2021	Email	In	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	This is[redacted] be in attendance on behalf of the FNNND Lands and Resources department. Thank you for keeping me copied on the communications.
E01090	April 8, 2021	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Project Description/Activities Meeting Coordination/Planning	Meeting Invite: I believe this time slot works for both Chance and[redacted] will update the invite with more details tomorrow or early next week.
E01125	April 8, 2021	Email	In	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	I'll be "there" then.
E01126	April 15, 2021	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning Engagement/Consultation	Attached is a draft agenda for the Chance and First Nation of Na-cho Nyäk Dun meeting April 30th. Please let me know if you have any changes you would like me to make. Then I'll finalize the agenda and attach it to the meeting invite.
E01127	April 15, 2021	Email	In	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	[redacted]. I've no additions to the agenda to suggest.

E01128	April 16, 2021	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	Does Chance have any additions they'd like to make?
E01129	April 17, 2021	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	Nothing to add from me.
E01091	April 23, 2021	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted],	Meeting Coordination/Planning Engagement/Consultation	Attaching the agenda.
E01057	April 26, 2021	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	Removing "Placeholder" from the title. Attaching the agenda.
E01094	April 28, 2021	Email	In	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	My apologies. I've just been told I'm to attend a meeting of a number of Chiefs at 10 AM this Friday April 30 for a couple of hours. A draft date/time was not provided to me, I just found out minutes ago. Hopefully, another date/time can be found that works for everyone.
E01095	April 28, 2021	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	Not a problem! Could you send some dates/times that work for you next week? Then I'll work with Chance to coordinate their attended, and hopefully we can find something that works for everyone!
E01096	April 28, 2021	Email	In	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	Thanks for your understanding. I'm available: May 3 Monday - all day May 4 Wed - 1 PM onward May 6 Thursday- before 3 PM May 7 Friday - after 1 PM
E01054	April 29, 2021	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	Meeting Invite: Just moving the appointment to next week. Let me know if you have any issues with this time slot.
E01097	April 29, 2021	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	I sent along an updated invite. If that date and time happens to not work, just let me know.
E01098	April 29, 2021	Email	In	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	Thanks for finding a time/date that works.
E01055	May 5, 2021	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Project Description/Activities Meeting Coordination/Planning	On the off chance that there are poor connection issues during our call this afternoon, I wanted to provide a PDF copy of the presentation Richard will be running through. I will still aim to have the PowerPoint up during the call though.
E01056	May 5, 2021	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Project Description/Activities Meeting Coordination/Planning	I'm sending along this meeting invite (in accordance [redacted] email) so that it is in everyone's calendars. A draft agenda for the Chance and NYRRC meeting is below. However, it can definitely be updated if any changes are proposed.DRAFT Agenda Introduction to meeting •Introductions •Review of agenda •Meeting purpose and objectives□ Eagle Plains Exploration Project •Provide overview of Project Description •Discussion and questions□ Next Steps •Timelines •Future meetings/engagement
E01193	May 5, 2021	Meeting - Teleconference		First Nation of Na-cho Nyäk Dun		[redacted]	[redacted]	Engagement/Consultation	The purpose of this meeting was for Chance to present a Draft Project Description of exploration activities proposed for the Eagle Plain Basin. Chance provided recent information and updates regarding baseline information gathered by consultants (Environmental Dynamics Inc. (EDI), Peer Solutions, Palmer) and Parties discussed next steps with community engagement and consultation schedules for the First Nation of Na-cho Nyäk Dun (FNNND).
E01071	May 13, 2021	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Engagement/Consultation Meeting Coordination/Planning Project Description/Activities	Attached are a couple of items that were discussed during the Chance/FNNND meeting last week. The first is a memo summarizing Chance's draft engagement schedule over the summer/fall. The second is the Heritage report that Chance completed back in 2013.
E01146	May 14, 2021	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Project Description/Activities Engagement/Consultation	I've attached the May 5th Chance / First Nation of Na-cho Nyäk Dun Meeting Summary Draft for Review.
E01147	May 14, 2021	Email	In	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Project Description/Activities Engagement/Consultation	I'll have a look at it this weekend.
E01159	May 18, 2021	Email	Out	First Nation of Na-cho Nyäk Dun Tr'ondëk Hwëch'in	[redacted]	[redacted]	[redacted]	Information Sharing Project Description/Activities	We recently received a report and accompanying appendices from Palmer Environmental who worked on permafrost/terrain studies as well as suitability mapping. I've attached the main memo/report from Palmer.
E01172	May 21, 2021	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Information Sharing	I wanted to check-in and see if you had any issues with downloading the maps.
E01174	May 21, 2021	Email	In	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Information Sharing	The only minor hassle was that I had to go into town to do it due to my poor off grid internet connection. But that is standard procedure with off grid life and office.

2. Reintroduction Meeting Discussion

Chief [redacted] led a welcome prayer.

[redacted] provided a safety share and initiated introductions. [redacted] shared that he is based out of Yellowknife and looks forward to learning and listening from everyone during the meeting. Grand Chief [redacted] said he has been in his role for 2.5 years and noted he has been involved in the mining industry for many years. Grand Chief [redacted] shared how his ancestors followed caribou in the Eagle Plains area. He noted the importance of this area to his people today. Grand Chief [redacted] added that he is interested in understanding more about the Eagle Plains Exploration Project (the Project) and Chance Oil and Gas Limited's (Chance) next steps [redacted] was born and raised in Inuvik and often drives through the Eagle Plains area. She noted interest in learning more about the objectives of today's meeting. Richard said he was born in Treaty Seven Territory and is the founding shareholder of Chance (previously known as Northern Cross (Yukon) Limited) [redacted] shared that the name Chance is taken from the Chance sandstone in the Eagle Plain sedimentary basin where oil was first discovered in Yukon in 1959 [redacted] thanked everyone for joining the meeting and said he looked forward to establishing a collaborative, constructive, and respectful relationship with all the participating First Nations. Willard noted he is a Gwitchin citizen born in Tetlit Territory. [redacted] is currently an Advisor for the Lands and Resources Department at Gwitchin Tribal Council (GTC). [redacted] expressed interest in learning more about the Project and shared he had been in his role for 13 months [redacted] said she is a Yukon Gwitchin member who was raised by her grandfather. She has been with Chance for 10 years and is based in Whitehorse, Yukon. [redacted] shared that he is Red River Métis and the Executive Director of the Vuntut Gwitchin First Nation (VGFN). Chief [redacted] was born and raised in Old Crow and noted a background in oil and gas, self-government agreements, land protection and management, and early negotiations. Chief [redacted] said she was previously the Minister of Environment and had extensive experience dealing with oil and gas licensing and permitting. Chief [redacted] also shared that her intention at today's meeting was to listen and create an open dialogue around intentions [redacted] introduced herself and noted she is the Intergovernmental Relations Coordinator for VGFN. Chief [redacted] introduced himself. [redacted] introduced himself and welcomed everyone to the meeting.

[redacted] reviewed the agenda and asked everyone to share proposed changes or suggestions.

[redacted] noted [redacted] from Chance had joined the meeting via speaker phone.

Chief [redacted] said the proposed agenda topics are not where they need to be. Chief [redacted] shared that the Indigenous Nation attendees had intricate technical knowledge of the Project area. Chief [redacted] noted the Indigenous leaders at today's meeting had an internal briefing prior to this meeting. Chief [redacted] asked [redacted] what her role was during the meeting and if Two Worlds Consulting (TWC) was participating in the Project's Impact Benefit Agreement (IBA) process. [redacted] said TWC is not supporting the Project's IBA process and was recently hired to support the Project's engagement scope of work including meeting facilitation and notetaking. [redacted] added that TWC staff were happy to step out at any time if discussions related to the IBA process

were going to take place. Chief [redacted] noted that Grand Chief [redacted] opening comments highlighted the importance of the Project area to all northern Indigenous Nations. She added that the Project's existing IBAs are maturing, and further discussions related to IBAs will be required.

Chief [redacted] shared community concerns for wells that exist on the Project site and the Yukon's definition of employment and income opportunities in the *Yukon Oil and Gas Act*. Other Project-related concerns shared by Chief [redacted] included impacts to the environment, Treaty and Aboriginal Rights, extent of engagement, how Chance plans to engage going forward, permits with First Nation Na-Cho Nyäk Dun (NND), the vision to push north, the removal of 5 northern permits with respect to hydraulic and conventional methodologies, land, water, fish, and caribou protections, and the Executive Committee stage. Chief [redacted] also noted there are outstanding engagement protocols to establish to sustainably build integrity and trust with Elders and communities. She expressed interest in understanding potential request for land use permits to potentially develop or maintain existing lands including and involvement in related discussions. Chief [redacted] noted the importance of re-establishing relationships with all northern Indigenous Nations and acknowledged the history that exists between meeting attendees. Added that the Project area is used by all northern Indigenous Nations and looks forward to having collective conversations going forward to establish new opportunities and protect their inherent rights. Chief Frost [redacted] Chance to clarify their engagement approach going forward (e.g., when do they want to meet, what information is needed etc.). Chief [redacted] said ethical and responsible partnerships that respect people, and the environment are the foundation to how the northern Indigenous Nations govern themselves. They have lived off the land for generations and Chance will need to communicate differently with their people going forward. Acknowledged that trust and integrity is currently lacking at the community-level. Chief [redacted] said her role as Chief is the voice of the people, to deliver messages on behalf of the people to Chance and advance how Chance can move forward in a respectful manner. Chief [redacted] noted Chance had not signed previous agreements with the northern Indigenous Nations. Stated they are not closed for business but are interested in sustainable opportunities rooted in the laws of the land and that is the laws of the people. Chief [redacted] looked forward to identifying priorities to move this process forward.

[redacted] thanked Chief [redacted] for her comments and said Chance is exploring for natural gas and oil resources in the Project area using permits that have already been awarded. He said Chance is looking to understand how each northern Indigenous Nation wishes to be engaged and the best way to share information. [redacted] said Chance is open to economic and environmental stewardship partnerships. He shared that Chance is proposing to conduct smaller-scale exploration activities over a longer period of time to minimize potential environmental impacts and maximize potential Project-related benefits. [redacted] shared that Yukon Government has mandated Chance to conduct further investigations of existing suspended wells dating back to the 1950s/1960s. He said hydrocarbons have been discovered in some suspended wells. Richard noted Chance hired consultants such as EDI, Palmer, and Ausenco (previously Hemmera) to assess potential Project-related effects to the Eagle Plains Basin and support Chance's Environmental Assessment Application to the Yukon Environmental Socio-economic Assessment Board (YESAB). Richard noted Chance has a lot of information to share with the northern Indigenous Nations and would like to further engage each Indigenous Nation to better understand issues that should be addressed through mitigation and/or prevention measures. He added there are up to 30 new exploration wells to be drilled, up to 1,500 square kilometres of

new 3-D seismic data acquisition and up to 2,000 kms of new 2-D seismic data acquisition. Drilling results will determine long-term natural gas/oil extraction within the existing exploration permit areas. [redacted] added that the exploration activities would take place during the winter seasons over an 8–10-year period depending on results as the program unfolds. The exact drilling locations have not yet been determined. [redacted] noted that no hydraulic fracking would take place because the anticipated drilling will evaluate resource potential in geological formations that are not expected to need hydraulic fracturing. He said the camp is located at KM 325 on Dempster Highway and can accommodate around 75 people [redacted] added that the drilling program will occur sequentially rather than all at once. He also shared that natural gas/oil resources from the Project would support local energy security, economic independence, economic diversification, and a reduction of cumulative greenhouse gas (GHG) emissions by transporting fuel over shorter distances.

[redacted] added he had been involved in the Eagle Plains since 1959 and noted the landscape is unique compared to other northern landscapes because there are no lakes, the terrain supports exploration/extraction equipment, and it will be easier to build roads without significantly damaging the environment.

Grand Chief [redacted] noted that he was recording the meeting for GTC's internal minute keeping and requested permission from all meeting attendees. All meeting attendees agreed to the recording. Grand Chief [redacted] said he struggled with the open-ended agenda and thought it was paternalistic. Expressed interest in more structured agendas to avoid wasting anyone's time and to supporting things moving forward. Grand Chief [redacted] said meetings were had with Chance during the COVID-19 pandemic. He suggested a certain level of transparency, respect, and integrity was required to move forward. Grand Chief [redacted] noted he expects transparency, respect, and integrity from anyone working within their Traditional Territory and said there is water under the bridge in terms of this Project.

[redacted] asked Grand Chief [redacted] if the agenda felt vague. Grand Chief [redacted] responded that the agenda felt a bit vague and shared that GTC agendas included an opening prayer, introduction, meeting content, action items, and next steps. Noted members will quickly share if too much was included in the meeting agenda. Grand Chief [redacted] said he had previously heard what [redacted] shared and preferred meetings with a presentation / opportunity to review maps/leases to understand what is being discussed. Grand Chief [redacted] noted GTC represents four Gwitchin councils, and Chance maps reference one of these councils. Grand Chief [redacted] added that the GTC expects Chance to engage all Gwitchin communities/Indian Band Act councils. Noted GTC will support bringing together the right group of people and expressed interest in visiting the Project's camp. Grand Chief [redacted] shared that the Project is in an area where Gwitchin people harvest caribou. Noted compensation should be the last topic of discussion, and instead discussions should be focused on the management of the land, water, resources, environment, and air. Grand Chief [redacted] suggested Chance simplify future meeting agendas and appreciated the effort to move forward together.

[redacted] said she heard there is an interest in building trust and integrity as well as understanding of historic use in and around the Project. She summarized that historic wells and current and future permitting, involving Elders, inherent rights, employment and economic opportunities, respectful and collaborative relationships, community level engagement timelines, and the

protection of land, water, and air resources are important topics to be discussed at future meetings. Erin asked meeting attendees if she heard them correctly. Grand Chief [redacted] added that the key values mentioned were respect, transparency, accountability, and integrity.

Chief [redacted] shared that it is unfortunate how things have gotten to this point and acknowledged the historical relationship between Chance and northern Indigenous Nations. He noted that he was one of four NND Chiefs to go through this process and felt like little had been accomplished to date. He suggested the northern Indigenous Nations wanted to get to work for their children and future generations. Noted the importance of getting right down to the basic facts. Chief [redacted] added that they need to keep a sharp eye on the issue from a political point of view and bring in politicians as needed and move quickly back to the technical folks. He said it is time to put the politics to the side. Shared the politicians are like the star at the top of a Christmas tree and will let information filter down. Chief [redacted] noted the discussions with Chance had been ongoing over the past 12 years. Emphasized the importance of straightening the politics and focusing on arrangements. Chief [redacted] suggested everyone move forward without going back over the past 12 years of deliberations. Noted NND has not had a large role in the Project to date and that the northern Indigenous Nations will charge hell with a snowball together. Thanked everyone for the opportunity to speak.

[redacted] asked if there was anything else that anyone wanted to add to the discussion. Chief [redacted] reflected on the process and the Project. Noted [redacted] had been involved in the region for a long time. Chief [redacted] said her people are fighting for refuge and noted pristine areas and it's significant to use as the refuges. Chief [redacted] said the previous Project application triggered an Executive Committee review and could not determine if there were any adverse effects to the Porcupine caribou herd because of proposed development in the region. She shared the importance of being more confident in numbers and determinations in the YESAB consultation and engagement process. Chief [redacted] expressed concern for the YESAB process. Specifically, caribou, environment, climate change, assessment planning, monitoring and evaluation, triggers for stopping and advancing work, inherent rights, and the full scope/development of the Project. Expressed interest in a broader agreement with Chance to set the bar higher than the *Yukon Oil and Gas Act* and influence Project triggers and remedies to consider environmental vulnerabilities (e.g., halting project operations). Chief [redacted] acknowledged how fragile the environment is currently, especially around climate change and the pressure of resource development. Added that the northern Indigenous Nations want to participate collaboratively in the Project to ensure it is well managed and not going to create long-term environmental degradation. Suggested this approach will create a degree of control for the Gwitchin people which is important for quantifying significant adverse impacts. Noted the significance of assessment, data, management, and planning work. Chief [redacted] said the northern Indigenous Nations will share their interests/concerns with Chance and will stop the process from advancing if it does consider local Indigenous Knowledge. Noted the importance of listening to Elders and their teachings to inform Project management, planning, and decision-making. Chief [redacted] added the importance of upholding sustainability objectives and expects Chance to work more responsibly.

[redacted] shared interest in having a full dialogue on issues, concerns, and values with the northern Indigenous Nations. Noted the Project's intention is to minimize impacts and hopefully create benefits too. Acknowledged that this exchange is required. [redacted] said he felt like Chance was previously delivering information in a one-way direction and hopes to have more of

[redacted] TWC kindly requests Chief [redacted] review and clarify this sentence to make sure it adequately captures what was being shared.

an exchange. Noted Chance is unable to react without feedback and looks forward to doing whatever it takes to address the concerns identified by the northern Indigenous Nations.

Grand Chief [redacted] acknowledged Gwitchin Treaty rights to harvest, including the rights to access to support their harvesting. Noted these rights come with the responsibility to legally and spiritually be stewards of their Traditional Territory. Shared a story about the late Elder [redacted], who travelled by dogsled in the 1960s in and around the Peel River area. Grand Chief [redacted] said the late Elder [redacted] saw smoke and assumed it was a camp. As he approached the smoke, he realized it was a drill rig. This was a troubling experience because late Elder [redacted] did not know who these people were or what they were doing on the land. This experience laid the groundwork for Gwitchin people to form the Gwitchin Comprehensive Land Claim Agreement (GCLCA) to prevent future incidents like this in their Traditional Territory. Grand Chief [redacted] explained the GCLCA was signed in 1991 and this agreement set a principle that non-Indigenous people, businesses, government, or elected agencies were not able to do anything in our Traditional Territory without speaking with the original inhabitants of the land. Noted this includes having the right to say no and share standards around what they are willing to allow. Grand Chief [redacted] shared porcupine caribou is the main concern for GTC as well as impacts to water, air, and the overall ecosystem (which is very fragile). Grand Chief [redacted] said he was not a fan of the term 'traditional knowledge' because it refers to the past, and Gwitchin Knowledge is current. He noted Gwitchin Knowledge Studies help Gwitchin people develop a record of their knowledge for community use purposes and stated the importance of respecting the intellectual property of such information. Expressed interest in advancing discussions around historic and current use of the land and impacts to Treaty rights and access. Grand Chief [redacted] shared that the Gwitchin standard is high for a good a reason.

[redacted] asked Chief [redacted] what collaboration looks like to her community. Chief [redacted] responded that she is at today's meeting to share the perspectives of her community and the standards they are trying to uphold. Noted these standards were established through their laws and agreements. Chief [redacted] said Chance had heard community feedback for over 20 years. Noted the northern Indigenous Nations are not interested in discussing only monetary compensation or relationships. They want to protect the land, water, air, and caribou. Chief [redacted] said there are outstanding questions to be answered around water, hydrology, and the assessment of oil and gas. These conversations will also include the Yukon Government. Chief [redacted] confirmed she had shared how her community would like to see this process move forward and preferred not to speak to her personal feelings. Chief [redacted] asked [redacted] to clarify what he meant by one-way conversation and lacking information. She said this comment was unclear because there is an established process through YESAB to obtain information. Requested further clarification from Chance. [redacted] said Chance has hired consultants to support their assessment and the Project has an interest from learning from the First Nations. [redacted] said he hears about Section 35 rights and mentioned he is looking to understand what those rights are and how the Project could potentially infringe on those rights. [redacted] added that the Chance had conducted baseline studies and offered to provide this information with the First Nations. Expressed interest in receiving First Nation feedback on what Chance has learned to help guide how they develop and manage the Project until conclusion. [redacted] said Chance is trying to develop a pathway to support conversations that will take place under a cooperation agreement including a terms-of-reference. He noted that previously this process did not go far and explained Chance is following this process because it was how mining companies in the Yukon

had moved forward their proposed projects. [redacted] asked the group to confirm if there is a different way of doing it.

Grand Chief [redacted] said he was surprised by the comment [redacted] made about not understanding legal rights. He said the courts look at collaborative agreements and IBAs to clarify the muddy waters. Grand Chief [redacted] said their rights have evolved over the last 30 years. Stated each Indigenous Nation has the inherent right to self-government in their Traditional Territories. Grand Chief [redacted] said if they seem sensitive it is because Chance is looking to occupy a part of their Traditional Territory and as a sovereign nation, they must review that. Noted it would take another 20 years to get an idea of rights. Grand Chief [redacted] expressed interest in clearly understanding timelines to convey this information back to the community level. Noted the Chiefs are spokespeople that have a responsibility to explain to their people what is being proposed. He said the support of Gwitchin will not be possible if he is unable to explain the Project to his people. Grand Chief [redacted] said he used to this type of back-and-forth dialogue. Noted there is often a desire to hold your cards close to your chest for fear of liability. He suggested Chance create frank and open discussions because that is what matters to the Gwitchin people. Shared that some people in the community may be upset around work being conducted in this area. Grand Chief [redacted] asked Chance if they will stop operations if the caribou migrate to the Project area. He explained that is the baseline of what Gwitchin people will expect and the community will also be interested in understanding what Chance is doing in the area to protect caribou and other species. Grand Chief [redacted] acknowledged some effort had been made to protect caribou. As a leader, Grand Chief [redacted] said he needs to be able to answer these questions from the community.

[redacted] said Chance loves feedback and had information to share. Noted Chance is looking to better understand how the northern Indigenous Nations would like to be engaged and how Chance should proceed after today.

Meeting attendees took a break between 3:50 pm – 4:05 pm.

[redacted] said Chief [redacted] wants the whole life cycle of Eagle Plains examined, and it is difficult for Chance because the Project is currently exploratory and does not go beyond that. Shared that the Project will determine if there is anything worth pursuing. If there something worth pursuing is found, then that is a better time to establish economic partnerships since the nature of the resource to be developed will be better understood [redacted] noted that Chief [redacted] understands this process because of the Victoria Gold project. [redacted] reiterated that the proposed Project is the first stage involving 30 wells to get an idea around what resources are available in the Eagle Plains for everyone. He added that pipelines and other works required after exploration will be considered later. [redacted] said Chance is willing to risk their money and assume that it might not work out, but they really hope that it will. Suggested the northern Indigenous Nations may regret getting into something now if it turns out differently because at this stage there is not enough information to move on. [redacted] said the northern Indigenous Nations can evaluate how the Project goes including how the terrain is treated and improvements needed to protect the environment better. [redacted] said Chance is focused on this first stage (exploration). He said that is hoping the northern Indigenous Nations will help Chance with that. Noted exploration is high risk in terms of very uncertain outcomes related to resource determination and they will not want to participate in that. Suggested involvement beyond exploration will be different, including a payoff for all the northern Indigenous Nations.

[redacted] said the exploration phase will create opportunities for businesses and these opportunities will continue even expand into development if the project proceeds beyond exploration.

Grand Chief [redacted] respectfully said they are not interested in any kind of payoff and said that [redacted] comment about payoff was offensive. [redacted] responded that he meant there would be an opportunity to be a full partner in the Project. Grand Chief [redacted] said they have different expectations and are interested in being full partners now. Expressed interest in understanding the nature of the operation and how and understood the long period of time between initial investment. Grand Chief [redacted] shared GTC experienced the false prospect of the Mackenzie Valley Pipeline. Shared that he felt the discussion was not getting anywhere productive and suggested Yukon Government attend the next meeting. Grand Chief [redacted] requested the meeting conclude. Chief [redacted] and Chief [redacted] agreed with Grand Chief [redacted] request to stop the meeting. Chief [redacted] added that they had addressed the major points and want further deliberation with Yukon Government present. Chief [redacted] added that the northern Indigenous Nations have an obligation to the Yukon Environmental and Socioeconomic Assessment Board (YESAB) as well and will take this time to reflect. Noted the importance of fully understanding what is involved in exploration, including the end product. Chief [redacted] said they want to know they did everything possible to protect the environment. Stated the Charter is intrinsic to everything they do. It is founded on Gwitchin ways. Chief [redacted] thanked everyone for making space for this conversation to happen and shared her appreciation.

[redacted] thanked everyone and said Chance would work on pulling together a summary of engagement topics and associated timelines. Noted the clock is ticking on land tenures. Chief [redacted] confirmed their awareness of the clock ticking and suggested the northern Indigenous Nations will get back to Chance with their perspectives [redacted] added that [redacted] booked accommodation in Old Crow in March at Porcupine Camp. Expressed that finding accommodation in Old Crow is a challenge.

DRAFT

3. Reintroduction Meeting Action Items & Next Steps

Table 2 below details action items and next steps identified during the Reintroduction Meeting.

Table 2: Reintroduction Meeting Action Items & Next Steps

Topic	Action Description	Responsible	Estimated Date
Meeting Minutes	• Review and provide comment on Draft Reintroduction Meeting Minutes with Two Worlds Consulting.	All	February 20, 2023
Meeting Minutes	• Incorporate meeting attendees' feedback on the Draft Reintroduction Meeting Minutes and share a finalized version of the minutes with all attendees for their records.	Two Worlds Consulting	March 1, 2023 (or approximately 2 weeks after receiving feedback from meeting participants)
Meeting Agendas	• Create simplified agendas for future meetings.	Chance	Ongoing
Meeting Format	• Utilize visual aids such as presentation slides and maps during future meetings.	Chance	Ongoing
Next Steps	• Share perspectives with Chance.	GTC, NND, VGFN	TBC

APPENDIX 2-A-13. August 3, 2023, Meeting Summary

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

Meeting Minutes

Subject	Draft Project Description Meeting
Prepared By	Two Worlds Consulting (TWC)
Groups Involved	Chance Oil and Gas Limited (Chance) First Nation Na-Cho Nyäk Dun (NND) Tr'ondëk Hwëch'in (TH) Environmental Dynamics Inc. (EDI) TWC
Participants	[redacted], Regulatory, Environmental and Community Relations Coordinator (Chance) [redacted], VP Government and Communication Relations (Chance) [redacted], Technical Advisor (TH and NND) [redacted], Regulatory Lead (EDI) [redacted], Senior Fisheries Biologist (EDI) [redacted], Engagement Facilitator (TWC)
Date/Time	August 3, 2023 8:30 AM – 9:30 AM
Copies to	Chance, NND, and TH

Purpose of Meeting

- Chance provided an Eagle Plains Exploration Project (Project) overview to Skeeter.

Topics Discussed

- Chance overview
- Project overview including information on exploration, design changes, baseline studies, regulatory process, schedule, engagement, proposed next steps

Key Issues Raised / Chance Responses to Issues

- Asked about availability of well abandonment service providers (i.e., future availability and anticipated service fees in the future).
    - Chance to inquire about well abandonment service providers (i.e., future availability and anticipated service fees in the future).
- Noted seismic impacts to predator-prey relationships had been a major objection from communities in the past.
- Inquired about outstanding Yukon Government directives.
    - Chance to follow up with Yukon Government about directives and confirm if anything is outstanding and then confirm with Nations when and how directives were or will be addressed.

Actions and Responsible Party

DRAFT

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

- Chance to inquire about well abandonment service providers (i.e., future availability and anticipated service fees in the future) – in progress.
- Chance to resend presentation to [redacted] – complete.
- Chance to send [redacted] 2D versus 3D seismic definition – complete.
- Chance to send [redacted] copies of primary socioeconomic baseline data and caribou baseline data – complete; Chance confirmed no socioeconomic baseline data was available to share at this time and that TWC has been engaged to draft the socioeconomic inputs of the draft Project Proposal.
- Chance to share linear features study with [redacted] – complete.
- Chance to check internal records to confirm receipt of [redacted] response to the 2022 Communication and Engagement Plan – in progress.
- Chance to follow up with Yukon Government about directives and confirm if anything is outstanding and then confirm with Nations when and how directives were or will be addressed – in progress.
- Chance to send meeting minutes to [redacted] – complete.
- Chance to send updated Project video to [redacted] – in progress.
- [redacted] to discuss information requests with leaderships from NND and TH and share feedback with Chance – in progress.

Details of Discussion

- [redacted] led a round of introductions.
- [redacted] introduced themselves.
- [redacted] shared he was attending the meeting on behalf of NND and TH. He previously worked as a land claims negotiator for the Yukon Government (YG) and other First Nations. He also worked on the drill floor for an exploration project.
- [redacted] said he is a senior fisheries biologist for the Project.
- [redacted] said she is supporting Chance in navigating regulatory requirements for the Project. This includes working with the Yukon Environmental and Socio-economic Assessment Board (YESAB) and the Project's consultants to submit a Project Proposal.
- [redacted] said the Project is the first oil and gas project going through YESAB. He shared that he was involved in writing the *Yukon Environmental and Socio-economic Assessment Act* (YESAA).
- [redacted] explained that [redacted] (Chance President) and [redacted] (Chance CEO) have been working together in the Eagle Plains area on oil and gas exploration for decades. He said 30 wells were drilled in the Eagle Plains area between 1959-1973. [redacted] shared that Chance has offices in Whitehorse and Calgary, and is a small company of approximately 5 people. [redacted] said oil and natural gas reserves were first discovered in the Eagle Plains area in 1958. Chance has focused on exploration activities to assess oil and gas potential in the Eagle Plains. More seismic and drilling is required to support this work. [redacted] said Chance wants to

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

be part of the Yukon energy strategy by providing oil and natural gas to Yukoners and businesses in the territory.

- [redacted] presented the Project's currently permitted area. He noted the Project falls within Gwich'in Tribal Council's (GTC) primary and secondary areas and Vuntut Gwitchin First Nation's primary area. He noted the Project area overlaps with the North Yukon Planning Region and Peel Watershed Planning Region (PWPR). Specifically, land use management zone 4. [redacted] acknowledged that the part of the Project area that overlaps with the PWPR is mostly in NND territory.
- [redacted] presented the proposed Project activities. He noted that Chance originally submitted an application to the Dawson City YESAB Designated Office (DO). The Project was referred by the DO to YESAB's Executive Committee in 2016. The referral was made after the DO determined that it was unable to assess whether the Project will have, or is likely to have, significant adverse environmental and socio-economic effects. Chance has been working on their Project Proposal for 9 years.
- [redacted] shared that Chance has completed seismic exploration across a 2500 sq km area and is proposing to drill up to 30 wells. This does not mean that Chance will necessarily drill 30 wells. The number of wells depends on the results from initial wells drilled. Drilling would be conducted during the winter, using a focused approach of approximately 5 to 7 wells per year. Good results will lead to extended flow testing of successful wells for 2 years.
- [redacted] shared the Project Proposal will include information on progressive reclamation.
- [redacted] presented the seismic program. He noted seismic will sometimes be done in the same location as the drilling.
- [redacted] asked what the difference is between 2D and 3D seismic.
- [redacted] responded that 3D is very dense and provides more detailed data.
- [redacted] asked if Chance would put the blasts closer together.
- [redacted] said the 3D seismic allows Chance to have a more detailed picture of the natural gas and oil reserves underground; similar to cutting a cake open.
- [redacted] followed up to ask if it's more how Chance is using the data that's different rather than the how Chance is obtaining it.
- [redacted] confirmed [redacted] understanding was correct. He noted the same method for 2D and 3D at the ground level. For example, there is a downhill target and both options support directional drilling.
- [redacted] asked if the data was being collected differently.
- [redacted] suggested Chance prepare and send [redacted] a plain language definition of 2D versus 3D seismic to support his discussions with leadership.
- [redacted] reviewed the use of the existing camp and proposed a remote camp. He noted the remote camp will have medical staff on site. He added that Chance is looking to build a winter airstrip to accommodate bigger aircraft to support crew changes, transportation of supplies, and emergency medivac if needed.
- [redacted] asked if Chance has received their water license yet.

DRAFT

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

- [redacted] confirmed Chance had not yet received their water licence. He shared the Project will also include a mix-bury-cover sumps and central processing facility. He noted the oil and gas will be sent to an approved site like Taylor, British Columbia for refinement.
- [redacted] said processing on site will create pure crude oil and that used water will be reinjected back to a regulator-approved zone. He added that oil gets trucked offsite. He said Chance will complete extended flow testing of the wells to understand the pressure, flow, and how many barrels per day the wells could yield as well as a reservoir analysis. [redacted] noted this data is just as important as seismic data [redacted] explained this part of the process will help Chance to understand the economic and production value of the oil and gas in the Project area.
- [redacted] said Chance's YESAB 2014 submission indicated that they wanted to build all season roads to the proposed drilling locations. Communities indicated they preferred not to see all season roads. In response, Chance's 2023 Project Proposal is focused on ice roads and 100% winter drilling. He noted camp operations would typically start in November/December and drilling would generally occur between December - March/April.
- [redacted] noted there are a lot of seismic lines in the Eagle Plains.
- [redacted] said the geophone data collection will be in spring and summer when the Porcupine Caribou Herd heads north.
- [redacted] added that seismic technology has changed over time, and noted the widths of rights-of-way are smaller than in the past.
- [redacted] reviewed how the current Project is different than the previously proposed Project, specifically, how Chance is looking to rebuild relationships and collaborate with First Nations, use low impact seismic, complete drilling activities only during the winter season, utilize the existing Project footprint and networks, spread activities across 10 years to minimize annual impacts and support steady employment, and use winter ice roads versus all season roads.
- Jennifer shared that many studies had been conducted since 2018 and are continuing this year, and noted Chance is trying to learn from past engagement and incorporate concerns. Jennifer presented completed baseline studies for terrain/surficial geology, permafrost, water quality and surface flows, fish and fish habitat, vegetation, wildlife (porcupine caribou, moose, American marten, grizzly bear, and birds), and heritage resources.
- [redacted] requested more recent caribou baseline information and primary socioeconomic baseline information.
- [redacted] said mapping has been completed across the whole Project area. That has been really helpful for the effects assessment. He also explained that Environmental Dynamics Inc. had completed a linear features study. They walked old seismic trails to get a feel for walking speed, how far you could see, etc.
- [redacted] said that is good because seismic impacts to predator-prey relationships had been a major objection from communities.
- [redacted] reviewed the regulatory process, and noted the Project was referred to the YESAB Executive Committee in 2016 and Chance is working on their Draft Project Proposal [redacted] said Chance was waiting for regulatory direction from YESAB on the Draft Project Proposal Table of Contents (TOC).

DRAFT

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

- [redacted] asked Chance to confirm that they had not gotten the TOC yet from YESAB.
- [redacted] confirmed Chance had not received a TOC from YESAB.
- [redacted] said they had all the information lined up and the First Nations told them not to come and do socioeconomic studies.
- [redacted] said he was not aware of that.
- [redacted] said the First Nations said no to meeting in 2019 and then the pandemic happened.
- [redacted] shared that Chance is hoping to submit an updated Draft Project Proposal on December 15th to YESAB.
- [redacted] said Chance is hoping to build trust in the communities and support their understanding of the Project. He noted the Project no longer includes fracking.
- [redacted] reviewed completed and proposed 2023 engagement activities.
- [redacted] asked [redacted] what NND's engagement preferences are. He asked if NND wants Chance to come to the community to conduct open houses and socioeconomic primary data collection. [redacted] said if NND prefers to defer engagement to Vuntut Gwitchin First Nation, Chance respectfully requests that deferral is made in writing to share with YESAB.
- [redacted] asked what level of involvement TH will have in the Project.
- [redacted] said Chance is legally required to consult all potentially impacted First Nations.
- [redacted] asked if Gwich'in Tribal Council has an interest in the Project and if the Project will impact their secondary use area.
- [redacted] confirmed the Project will impact Gwich'in Tribal Council's secondary use area.
- [redacted] suggested Chance follow the Yukon Oil and Gas Act, land claims, and North Yukon Regional Land Use Plan guidelines.
- [redacted] forwarded Chance's virtual meeting invite with YESAB on August 23, 2023 to [redacted]
- [redacted] asked what happens after the submission of the Project Proposal. He also asked what the referral process means and what are the milestones to accomplish to have an adequate submission.
- [redacted] said Chance is looking to get feedback from YESAB on the regulatory process for the Project. She added that Chance is trying to hit on the requirements and wants to submit a complete Project Proposal. [redacted] said Chance will append the baseline reports to the Project Proposal.
- [redacted] acknowledged YESAB is going through their own changes.
- [redacted] said Chance is open to meeting virtually as needed. Noted the logistical challenges of engaging in-person (e.g., lack of accommodation in Mayo).
- [redacted] asked Chance about three outstanding directives issued by Yukon Government to address old wells. He said the work has not been done and he had heard from the Yukon Government that Chance had yet to respond to the directives.

DRAFT

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

- [redacted] said one directive was to complete the consultation reports for the land disposition, and noted this year's reports were being submitted to Yukon Government that day. [redacted] said Chance did not receive responses on those reports for the last 3 years.
- [redacted] said he did respond to a previous consultation report for the land disposition.
- [redacted] confirmed they were meeting with Yukon Government that afternoon.
- [redacted] confirmed the Impact Benefits Agreement had been sent to leadership for signature. He also shared that NND is supporting the well maintenance work getting done as soon as possible.
- [redacted] explained that Chance's camp has a water system that treats water for cooking, bathing, etc. He said First Nations and Yukon Government want Chance to reassess the camp's wastewater management.

DRAFT

APPENDIX 2-A-14. October 13, 2023, Meeting Summary

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

Meeting Minutes

Subject	Consultation and Capacity
Prepared By	Two Worlds Consulting (TWC)
Groups Involved	Chance Oil & Gas (Chance) TWC The Yukon Government (YG) Canadian Northern Economic Development Agency (CanNor) Crown-Indigenous Relations and Northern Affairs Canada (CIRNAC) First Nation of Na-Cho Nyak Dun (FNNND) Tr'ondëk Hwëch'in First Nation (TH) Gwich'in Tribal Council (GTC) Vuntut Gwitchin Government (VGG) Yukon Environmental and Socio-economic Assessment Board (YESAB)
Participants	• [redacted] Executive Committee Manager (YESAB) • [redacted] Aboriginal Relations (YG) • [redacted] Major Projects Director (YG) • [redacted] Major Projects Manager (YG) • [redacted] Geothermal & Petroleum Resources Manager (YG) • [redacted] Regional Environment Manager (CIRNAC) • [redacted] Manager (CIRNAC) • [redacted] Project Officer (CanNor) • [redacted] Project Manager (CanNor) • [redacted], Resources & Governance Consultant (FNNND and TH) • [redacted], Lands & resources coordinator (GTC) • [redacted], Technical Advisor (VGG) • [redacted], Caribou Coordinator (VGG) • [redacted] (Chance) • [redacted] (Chance) • [redacted], Regulatory Lead (Chance) • [redacted], Transboundary Specialist (GTC) • [redacted], [redacted], and [redacted] (TWC)
Date/Time	October 13, 2023 from 10:30am – 12:00pm PST
Copies to	[redacted]

Purpose of Meeting

- Discuss Consultation and Capacity

Topics Discussed

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

- YESAB Screening Process
- Consultation Plan
- Transboundary Territory

Key Issues Raised / Chance Responses to Issues

- Inquired about international transboundary lands and if there is a plan to address that.
    - Chance stated they are following the YESAB regulations and there is nothing explicitly about international transboundary consultation requirements.
- Noted the need for Nations to receive capacity funding prior to the submission of proposals.
    - CIRNAC stated that NPFP is flexible and can be arranged to support this

Actions and Responsible Party

- VGG to set up all Nations meeting.
- YG to set up meeting with VGG, TH, FNNND, GTC to discuss Consultation Plan after all Nations meeting.
- VGG, TH, FNNND, GTC to follow up with CIRNAC about capacity funding.
- CIRNAC to follow up about Transboundary with US consultation protocol

Details of Discussion

- [redacted] talked about Chance's project proposal. [redacted] discussed Engagement with Chance and the somewhat revised project description. He clarified that this meeting is about the process moving forward and not the project details, as well as to better understand the Nations feelings. John introduced the idea of making a joint consultation plan process to ultimately look at capacity funding for all Nations to meaningfully participate in further engagement. [redacted] clarified that this meeting is to hear the party's perspectives on consultation and capacity and not to talk about the project or project details.
- [redacted] reiterated that this meeting is for consultation discussions. [redacted] described the screening process for YESAB. He stated that YESAB through the screening process checks to see if the proponent has fulfilled consultation duties with communities and First Nations using the four-point test. He clarified YESAB doesn't need consultation records during the screening period, as this is separate from the records of past consultation leading up to the screening period. [redacted] said he is here to answer any further questions about the screening process as the meeting progresses.
- [redacted] asked for clarification about the project history and new regulatory screening process since the project went from Dawson City Designated Office to the Executive Committee. [redacted] continued that with the newer consultation under the Executive Committee how will this change the screening process since the project is referred from the DO?
- [redacted] clarified this is a referred project and now must update under new regulation. He stated Chance is not submitting a new project rather a revised proposal and consultation record to meet new standards.
- [redacted] asked whose regime Chance was under before compared to now and how that has changed the process.
- [redacted] added that Nations are dealing with a proposal that has not been submitted yet and the consultation record only covers what has happened during the DO days.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

- [redacted] stated that First Nations are providing comments but asked [redacted] if Nations should expect face to face discussions to provide input moving forward.
- [redacted] answered yes, this is a possibility. He said YESAB could include Nations in the screening process if needed and desired.
- [redacted] redirected the conversation onto Aboriginal Relations with Yukon Governments
- [redacted] proposed adding to the meeting agenda more discussions regarding the Yukon government. He stated the Yukon Government is a regulator on this project and decision maker on this project and will make recommendation based on the Department of Economic Developments input. [redacted] further explained that the Yukon will lead a consultation under major projects Yukon, with affected Nations and YG will be relying on the screening process which means Nations need to participate in the screening process to inform how treaty rights are affected and how YESAB are taking those impacts and converting to values ultimately to inform decision making. [redacted] continued that the YESAB approach is to engage early in addition to the ongoing screening. He said this meeting is a good time to understand what the consultation process looks like moving forward. He informed that YESAB will be leaning on the Aboriginal Relations to inform and set up that consultation approach. He clarified the assessment itself will be informed by regulators providing technical expertise.
- [redacted] agreed with [redacted] and explained the process further.
- [redacted] explained that YESAB has a less defined consultation process to let it be led more by participants. She explained that YG has been working on multiyear consultation efforts. She invited a discussion of the components that need to be improved in the engagement process. [redacted] stated that she looks forwards to using consultation tools to better inform a process moving forward.
- [redacted] asked if YG is aware of the transboundary areas and how consultation works with Alaskan transboundary lands. He also asked how YG feels about transboundary lands with America.
- [redacted] answered that YG takes transboundary issues seriously but can't confirm if there is a case to reference where an organized Indigenous group in America had transboundary lands with Canada. [redacted] explained that YG has dealt with transboundary within Canada and Provinces more frequently than National transboundary lands.
- [redacted] asked to hear from other Federal representatives on International transboundary protocol.
- [redacted] answered speaking to the federal approach to consultation and the federal participation in these major projects. [redacted] stated that this project may not require federal decision bodies. She clarified that Canada's engagement and duty to consult relies on what is determined through the YESAB screening process.
- [redacted] stated that the Northern Participant Funding Program (NPFP) is designed to assist First Nations in participating in big projects but is limited to 150,000 dollars per fiscal year. He further explained that NPFP is limited to projects that are for sure to go through the assessment process.
- [redacted] asked [redacted] if Nations can't trigger NPFP funding until the proposal is submitted how can Nations get ready for the assessment, as Nations don't want to be left behind. [redacted] asked, if there was a possibility for capacity funding about 2 months before the proposal is submitted.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

- [redacted] answered that CIRNAC tries to be very flexible with this and are open to discussions before submission if things are moving quickly. Shane continued that CIRNAC is looking to maximize participation and readiness.
- [redacted] asked [redacted] if he would be open to assisting in creating a consultation plan
- [redacted] answered that he would be very open to help with a consultation plan. He clarified that Provincial limiting doesn't limit federal funding.
- [redacted] asked If Canada is not a decision body how are transboundary lands addressed with the US for Federal consultation.
- [redacted] asked, for the federal money that is available, is there any documents on the responsibility of proponents to provide capacity funding or is there federal linkage to proponent obligation.
- [redacted] answered, no, federal funding is not linked to proponent responsibility, rather federal funding is supplementary.
- [redacted] asked what Transboundary lands are in question.
- [redacted] clarified that Gwich'in territory extends into Alaskan transboundary lands. [redacted] asked if there is a plan around addressing this.
- [redacted] asked if this is referencing Porcupine Caribou Herd. [redacted] continued that Chance follows YEASB regulations and is concerned over the international regulations being brought into the equation as Chance is following all required regulations that are known.
- [redacted] answered that there are international transboundary Porcupine Caribou Herd relations that he wants clarification on about if there is existing federal protocol for but he just wanted to raise question not to raise concern.
- [redacted] echoed [redacted] and thanked John for clarifying on importance of concern raised.
- [redacted] reiterated that there is no question about FNNND desire to be very involved but the form that will take on how that participation will look he is not sure on. He stated that FNNND is overlapping with TG and that both First Nations want to be involved but have to sort out the details.
- [redacted] stated that Chance has been working with FNNND for a while now and Chance needs to know what level of consultation is required as previous meetings have been postponed and there is not a clear understanding of what FNNND wants consultation wise. [redacted] wanted to get confirmation about level of consultation desired by FNNND. He stated porcupine caribou is common priority amongst all Nations involved and that is known. [redacted] said that Chance would like to schedule meetings with FNNND and asked if [redacted] could help Chance in a timely matter to get some direction on how and when to consult with FNNND as it has been hard in the past. [redacted] recognized that the type and degree of consultation needs to be sorted out on direction that further consultation will take.
- [redacted] answered that there has been some difficulty lately with new governments in both Nations and all new staff causing delays. [redacted] stated that he is working on trying to facilitate more understanding on needs.
- [redacted] stated that he had a few meetings with Chance regarding the proposal and GTC and Chance have a good working relationship, but this relationship doesn't replace the federal duty to consult, and GTC looks forward to discussing that further when the time comes.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

- [redacted] talked about the how the Old Crow meetings back in May discussing the revised project description were delayed due to floods but the but the Mid September meetings in Old Crow were very productive. [redacted] thought it was a good session. [redacted] shared that the VGG perspective is to get ahead of this and have regular meetings with Greg, to keep in touch. John shared that VGG are in support about the proposal being submitted. [redacted] shared that VGG would like to know what the consultation process looks like so VGG can prepare. [redacted] proposed that VGG works together with the other Nations to be more efficient and share resources and to be coordinated in the consultation process. John asked for a First Nations reps only meeting to get organized and so Nations can be active and not passive in the consultation process.
- [redacted] asked if the current project proposal is the final version of the proposal. [redacted] said that the last timeline heard was mid December for probable submission to YESAB. [redacted] asked if FNNND and TH are currently being consulted on the final or work in progress proposal.
- [redacted] answered that Chance has a description of the project in draft from. [redacted] said that the Nations consultation on the project so far has not just been about ticking off a box about rather what people think about the project. [redacted] said that all Nations are going to see the final proposal when it is submitted. [redacted] stated that Chance is looking at a submission in January and said [redacted] can talk to that more.
- [redacted] said that Nations are currently dealing with the draft proposal currently, but the final will be the one that is focused on moving forward.
- [redacted] asked if it can be confirmed that the proposal can be adjusted.
- [redacted] answered that the proposal can be adjusted until submission.
- [redacted] Presented Chance project updates: [redacted] showed slides. [redacted] thanked everyone for attending. He stated Chance is working to meet all four points under YESAB screening. [redacted] stated nothing has really changed from 2014 to the new project. He continued that minor changes were made to First Nations engagement, like seasonal road. [redacted] informed that between now and January 2024 the goal is to submit proposal early to mid February. He stated Chance is happy to do virtual meetings. [redacted] said Chance doesn't want to be throwing big packages at you, Chance wants to make sure that it can be a meaningful conversation. He stated Chance will be doing a document review and that Two Worlds Consulting was hired to support in this endeavour. He finished by saying the meeting held with YESAB about traditional knowledge was critical and Chance wants to capture that Knowledge and use it to influence the submission.
- [redacted] closed the meeting by discussing possible next steps like an all Nation only meeting and a consultation plan with help of YG. [redacted] stated that it was good to hear about support for consultation and about capacity funding as needs are there. He finished by sharing that it might be a good idea to collapse all nations together to save money.

APPENDIX 2-A-15. Proposed Eagle Plains Exploration Project Engagement and Consultation Update Letter

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

Via Mail and Email

November 17, 2023

Chief [redacted] and Council
First Nation of Na-Cho Nyäk Dun
PO Box 220
Mayo, Yukon Y0B 1M0

Dear Chief [redacted] and Council,

RE: Proposed Eagle Plains Exploration Project Engagement and Consultation Update

Chance Oil and Gas Limited (Chance) is in the process of developing a Project Proposal for the proposed Eagle Plains Exploration Project (the proposed Project) for submission to the Yukon Environmental and Socio-economic Board's (YESAB) Executive Committee. The Project Proposal is scheduled to be submitted for assessment in February 2024.

Chance is committed to engaging and consulting with potentially affected First Nations and communities about the proposed Project. It values open communication and receiving feedback, concerns, and questions. Chance will consider and address comments received throughout all stages of the proposed Project.

Chance is committed to meet consultation requirements under sections 3 and 50(3) of the *Yukon Environmental and Socio-economic Assessment Act* (YESAA) and section 14 of the Yukon *Oil and Gas Act* (OGA). Under YOGA, Chance is required to consult with First Nations whose Traditional Territories overlap with oil and gas permitted land during the Government of Yukon's permit extension process.

Chance understands that [redacted] has been employed by First Nation of Na-Cho Nyäk Dun to facilitate engagement between the two parties. On November 14, 2023, Chance received a communication noting that First Nation of Na-Cho Nyäk Dun does not wish to be consulted about the proposed Project or Project Proposal prior to its submission to YESAB's Executive Committee. As such, Chance is requesting written confirmation to this effect.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

Chance
OIL AND GAS LIMITED

If, at any time, First Nation of Na-Cho Nyäk Dun wishes to be consulted regarding the proposed Project or the Project Proposal, please let me know and Chance will follow-up and provide relevant documentation. Until then, Chance will continue to provide Project updates and share important information by email and/or letter to First Nation of Na-Cho Nyäk Dun.

Sincerely,

[redacted]

VP Government and Community Relations
Suite 202, 208 Main Street
Whitehorse, YT Y1A 2A9
Office: 867.456.7805
Cell: 867.3330010

APPENDIX 2-A-16. December 20, 2023, Meeting Summary

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

Draft Meeting Minutes

Subject	Technical Working Group – Fish and Wildlife
Prepared By	Two Worlds Consulting
Groups Involved	Chance Oil and Gas (Chance) Environmental Dynamics Inc. (EDI) First Nation of Na-cho Nyäk Dun (NND) Porcupine Caribou Management Board (PCMB) Tr'ondëk Hwëch'in (TH) Two Worlds Consulting (TWC) Vuntut Gwitchin First Nation (VGFN) Yukon Government (YG)
Participants	**Chance Oil and Gas (Chance)** • [redacted], Community Engagement and Permitting • [redacted], Vice President Government and Community Relations **Environmental Dynamics Inc. (EDI)** • [redacted], Senior Biologist • [redacted], Senior Biologist • [redacted], Quantitative Ecologist **First Nation of Na-cho Nyäk Dun (NND)** • [redacted], Advisor **Porcupine Caribou Management Board (PCMB)** • [redacted], Executive Director • [redacted], Chair • [redacted], Minute Taker **Tr'ondëk Hwëch'in (TH)** • [redacted], Advisor **Two Worlds Consulting (TWC)** • [redacted], Engagement Facilitator • [redacted], Engagement Support **Vuntut Gwitchin First Nation (VGFN)** • [redacted] Technical Advisor **Yukon Government (YG)** • [redacted], Caribou Specialist
Date/Time	December 20, 2023, 8:00 to 12:00 am MST
Copies to	All groups involved

Purpose of Meeting

- To provide a Project summary and updates; and share results of Environmental Baseline Studies including preliminary potential effects and mitigation to Fish, Wildlife, Porcupine Caribou Herd, Linear Features, and North Yukon Land Use Planning Conformity.
- A question and answer period followed the information sharing.

Topics Discussed

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

- Project summary and updates
- Baseline Studies
- Effects Assessments
- Fish and Fish Habitat
- Wildlife and Wildlife Habitat
- Porcupine Caribou Herd

Key Issues Raised / Chance Responses to Issues

- Participants would like more detail about the Project Proposal and requested Chance to include all activities in the Project proposal. / Chance to review.
- Participant inquired about meandering seismic lines and how operators are informed about the design. / Chance confirmed that there is a design in place and that scouting will occur prior to the work, to understand the density of the forest and to optimize line locations.
- Asked if the Project videos are online. / Chance is developing a webpage.
- Requested more information on Chance's interpretation of disturbance. / Chance responded that key disturbance factors include noise, smells, and human movement/presence, and consider how far away caribou are from the well sites. Chance stated that disturbance is dependent on how the caribou are responding. Studies on Zone of influence are mixed, with various analytical methods, and depending on interpretation can range from no avoidance up to 40 kilometres of avoidance. There are many issues with analytical approaches that are scale dependent, and not often considered by those authors.
- The priority is to not disturb the caribou, but further work is needed to determine what is too much disturbance. Participants inquired about mitigations and if there is anything other than seasonality. / Chance responded that there will be mitigations in place, and there will be direct and indirect effects.
- A participant cautioned about using a 1-kilometrer Zone of Influence (ZOI), and believes the literature will reflect larger zones. Shared that he thinks Chance will have a difficulty finding that in the literature. / Chance responded that the primary reason for the buffer was because of sensory disturbance and that in larger ZOI assessments there is not a clear mechanism that is associated with the level of disturbance. Chance is focused on addressing local scale sensory disturbance within the work area, and that linear avoidance is assumed within the literature on ZOI's. The assessment applies a uniform 75% reduction across the 1-kilometre zone, which is a conservative (i.e., likely over-estimate) of the effect throughout the zone.
- PCTC (Porcupine Caribou Technical Committee) advised against doing the ZOI analysis based on low sample size (few caribou interacting with 3D seismic across the range). / Chance said that they could not ignore existing data and conducted the analysis regardless, and in the end did not rely on a 3D ZOI analysis as it was not conclusive.
- Participants expressed concerns about the ability of the Land Use Planning Council to review the Project for a conformity check, compared to the capacity of the North Yukon Commission. / Chance said that there are knowledgeable people on the council who have been there for a while. Shared that the North Yukon Commission no longer exists.
- Inquired about how Chance will be able to privatize a road. / Chance responded that the Chief Operating Officer can make it a private road. Said that that it is more of a safety concern, and that people are not interested in hunting around the drilling area. The company could grant access to subsistence harvesters, but this may create a safety concern for staff on site.
- Expressed concerns about the lack of communication between Chance and the Executive Committee. These conversations are important.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

- A participant shared concerns that their experience on drill projects, drill sites needed a 24-hour supply of water, which was trucked into the site. Unless technology has changed, that is one example of essential road traffic even if there are caribou in the area. Participant asked if the reduction would be sufficient or not. / Chance does not have the details on what is considered essential road traffic right now, but will include that in the Project Description.
- Participant requested an end of season report, to understand if caribou mitigation efforts worked and is concerned that this is not being considered. / Chance is interested in learning how the caribou are impacted, and that Chance will learn over the project lifecycle (10-year program).
- Participants encouraged ongoing in-person discussion outside of the YESAB review, which, through written format, can become hostile.

Actions and Responsible Party

- No actions.

Details of Discussion

[redacted] (Chance) gave a brief Project summary and added that [redacted] (EDI) would lead the presentation. [redacted] emphasized that the Project is a proposed exploration program and reiterated that the proposed submission of their Project Proposal is February 2024. Chance has been conducting virtual and in person engagement meetings. He mentioned First Nation of Na-Cho Nyäk Dun leadership currently does not want to participate in community engagement. Chance will continue to provide Project information and that engagement will continue with the First Nations and residents of communities. Chance will also share technical reports with First Nations. Chance is proposing a 10-year program.

The group shared a round of introductions.

[redacted] (EDI) stated the exploration area is around 2400 square kilometres, with clearing occurring during the winter and that it will be approximately 1500 square kilometres total of 3D seismic spread over 10 years. He added that there will be 2000 square kilometres of 2D seismic. [redacted] (EDI) noted that the Project is looking at up to 5 wells per year, equivalent to 2 hectares, and a maximum of 30 wells total. He stated that winter operations will last about 1 to 3 years in each area. He added that there will be three Project work areas and winter access roads will be created. He noted that there will be spring and summer seismic activities with helicopter support and extended flow testing. He stated that the seismic work is different than what was done in the 1950s.

[redacted] (Chance) added that extended flow testing occurs during the winter months and a well of interest will be flowed for natural gas and oil to a service rig. He shared that Chance will be abandoning 3 or up to 5 wells next winter.

[redacted] (PCMB) asked if the seismic testing will include installing and retrieving geophones, which was done previously.

[redacted] (Chance) said that it is new to Chance and that they use the same equipment from the seismic program in 2013.

[redacted] (PCMB) mentioned that he knew Chance was working on site.

[redacted] (Chance) stated that the geophones will be flown out when the snow and wildlife are gone in the spring. He added that if the caribou are hanging out, they can employ mitigation measures and hold off detonation and data collection until the caribou migrate north.

[redacted] (NND/TH) asked if this includes surface drilling.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

[redacted] (Chance) said that it would involves drilling a 3-to-5-meter hole, and the charge will be put down and repacked.

[redacted] (NND/TH) inquired if it was helicopter access and if Chance would be setting up a portable drill.

[redacted] (Chance) mentioned that the site is accessible by vehicle and that Chance would transport the drilling equipment. He added that Chance can hold off until late spring to detonate and take samples.

[redacted] (NND/TH) inquired if it was restricted access.

[redacted] (Chance) confirmed that it will be restricted access.

[redacted] (PCMB) stated that in 2013 there were caribou around. If caribou are around when Chance conducts work, will they hold off on the seismic activity?

[redacted] Chance) said Chance would hold off on detonation activities, but this needs to be discussed further. Chance will make these decisions as they occur and depending on how many caribou are in the area. [redacted] does not understand what the criteria is for this. In the baseline data being gathered for the technical review, there is the understanding that the caribou will migrate. He noted that Chance will go back to that location after the caribou move through. He stated that it depends on the number of caribou that are migrating in the winter range. Chance won't know until they do the field work and determine caribou movement through wildlife monitoring.

[redacted] PCMB) said that if there are caribou moving through the area, it won't be just one hundred in the Eagle Plains Basin. It will be a lot more caribou than that. This is what the collared data suggests.

[redacted] (EDI) noted that the Project team wants to have a good understanding of caribou movement. He added that protecting the lichen protects the herd. He noted that this is why activities are occurring in the winter to minimize the impacts. Seismic lines don't have to be straight anymore, and it is not the Project that was proposed in the past. This is a different seismic operation and that the key thing is that it will be spread out over 10 years.

[redacted] (EDI) presented the Baseline Studies Completed slide.

[redacted] (EDI) shared that the Project was bumped up to Executive Committee screening, which required Chance to do several studies.

[redacted] (PCMB) inquired about information on the Executive Committee.

[redacted] (EDI) said that it is a higher level of consultation and requirements. The Executive Committee reviews the Project.

[redacted] (Chance) said that they require additional data and baseline studies. The original Project went to the Yukon Environmental and Socioeconomic Assessment Board (YESAB) Dawson office and four out of six concerns came from it. These concerns put the Chance Project into a higher level of screening.

[redacted] (EDI) stated that field studies from 2019 to 2021 included: ecological mapping, linear features, fish, water, birds, and desktop studies that includes Porcupine Caribou Herd (PCH), moose, and martens. Chance wanted to do a linear features study to feed into the Land Use Plan (LUP) conformity check. He noted that the PCH are in the desktop studies because there is so much information available on them. He added that there were concerns about grizzly bears, but Chance doesn't have information on them.

[redacted] (EDI) presented the Effects Assessment Approach slide.

[redacted] (EDI) said there will be an impact on caribou, and we are assessing the significance of the effects. He added that Chance put the Environmental Assessment in the context of the LUP. He noted that there is more disturbance which is included in the Linear Features Study. The constraint maps help to develop scenarios to figure out future impacts. He noted that the spatial

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

scale is relevant to the species. He said that exploration programs typically do not trigger an Executive Committee review. He added that this Project is going through the same review as the Casino mine project. He said that there is enough concern that it triggered an Executive Committee screening. There are always questions about the Project. He stated that Chance can't do an impact assessment without confirmed sites, which is why the Project team is using scenarios.

[redacted] (Chance) stated that Chance is taking an ecological perspective. Chance is trying to do the Project in a sustainable way by using constraints mapping and studies. Chance knows where the Project would like to drill. Chance needs to design winter access that considers constraints and previous disturbances. The Project team has described this to the Executive Committee and to communities to understand that Chance is listening and modifying the Project Proposal. They are not drilling year-round, and Chance's approach is unique and hasn't been done in the Arctic.

[redacted] (PCMB) asked for clarification whether the Project team was talking about next steps in the permitting process and if they had stopped talking about drilling.

[redacted] (EDI) said seismic comes first to identify the drill targets.

[redacted] (PCMB) said drilling is part of the exploration program, but we are talking about seismic right now.

[redacted] (Chance) said that Chance will still have to drill but initially they must get the targets and do the seismic. He added that this is what will help us understand what kind of resources are out there.

[redacted] (PCMB) inquired as to whether seismic would give Chance that information.

[redacted] (Chance) responded that no, it won't. He added that once it is put in a controlled environment, seismic will be used to understand of the layers of rock formation, depth of it, and any anomalies. He noted that drill site locations will be determined in the seismic studies.

[redacted] (PCMB) questioned whether Greg believed seismic and drilling to be one and the same. [redacted] (Chance) stated they are indeed different, and that identifying drill targets requires the seismic work.

[redacted] (PCMB) said [redacted] (EDI) said the drill on the slide was unconventional.

[redacted] (VGFN) asked if the last step in the process is flow testing.

[redacted] (Chance) said that that is correct. Geologists have said there is a 10 to 20% success rate, which means that 3 of 30 wells or 6 of 30 wells may be successful. Currently they do not know how successful they will be, but that there is opportunity. He noted that the business plan is focused on local consumption and that the Yukon needs additional energy. He said that Chance needs to understand what kind of gas there is and flow it. He noted that the flow time is up to six weeks. Chance would like to understand what kind of gas there is.

[redacted]NND/TH) mentioned that even if heating oil is locally sourced, it would need to be refined down south and then shipped back up. To be a local supplier, Chance would still have to ship oil south.

[redacted] (Chance) said that oil would need to be shipped south during the flow tests, but that there is technology to be refined at the site, but that's not a part of this Project.

[redacted] (YG) said that natural gas flow testing would occur for 6 weeks to prove the resource and asked Greg how long it would be with oil.

[redacted] (Chance) said it would require two years for flow testing and that Chance would be awaiting recommendations from YESAB. He added that it is longer for oil than gas. He noted that when the pressure comes up, the oil is a heavier liquid. He said that it takes time to understand it.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

[redacted] (YG) inquired about how long it would need to flow for.

[redacted] (Chance) said that the Project is not able to flow test summer months as Chance does not have all season roads. If there are successful wells, then Chance will need to seek a permit for an all-season road.

[redacted]YG) said that he's trying to understand the level of disturbance and if Chance would have to turn off the tap and begin flow tests in the following year.

[redacted](EDI) stated that that is something that Chance will have to include in the Project description.

[redacted](Chance) said that winter activities will only be 4 to 5 months.

[redacted] (VGG) asked if flaring would occur during flow testing.

[redacted](Chance) said that yes that is why flow testing is shorter because it would include a minimum of 3 weeks of flaring.

[redacted] (YG) expressed concern about how the trucks would be staged up to get the oil.

[redacted](Chance) said that Chance could get him the information. There will be heated storage, and will include 400-barrel trucks to keep the crude oil in. He said that the oil will come into a station area and before it gets taken away, there will be separators. He stated that Chance will probably have to reinject produced water back down into the wells.

[redacted] (VGG) stated that there needs to be more details about the Project Proposal and what activities Chance is proposing. For example, what are the activities associated with flow testing so that it can be evaluated. He noted that if the detail is in the Project Proposal to start with it saves everyone time. Chance will review.

[redacted] (EDI) presented the Land Use Plan Context slide.

[redacted] (EDI) said there are differences between how it works. There is the Integrated Management Area Zone 4 and that this is where it is expected that development will occur in the area. This zone has a higher level of protection than other areas. Even though Chance is looking at development in this area, Chance is looking at a high level of environmental protection. He added that it is likely one of the highest levels of protection with protection covering 37% of late winter and 31% of the fall range.

[redacted] (EDI) presented the Low Impact Seismic slide.

[redacted] (EDI) said Chance will use meandering lines to avoid large trees and to make the lines of sight to be less than 70 meters. There will be small narrow mulchers used for the seismic lines (2.5 m), which will help to protect vegetation. There is low ground pressure equipment over at least 20 cm of packed snow/ice. The vegetation will be pushed over, not cut, which means a faster recovery.

[redacted] (YG) asked if that is 20 centimetres of snowpack.

[redacted] (EDI) confirmed that it is 20 centimetres of snowpack.

[redacted] (Chance) Chance wants 20 centimeters of snowpack for winter roads, and in Chance's mitigation section, it says Chance will strive to get 20 centimeters.

[redacted] (VGG) asked if there is a design in place for meandering seismic lines and how Chance will communicate this to the operator.

[redacted] (EDI) said that that is an excellent question and [redacted] is the expert.

[redacted](Chance) said that scouting will be done in advance to understand the density of the forest, determine the location, and design it based on that information. If there are dense trees on the south side, Chance will design it to go around.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

[redacted] (VGG) asked if Chance would design it.

[redacted] (Chance) responded yes, they go out and walk it before they design it. There was helicopter support in the past to scout areas, to avoid mulching and to decide where to mulch. He noted that Chance will get more information about the criteria.

[redacted]. (YG) said they are trying to avoid site lines from certain lengths.

[redacted](VGG) said that it is up to Chance to design meandering seismic lines.

[redacted] (EDI) said that is how it works operationally.

[redacted](YG) said aerial photos could be helpful.

[redacted] (EDI) noted that Chance does not have any high-definition photos.

[redacted] (YG) said that the Yukon Government has some photos.

[redacted] (EDI) presented the Linear Feature Disturbance slide.

[redacted] (EDI) said that there are indicator levels of linear disturbance. He added that cautionary is 0.75 kilometres/square kilometer and the Regional Study Area (RSA) is 1.79 kilometres/square kilometre (unadjusted), and 0.52 kilometres/square kilometres(adjusted). He said that if the 3D lines are removed, it could be down to 0.48 square kilometers. He added that the background isn't presented too much in the LUP. He noted that Chance is utilizing the cautionary level.

[redacted](YG) said this is all the discussion from the LUP process.

[redacted] (EDI) said that there is a lot of theory around it, and that is why Chance did a linear effects study.

[redacted](YG) said that the numbers came from the caribou work. He said that he was not at the table but talked to people, such as [redacted], after the plan was done.

[redacted] EDI) said that information came out of Alberta, for example, different land uses and species in the area such as wolves preying on moose rather than caribou.

[redacted] (YG) asked what Chance meant by vegetation recovery.

[redacted] (EDI) said that they used the tall shrub stage, which was 2 metres instead of 1.5 metres from the LUP.

[redacted] (EDI) added that the old seismic approach was to cut the vegetation down.

[redacted] (EDI) presented the Environmental Constraints Mapping slide.

[redacted] (EDI) said Chance intends to avoid heritage sites, permafrost/terrain sensitive areas, riparian management areas, priority ELC units, caribou habitat, and moose habitat. He added that directional drilling is good to avoid high quality habitat, another mitigation measure.

[redacted] (Chance) said that Chance needs to get surface distance between 1.5 to 2.0 kilometres. He said that the Project team could stay on top of the hill and still drill in the valley.

[redacted] (VGG) asked if the Project videos are online.

[redacted] (Chance) said that Chance is in the process of developing a webpage.

[redacted] (Chance) said that Chance wants to launch the website before the new year and the February 2024 submission.

[redacted] (EDI) presented the Well Site Scenarios slide.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

[redacted] (EDI) said that the well site locations are unknown. He added that Chance develops scenarios within constraints to the range of potential habitat effects. Chance develops scenarios based on Scenario 1 which is developed by the seismic team.

[redacted] EDI) presented the Project Interactions slide.

[redacted] (EDI) said that there will be direct and indirect habitat interactions. Direct being vegetation clearing and indirect such as sensory disturbance. He added that there are areas where the Project team will avoid human activity. He said that there will be an indirect and direct mortality risk, direct being vehicle collisions and indirect will be due to increased predator access. This is what YESAB brought up in the first review. Chance is trying to reach a balance in the assessment.

[redacted] (PCMB) inquired about Chance's interpretation of disturbance.

[redacted] (EDI) responded that key disturbing factors are noise, smells, and human movement/presence. He added that this depends how far away caribou are from the well sites. He noted, based on mixed results in literature using various analytical methods, some possibly erroneously, that disturbances could result in no avoidance and up to ~40 kilometres of avoidance. He said that it is dependent on how the caribou are responding to the disturbance.

[redacted] (NND/TH) asked if there would be something on the ground at whatever distance it is. He asked what mitigation is there. He added that the concern is not to disturb the caribou, but how much is too much disturbance. He asked if there were other mitigations other than seasonality.

[redacted] (EDI) responded that there is a mitigation. He added that Chance calls them direct and indirect effects.

[redacted] (EDI) presented the Porcupine Caribou slide.

[redacted] (EDI) said that the key resource in the LUP is the caribou. He added that the information that Chance presents on the caribou is far more descriptive than in 2013. He noted that it was important to characterize the caribou. He added that Chance must understand the caribou enough to understand interactions with the Project. He said that Chance can't avoid all locations, and that Chance has looked at potential effects on PCH habitat and movement. He said that when looking at mortality it is challenging to quantify. He added that Chance has looked at residual effects, which are effects that are left over after mitigation is applied and that cannot be addressed.

[redacted] (EDI) presented the Porcupine Caribou – Distribution slide.

[redacted] (EDI) identified the PCH-identified life cycle periods or seasons. He added that there are patterns of occurrence from 1970 to 2016, supplied by PCTC. He said that Chance is looking at rut and winter overlap. He added that there is no doubt that Chance will see the caribou and that they will likely show up some time during the 10 year operation, and when they do, they will show up in large numbers.

[redacted] (EDI) shared movement of the PCH after the 2013/2014 seismic program. He said that the PCH moved through the Project area in 2015. He added that there were 13,000 to 14,000 observations through the cameras. He said that it was evident that they had moved through there. He noted that this has not happened ever since. He said that he is unsure where the PCH are now in the winter.

[redacted] (YG) said that the time where it does split, they used winter ranges in Alaska recently. He added that the challenge is that the PCH may go to the same area for two decades and then never go there again. He noted that he has not seen them in the uplands for two decades but that is where they used to be. He said that it is common to see them overlap with the December range.

[redacted] (EDI) said that there could be richer detail to describe. He said that when the PCH do show up it will be a lot.

[redacted] (YG) said that they do not have detailed GPS data prior to 2015. He added that collared data did not start until 2012.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

[redacted] (EDI) added that before, there were different collars.

[redacted] (YG) confirmed that previously, the location was tracked every day versus now, where you can track every minute of their movement. He added that most survey work occurs during the summer periods. He said that they had late winter data to look at distribution.

[redacted] (EDI) presented the Porcupine Caribou – Movement slide.

[redacted] (EDI) stated that in 2015, caribou travelled through a network of 2D seismic lines, winter roads, and a large 3D seismic grid. He said that the PCH will probably show up in abundance based on the work Chance has done.

[redacted] (YG) said this is late winter data. He added that that is when distribution would be done.

[redacted] (EDI) said that this is why the Project went to the Executive Committee. He added that Chance doesn't know enough about the PCH in the winter. He said that in the baseline effects, the Project can compile that data. He shared that a lot of the information was not available to the Chance team. He noted that if Chance misses anything, that this is what Chance is looking for.

[redacted] (EDI) said that caribou occupy the RSA in less than 20% of previous years. He added that rut/late fall and winter seasons are considered the least biologically sensitive periods for the herd. He said that that doesn't mean that the Project team isn't treating them sensitively, caribou are just less sensitive during these times. Winter is the least sensitive period relative to all seasons. He said that protecting calving grounds is key. He added that this herd keeps going back and other caribou herds are quite different. He noted that, the PCH are in good health this time of year and less sensitive than other times of the year. He shared that this information came from the PCTC report.

[redacted] (EDI) said that they are looking at the movement rate of PCH and what will they be exposed to. He said that based on the PCH collared data, it is evident that they move through the area. He added that it is roughly 4 to 5 days in the rut and late fall or 15 to 16 days in the winter.

[redacted] (EDI) said that the analysis consisted of quantifying daily travel times. He added that Chance characterized the seasonal ranges by dividing the seasonal range into around 2500 square kilometres of cells. He said that after that, they compared the different travel rates and residency times. He noted that the Project can say that the RSA is around half in the late fall and there are about ten days less spent in the winter. He shared that overall, caribou are spending less time in the RSA when they are there.

[redacted] (EDI) said that this is why it is important to characterize what the caribou are doing in the area. He added that they seem to be moving through the area quickly.

[redacted] (YG) asked if Chance is characterizing that their residency will be half of when they are going into the area.

[redacted] (EDI) said that we calculated residency times as an average, and that we are making a relative comparison of residency in the RSA versus the broader seasonal ranges using the collar data. He said that when the Project team is making a comparison of residency times, they are seeing this much of a difference.

[redacted] (YG) said that he is unsure if he would base the data on the limited set of examples, but it does give a sense. He added he would be leaning more on to the seasonal range data (SRD). He shared that the residency of SRD is useful. He said that he would be careful saying that about collared data.

[redacted] (EDI) said that there will be a list of uncertainties in the Environmental Assessment.

[redacted] (EDI) said that the standard error is associated with the ranges. He shared that the seasonal range average is not directly comparable to the RSA and that he is not sure if the seasonal range residency time is the best average to use. He said

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

that the composition of the eco ranges is different. He added that they wouldn't expect the same amount of residency time in the RSA.

[redacted] (YG) said that there is a lot of data, around 50 years of movement data for the herd. He added that there is only GPS data for a decade, which isn't that much.

[redacted] (EDI) said that the Project team must move through with some level of confidence. He said that the Project talks about reversibility of effects and if it is reversible.

[redacted] (EDI) presented the Porcupine Caribou – Habitat Selection slide.

[redacted] (EDI) shared a recap of the methods and results for PCH. He said that they used a standard approach to developing these models and used a generalized linear mixed model. He added that it was a 1:10 used-available design. He shared that they are looking at interactions with lichens, and plant functional type layers (e.g., light microlichens, conifer, forbs, deciduous shrubs, graminoids, and evergreen shrubs). He said that it included elevation, slops, aspect, and distance to waterbodies. He added that they did random effects on the caribou year and did a 5-fold cross variation of model predictions. He added that they mapped RSF predictions across seasonal ranges.

[redacted] (EDI) said that they used selection ratios to identify the RSF prediction threshold where the proportion of used locations is greater than available. He added that this corresponds to selected habitat by caribou; these predictions considers the partial effects of all habitat covariates (rather than single covariate coefficients). He shared that they were able to identify four habitat ratings: high, moderate, low, and very low. He said that the selection threshold identified the split between high/moderate and low/very low and that the split between high and moderate was based on midpoint value, the same for low and very low.

A participant asked if this is describing the quality of the habitat or the ratio of use.

[redacted] (EDI) said that it is quantifying selection. He added that when Chance maps that, it has been classified as a habitat with high or moderate rating. He shared that it is selection, not use.

[redacted] (EDI) said that the moderate and high ratings are the areas associated with selected habitat. He shared that that corresponds to caribou using the areas more frequently than what would be expected by random chance. He added that the Project team chose the term 'selected' habitat and didn't want to use 'suitable' habitat because all habitats can potentially be suitable and used by caribou. He said that the habitat ratings are associated with higher macrolichen cover.

[redacted] (YG) asked what the Y-axis on the top graph said.

[redacted] (EDI) responded that it is the proportion of locations. He said that both figures show the same information in a different type of way.

[redacted] (EDI) presented the Caribou / Project Interaction – Review slide.

[redacted] (EDI) shared that the RSA overlaps with the PCH seasonal ranges. He added that the caribou occupy the RSA in less than 20% of years (or approximately 1 in 5 years). He shared that rut/late fall and winter seasons are considered the least sensitive periods for the herd. He added that the exposure period of individual caribou is expected to be 1 to 2 weeks. He said that Chance is looking at the assessment of criteria of seasonal habitats and that they were built into the LUP.

[redacted] (EDI) presented the Potential Habitat Effects slide.

[redacted] (EDI) shared that direct habitat effects refers to areas cleared of vegetation. He said that this affects 2% of selected rut/late fall and winter habitats within the RSA. He added that it affects 0.2% of selected rut/late fall and winter habitats at the Eagle Plains ecoregion scale. He said that the 3D seismic may not create a functional loss if lichen persists. He shared that it should not affect the lichen.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

[redacted] (EDI) shared that the indirect habitat effects refer to sensory disturbance. He added that they did a ZOI study that was applied around all disturbances. He said that they assumed a 75% reduced habitat effectiveness within a 1-kilometer ZOI. He shared that it is hard to quantify the area. He said that it means that there is a 75% chance that caribou are less likely to select the area. He added that annually, about 32% of the RSA experiences sensory disturbance and affects 23% of the selected rut/late fall and winter habitats within the RSA. He said that it affects 5% of selected rut/late fall and winter habitats at the Eagle Plains ecoregion scale. He added that it is a temporary effect which is reversed once activity stops.

[redacted] (YG) asked where 1 kilometre came from.

[redacted] (EDI) said that it is based on the permanent disturbance, which was their own zone of disturbance. He added that they looked to find a balance of something that was reasonable. He said that 1 kilometer seemed like a reasonable measure.

[redacted] (YG) said that activities like helicopter work and safety checks, cause greater disturbance than the mulcher. He added that he cautions using the 1-kilometer buffer. He shared that he thinks Chance will have a hard time supporting that in the literature.

[redacted] (EDI) said that the primary reason was to associate the ZOI with sensory disturbance. He said that in assessments where ZOIs were found to be large, there hasn't been a test or link to a clear mechanism that could lead to such large areas of avoidance. He argues that studies with large ZOIs often capture broad changes in a herd's range distribution rather than local effects of a Project. He added that this assessment is focused on local-scale sensory disturbance which covers the work area. He said that, in the literature, ZOIs are most often quantified as linear avoidance up to the ZOI threshold. This causes the average avoidance effect to be about halfway up the sloped line. He shared that, for this assessment, they applied a uniform 75% reduction across the 1-kilometer buffer.

[redacted] (YG) said there is a potential effect for the whole area. He asked how they could get this into more detail. He said they will be looking at it very closely.

[redacted] (EDI) said that they identified a 2- or 4-kilometre ZOI associated with the 2D seismic lines (including winter roads and trails). However, he stated that they identified attraction (rather than avoidance) to the 3D seismic grid. He added that the 2–4-kilometre ZOIs for historical 2D seismic are small in magnitude. Habitat effectiveness is reduced by 20–40% on the footprint itself, but the average reduction across the ZOI is much smaller.

[redacted] (EDI) asked what the sample size for the 3D seismic sample size analysis was.

[redacted] (EDI) said that he will have to circle back.

[redacted] (YG) said that the PCTC advised against doing that analysis.

[redacted] (EDI) said that Chance did not rely on a 3D ZOI analysis.

[redacted] (YG) said that it was raised. He added that it may or may not be the case, but they don't have the data.

[redacted] (EDI) added that it is not conclusive.

[redacted] (YG) said that's perfect.

[redacted] (EDI) said that Chance expects those comments to come up too and that's why the analysis is there.

[redacted] said that when you talk about all this data, so next year when you are doing the seismic, there is no additional effects to the PCH at that location.

[redacted] (EDI) said that there will be a leftover footprint. He added that there is a linear disturbance that brings in predators.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

A participant said that it seems reasonable for seismic activity, but then there is a well being drilled. They said that the ZOI would be much bigger based on that. They said that there is going to be less of an impact.

[redacted]. (EDI) said that the impact could be up to 1 kilometer, but Chance could revisit that and rethink the details of that too.

[redacted] (EDI) shared that it was 1 kilometer impact for everything sticking to sensory disturbance.

[redacted] (NND/TH) said that if the caribou are discouraged from using the ZOI and activity stops, that they came back through. He added that he doesn't know if there is any information on prolonged activity. He said that they are talking about several winters. He said that if there is a prolonged period of disturbance, he hasn't come across the information. He asked if there is any information on permanent discouragement of using the area, even after the mulching disturbance stops.

[redacted] (EDI) said that he would look at caribou near mine sites and the Central Arctic Herd and how they responded. He said that they looked it on a herd basis, but he is unsure if they respond well. He shared that work has been done on caribou response to roads, and other development. He said he cannot think of whether they responded to any well site. He said thinking about the development in Prudhoe Bay, there was work on the caribou's response to the road and pipeline. He added that they had deemed a 300-meter zone. He said that if it is not fenced off, the caribou will move through.

[redacted] (YG) said Heather did the most recent analysis on that, and their role is to do objective PCTC science. He said it is the calving and post calving information that has not been developed in the last 30 years. He added that it was around 5 or 6 kilometers. He said that it was a tundra environment and oil field, in the summer. He shared that there were many differences.

[redacted] (EDI) said that it is hard to make that comparison of linear disturbance in Alberta to Eagle Plains. He shared that a caribou response to a single well site would need a wealth of data. He said that there are forty well sites out there.

[redacted] YG) said a camera on the well site would be good.

[redacted] (EDI) said that if you look at an oil rig and the caribou herd are going through, there is a clear answer to that.

[redacted] (VGG) asked if the linear thresholds Chance talks about, are based on the proposed linear disturbance.

[redacted] (EDI) said that that is why the planning commission did their own effects strategy.

[redacted](VGG) asked if Chance has talked to anyone at the Yukon Government about cumulative effects or linear features.

[redacted] (YG) said one of the linear things that was discussed was that the threshold is 1.5 meters of wooded vegetation. He added that they just don't know.

[redacted] (Chance) said that the last direction that Chance got was from [redacted] office when she was Deputy Minister and that the challenge is that the environmental groups are challenging the Yukon Government because the proponent is responsible to go to First Nations to work with them to get their permission on conformity checks. He asked if the proponents are responsible for making communities understand the effects.

[redacted] EDI) said that at the community level during our meetings, it has not been a topic of discussion.

[redacted] (VGG) said that it's coming up in another process around cumulative effects. He added that he is curious as it sounds like a lot of that work was based on studies from Alberta. He asked what the underpinning of the analysis is and if there is other information that is new to him.

[redacted] (EDI) said that Chance looked at the line of sight, travel speeds, visibility, and different levels of regeneration. He added that the Project team wanted to inform the planning commission.

[redacted](Chance) said that when Chance made the original submission, their understanding was that the Land Use Planning Council was working with them. He stated that they were told that Chance must figure that out and convince any other affected

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

parties. He asked how Chance does that work. Chance completed what it was required to do based on what was agreed to. He said that it is basically an EMR (Energy, Mines, and Resources) office that is just trying to figure it out. He shared that Chance is confused on who will oversee the old studies and disturbance that didn't occur from Chance/Northern Cross.

[redacted] (EDI) added that Chance did their own studies of effects. He added that that is how Chance came up with adjusted numbers.

[redacted] (NND/TH) said that he's come across concerns about the Land Use Planning Council not having the background that the commission has. He added that this is a compounding factor. He said that the council doesn't have a knowledge of history that the commission developed under the treaty, and that the council doesn't have the background to consider a project. He said that there are concerns about the council being capable of having a reliable opinion.

[redacted] (Chance) said that Sam is at the council and has a lot of knowledge and has been there for a while. He shared that there is no North Yukon Commission now.

[redacted] (YG) said that he is interested in talking about mitigations. By focusing on if the herd is coming through, it minimizes the issue. What happens when they do come through. It may be important to get information from the PCTC or Mike Suitor from the Yukon Government. If you hear caribou are coming your way and will be there in 3 days, what will the response be to that data.

[redacted] (EDI) said that they will get into that. He added that the monitoring part is an important part of the assessment.

[redacted] (EDI) presented the Potential Movement Effects slide.

[redacted] (EDI) said that there will be local movement effects such as reduced crossing if there is traffic on roads and seismic lines. Effects to seasonal movements or migrations are unlikely. Long distance movements will mostly be in fall and do not overlap with the bulk of Project activities. Short residency times and fast movement rates through the RSA and caribou travel through network of linear features in the RSA.

[redacted] (YG) said that pertaining to the effect of harvesting activities, there are areas where similar work has been done. A similar migrating effect can be seen and that it is possible that it may change a migration pattern. He said that he doesn't want to discount it.

[redacted] (Chance) asked what the probability is of that occurring.

[redacted] (YG) said that he is unsure exactly. He added that in 2015 it almost happened.

[redacted] (Chance) said that it is easy to tell that they go along the Dempster Highway.

[redacted] (YG) said that humans are travelling the same way the PCH like to because it is the easier travel. He added that it is a scenario that could occur, and it shouldn't be discounted.

[redacted] (PCMB) said that if looking at the probability, what's going to be in place with the PCTC, the people, and what is the plan to respond.

[redacted] (EDI) said that Chance will note it. He asked if it is going to stop them from entering the work area. He stated that Chance is assuming a 75% probability. He said that he is not trying to downplay the potential effects, but it is only an exploration project.

[redacted] (YG) said that YG has programs that shut down for 2 to 3 weeks when the herd hits.

[redacted] (EDI) said that that will certainly happen. He said that the Project team can't operate with thousand caribou around us. He added that it will affect their localized movement.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

[redacted] (EDI) presented the Potential Mortality Effects slide.

[redacted] (EDI) said that direct effects are vehicle collisions, but this is low risk on access roads and seismic lines. He said that by restricting the road, it won't be public access. He stated that the indirect effects are predation and hunting. He added that linear features might give more access to humans.

[redacted] (NND/TH) said that the resource road regulation on the Territorial Roads Land Act should give Chance permission to make the road private. He asked how Chance can use it as a private road. He asked if under the Oil and Gas Act they would be able to say it is a private road. He asked if Chance has had that discussion.

[redacted] (Chance) said that the Chief Operating Officer (COO) can make it a private road. He said that it is more of a safety concern, and no one wants to hunt around the drilling area. He added that it is one thing to give the access to an Indigenous harvester, from a safety point of view there is an issue around the work area buffer.

[redacted] (NND/TH) asked if the COO has the capability to give Chance a private road.

[redacted] Chance) confirmed yes and that they have had a COO do it before.

[redacted] (EDI) said that any predator wants easier access. He shared that it would have a temporary effect, limited to annual work areas where activities pack the snow on linear feature. He added that there aren't resident caribou in the Project area compared to other herds. He said that it is hard to conceptualize.

[redacted] (YG) said that he has seen people using the seismic lines. He said that there is no real monitoring of it. He stated that on predation, it is a different scenario. He shared that it is complicated because there are migratory wolves. He added that the question is if the herd has a major decline. He said that it is being anticipated sooner or later but they don't know.

[redacted] (EDI) said that there is uncertainty around mortality effects. He shared that it is more around Indigenous access, but Chance doesn't know how to move around that.

[redacted] (YG) said that the affected harvest on ZOI basically has a double effect.

[redacted] (EDI) said that as soon as the Project increases predation risk, there will be an increased effect. He added that it is important to increase local awareness there.

[redacted] (YG) said that this can be dealt with in the Project Effects Assessment.

[redacted]. (EDI) said that there is no harvest policy other than the Indigenous Rights to Harvest.

[redacted]. (EDI) presented the General Protection Measures slide.

[redacted] (EDI) said there is environmental constraints mapping to reduce habitat loss. Chance will stay out of this area when caribou are coming. There will be a limited annual footprint, reducing sensory disturbance. There will be access management to reduce mortality risk. People will probably use the winter access. He shared that he doubts that individuals will use the 3D seismic access.

[redacted] (YG) agreed that people likely won't use it as well.

[redacted] (EDI) shared that low impact seismic will help to reduce habitat loss and has been developed over the years. He added that there will be a maximum width of 2.5 meters that will retain ground vegetation. There will be speed limits in place to reduce mortality risk. He emphasized the importance of worker awareness, including reporting any sightings. There will be a caribou interaction response plan. He asked if there is an information database that Chance can use to understand weekly migration patterns.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

[redacted] (YG) said that the YG is trying to get a database in place. He shared that the PCTC updates their website and YG does the updates as they can. He said that the YG has a regulatory meeting that often changes things.

[redacted] (EDI) asked if YG will tell them when the caribou are coming.

[redacted] (YG) said that some companies are required to contact YG on a schedule. The other more likely scenario is just paying attention to the herd. He said the Chief of Mine and Land Use provides emails and the YG provides weekly updates after that. He shared that YG has been doing it for 5 years and it is working well.

[redacted] (EDI) said that there is flexibility with the seismic operation and that it will be Chance's bad luck. He added that Chance can't move the seismic and once a drill is spinning, the Project team can't stop.

[redacted] (NND/TH) said that it is possible to stop the drill.

[redacted] Chance) said that when driving, risks of potential impacts are increased. He added that there are speed controls, traffic controls, and the only traffic would be wildlife monitors.

[redacted] (EDI) said anything that is necessary.

[redacted] (NND/TH) said there was a constant of bringing water in with big trucks when he worked at the mine sites.

[redacted] (EDI) said that once the drill is going, it is not stopping.

[redacted] (PCMB) said that a caribou action response plan has potential, and he knows PCMB would be interested. He said it would be great if Chance could get their caribou information from PCMB and PCTC. He added that it would be good to see something established. If Chance is responding to caribou interactions, it would be nice to have a plan established. It would make sense if there was official communication linkage to be notified. These communications could establish a cooperative protocol. He added that this could help PCMB study the herd.

[redacted] (EDI) said that he wouldn't be able to develop that independently.

[redacted] (Chance) said that he agrees with getting the real data.

[redacted] (YG) said there will always be redundancy on this, and YG is trying to figure that out. He added that there are ways to do it. He said that the challenge for using satellites to track is that there could be several thousand caribou that don't have collars.

[redacted] (EDI) said that he agrees that it is only a small portion.

[redacted] (YG) said that there are 110 collars on the caribou.

[redacted] (EDI) said there is a level of warning from local monitors. He added that there will be a balance of reported observations, onsite. He shared that Chance would have to do aerial surveys.

[redacted] (YG) said there is no need for aerial surveys. He added that it can give you a sense of what you are dealing with and that they did that in 2013.

[redacted] (PCMB) said that it makes her think about how PCMB could help. If there are wildlife monitors around, it would be great to get regular updates on what they are observing. She added that if there is a situation where several caribou are coming to the Project area, the PCMB has connections to the Porcupine Caribou communities to get the word out. PCMB can help communicate things to bring show that we are engaged and that communities can be confident that Chance and PMCB are working together and sharing accurate information. PCMB wants the communities to be comfortable with what is happening. She added that there is the opportunity to look at the PCMB and Chance engagement as a very positive thing.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

[redacted] (EDI) said that this could be something to work on. He said that he agrees on collaboration and that aerial surveys during operation will be good. He shared that he thinks that the project can operate safely. He said that a lot of this relies on the observers being there.

[redacted] (NND/TH) said that with an existing drill site, and caribou in the area, Chance won't be able to shut down the drill. He said that the idea being that traffic could be reduced. He doesn't know where the water is coming from for the drill. He said that in past projects, there was a 24-hour supply of water from the water source to the drill site. He said that unless technology has changed, that is one example of traffic that can't be stopped if there are caribou in the area. He asked if the reduction would be sufficient or not.

[redacted] (EDI) shared that Chance doesn't have the details on what is considered essential road traffic right now. He shared that 5 vehicles a day sounds manageable.

[redacted] (YG) said that his issue is that there are no communications occurring with the Executive Committee. He said that it is important to have these conversations. These conversations will greatly increase Indigenous relations.

[redacted] (PCMB) said that the PCMB represents PCMB from the PCMB Agreement parties. She said that the PCMB isn't a decision-making board, but they can provide input to regulatory processes and review processes. She added that the PCMB knows trust is important with communities and when working with groups that are willing to go over and above what is specified in regulatory decisions. When the PCMB knows that there is an interest in building that trust, if anyone is looking at building positive relationships, it must be a collaborative process. There needs to be transparency and a willingness to work together no matter what the information may be. It is important for PCMB to do that and that the PCMB wants to work together. It is reasonable to say Chance can't shut down a well in production if there is a conversation ahead of time. If they know about these concerns in advance, there could be something in place that incorporates Traditional Knowledge that would address the communities' concerns. She shared that when caribou come and you can't shut down the well, the PCMB knows that that is reasonable, and they can support that. The PCMB can help with mitigation around that. She said not to underestimate the trust with PCMB and that the PCMB wants to work with Chance to do a good job of this. She shared that what happens with the Project will last in people's minds.

[redacted] (NND/TH) said that even if the PCMB aren't a decision maker, they are important.

[redacted] (EDI) said that the next step is mitigation. He said that he has seen a change in the approach by Chance. It comes down to the communication aspect and the seismic program is flexible.

[redacted] (YG) said regarding the effects monitoring piece, that looking at developing a couple of well-focused designs would be helpful. He said that if the exploration project is successful, Chance will get towards a development stage and there won't be any data.

[redacted] (EDI) said that to determine if mitigation is successful, Chance will have to do an experimental approach.

[redacted] (NND/TH) said that they do a report at the end of the season, to understand if it worked. He is amazed that this is not being considered.

[redacted] (EDI) said that this is a 10-year program, and it is Chance's opportunity to learn. He added that Chance wants to understand what the caribou do.

[redacted] (YG) said that the collared data is one scale.

[redacted] (EDI) said that it makes sense to put in effects monitoring.

[redacted] (YG) said that he is happy to work with Chance and discuss with PCTC to provide input. It is going to have to be a collaborative approach somehow.

APPENDIX 2-A-17. Exploration Project Information

NORTHERN CROSS

Exploration Project

- Small size impact: less than 1 square kilometer of total impact if all 20 of the proposed exploration wells are drilled and all are discoveries of oil or natural gas that proceed to extended flow testing, which also includes building up to 87 kilometers of year round access roads
- For perspective, excluding the airfields, the town sites of Mayo and Old Crow each cover an area similar to the maximum impact of the exploration drilling program. Dawson City covers an area that is more than 30 times the size of the area of maximum impact.
- The proposed exploration project is planned to occur within the 325 square kilometer area where 3D seismic data was obtained during the winter of 2013-2014
- This project proposal is exploration related work and is not development. More YESAB screening is expected on any discoveries that become development projects
- Exploration activities have uncertain outcomes.
- How many of the proposed 20 wells actually get drilled depends on results as the drilling program proceeds because many of the planned wells depend on successful outcomes from the initial wells drilled
- If drilling results are discouraging, fewer exploration wells will get drilled
- The most likely outcome is that only a few discoveries will be made and undergo extended flow testing, which means the impact will be much less than the maximum described above.
- Any wells undergoing flow testing provide useful information to be able to design development plans
- Nothing in the proposed exploration project is resource development
- Northern Cross has an excellent track record of environmental protection and minimizing impacts
- Activities are designed to be small scale and extend over a longer time period to create more job and business opportunities for Yukoners and to minimize environmental impacts
- Hydraulic fracturing is not part of the proposed exploration drilling and evaluation program.
- The proposed exploration activities are not in the Peel River Watershed

Partnership Opportunities

- Northern Cross recognizes the important role that First Nations offer in the longer term success of resource exploration and development
- Environmental stewardship (base line studies, monitoring, adaptive management plans, protecting traditional uses)
- Business development opportunities (oil field services, direct investment similar to the VG ownership of Air North, synergies with other VG businesses)

Judicial Review

- Northern Cross has challenged YESAB on grounds of procedural unfairness
- YESAB made a referral to Executive Committee based on reasons that had never been presented to Northern Cross
- Northern Cross was never given the opportunity to address these new concerns
- In the interest of fairness, Northern Cross wants the opportunity to respond to the new issues identified by YESAB in its Evaluation Report of February 8, 2016
- The judicial review is a challenge only against the Government of Canada, who is acting on behalf of YESAB in this court process.
- Northern Cross is NOT challenging any First Nation or any legal rights of First Nations under Umbrella Final Agreements in this Judicial Review
- However, all parties who participated in the YESAB review of the exploration drilling program were served with the court application made by Northern Cross for a Judicial Review in the normal course of the legal process

Caribou protection

- Northern Cross cares deeply about caribou and the environment and manages its activities to minimize or eliminate impacts.
- Northern Cross has a demonstrated track record of environmental protection, including protecting caribou
- Northern Cross has prepared several management plans with the help of professional experts in their fields including recognized experts knowledgeable in the Porcupine Caribou Herd
- The management plans have been reviewed by VG government departments and are designed to be adaptable based on experience gained in the field.
- Northern Cross has proposed forming a Caribou Stakeholder Advisory Board comprised of interested stakeholders to provide guidance in the management of project activities in situations where caribou are present.

APPENDIX 2-A-23. *Eagle Plains Environmental Studies 2018*

Eagle Plains Environmental Studies 2018

Chance Oil & Gas is conducting environmental studies in summer 2019 to collect data on fish, water, permafrost, vegetation and wildlife to support its proposal to conduct exploration activities in the Eagle Plains project area. Chance welcomes participation of local First Nation citizens and traditional knowledge holders in these programs.

All projects will require varying degrees of hiking in steep, rugged terrain and thick bush under production-oriented work conditions. Participants will require average to above average fitness to participate in the work, depending on the survey.

Chance regrets that opportunities for participation in the field studies are limited due to safety and logistical considerations, and all interested citizens may not be able to participate. The logistics of participation in the studies are still being finalized, however, there will be approximately spots for two participants from each First Nation with Traditional Territory overlapping the project area. Travel to and from Eagle Plains Hotel will need to be coordinated by each First Nation.

In addition to these field programs, Chance will be holding a number of community meetings, to provide an opportunity for First Nation citizens, who cannot participate in the field programs to be able to comment on the proposed program.

Access to all work sites will primarily be by helicopter out of Eagle Plains. A small number of sites will be accessed off the Dempster Highway.

A short description of each survey is provided, below.

Bird Surveys

Bird surveys will follow standard 'point count' methods that involve recording all the birds the observers hear and see from an observation station during a 10-minute survey period. Stations are located 500-1500 m apart and are accessed via hiking. This work is very production oriented in order to meet sample size requirements during the relatively short 'dawn chorus' when birds are singing and requires above average fitness to hike quickly between stations. Total hiking distance of 5-10 km per day through rugged terrain and thick bush will be required. The daily work shift is 2:30 am to noon. Participants should have a set of binoculars to get the most out of the survey, but they are not absolutely required.

Vegetation Surveys

Vegetation surveys are being conducted to verify ecosystem/habitat maps and to survey for rare plants. Work will be split over 2 shifts. The daily shift in round 1 will be from 4am to 3pm, to coordinate helicopter use with bird surveys. The shift during the second round is a more civilized 7am-6pm. The work will consist of 15-45-minute vegetation plots where the surveyors record plant occurrences, site conditions, and wildlife sign and habitat. Successive plots will be accessed by a combination of hiking and heli bumps. Participants will need to hike 3-6 km per day through rugged terrain and thick bush, requiring average fitness. No special gear is required.

Seismic Line Study

The purpose of the seismic line study is to document the degree of vegetation regeneration on old lines from past exploration programs 1950-2000's and to characterize the characteristics of new lines (i.e. from 2014) and how they may affect wildlife. The details of survey methodology are still being developed but will likely consist of ~15 minute vegetation plots at multiple spots along different seismic lines. Successive plots will be accessed by a combination of hiking and heli bumps. Participants will need to hike 3-6 km per day through rugged terrain and thick bush, requiring average fitness. No special gear is required.

Aquatic Surveys

Fish and water surveys are being conducted to improve knowledge of fish distribution and water conditions across the proposed project area. Surveys at each site will include electrofishing, stream site descriptions, and water sampling. Each site will take 45-90-minutes to complete. Access to most sites will be via helicopter with a relatively short walk to the stream (i.e. <300m). However, some sites may require hikes of up to 1km to get into.

Chest waders are required to participate in the fish and water surveys.

Required Field Gear for all projects includes:

- Sturdy hiking boots (second pair for when the first get wet is recommended)
- Rain gear
- Appropriate layers of clothes
- Personal first aid/survival kit
- Bug hat/insect repellent
- Hat
- Backpack or cruisers vest
- Bear spray (*Note that EDI does not permit firearms to be carried in the field or brought to a work site).

1.0 INTRODUCTION

Chance Oil and Gas Limited (Chance) (the "Proponent") is proposing to conduct routine maintenance on eight of its suspended wells near Eagle Plains, Yukon (the "Project"). Government of Yukon, Oil and Gas Branch (the "Regulator"), has notified Chance that well maintenance is required in order to maintain the suspended well status on four of the wells: NCY McParlon A-25, NCY Ehnjuu Choo B-73, NCY East Chance E-78 and NCY West Chance H-28. Wells Canoe River Chance J-19, Socony Mobil WM Blackie No 1 M-59, Socony Mobil WM Chance YT No 1 YT G-08, and Western Minerals Chance YT No 1 M-08 will also undergo maintenance work. A suspended well is considered a well that is not producing and has been safely secured. With a well in suspension, there is potential to restart production later. This differs from well abandonment where the well is permanently shut down, plugged, the well head is removed and is considered safe and secure by regulators (CAPP, 2019). The well maintenance activities will be executed within the confines of the Oil and Gas Drilling and Production Regulations (OGDPR). Well maintenance activities, also known as well workovers, generally include the following activities:

- Pressure testing to confirm integrity of the casing and well head valves;
- Removal of equipment in the well bores such as tubing and plugs;
- Wireline investigations to measure temperatures and cement integrity and to convey any perforating equipment;
- Remedial work such as cement squeezes; and
- Conducting a wellbore integrity analysis to determine possible well abandonment.

To mobilize maintenance equipment and crews to the well sites, the project will require re-establishment of the Chance and Blackie winter roads.

The proposal is being submitted to the Yukon Environmental and Socio-economic Assessment Board (YESAB) for an assessment under the *Yukon Environmental and Socio-economic Act* (YESAA). This is required in order to obtain the necessary permits and authorizations to perform the work.

1.1 Proponent Contact Information

The Proponent has retained Hemmera to prepare and submit the Project Proposal to the Dawson Designated Office (DO).

The Proponent contact information is:

Greg Charlie, Vice President
Chance Oil and Gas Ltd.
Suite 202, 208 Main Street
Whitehorse, Yukon, Y1A 2A9
Email: gcharlie@chanceyukon.ca
Phone: 867-456-7805

The Agent contact information is:

Andrew MacPhail, Project Manager
Hemmera Envirochem Inc.

230 - 2237 2nd Avenue
Whitehorse, Y1A 0K7 Yukon
Email: andrew.macphail@hemmera.com
Phone: 867-456-4865 ext. 717

The preferred method of communication for the Proponent and Agent is via email. The Agent authorization form has been submitted to the Dawson DO as part of the Project Proposal documents.

1.2 Location

The Project is located 30 to 70 km south of Eagle Plains Hotel, in northeast Yukon (**Figure 1-1**). The exploration wells requiring maintenance are detailed in **Table 2-1** and **Figure 2-1**.

Seven of the wells are located in the upper reaches of the Porcupine River watershed on the west side of the Dempster Highway and one is located in the upper reaches of the Peel River watershed on the east side of the Dempster Highway. The nearest watercourse to the wells located in the Porcupine watershed are McParlon Creek which has two tributaries framing the south and western sides of the Chance Significant Discovery License and Ehnjuu Choo Creek. The watercourse nearest the Blackie M-59 well is Dalgleish Creek which flows into the Ogilvie River. There are no water bodies (i.e., lakes or ponds) in the area of proposed activities.

The Dempster Highway transects the area and provides the all season access to the Blackie winter road, the Chance winter road, and the suspended wells at McParlon A-25 and Ehnjuu Choo B-73 which are located immediately adjacent to the Dempster Highway. The nearest outpost is the Eagle Plains Hotel and Highway Maintenance Base which is located approximately 30 to 70 km north of the locations where the workovers are planned to occur. (**Figure 2-1**).

The latitude and longitude coordinates for the proposed Project are:

NW:	66.20808719	(lat/northing)	-137.6280058	(long/easting)
NE:	66.21832565	(lat/northing)	-136.9320243	(long/easting)
SW:	65.96218433	(lat/northing)	-137.6037058	(long/easting)
SE:	65.97269282	(lat/northing)	-136.9164459	(long/easting)

Figure 1-1 Project Location

1.3 Regional Land Use Plans

The proposed Project is located within the boundaries of the North Yukon Planning Region and Peel Watershed Planning Region and is therefore subject to the North Yukon Land Use Plan and (NYLUP) Peel Watershed Land Use Plan (PWLUP). Locations of proposed Project activities are within Land Management Unit (LMU) 9 of the NYLUP and LMU 7 of the PWLUP. (**Table 1.1**). Both are located within the Eagle Plains basin, with the highest potential for oil and gas development. Details regarding how the Project will meet the requirements of the Northern Land Use Plan and Peel Watershed Land Use Plan is provided in **Section 7.5** and **Table 7.2**.

Table 1.1 Landscape Management Units Overlapping the Project

Landscape Management Unit Number	Landscape Management Unit Name	Integrated Management Area (IMA)
9 (NYLUP)	Eagle Plains	4
7 (PWLUP)	Dalglish Creek	4

1.3.1 First Nations and Indigenous Groups

The proposed Project is located in the following First Nations and Indigenous groups' traditional territories (**Figure 1.1**):

- First Nation of Na-Cho Nyäk Dun (FNNND)
- Tetlit Gwich'in Council (TGC)
- Gwich'in Gwich'in Tribal Council (GTC)
- Vuntut Gwitchin First Nation (VGFN)

Vuntut Gwitchin First Nation (VGFN) and Tetlit Gwich'in Council (TGC) are Gwich'in First Nations that have traditionally used and occupied lands in the Northwest Territories and the Yukon, and are linked by close cultural and linguistic (Athapaskan) traditions. VGFN are based in Old Crow, Yukon, while the TGC are based in Fort McPherson, Northwest Territories. The Gwich'in Tribal Council (GTC) is an Indigenous organization based in Inuvik, Northwest Territories. The GTC holds rights under Section 35 of the Constitution Act, 1982, Treaty 11 and the Gwich'in Comprehensive Land Claim Agreement (GCLCA),– Yukon Transboundary Agreement (YTA). Under the GCLCA, GTC is the body responsible for representing the collective rights of GCLCA participants, including all Tetlit Gwich'in as defined in the YTA. Yukon lands of the TGC are identified in the YTA as the Primary Use Area and the Secondary Use Area lands.

The proposed Project area is immediately north of the Tr'ondëk Hwëch'in First Nation Traditional Territory and Settlement Land. The Tr'ondëk Hwëch'in (TH) are a Yukon First Nation based in Dawson City, Yukon. They are descendants of the Hän-speaking people and are a diverse mix of families descended from Gwich'in, Northern Tutchone, and other language groups. The First Nation of Na-Cho Nyäk Dun (FNNND) are a Yukon First Nation based in Mayo, Yukon. They are also of the Northern Tutchone language and cultural group.

1.3.2 Yukon Environmental and Socio-Economic Assessment Act (YESAA) Triggers

The proposed Project requires an evaluation by a Yukon Environmental and Socio-economic Assessment Board (YESAB) Designated Office (DO) because:

1. The project location is in the Yukon;
2. The *Assessable Activities, Exceptions and Executive Committee Projects Regulations* identifies several triggers for the Project including:
    a. Schedule 1, Part 3, Oil and Natural Gas, Item 2:

    On other than an Indian reserve, drilling, operation, modification, decommissioning or abandonment of, or other activity in relation to, an oil or natural gas well or seismic shot hole, but not including a hole drilled to obtain geological information.

    b. Schedule 1, Part 13, Miscellaneous, Item 13:

    On Crown land or settlement land, levelling, grading, clearing cutting or snow ploughing of a route that provides access to land for the purposes of a geophysical, geological or engineering survey.

3. An authorization by a government agency is required for the activities to be undertaken.

The Project is located near Eagle Plains, Yukon and it is understood that the Dawson Designated Office will carry out the evaluation.

1.4 Permits and Licenses / Regulatory Requirements

Chance currently holds the following licenses and approvals from previous activities at the Site:

- Type B Water Licence (MN12-061-1)

To complete the Project the following approvals are required.

- Air Emission Permit
- Land Use Permits
- Dempster Highway Authorization Permit
- Storage Tank Permit
- Waste Management Permit
- Work within Highway Right-of-Way Permit

1.5 Alternatives

Currently there are no alternatives being considered. The proposed well maintenance work has been directed by the Government of Yukon and is designed in accordance with Part 7 of the OGDPR. Alternative technologies and methods for accessing the well sites are also not feasible. Winter access and work are being proposed in order to reduce and eliminate potential effects to various valued components (e.g., permafrost, vegetation, etc.) and has been designed according to best practices and Government of Yukon standards. Other means of access such as helicopter supported are not feasible during winter and low light conditions for personnel health and safety considerations.

2.0 PROJECT DESCRIPTION

2.1 Project Activities

This section provides an overview of the proposed Well Maintenance Program. There are two main components to the Project that include:

- Routine maintenance of suspended wells (well workover); and
- Re-establishment of the Chance winter road and Blackie winter road.

The well maintenance activities proposed are being conducted in order to satisfy a direct order from Government of Yukon, Oil and Gas Branch. Accessory activities, such as construction and re-establishment of the winter roads, is required to access the suspended well sites and complete the maintenance of each well. A letter outlining the order from the Government of Yukon, Oil and Gas Branch is provided in **Appendix A**. Locations for each of the wells is provided in **Table 2.1** and **Figure 2-1**.

2.2 Well Maintenance

The following section describes the work proposed at each of the wells. Each of the wells is deemed suspended by the *Yukon Oil and Gas and Drilling Production Regulations* (OGDPR) (is not producing and safely secured). Well maintenance is required to continue to meet the OGDPR suspended well status regulations. Well servicing equipment may include a service rig, wireline truck and cementing trucks along with the associated support equipment. All equipment will be mobilized to each of the wells on a sequential basis (one at a time) to complete the required maintenance work (downhole suspension, wellbore fluid replacement, replace substandard equipment). The eight wells that require maintenance include:

- Socony Mobil WM Blackie No 1 M-59 (M-59);
- Western Minerals Chance YT No 1 M-08 (M-08);
- Canoe River Chance YT J-19 (J-19);
- Socony Mobil WM Chance YT No 1 YT G-08 (G-08);
- NCY McParlon A-25 (A-25);
- NCY Ehnjuu Choo B-73 (B-73);
- NCY West Chance H-28 (H-28); and
- NCY East Chance E-78 (E-78).

A detailed description of the planned maintenance activities at each well is summarized in the following sections. A summary of the activities at each well is provided in **Table 2.2**.

Table 2.1: Well Locations

Well Name	Location	
	Latitude	Longitude
Socony Mobil WM Blackie No 1 YT M-59	65° 58’ 54.93.9” N	137° 18’ 58.2” W
Western Minerals Chance YT No 1 M-08	66° 07’ 46.0” N	137° 31’ 27.3” W
Canoe River Chance YT J-19	66° 08’ 31.0” N	137° 32’ 27.0” W
Socony Mobil WM Chance YT No 1 YT G-08	66° 07’ 18.1” N	137° 30’ 50.8” W
NCY McParlon A-25	66° 04’ 10.3” N	137° 18’ 58.2” W
NCY Ehnjuu Choo B-73	66° 12’ 10.3” N	136° 59’ 01.5” W
NCY West Chance H-28	66° 07’ 29.8” N	137° 34’ 05.6” W
East Chance E-78	66° 07’ 18.5” N	137° 14’ 46.8” W

2.2.1.1 Legacy Wells

Legacy wells were drilled by other operators from 1959-1968,and are located on Significant Discovery Licenses Blackie (021) and Chance (022).The Legacy wells requiring maintenance include:

- Socony Mobil WM Blackie No 1 YT M-59
- Western Minerals Chance YT No 1 M-08
- Canoe River Chance YT J-19, and
- Socony Mobil WM Chance YT No 1 YT G-08

A pressure test is conducted to ensure the integrity of the wellhead and the existing casing in the wellbore. The well will then undergo surface casing vent flow and gas migration testing. Surface casing vent flow (SCVF) is a condition where fluid or gas is flowing from the surface casing vent assembly. A well that has a leak, or a well integrity problem may exhibit signs of SCVF. Gas migration tests are conducted to determine if the well has a gas migration problem. For the purpose of this test, gas migration can be defined as the movement of gas from a subsurface zone to surface through a barrier that should prevent its movement, whether this barrier is natural (overburden, shale) or artificial (cement sheath, external casing packed, pipe joints etc.). It should be noted that during annual inspections, no SCVF has ever been detected. If there is evidence of surface casing vent flow the well will be logged with a variety of tools (e.g., noise tool, temperature tool, bond log tool) to determine the source of the surface casing vent flow and/or gas migration. The logs will be analyzed and a plan will be formulated to complete a downhole shut off at the source of the surface casing vent flow and/or gas migration.

Once the pressure testing, surface casing vent flow testing and gas migration testing is complete, the service rig, support equipment and wireline will be moved to the wellsite. A blowout preventer (BOP) will be installed on the well. Blowout preventers are specialized pressure-control equipment attached to the wellhead to seal, control and monitor oil and gas wells to prevent the uncontrolled release of crude oil or natural gas while operations are occurring on the well. A temperature log will then be conducted to a depth of 300 meters below Kelly bushing (mKB). The temperature log is interpreted by looking for anomalies, or departures, from the reference gradient. This reference gradient might be the geothermal gradient, a log recorded before production or started, or a log recorded with the well shut in. Most anomalies are related to the entry of fluids into the borehole or fluid exit into the formation. Following the temperature log, a cement bond log will be run. The cement log is a log that uses the variations in amplitude of an acoustic signal travelling down the casing wall between a transmitter and receiver to determine the quality of cement bond on the exterior casing wall. The fundamental principal is that the acoustic signal will be more attenuated in the presence of cement than if the casings were uncemented. The cement log is used to identify sections of the well bore that will need interventions to isolate porous formations from adjacent formations.

To isolate a formation from an adjacent formation, the casing will be perforated at the appropriate depth with a wireline conveyed perforating gun. Tubing will then be used to inject cement through the perforations in sufficient quantity to ensure adjacent formations are isolated from each other, at which point pressure will be applied from surface to force the cement into the perforations. Once the cement has cured, the cement will be pressure tested as per the Yukon Oil and Gas and Drilling Production Regulations. The process is then repeated until all formations are isolated from one another and pressure tested. The isolation operations will begin with the deepest non-isolated formation and progress to the shallowest non-isolated formation. Once all the testing/isolation procedures are complete, the tubing will be pulled from the

well, a new well head assembly will be installed, and the well head will be pressure tested once more. The service rig and all support equipment will then be removed from the site.

Additional activities at M-59 include installation of a wellhead that conforms to the OGDPR regulation. In addition, for G-08 and J-19, the tubing and packer will be removed during the workover following completion of gas migration testing.

2.2.1.2 Modern Wells

The modern wells were drilled by Chance/Northern Cross in 2012-2013. The modern wells requiring maintenance include:

- NCY McParlon A-25
- NCY Ehnjuu Choo B-73
- NCY West Chance H-28, and
- NCY East Chance E-78

A pressure test is conducted to ensure the integrity of the wellhead and the existing casing in the wellbore. The well will then undergo surface casing vent flow and gas migration testing. SCVF is a condition where fluid or gas is flowing from the surface casing vent assembly. A well that has a leak, or a well integrity problem may exhibit signs of SCVF. Gas migration tests are conducted to determine if the well has a gas migration problem. For the purpose of this test, gas migration can be defined as the movement of gas from a subsurface zone to surface through a barrier that should prevent its movement, whether this barrier is natural (overburden, shale) or artificial (cement sheath, external casing packed, pipe joints etc.). It should be noted that during annual inspections, no SCVF has ever been detected on any of the wells. If there is evidence of surface casing vent flow the well will be logged with a variety of tools (e.g., noise tool, temperature tool, bond log tool) to determine the source of the surface casing vent flow and/or gas migration. The logs will be analyzed and a plan will be formulated to complete a downhole shut off at the source of the surface casing vent flow and/or gas migration.

A temperature log will then be conducted to a depth of 300 meters below Kelly bushing (mKB). The temperature log is interpreted by looking for anomalies, or departures, from the reference gradient. This reference gradient might be the geothermal gradient, a log recorded before production or started, or a log recorded with the well shut in. Most anomalies are related to the entry of fluids into the borehole or fluid exit into the formation. Following the temperature log, a cement bond log will be run. The cement log is a log that uses the variations in amplitude of an acoustic signal travelling down the casing wall between a transmitter and receiver to determine of the quality of cement bond on the exterior casing wall. The fundamental principal is that the acoustic signal will be more attenuated in the presence of cement than if the casings were uncemented. The cement log is used to identify sections of the well bore that will need to be hydraulically isolated.

The wellbore fluid will be sampled and tested to determine if the fluid meets the OGDPR regulations. After the wellbore fluid is tested and if necessary, a service rig may be moved in to replace the well fluid to conform to the Yukon Oil and Gas and Drilling Production Regulations 99(a) and 99(b). A wellbore fluid test is a test or series of tests, performed to check that no undesirable reactions occur with a specific fluid. The testing process may include checks for compatibility with other treating fluids, wellbore fluids, reservoir fluids, and the reservoir formation. The removed fluid from the wellbore is anticipated to be recycled and

used in the well to meet OGDPR Part 7 Section 99 requirements. If it can't be recycled the fluid will be transported to and disposed of at a permitted waste disposal site. No other activities are anticipated at these wells.

2.2.1.3 Wellbore Integrity Analysis

To determine if a well will be abandoned, the wellbore integrity will be analyzed to determine the suitability of the well for future use. The wellbore integrity analysis will include:

- Pressure testing of the wellhead and casing;
- Bit and scraper run on tubing to ensure the wellbore is still full drift;
- Analysis of the cement behind the production casing and/or liner casing with a cement bond log tool to determine the cement quality;
- Geological analysis to determine what formations need to be isolated after the cement analysis;
- Sampling of wellbore fluid on the wells (if necessary); and
- Location of the well with respect to the other wells which remain.

The wellbore integrity analysis is required to formulate the final plan for each of the wellbores. The analysis will determine if any the following are required:

- No action;
- Cement squeezes to isolate formations from other formations in accordance with OGDPR Part 7 Section 95(1)(b);
- Casing patches to repair any casing breaches found;
- Cement plugs and/or bridge plugs set to suspend or abandon producing formations in accordance with OGDPR Part 7 Section 97 (1) and Section 97 (2); and
- Surface abandonment in accordance with OGDPR Part 7 Section 96.

Cement squeezes, if required to isolate a formation to satisfy OGDPR Part 7 Section 95(1)(b), will entail perforating an interval close to the formation top and squeezing arctic compatible cement in to the annular space between the production casing and the formation face to create a cement sheath that will isolate the formation from other formations above it in the wellbore. The cement squeeze and remaining plug left in the wellbore will conform to the requirements set out in OGDPR Section 98 (1)(b) and Section 98(2) and location of the remaining cement plug will be located afterwards with the method of setting down on the cement plug with a minimum 90 kN force with the cementing string after 12 hours as set out in OGDPR Section 100(1)(b). Fluid in the wellbore may have to be replaced in a wellbore if it does not meet the requirements of OGDPR Part 7 Section 99.

2.2.1.4 Equipment

Equipment required for well maintenance is described below in **Table 2.3**. Equipment will be stored on site mainly on trucks and flatbed trailers. Some items such as the boiler and cement tanks will be placed on the ground on skids.

Table 2.3: Equipment and Infrastructure components

Quantity	Component	Description
	Re-establishment of Winter Road	
Multiple as needed	Construction Equipment	Challenger cats, D6 cats, snow cats, graders, snow making equipment, water trucks and with drags (small trailer pulled behind truck) will be utilized during the initial phase of the project to prepare the roads and well pads for the operations
	Mobilization and Demobilization for Well Maintenance	
6	8' x 40' mats	These can be wooden or steel mats placed on the ground in an interlocking manner for the service rig and connected equipment to sit on.
1	Skid Service Rig Structure (likely 32-40 wheeled loads)	Components required to service the well, including: • Sub-structure, or base, to which the derrick (i.e., framework to support drilling apparatus) is fixed • Derrick that supports the draw works and handling equipment • Draw works that lifts and lowers the handling equipment in the derrick/mast to run pipe in and out of the hole • Blowout preventers, which are pressure control equipment that can hydraulically shut in a well in the event of unplanned influxes of formation fluids into the wellbore
1	Skid Dog House	Skid mounted unit which contains a generator for supplying power to the rig, an office and change rooms for the crew, and a hydraulic control system to operate the BOP stack remotely
1	Skid Pump	Skid mounted unit which contains a pump to provide hydraulic pumping power to pump fluids in to the wellbore (same as pumps below)
1	Skid Tank	Skid mounted fluid storage tank for the service rig. Can store fluid to be pumped in to the wellbore or store fluid which is pumped out of the wellbore.
1	Skid Boiler	Used extensively in very cold and Arctic climates for preventing equipment and fluids from freezing.
1	Junk Skid	This is skid mounted trailer with an inventory of spare parts and equipment used during the well maintenance work
1	Catwalk and Pipe Racks	These are used for the storage of tubing or tools which is removed from or to be ran in to the wellbore and for picking up / laying down tubing or tools.
1	Enclosed Trailer (chemicals, tools, etc)	Dry storage trailer to keep tools, and chemicals to be used during the operations
5	Baskets of Tools	Tools used in the operation of the service rig
350	Tubing Storage: Joints of 73.0 mm, L-80, 9.67 kg/m tubing (9.5 m average length)	Tubing will be stored on location until required to be run in the hole.
1	Super Single Shack	Skid mounted office and accommodation for wellsite supervisors
3	20 kw Generator / Light towers, miscellaneous equipment	Light towers will be required on the wellsites as the operations will run 24 hours a day

Quantity	Component	Description
2	400 bbl tanks	These are skid mounted cylindrical steel tanks about 10 feet in diameter and stand about 20 feet high used for the storage of fluid
1	Miscellaneous Equipment	Additional equipment brought up on a trailer to be used in the operation of the service rig (example – downhole tools, fan heaters, etc.)
1	Skidded Office/Medic Trailer	Essential personnel trailers which serve as offices. All office trailers will have self-contained sewage storage and sewage will be moved periodically to the sewage lagoon at the Chance camp at Km 324.
1	Fuel Storage	Fuel for use for equipment including service rig, pumps, generators, etc. Bulk fuel will be staged at the Chance camp at Km 324 and daily needs will be distributed via pickup trucks with slip tanks during crew changes.
1	Tank Truck	Used to transport fluid to the service rig during operations (mainly fresh water)
1	Vacuum Truck	Used for removal and transportation of wastewater and sewage from the medic/first aid trailer for disposal.
1	Cement Bulker	Cement storage and mixing for use in wells.
1	Cementing Unit	Unit used top pump cement in to the wellbore during the required cementing operations
1	Cement Bins	Large tanks, normally upright, fully enclosed and pressurized, where cement products are stored. Cement is pneumatically pumped from the tank into the cementing unit.
1	Wireline Unit	Unit to convey tools into the wellbore on wire rope to allow for analysis of the casing integrity, setting of bridge plugs and perforating of the casing
1	Slickline Unit	Unite to convey tools into and out of the wellbore on steel wire to allow for the pulling or setting of bridge plugs in the tubing
1	Pumps	Pumps used to circulate the fluid down the pipe, around and up the annular space between the pipe and the casing to surface.
1	Main Workover Fluid Storage	Location where all the fluid additive materials are stored. Normally these materials are delivered on pallets neatly stacked and shrink wrapped to protect them during the truck journey north.
1	Flare Tank and Flare	Flare used to burn combustible gas from the well. The flare tank is a reservoir to ensure the flare does not starve of combustible gases. Flaring is only planned in the unlikely event the wells that have perforated intervals require depressurization prior to the planned workover operations. The flaring cannot be scheduled in an operation as it may or may not be required depending on the circumstances encountered. The flare stack will be a minimum of 18 metres off the ground.
1	Water Storage and Water Treatment	Water storage tank and treatment containers to provide potable water for the rig crew and personnel.
6-10	1/2 Ton Trucks	Pickup trucks will be used for transportation of work crews, fuel and other supplies between the camp/Eagle Plains Hotel and the wellsites.
	Throughout Project	
1	Cement Bulker (2 -3 times throughout project)	A transport truck to deliver cement to the sites for cementing operations
1	Fuel Tank Bulker (7-8 times throughout project)	A transport truck to deliver fuel (diesel and gasoline) to site to be used for fueling equipment on the sites.

2.2.2 Winter Road Construction

2.2.2.1 Site Access

The Project is accessed via the Dempster Highway. Wells H-28, J-19, M-08, G-08 and H-28 will be accessed by re-establishing the Chance winter road. Wells A-25 and B-73 are located immediately adjacent to the Dempster highway, and already have access with rig matting in place. Well M-59 will be accessed by re-establishing the Blackie winter road. The Blackie winter road is approximately 6.5 km in length and approximately 8-10 m in width. The Chance winter road is approximately 25 km long and 8-10 m in width (**Figure 2.1**). The total surface area of the both the Chance winter road and Blackie winter road is approximately 1,875 m^2. The footprint at each wellsite is anticipated to be approximately 100 m x 100 m (1 Ha) with the wellhead at the centre. Exact dimensions of the well sites are dependent on topography and may not be exact squares but will cover an area approximately 1 Ha (e.g., 125 m x 80 m).

2.2.2.2 Winter Road Construction Methods

Winter road construction will utilize similar techniques as previously applied by Chance in previous assessments (YESAB # 2006-0237, 2006-0285, 2007-0219, 2008-0047 and 2012-0140). Before any winter road construction will proceed, a minimum snow depth of 10 cm will be verified to ensure there is sufficient snow cover to protect the ground surface from tires or tracks of vehicles. To promote snow compaction in the early winter, the Chance winter road and Blackie winter road will be driven with snowmobiles and snowcats in late fall/early winter. Priority will be given to re-establishing the Chance winter road first and the Blackie winter road second. This is because there are four wells to access from the Chance road and no overgrowth limiting access, while there is only one well to access from the Blackie winter road, which is more overgrown and requires the development of a substantial snowpack. This will allow more time for the snowpack to develop at the Blackie winter road. Upon construction, if the snow depth (minimum of 10 cm) is not sufficient in certain areas, additional snow will only be collected from areas where a surplus of snow is available or from areas where there is no potential for disturbance to the surrounding environment. These areas may include depressions where significant amounts of snow have accumulated. Snow will only be removed where 10 cm of base will remain compacted to protect surface vegetation. Alternatively, as done in previous years, additional snow may be removed from the Chance camp laydown area (approximately 13 Ha area). Only clean snow, free of deleterious substances, will be used for winter road re-establishment.

Once the snow depth is adequate (i.e., 10 cm or greater in depth without compaction), vegetation along the routes will be cleared using a bulldozer and mulcher. The bulldozer blade will be raised off the ground such that it does not cut the tops of hummocks, tussocks or high spots. The vegetation removed will be mulched with a track mounted mulcher and distributed on the road. Any trees or large brush encountered will be removed at the ground surface using a mulcher to avoid tearing the surface organic layer thereby reducing the chance of thawing ice-rich mineral soil beneath. The mulch helps keeps the soil in place while protecting the root system of ground-cover plants and natural grasses. The likelihood of large trees or brush is low on the Chance winter as the road was last used in April 2014. Where it is safe and practical, standing live or dead trees along the route that provide wildlife habitat will be saved.

Following vegetation removal, the surface of the road will be constructed using accumulated snow to construct berms on the road margins and filling the space at the roads edge with snow and water trucked from approved sources. A combination of snowcats and bulldozers using drags will be used to push and

compact the snow along the access routes. To ensure the roads ability to safely support the service rig and other heavy loads, all construction activities will be supervised by a qualified geotechnical engineer.

The same methods will be utilized to establish well sites and clear any vegetation surrounding the well site for equipment and site infrastructure.

2.2.2.3 Water Withdrawal

Water for the service rig and winter road icing will be primarily sourced from existing withdrawal locations on the Eagle River, with locations on the Ogilvie River as an alternative source. The Eagle River is preferred due to its closer proximity to Chance's operations, with the Ogilvie River being more convenient for the Socony Mobil WM Blackie No 1 (M-59) and NCY McParlon (A-25) operations. No more than 100 m³ of water will be withdrawn daily. All water withdrawal will be conducted following Department of Fisheries and Oceans (DFO) Freshwater Intake End-of-Pipe Fish Screen Guidelines (DFO 2020).

2.2.2.4 Maintenance

Maintenance of winter access routes may include low ground pressure vehicles (e.g., snowcats), a road grader equipped with a wing snow plow and some water application. Grading may be required over certain stretches and depressions along the roads filled with snow, to smooth the surface.

In the event that natural snowfall is below the minimum required depth to construct and maintain the winter roads, snow making may be used to make up the shortfall. This is a contingent consideration and could require up to 100 m³ of water per day for a short period of time (a few days to a week). The sources of water include the Eagle River and the Ogilvie River. The water to be used to make snow and ice the winter road(s) will be trucked from the source to the point of use. The actual number of trucks being used will be less since a truck can probably complete 1 to 3 deliveries per day. Generally low snowpack is only an issue during the early part of winter so this provision would only apply on a contingent basis during the months of November, December and January. The timing for making artificial snow will depend on how late in the winter season winter road construction begins. If, for example, in late December there is little or no snowfall or snow accumulation on the ground, snow making could ensure a sufficient snow base to commence winter road construction. Snow can only be made when the ambient temperature drops to zero degrees centigrade.

2.2.2.5 Equipment

Equipment will be required for clearing, grading, water transport, and material transport. Light equipment for personnel, fuel and other supply transport will be required periodically during construction and well maintenance.

It is anticipated that Challenger cats, D6 cats, snow cats, graders, snow making equipment, water trucks and drags will be the primary construction equipment. Pickup trucks will be used for transportation of work crews, fuel and other supplies. Water trucks will be used for transport of water from the Eagle River and the Ogilvie River to the Project. Flatbed trailers would be used to transport equipment and larger supplies.

2.2.3 Access Control

Chance understands that increased winter access into the area is of significant concern to First Nations and Indigenous Groups, local residents, trappers and outfitters. Chance has safety concerns regarding unauthorized users due to the potential for sour gas (H_2S) to be present at some wells, and the use of narrow access routes. Additionally, Chance cannot allow the use of firearms in areas where crews are working to ensure safety of their crew. These access routes will be radio controlled by Chance to ensure authorized personnel gain unobstructed access, but this could be adversely impacted by the presence of unauthorized users. To address concerns related to access (e.g., increased use and ease of access, increased hunting, public safety, and safety of Chance personnel) gates will be placed at the junction of the Blackie and Chance winter roads with the Dempster Highway. The gates will be constructed of heavy materials and located such that there are obstacles on either side as much as possible (e.g., heavy forest) to restrict vehicle access.

2.2.4 Anticipated Road Use

The majority of the traffic volumes include mobilizing the service rig and site infrastructure, the setup of the service rig will take approximately one day to complete at each well site. A total of approximately eleven flatbed truck loads will be required to mobilize equipment into each well site. Once a site is established (i.e., maintenance equipment set up), traffic will include approximately 1-2 pickup trucks (for supplies and personnel), 1 water truck and one fuel truck. The fuel and water trucks will come to the project site approximately every three days or as demand dictates.

All vehicles will be equipped with radio communication and any traffic on the roads will be radio controlled. Unauthorized vehicles will not be allowed on the winter roads and the roads will be restricted from public access.

2.2.5 Reclamation

The Project proposes to re-establish the Blackie winter road to one existing well site (M-59), and the Chance winter road for J-19, M-08, G-08 and H-28. Wells A-25, E-78 and B-73 are located immediately adjacent to the highway, and already have access with rig matting in place and/or pre-existing cleared area as a borrow pit or Chance's Base Camp.

Reclamation activities will aim to return the site as closely as possible to its pre-project condition. These activities are intended to effectively:

- Leave the site clean following project completion;
- Remove all garbage, petroleum products, and equipment; and
- Prevent long-term erosion/slumping and promote successful natural revegetation of disturbed areas.

Given the winter road construction methods employed (i.e. allowing for 10cm of snow cover before building the winter road) it is not anticipated that additional reclamation is required for the winter roads. As discussed in **Section 2.1.3**, access to each of the roads will be restricted during operations and following the completion of the proposed activities. This will ensure that the road can fully melt, without any potential for more disturbance from outside users. It is less harmful to leave the road to melt in the spring.

2.2.6 Camp Facilities

Chance anticipates using the Eagle Plains Hotel for housing workers for the Project. The Eagle Plains Hotel, located at kilometer 371 of the Dempster Highway, has been operating since the late 1970's and provides a variety of services including hotel facilities, accommodations (64 people during peak use), restaurant, lounge, public washroom, laundromat and service garage. The hotel is a recognized tourist destination and provides support services to the Government of Yukon, Department of Highways and Public Works, Eagle Plains Maintenance Camp.

Chance's existing camp, office and storage yard was established in October 2011 and is located at km 325 of the Dempster Highway. It is accessible year-round by vehicle unless the highway is closed due to weather or construction. For this Project, Chance plans to utilize the camp for storing and transporting equipment and supplies needed for operations, but Chance personnel will not stay at the camp, and will instead utilize the Eagle Plains Hotel.

Approximately 7-12 fixed wing flights over the course of the entire project, with up to 2 flights per week, will be required for shift changes. Flights will be privately chartered from Edmonton to Inuvik and then to the Wiley airstrip located at km 389.5 of the Dempster highway or the Chance Camp airstrip, located at km 325 of the Dempster highway.

A small medic/first aid trailer equipped with a heater may be installed at the wellsite being where work over operations are occurring to provide refuge for workers and essential first aid supplies. Sewer facilities and water will be available in the trailer. All wastewater and sewage will be collected in CSA approved tanks and transported offsite for disposal at an approved facility in Fort McPherson.

2.2.7 COVID-19 Safety Considerations

Coronaviruses are a large family of viruses found mostly in animals. In humans, they can cause diseases ranging from the common cold to more severe diseases such as Severe Acute Respiratory Syndrome (SARS) and Middle East Respiratory Syndrome (MERS). The disease caused by the new coronavirus has been named COVID-19.

While many of the characteristics of COVID-19 are still unknown, mild to severe illness has been reported for confirmed cases. Common symptoms for COVID-19 are:

- Fever
- Cough
- Sneezing
- Sore throat
- Difficulty breathing

Coronavirus is transmitted via larger liquid droplets when a person coughs or sneezes. The virus can enter through these droplets through the eyes, nose or throat if you are in close contact. The virus is not known to be airborne (e.g., transmitted through the particles floating in the air) and it is not something that comes in through the skin. It can be spread by touch if a person has used their hands to cover their mouth or nose when they cough.

Droplet Contact: Some diseases can be transferred by large infected droplets contacting surfaces of the eye, nose, or mouth. For example, large droplets that may be visible to the naked eye are generated when a person sneezes or coughs. These droplets typically spread only one to two metres and are too large to float in the air (i.e., airborne) and quickly fall to the ground. Influenza and SARS are two examples of diseases capable of being transmitted from droplet contact. Currently, health experts believe that coronavirus can also be transmitted in this way.

Airborne transmission: This occurs when much smaller evaporated droplets or dust particles containing the microorganism float in the air for long periods of time. Currently, health experts believe that coronavirus cannot be transmitted through airborne transmission.

At present, COVID-19 is a public health emergency in Yukon. Guidelines for ensuring public safety have been established by the Chief Medical Officer of Health for Yukon. These guidelines include physical distancing, enhanced cleaning, infectious disease control strategies, and hand hygiene. The state of the pandemic and the responding guidelines are rapidly evolving and will be monitored and followed throughout the duration of the Project.

The camp utilized for Project activities and the Eagle Plains Hotel used for crew housing will follow all guidelines including physical distancing and sanitization procedures to ensure a healthy environment for workers. The Eagle Plains Hotel currently abides to all guidelines established by the Chief Medical Officer of Health for Yukon. Crew members will be provided with up to date information regarding the current state of the pandemic and the procedures in place to address it while they are at camp. A screening procedure conducted prior to a worker's arrival at the Eagle Plains Hotel will include questions related to symptoms, travel, and known interaction with an infected person. Face masks will be worn during air travel to the site. Crew members who fail the pre-screening will not be permitted to travel to site. As per the Yukon Government guidelines, only staff arriving from outside British Columbia, Yukon, Northwest Territories and Nunavut will be required to self-isolate prior to their travel to site. During the duration of construction, daily screening, including temperature checks, will occur and workers will be instructed to monitor and report any symptoms they may develop. In the event that a crew member reports a COVID-19 symptom, they will be isolated until a COVID-19 test result can be confirmed. Confidential documentation of Project information including crew member names, arrivals and departures details, and worker origin will be kept.

2.2.8 Fuel Storage

A draft Spill Response Plan is available in **Appendix B**. The plan will outline the procedures to be followed in the event of a petroleum product spill during all phases of the project. Safety procedures for personnel and proper equipment usage during such operations will be discussed in the plan

Fuel will be stored in portable tanks (i.e., slip tanks) and tanker trucks and will not exceed 8000 litres in aggregate. Fuel storage will only occur during periods necessary for the road construction and well maintenance and will be removed upon completion. All fuel caches will be located a minimum of 60 m from the high water mark of any nearby watercourse. Fuel will be transported in tidy tanks or by tanker truck, as required. A fuel spill contingency plan will be posted at all storage areas and fueling stations.

The fluid additive materials will be stored in the Chance lay down yard located at km 325 of the Dempster Highway. They will be stored in a dry trailer/s in their original packaging. The cement will be transported to site in a bulk trailer and left at the lay down yard. Fluid additive materials will include:

- Potassium Chloride (KCL)
- Fluid Inhibitor
- Cement

2.2.9 Waste Management

All garbage and recyclable materials will be taken off site and disposed of at a licensed disposal facility.

Once all the testing/isolation procedures are complete, the tubing will be pulled from the J-19 and G-08 wells. If it is deemed that it is still usable, it will be stored at Chance's camp and if not, it will be transported to approved disposal facilities in Yukon, Alberta or British Columbia. Cement waste and wastewater will be collected and transported to an approved disposal facility.

2.3 Project Schedule / Temporal Scope of Activities

Construction of the winter roads and well maintenance is anticipated to occur during the winter of 2020/2021. Initial site visits would occur in late November or early December of 2020, timed to meeting the minimum snowpack, to pack the access routes with snowmobiles. Winter road construction is anticipated to occur in late December to February. Well maintenance activities are anticipated to take approximately up to 70 days to complete the work at all eight wells. It is anticipated that well maintenance activities will commence in February and be completed by mid-April.

3.0 SUMMARY OF CONSULTATION

The Proponent recognizes the importance of consulting affected First Nations governments prior to making decisions about the Project.

3.1 Potentially Affected Parties

The Project and all proposed Project activities are located within the traditional territories of the Vuntut Gwitchin First Nation and the First Nation of Na-cho Nyäk Dun, as well as the Tetlit Gwich'in Secondary Use Area of the Gwich'in Settlement Region. The proposed Project is also located to the north of Tr'ondëk Hwëch'in Traditional Territory.

Based on the location of the Project within a First Nation's Traditional Territory and/or the proximity of the Project to a First Nation's Traditional Territory (with the potential for indirect effects), the project team identified the following First Nations as potentially affected parties:

- Vuntut Gwitchin (VG)
- First Nation of Na-Cho Nyäk Dun (FNNND)
- Gwich'in Tribal Council (GTC)
    - Tetlit Gwich'in Council (TGC)
- Tr'ondëk Hwëch'in (TH)

Engagement activities were designed to inform potentially affected parties of the proposed Project, and to provide those parties with a reasonable opportunity to engage the project team, to learn about the proposed Project, and to provide input or feedback. Chance's approach to engagement was guided by existing

engagement and communications plans that Chance has with each of the potentially affected First Nations that are identified above.

3.2 Summary of Engagement Activities

The following sub-sections provide brief summaries of engagement activities with each potentially affected First Nation.

3.2.1 Initiation

Written communication was sent via email to FNNND, GTC (including TGC), and TH in order to initiate engagement. Initial communication packages for these First Nations included a high-level overview of the proposed Project (e.g., project activities, components, goals and outcomes), the regulatory submissions Chance would be making, a brief introduction to Hemmera and it's role, as well as the request to discuss any concerns the affected party may have and the offer to arrange a conference call should they so desire. Also included was a 4-page project summary and map of the Project Location.

A distinct communication package was sent via email to initiate engagement activities with VG. This package was structured in accordance with protocols outlined in the *Vuntut Gwitchin Government Oil and Gas Engagement Policy*. As such, this package included an earlier draft of the Project Description dated May 22, 2020.

3.2.1 Vuntut Gwitchin

Initial notification was sent to VG's Director of Natural Resources on May 25, 2020. VG and Chance organized a conference call July 9, 2020 wherein VG requested a high-level overview of the proposed Project. VG asked Chance questions in order to attain additional information for the First Nation to complete their review of the draft Project Description dated May 22, 2020. To assist Chance in preparing meeting materials for the July 9th meeting, VG provided an agenda and questions ahead of time. On July 10, 2020, VG provided Chance with formal information requirements related to the proposed Project. Themes raised by VG included:

- Requiring additional information on mitigation measures to avoid or minimize potential environmental effects (specifically with respect to Porcupine Caribou)
- Requiring additional information on the regulatory context
- Requiring additional details on well tests (e.g., vary tests between the wells, how would Chance address evidence of gas migration, what would be done with removed fluid) and project components (e.g., what materials would be stored on site, what materials will be incinerated, vehicles planned to be used)
- Requiring additional information on water withdrawal (e.g., sources, volume, schedule)

The additional information requested by VG was drafted and refined during the effects assessment and development of the Project Proposal. However, feedback from VG impacted the development of mitigation measures and contributed to identifying information that was previously inadequate in the earlier draft project description and the project proposal as a whole (e.g., additional information on the regulatory context, additional information on the rationale for maintaining the wells in suspended well status versus abandonment).

Chance responded to VG, in the format requested, on July 22, 2020. This document can be provided upon request.

A draft of the Project Proposal was shared with VG July 22, 2020.

In the coming weeks Chance will be initiating discussions with VG in order to meet requirements under section 68 of *YOGA* (i.e., benefits agreements).

3.2.2 First Nation of Na-cho Nyäk Dun

Initial notification was sent to FNNND May 25, 2020. Additional communications followed June 9th, June 24th, and July 20th. Chance did not receive feedback from FNNND while the Project was being refined and the Project Proposal was being drafted. A draft of the Project Proposal was shared with FNNND July 24, 2020.

Chance looks forward any feedback FNNND may provide in the future and to initiating discussions with FNNND in order to meet requirements under section 68 of *YOGA* (i.e., benefits agreements).

3.2.3 Gwich'in Tribal Council

Initial notification was to GTC and TGC May 25, 2020. On June 12, 2020, GTC provided input from its departments of Lands and Resources, Cultural Heritage, and Economic Development. Themes raised by GTC included:

- High environmental standards in the Peel River watershed and protection of scattered wetlands within the Land Management Unit 7
- Protection of wildlife and wildlife habitats
- Protection of the environment, water quality, and quantity and risks with respect to potential spills
- Protection of cultural heritage resources/values

GTC also requested that Chance share the Project Description and any other materials related to the Project that might be available. Chance was able to send a draft Project Description dated May 22, 2020 to both GTC and TGC, however no other materials (e.g., effects assessments, summaries of mitigation measures, management plans) were available at that time.

GTC's original feedback helped Chance select Valued Components, identify mitigation measures, and identify where additional detail was needed in the Project Description. Chance was able to provide a response to GTC on July 9, 2020.

Chance and GTC organized a conference call for July 22, 2020 where parties were able to further discuss the proposed Project. During this call Chance was able to update GTC on any changes that had been made to the project design since the draft Project Description dated May 22, 2020, and GTC was able to ask Chance follow-up questions about potential project impacts.

A draft of the Project Proposal was shared with GTC/TGC July 24, 2020.GTC also flagged potential services that Gwich'in businesses might be able to offer Chance and inquired as to what employment opportunities would be available as a result of the Project. Chance indicated that it welcomes the opportunity to have further discussions with GTC to identify and facilitate potential economic development opportunities.

Chance will balance these interests with requirements to source specific equipment/professions for the maintenance work and requirements under section 68 of *YOGA* (i.e., benefits agreements with Yukon First Nations).

3.2.4 Tr'ondëk Hwëch'in

Initial notification was sent to TH on May 25, 2020. A conference call was organized between Chance and TH for June 17, 2020. The purpose of that meeting was for Chance to provide an overview of the proposed Project and to provide an opportunity for TH to ask questions and/or provide any feedback with respect to the proposed Project. During the conference, TH requested that Chance ensure that TH is identified as a potentially affected First Nation. Even though Project Activities do not occur in TH Traditional Territory, TH are indirectly affected by activities (e.g., increased traffic, impacts to wildlife in the region). Themes raised by TH included:

- Requiring additional information with potential risks associated with the Project and identified mitigation measures
- Requiring additional information with respect to the Project's potential wildlife management plan and information on how Project Activities would be affected if Porcupine Caribou are in the area (possibly the 40 Mile Caribou Herd and Hart River Caribou Herd as well)

TH also recommended that Chance look in the availability of traffic data in the Project Area and surrounding region. The presence and absence of traffic data in the region could inform what baseline studies Chance may need to conduct for future project proposals.

At the time of Chance and TH's initial call, no other materials (e.g., effects assessments, summaries of mitigation measures, management plans) were available. However, when the draft Project Proposal was completed, a draft was shared TH on July 24, 2020.

3.3 Ongoing Engagement Activities

Chance continues to be committed to engaging with potentially affected First Nations, should they wish to discuss the Project in more detail, and look forward to their involvement throughout the DO evaluation process.

4.0 ENVIRONMENTAL AND SOCIO-ECONOMIC EFFECTS ASSESSMENT METHODOLOGY

The assessment methodology outlined in this section provides a structured framework that is consistently applied to all valued components. The following guidance documents were considered when developing the Project's effects assessment methodology:

- *Proponent's Guide to Project Proposal Submission to a Designated Office* (YESAB 2010)

This methodology makes use of assessment terms Valued Components (VCs), defined as elements of the environmental and socio-economic systems valued for environmental, scientific, social, aesthetic, or cultural reasons.

The assessment methodology for VCs follows the main steps described below:

- Conduct assessment scoping (i.e., identify VC subcomponents and establish assessment boundaries);
- Establish baseline and existing conditions;
- Identify Project-related interactions and potential effects;
- Apply mitigation measures to address potential effects; and,
- Conduct effects characterization and significance determination.

4.1 Assessment Scope

The scope of the effects assessment focuses the application on the Project activities with the greatest potential to cause significant adverse effects on selected VCs. The VCs selected for this assessment were based on Project relevance and importance to First Nations, government agencies, and stakeholders, as well as previous assessment documents for related oil and gas and winter road projects in Yukon. VCs selected are discussed further in **Section 5.0**.

4.2 Establishing Assessment Boundaries

Assessment boundaries have been identified to define the spatial and temporal extent of the assessment. The spatial assessment boundaries are based on the spatial characteristics of the Project and the VC, and the areas where the Project-VC interactions and effects are expected to occur. Temporal boundaries encompass periods when the Project is expected to affect VCs. The temporal boundaries were determined based on the timing and duration of the Project. The spatial and temporal boundaries for the assessment of the Project are defined in **Table 4-1**.

Table 4.1 Spatial and Temporary Boundary Definition

Boundary	Definition
Spatial Boundaries	The spatial boundaries of the Project Area are outlined in Inset A of Figure 2-1.
Temporal Boundaries	The temporal boundaries for the assessment of the Project covers the construction, operation and maintenance of the winter roads and maintenance of the wells. To include permitting and construction timelines with some contingency, the temporal scope of this assessment is 2 years.

4.3 Establishing Baseline Conditions

The first step in performing an environmental and socio-economic effects assessment is to understand the existing environmental and socio-economic conditions currently present within the assessment area. The existing environmental and socio-economic conditions within the Project Area are based on a number of sources including historic literature, recent technical reports, databases, monitoring programs, government information, and first-hand knowledge. A summary of existing conditions is provided as part of each VC assessment to establish the setting for the assessment of Project-related effects on each VC. The level of detail provided for the existing conditions is sufficient to enable potential Project–VC interactions to be identified and understood.

4.4 Identifying Project-Related Interactions and Potential Effects

A key step in performing the environmental and socio-economic effects assessment is to understand the Project-related activities that are proposed and how those activities are likely to interact with the selected VCs. The intensity of the interaction will result in the potential effect on the VC and will ultimately dictate the mitigation measures implemented to minimize the effect of that interaction. The intensity of the interaction may be “none”, “negligible”, or “potential”. All Project components/activities that will not interact with a VC and will not result in potential effects are not considered further in the assessment. Where a potential interaction is predicted, a potential effect is identified and carried forward in the assessment. Where there is potential for the effect to be significant, mitigation measures are developed.

Consistent with direction provided in *YESAA*, each VC assessment section includes descriptions of mitigation measures of relevance to the particular VC to eliminate, reduce, or control adverse Project-related effects, as well as measures contained in industry codes and standards. The effectiveness of mitigation measures in reducing the potential effect is considered in the effects characterization.

4.5 Effects Characterization and Determination of Significance

For each VC, an effects characterization is performed, which evaluates the potential Project-specific effects with the implementation of the mitigation. Each effect is characterized based on its direction, magnitude, geographic extent, timing, frequency, duration, reversibility, and probability of occurrence. Each VC assessment section provides a description of the relative context for the assessment in terms of the resiliency and sensitivity of the VC. General definitions for these characteristics are presented in **Table 4.2.**

Table 4.2 Residual Effects Characteristics

Residual Effect Characteristic	General Definition	General Rating
Direction	Identifies whether the residual effect will be adverse or positive	• Adverse • Positive
Magnitude	Size or severity of the residual effect relative to the existing condition of the VC, generally measured in terms of the proportion of the VC affected within the Project Area, relative to the range of natural variation (or historic variation in the case of human environment VCs)	• Low • Moderate • High
Geographic Extent	Geographic area where the residual effect is likely to occur	• An area within the Project Area
Timing	Occurrence of the residual effect with respect to a temporal attribute important to the VC (e.g., time of day, season, stage in life cycle, etc.)	• VC-specific
Frequency	How often the residual effect is likely to occur, taking into account VC-specific temporal characteristics	• Infrequent • Frequent • Continuous
Duration	Length of time the residual effect to the VC is likely to persist, taking into account VC-specific temporal characteristics	• Short-term • Long-term • Permanent

Residual Effect Characteristic	General Definition	General Rating
Reversibility	Degree to which the residual effect can be reversed once the causal factors cease; irreversible effects are considered to be permanent	• Fully reversible • Partially reversible • Irreversible
Context	The extent to which the VC has been affected by past and present environmental and socio-economic processes and conditions, and its potential sensitivity to the Project-related residual effect, and its ability to recover from that effect	• Undisturbed • Disturbed • Resilient • Sensitive
Probability of occurrence	Likelihood that the residual effect will occur, taking into account how probable it is that a disturbance will actually be caused by the Project or that a specific mitigation will be successful	• Likely • Unlikely

The significance of effect on the VC will be assessed based on the effects characteristics, and the likelihood of the effect. The likelihood of the effect is in part determined by the scientific certainty relative to the quantification of the effect, scientific certainty relative to the effectiveness of the proposed mitigation, and professional judgement based on prior experience in assessing effects and the known effectiveness of proven mitigation measures. The rationale for the determination of significance is provided for each VC.

5.0 VALUED COMPONENT SCOPING

Valued ecological, social, cultural, and economic components (VC) identified for the Project form the basis of the assessment conducted in **Section 6.0**. These components were selected based on the results of environmental and archaeological field studies, literature reviews, consultation with First Nations, and professional expertise. The valued components are described in **Section 5.1**, along with a rationale for their selection. The assessment in **Section 6.0** focuses on these valued components.

Potential VCs and VC subcomponents were selected based on (1) their value as ecological, social, cultural or economic factors, (2) spatial, temporal, and mechanistic ability to interact with the Project, and (3) technical feasibility of conducting an assessment. Ecological values included consideration of foundational environmental factors or processes, species of conservation concern (e.g., caribou), and more general species or processes that represent biodiversity. Social and cultural values were based primarily on current and historic human use, such as hunting, recreation, and heritage values. Economic values relate to existing or future use of resources to derive monetary benefits. Often potential VC subcomponents can include multiple value types. For example, furbearers have ecological, cultural, and economic values.

VC's and subcomponents were also screened based on their ability to interact with the Project, including the degree of spatial and temporal overlap with the Project and mechanism to be affected by the Project. For example, birds are sometimes included as a VC subcomponent for EAs for some projects because of the numerous species that contribute to biodiversity and diverse habitat associations the group has. However, for this Project the potential to interact with the VC is low because most species have migrated south during the winter when the Project will be active and the project has low potential to affect the few resident birds that are present.

Finally, technical feasibility was considered for selection of VC subcomponents. These criteria relate to technical factors that could affect the effects assessment, such as the availability of baseline data or the level of understanding of how the project could affect the VC subcomponent.

Potential VCs that were considered in the scoping exercise but were NOT carried through for assessment are described in **Section 5.2**. These issues were investigated for potential interactions with the Project and were determined to not require further assessment. **Section 5.2** provides a description of the issues, and a rationale for not including them as valued components. Mitigation measures and best practices are identified for these issues where applicable.

5.1 Valued Components Selected

The VCs selected for assessment are wildlife and wildlife habitat, vegetation and wetlands, and heritage resources. The rationale for selecting these VCs and specific subcomponents within each VC to be assessed are provided below.

5.1.1 Wildlife and Wildlife Habitat

Wildlife and wildlife habitat were selected as a VC because there is a potential for interaction between wildlife and wildlife habitat and Project activities. Wildlife and wildlife habitat are valued as important ecological components, for aesthetic and cultural reasons, and as subsistence food sources. Sensitive species and/or habitats will be given special consideration within this VC. The indicators used to describe and evaluate potential Project-related effects on wildlife and wildlife habitat include habitat, movement and distribution, and mortality or injury.

As a group, ‘wildlife’ encompasses numerous taxa with diverse habitat requirements. Effects assessments for most resource development projects include a suite of species or species groups as subcomponents to represent the diversity encompassed within the wildlife VC. The suite of species and species groups that were considered during VC selection are outlined in **Table 5.1**. Based on the selection process, caribou and moose were selected as VC subcomponents for effects assessment.

Table 5.1: Summary of selection process for wildlife valued components

Potential Subcomponent	Value (Ecological, Social, Economic)	Potential to Interact with Project (Spatial, Temporal, Mechanism)	Evaluation Outcome
Caribou	High. The Porcupine Caribou Herd is highly valued for subsistence hunting, cultural values, and ecological values.	Moderate. The Project occurs within the PCH winter range when caribou may be present; however, caribou do not use the Project area every year. If caribou do occur, the Project have the potential to affect local movements and habitat availability.	Selected as a VC subcomponent.
Moose	Moderate. Moose are valued as a secondary species for subsistence hunting, after caribou.	Moderate. The Project occurs within annual moose range and Project activities could have a localized effect on moose distribution and habitat availability.	Selected as a VC subcomponent.
Furbearers	Moderate. Marten and lynx have high cultural and moderate economic value for trapping, but the area has not been actively trapped for several years.	Low. The Project occurs within marten and lynx ranges, but these species tend to be tolerant or adaptive to low levels of industrial work, as required for this project. The project will not create new access on which snowmobiles cannot already travel.	Not selected as a VC subcomponent, but mitigations are provided
Grizzly Bears	Moderate. Grizzly bears are often a species of conservation concern because they occur at low densities and can be sensitive to human disturbance.	Very Low. Grizzly bears will be denning while the Project is active and the chance of a den occurring near work areas is very low.	Not selected as a VC subcomponent, but mitigations are provided
Wolves	Moderate. Wolves play an important role in large mammal predator-prey relationship in northern ecosystems; however, they generally have low social and economic value.	Low. Wolves occur within the project area but tend to relatively tolerant or adaptive to low levels of industrial work, such as required for this Project.	Not selected as a VC subcomponent; no specific mitigations
Birds	Moderate. Birds are often included as a VC subcomponent in effects assessments because, as a group, it includes numerous species that contribute to biodiversity and have diverse habitat associations.	Very Low. The Project has very low potential because the majority of birds in the area are migratory and will be on their wintering grounds, the timing of work is outside the breeding season, when birds may be sensitive to disturbance, and affects to bird habitat are very limited.	Not selected as a VC subcomponent; no specific mitigations

5.1.2 Vegetation and Wetlands

Vegetation and wetlands were selected as a VC because there is a potential for interactions with Project activities, and because of their role supporting biodiversity and wildlife habitat. Further, they are valued by First Nations and local residents who may use certain species as a subsistence and economic resource. Project activities may disturb, change, or remove vegetated areas, habitat containing traditional and medicinal plants, and ecological communities that may host rare plants or wetlands.

5.1.3 Heritage Resources

Heritage Resources were selected as a VC because of the value of heritage sites and historic resources rests within their context in the land in which they are located and there is potential for interactions with Project activities. Once disturbed or removed, that value cannot be restored. The term “heritage resources” is used here to refer to archaeological resources, historical resources, and paleontological resources collectively (i.e., all are considered to be types of heritage resources). In Yukon, the *Historic Resources Act* (RSY 2002, c.109) and Archaeological Sites Regulation contain legislation that mandates the management and protection of Yukon archaeological, historical, and paleontological resources. This legislation applies to heritage resources on both private and public land that are older than 45 years. Archaeological, historical, and paleontological resources are protected from unpermitted surveys, disturbances, alterations, or excavations.

5.2 Other considerations

Other valued components considered in our report but not included in the effects assessment include fish and fish habitat, permafrost, air quality, fish and wildlife harvesting, community safety and well-being of indigenous people; tourism and aesthetics; economic activity; land use and recreation; traditional land use; health and safety; and site access and traffic.

5.2.1 Fish and Fish Habitat

Fish and fish habitat are recognized as important values in the Eagle Plains area. However, Fish and fish habitat are not included as valued components because they have negligible potential to interact with the Project. No direct effects to fish and fish habitat will occur because access roads do not cross any streams and all well sites and access roads are greater than 200 m from mapped water courses or water bodies. Indirect effects, such as sedimentation or water quality are deemed to be negligible because winter roads have minimal effect on natural drainage patterns and do not expose soil for sediment transfer (i.e., there is no ditching along the winter roads and the duff layer and ground vegetation are protected).

5.2.2 Permafrost

Permafrost was considered as a potential VC for the assessment. However, the timing of the proposed activities (i.e., completed in winter) and the relatively short duration of the Project greatly limit any potential effects on permafrost in the area. Additionally, the methods proposed for winter road construction are designed to reduce ground disturbance by mulching large vegetation (trees) rather than pushing it over with a bulldozer, which could potentially pull up root systems and expose underlying sediments. Winter road construction will leave the surface organic mat (moss and peat) intact and uncompressed, minimizing effects on permafrost. Winter roads actually promote penetration of wintertime cold into the ground due to higher thermal conductivity of ice than adjacent snow, a response that will help counteract any minor reduction in cold penetration below road-edge berms. Excess accumulation or piling of snow will not occur

to avoid potential effects on local ground temperatures. Well maintenance activities will not have the opportunity to adversely affect permafrost. Therefore, permafrost was not considered further in this effects assessment.

5.2.3 Air Quality

Air quality was considered as a potential VC for the assessment. However, given the remoteness of the Project site, the relatively short duration of the Project, the air quality within the Project area will not deteriorate with the installation of the winter roads or well maintenance activities. The Project will involve burning of fossil fuels to operate the equipment to work on the winter roads as well maintenance activities. Emissions from equipment will be relatively low and localized to the areas of active construction and at each well. Additionally, the construction phase of the Project is only projected to last one winter at which point air quality will return to baseline conditions and will not have a lasting effect on local air quality. Therefore, air quality was not considered further in this effects assessment.

5.2.4 Fish and Wildlife Harvesting

Fish and wildlife harvesting were considered as a potential VC given the importance of this activity for both traditional and subsistence purposes. In this context, harvesting includes hunting, fishing, and berry picking. Harvesting is important for First Nations to maintain their connections to their traditional territories and helps to preserve and enhance their culture, identity and values. Since Project activities will be located primarily in previously established well sites and where roads had historically been constructed it is anticipated that the effects to opportunities to practice harvesting caused by the project will be minimal. If Project activities overlap spatially and temporally with Porcupine Caribou Herd migration, there could be potential interactions between Project activities and caribou hunters, specifically human health and safety. Negative effects caused by these interactions will be mitigated by the measures implemented in Section 6.1 – Wildlife and Wildlife Habitat. Therefore, fish and wildlife harvesting were not considered further as a VC in this assessment.

5.2.5 Community Safety and Well-being of Indigenous People

Community Safety and Well-being of Indigenous People was considered as a potential VC in response to the Calls for Justice for Extractive and Development Industries from the National Inquiry into Missing and Murdered Indigenous Women and Girls (MMIWG1b 2019). Resource extraction and development projects can exacerbate issues of violence against Indigenous women and girls (MMIWG1a 2019).This potential VC was not carried forward in the assessment because of the Project's approach to staffing the site; staff will not be spending time in nearby communities or along public roadways during their transit to site and instead will arrive on site via a fixed-wing aircraft directly to the Eagle Plains airstrip.

5.2.6 Tourism and Aesthetics

Tourism and aesthetics were considered as a potential VC due to the Klondike and Dempster Highway's use as a popular tourism route in the territory. Two of the wells are located immediately adjacent to the highway and already have access routes with rig matting in place. These wells will be visible to the public, however tourism and aesthetics were not carried forward in the assessment because the Project activities likely to affect tourism and aesthetics will be limited to the construction period of the winter of 2020/2021 during the tourism off season. Project activities will also be localized to the areas of active construction, and will return to baseline conditions following the end of the construction period.

5.2.7 Economic Activity

Economic activity in the area surrounding the Project site was considered as a potential VC because it was identified as an area of interest for the affected First Nations. The Project has limited interaction with local businesses aside from necessary stops (i.e., fuel stations) by resource delivery drivers during construction and is therefore not considered further in this assessment.

5.2.8 Land Use and Recreation

Land use and recreation were considered as a potential VC given the high volume of traffic along the Dempster Highway and use of the area for land use activities and recreational purposes. The Project is not likely to overlap with land use and recreation activities potentially occurring in the area. Effects will be localized to the areas where roads had previously been built and to previously established well sites and camp facilities. Furthermore, the proposed activities are anticipated to be completed in one winter (December to March). Therefore, it is not expected that Project activities will have lasting interactions with land use and recreation beyond the Project's construction schedule and is therefore not considered further in this assessment.

5.2.9 Traditional Land Use

Traditional Land use was considered as a potential VC for the project. Give the location of the Project, it is not expected that Project activities will have lasting interaction with traditional land use beyond the Project's construction schedule and is therefore not considered further in this assessment. The Project is not likely to overlap with land use and recreation activities potentially occurring in the area. Effects will be localized to the areas where winter roads had previously been built and to previously established well sites and camp facilities. Furthermore, the proposed activities are anticipated to be completed in one winter (December to March).

5.2.10 Site Access and Traffic

Site access and traffic were considered a potential VC for the assessment given the high volume of traffic along the Klondike and Dempster Highway and a potential increased level of access among travellers to the surrounding lands and site area via the winter access road that will be constructed for the Project. Due to the implementation of security measures (included a gated entrance) at the commencement of the winter access roads, this VC was not carried forward to assessment.

6.0 ENVIRONMENTAL AND SOCIO-ECONOMIC EFFECTS ASSESSMENT

6.1 Wildlife and Wildlife Habitat

6.1.1 Existing Conditions

6.1.1.1 Caribou (Rangifer tarandus)

The Project occurs exclusively within the range of the Porcupine Caribou Herd. The transport of equipment to and from the Project, likely from Alberta or northeastern British Columbia, would travel through several additional caribou herds, including the Forty Mile Herd and the Hart Herd along the Dempster Highway. However, the incremental amount of Project traffic compared to regular highway traffic is small and, as

such, the effects of travel to and from the Project are not included in this assessment. Project equipment would consist of approximately two dozen trucks which would travel to and from the Project area over a 3 to 5 day period.

The Porcupine Caribou Herd is a subpopulation of barren-ground caribou. Barren-ground subpopulations are known for their large aggregations, dramatic population fluctuations, lengthy migrations, and significant cultural and social value to northern Indigenous people and other Canadians (COSEWIC 2016). Barren-ground caribou have been assessed as “Threatened” by the Committee on the Status of Endangered Wildlife in Canada (COSEWIC 2016). Within Yukon barren-ground caribou are considered “Vulnerable/Apparently Secure” (Yukon Government 2020). Although many barren-ground caribou are declining, the Porcupine Caribou Herd has been increasing at a rate of approximately 4% from 123,000 animals in 2001 to 218,000 in 2017 (Yukon Government 2018).

The Porcupine Caribou Herd’s annual range extends approximately 250,000 km² from Alaska, through Yukon, and into the western edge of Northwest Territories. The herd undertakes long distance migrations across seasonal ranges necessary for key aspects of their life cycle. Seven primary life cycle periods occur for the Porcupine Caribou Herd (**Table 6-1**) (Porcupine Caribou Technical Committee 1993). The timing of this Project (December to mid April) coincides with the *Early, Mid, and Late Winter* season and the *Spring, Spring Migration, and Pre-calving* season of the Porcupine Caribou Herd.

Winter is considered the season of lowest importance to the herd (Porcupine Caribou Technical Committee 1993). The herd is at its most dispersed stage during winter, both in terms of the extent of the range it uses and in terms of group aggregations. Average daily movement distances (2-5 km/day) (Russell and Gunn 2017) are lower than other seasons, except for cows during calving. Winter range use varies from year to year depending on snow depth and condition. In Yukon, during deep snow years, use is concentrated in the Richardson Mountains and the Ogilvie-Hart basins. In low snow years, the Whitestone River and Eagle Plains areas, which contain abundant lichen resources, are used more. Forage, primarily lichens, is generally not limiting during the winter and in shallow to normal snow years the caribou appear to maintain neutral to surplus energy balances. The Porcupine Caribou Herd are relatively tolerant to human activity during the winter (Porcupine Caribou Technical Committee 1993).

During the *Spring, Spring Migration, and Pre-calving* season caribou begin moving north towards the calving grounds. Average daily movement rates increase from approximately 6 km/day at the start of the season to approximately 24 km/day through May. Caribou, especially pregnant cows, typically enter an energy deficit during spring due to reduced forage availability, as they leave the lichen-rich taiga and before forbs have emerged, and higher energy expenditure associated with migration. Spring is rated higher importance than winter, but still relatively low overall, due to lack of association with specific habitats, relatively low threats from predators, and lack of insect harassment (Porcupine Caribou Technical Committee 1993).

No Wildlife Key Areas occur for caribou within the Project area (Environment Yukon 2016a).

Table 6.1: Key life cycle periods for the Porcupine Caribou Herd (from Porcupine Technical Committee, 1993)

Season	Dates	Characteristics	Importance
Early, Mid and Late Winter	Dec 1 to Mar 31	The herd is at its most dispersed at this time across two winter ranges: in Yukon, mostly south of the Porcupine River in boreal taiga and, in Alaska, centred in the Chandalar River/Arctic Village area. Winter range use varies from year to year depending on snow depth and condition. Caribou at this time of year are relatively tolerant to human activity. In shallow to normal snow years animals can gain weight.	4 (Lowest)
Spring, Spring Migration, and Pre-calving	Apr 1 to May 31	Distribution of the herd varies depending on snow melt; migration routes vary from year to year. Pregnant females are typically in energy deficit due to reduced forage once they leave the lichen rich taiga.	3
Calving (cows)	June 1 to 10	Calving occurs on the coastal plain of NE Alaska and, to a lesser degree, NW Yukon. This area offers reduced predators and abundant spring forage; no alternative range is available. Cows are at the lowest point of physical condition and are least tolerant to human disturbance.	1 (Highest)
Post-calving and Movement (cows)	June 11 to 30	As calves develop over the first two weeks of life the cows and calves tend to aggregate into larger groups and increase movement rates to track plant green-up. The post calving period imposes high energetic demands on lactating females and cow/calf groups are relatively intolerant of disturbance. The post-calving range is primarily in Alaska and cows that calved in Yukon tend to move west along the foothills into Arctic National Wildlife Refuge (ANWR). Insect avoidance can affect distribution by the end of June.	1 (Highest)
Calving to Movement (bulls)	June 1 to 30	Bulls, non-pregnant cows, and subadults tend to concentrate east of the calving grounds in the northern Yukon. Animals track the progression of greenup from the coastal plains to the northern foothills, to intermountain regions.	3
Early Summer	July 1-15	Cows continue to require high energy intake for milk production, but insect avoidance also drives distribution. Key areas selected for insect avoidance are the coastal plain adjacent to the Beaufort Sea (mostly cows/calves) and mountains in the Brooks and British Mountains (mostly bulls and cows without calves). Long distance movements during this period are also an insect avoidance behaviour.	2
Mid Summer	July 16 to Aug. 7	Mid summer continues to be a period of high insect harassment. Two areas are consistently used – the northern Richardson Mountains in Yukon and the southern portion of the Brooks Range in Alaska. Females with cows may be in energy deficit.	2
Late Summer and Fall Migration	Aug. 8 to Oct. 7	As insect activity declines the herd disperses widely but mostly stays north of the tree line until the latter part of the period – in Alaska south of the Brooks Range and in Yukon north of the Porcupine River. Animals exhibit high feeding rates and gaining fat for the winter.	3
Rut and Late Fall	Oct 8 to Nov 30	The region where rut occurs has no affinity from year to year; rut occurs wherever the herd happens to be along fall migration. In Yukon distribution can occur from the southern Olgilvie Mountains to the Richardson Mountains.	4 (Lowest)

6.1.1.2 Moose (Alces alces)

Moose occur throughout the Project area and are present in all seasons; however, population levels are poorly known. The Regional Biologist with Environment Yukon has suggested that the density of moose in Eagle Plains is low compared to populations in central and southern Yukon, but relatively high compared to other areas in north Yukon, and may be rising (M. Suitor, pers. comm.). Extensive wildfires within the Eagle Plains area over the last 30 years are currently in shrub-dominated successional stages that offer productive summer and winter forage for moose, which are expected to support higher numbers of moose than later successional black spruce forests. In November 2000 an aerial moose survey was conducted for a study area that mostly overlapped with the project area for this Project (Access Consulting Group and EBA Engineering Consultants Ltd. 2001). That survey observed 30 moose and estimated a total population of 60-90 based on additional tracks seen and a low sight ability factor.

Winter is normally a limiting season for moose. Reduced forage, higher energy expenditures, due to snow and cold, and higher vulnerability to predation all contribute to limit moose fitness during the winter. During winter, moose are primarily associated with shrub-dominated habitats for forage, which include regenerating burns, riparian areas, shrub-carrs, wetlands, stream valleys, and upland deciduous and mixed forest (Suring and Sterne 1998, Environment Yukon 2016b, McCulley et al. 2017). In other areas in Yukon, moose typically use higher elevation area in early winter and move to lower elevations in late winter to avoid deep snow and to utilize habitats such as riparian areas with shrubs for forage (Environment Yukon 2016b). It is unverified if this occurs in the Project area, but winter snow depths often exceed 50 cm in the Eagle Plains area (Russell and Gunn 2017), which is the threshold at which moose tend to exhibit winter movements to seek lower snow packs (Poole and Stuart-Smith 2005).

No Wildlife Key Areas for moose occur within the Project area (Environment Yukon 2016a)

6.1.2 Project Interactions and Potential Effects

Potential effects to VC subcomponents were evaluated based on the degree of spatial and temporal overlap between Project activities and the VC subcomponents and the type of interactions the Project could have on the VC subcomponents. Types of interaction include both direct affects, such as displacing animals due to sensory disturbances, and indirect effects, such as increasing mortality risk from hunters or natural predators. Project activities and interactions could result in effects to wildlife and wildlife habitat during three primary Project stages (**Table 6-2**).

Table 6.2: Potential interactions between Project activities Wildlife and Wildlife Habitat

Activity	Project Interactions	Potential Effects
Winter road construction	• Vegetation Removal • Use of heavy equipment • Human presence	• Sensory disturbance • Localized effects to movement and distribution • Direct and indirect habitat effects
Road travel (along the Dempster and winter roads)	• Vehicle travel	• Sensory disturbance • Localized effects to movement and distribution • Indirect habitat effects • Direct and indirect mortality

Well site maintenance	• Vegetation Removal • Use of heavy equipment • Human presence	• Sensory disturbance • Localized effects to movement and distribution • Mortality or injury

6.1.2.1 Caribou

A detailed assessment of potential effects of oil and gas activities in Eagle Plains on caribou was conducted by Russell and Gunn (2017). This assessment draws from their work, adapting to the limited scope of this well maintenance program.

There is increasing evidence that ungulates, including caribou, tend to respond to human presence and activities in similar manners to how they respond to predators (Frid and Dill 2002). The most common response of caribou is to avoid human activity areas or to exhibit greater vigilance behaviours. Reported response distances of caribou vary widely but are mostly in the magnitude of several hundred metres (e.g., 600 m (Murphy and Curatolo 1987). Caribou may also change their distribution relative to disturbance. In most studies, avoidance of roads is less than 4 km (Vistnes and Nellemann 2001, Cameron et al. 2005), but avoidance of the Dempster Highway varied from 18-30 km over a twenty year period depending on land use and hunting regulations (Johnson and Russell 2014). Responses by caribou to human disturbances vary widely and causal relationships are often poorly understood.

Patterns of avoidance by caribou to human disturbances are often affected by the nature of the human activity, specifically, whether caribou are directly hunted or harassed by humans, and time since disturbance began. Reduced behavioural response and apparent avoidance in distribution patterns (i.e., habituation) appear to be associated with lack of hunting and predation (Lawhead et al. 2006, Haskell and Ballard 2008). This highlights the importance of factoring hunting management into mitigations. However, effects on distribution can occur outside of hunted areas and several years after the disturbance began (Johnson et al. 2019).

Russell and Gunn (2017) frame their assessment in terms of *sensitivity* of the Porcupine Caribou Herd to potential effects and degree of *exposure* to effects. Sensitivity relates to factors such as herd size and trend, seasonal body condition, ecological life history activities, and environmental stressors, like insects. Caribou are generally more sensitive to effects when populations are low and declining, when their body condition is low or they are exposed to other stresses (e.g., insect harassment), and during critical life history periods, notably calving. In the context of the current condition of herd and the timing when the Project could interact with it, the sensitivity of the herd is low:

- The herd is at a historically high population level and showing an increasing trend.
- During winter, when the Project would occur, Porcupine Caribou are typically in good body condition and free of stressors, such as insects.
- The winter period is not associated with a critical life history stage.

Exposure relates to the degree of spatial and temporal overlap between caribou and potential human effects, as well as the mechanisms of effects (e.g., type, magnitude, and duration of effects). In terms of type of effects, the most likely effects of the Project are localized, temporary effects to distribution, which can translate to indirect habitat effects. The only potential source of direct mortality from the Project would

be vehicle collisions, and those can be effectively mitigated. Linear features can indirectly affect the rate of mortality of caribou caused by natural predators and hunters, by increasing ease of travel. However, this Project will avoid creating new linear features by re-establishing existing winter roads. The Project is aiming to have a neutral effect on hunting, to balance mitigating effects to caribou while maintaining indigenous hunting opportunities. Although hunting will not be available from the Blackie and Chance winter roads, the project will not inhibit hunting indigenous hunting opportunities in the broader area that may be accessed from the Dempster Highway.

Russell and Gunn (2017) assessed the potential spatial and temporal overlap between the Porcupine Caribou Herd and a similar, but slightly larger extent, as this Project, using thirty years of telemetry data. Their primary analysis area was a 30 km buffer around the project, based on the maximum distance that caribou avoided the Dempster Highway in another study (Johnson and Russell 2014). Russell and Gunn (2017) found that a collared caribou occurred in the 30 km buffer area during the months of January to April in 15-22% of the years. The average percentage of the herd using the 30 km buffer area ranged from 3% in January to approximately 1% in February to April. Average residency times varied from 9 to 17 days/month during the January to April period. In other words, on average, 98% of the herd's movements during the winter occur outside the 30 km buffer surrounding the Project and, for any animal that does occur in the area, they typically spend a third to half of a month there before moving out of the area.

6.1.2.2 Moose

Moose can be affected by human land use activities, although moose are generally less sensitive than caribou. As outlined below, Project activities could result in four types of effects to moose.

1. Sensory disturbance. Human presence, work activities and vehicle travel/equipment operation will generate noise and other sensory effects that moose may respond to. The most likely response of moose to sensory disturbance is to avoid areas where disturbances are occurring. This could result in localized effects to movement and distribution and indirect habitat effects (Lykkja et al. 2009) (see 2 and 3, below, respectively). When moose are unable to move away from sensory disturbances, it can result in physiological stress responses and behavioural modifications (e.g., increased vigilance). However, these responses are not anticipated to occur for this Project because moose can move away from the work areas to avoid them.
2. Localized effects to movement and distribution. Numerous studies have examined responses of moose to human activities, including roads, industrial activity, and rural residences (Andersen et al. 1996, Burson et al. 2000, Yost and Wright 2001, Lykkja et al. 2009). Most studies found avoidance of human activity areas out to approximately 300 m (EDI Environmental Dynamics Inc. 2017). However, there are also cases where moose appear to choose to be nearer to human activity to avoid natural predators (Muhly et al. 2011). Similar to caribou, responses are greatest when moose are directly harassed or hunted.
3. Indirect habitat effects. A consequence of localized avoidance of human activity areas is that the habitat within the zone of influence is temporarily not used by animals. As per the effects on movement and distribution, the zone of influence for indirect habitat effects is approximately 300 m.
4. Direct and indirect mortality. The Project has the potential to have a direct effect on moose mortality via vehicle collisions (EDI Environmental Dynamics Inc. 2015). However, mitigation measures, below, are expected to effectively eliminate the risk of vehicle collisions. The Project could have an indirect affect on mortality by improving access along the winter roads for human hunters and natural predators.

6.1.3 Mitigation Measures

6.1.3.1 General Mitigation Measures for Wildlife and Wildlife Habitat

- All Project personnel will be required to complete formal orientation and training related to wildlife mitigation measures.
- Work will be scheduled to minimize the spatial extent across which work is concurrently occurring.
- Access to the well sites will utilize existing and historic winter roads to minimize the creation of new linear features.
- Project footprints, notably the widths of winter roads, will be minimized as much as possible. On the Chance Road, the width will not exceed the existing right-of way extent.
- Firearms are not allowed on-site by Project personnel. No hunting or shooting rules will be in effect.
- A no harassment of wildlife policy applies to all personnel. This includes attempts to chase, catch, divert, follow, photograph, feed, or otherwise harass wildlife, whether on foot, in on-road or off-road vehicles, heavy equipment, or aircraft.
- The use of on-road and off-road vehicles, including snowmobiles, will be restricted to essential Project access routes.
- Personal use of unmanned aerial vehicles (UAVs or drones) is prohibited.

6.1.3.2 Road Operations

The following measures are designed to mitigate the risk of vehicle collisions and effects of road use on wildlife movements.

- The maximum speed limit along the Dempster Highway is 90 km/h.
- The maximum speed along winter roads is 30 km/h.
- Wildlife will always have the right-of-way. This requires vehicle operators to stop when wildlife are observed on or beside the road, allowing them to cross safely. If wildlife stays on the road or right-of-way for >5 minutes, drivers may resume travel and pass the animals at <10km/h.
- Special rules apply to caribou.
    - For Caribou within 100 m from the road:
        - Stop as far back as possible;
        - Alert other drivers;
        - Wait until caribou have crossed and moved beyond 500 m from the road or are lost from sight before proceeding;
        - Proceed with caution.
    - For Caribou beyond 100 m from the road:
        - Proceed with caution;
        - Alert other drivers;
        - Watch for direction of movement and change in behaviour.

- When moose and caribou are on a road they will sometimes run down the road away from a vehicle. If this happens, stop and wait at least 5 minutes to allow the animal to move off the road. If the animal remains on the road, drive forward at 10 km/h, then stop again when the animal begins to run away. Wait 2 minutes and repeat this procedure. If the animal still does not leave the road, wait 10 minutes and repeat the procedure, alternating with a 2- and 10-minute stop between driving attempts.
- Drivers are required to use two-way radio communication. The location of any wildlife observed along Project roads is to be communicated to other road users on the radio.
- Drivers will not exit the vehicle to chase, catch, divert, follow, photograph, or otherwise harass wildlife.
- Along winter roads:
    - snow banks will be maintained at heights <1 m to reduce the hinderance to wildlife crossing them;
    - where snow banks exceed 60 cm in height, regular breaks (at least every 500m) will be created to facilitate easier animal crossing and as 'escape routes' off the road.
        - Create matched breaks on either side of the road that animals can use to cross.
        - On corners, create run-outs, in each direction, that are obvious alternative routes for animals to use, instead of following the road.
        - Avoid breaks at seismic lines, which could provide human access.

6.1.3.3 Aircraft Operations

The following measures are designed to mitigate the effects of aircraft use on wildlife:

- Altitudes of greater than 300 m above ground level will be maintained at all times of the year.
- Altitudes of greater than 600 m above ground level will be maintained during sensitive times of the year.
- Areas where caribou have been observed in the past will be avoided.
- Flights paths will be designed to avoid important areas during sensitive times of the year.
- No caribou observed will be flown towards, circled, or harassed.
- If caribou are seen to be in a panic or startled the plane will ascend to a higher elevation.

6.1.3.4 Caribou

The majority of potential effects to caribou will be mitigated via measure for general wildlife, road operations and aircraft operations. Additional measure specific to caribou include:

- Packing of snow will not occur on any linear features that are not essential to Project work.
- Access to linear features off the winter roads will be minimized by avoiding creation of breaks in snow berms at junctions with linear features.
- All sightings of caribou will be reported to the Environmental Monitor.
- If more than a dozen caribou are observed, or if any number of caribou are observed in the same location for longer than a three-day period, a qualified environmental professional (QEP) will be consulted to determine if site-specific mitigations may be warranted.

Due to the variable nature of caribou occurrence and snow conditions from year to year, a pre-operations assessment will be conducted in December, prior to Project initiation, to assess local conditions (specifically including information about caribou occurrence and snow conditions) that could warrant tailored management measures. For example, if telemetry data indicated that several collared caribou were in the Project area, near work areas, additional measures may be put in place to mitigate potential effects.

6.1.4 Effects Characterization and Significance

6.1.4.1 Caribou

With the mitigation measures listed in **Section 6.1.3** applied, it is predicted that Project activities will not result in significant effects to habitat, movement and distribution, and mortality or injury to caribou. Detailed effects assessments are provided for each indicator in Table 6.3, Table 6.4 and Table 6.5 respectively. Key factors that result in this significance determination are:

- Although the timing of the Project does overlap with the potential occurrence of the Porcupine Caribou Herd in the area, the extent of the Project area, including a zone of influence, is a small proportion of the herd's total winter range. If caribou choose to avoid the work areas (i.e., due to sensory disturbance) alternative habitat is available.
- The timing of the Project, during winter, is a season of lowest importance for the ecology of the Porcupine Caribou Herd and a period when the caribou are relatively tolerant of human disturbance (Porcupine Caribou Technical Committee 1993).
- The most likely potential effect to caribou is temporary, localized avoidance of work areas due to sensory disturbance.
- The Project will be re-establishing existing winter access, not creating new access features, and will therefore not result in a change in access for human hunters and natural predators.

Table 6.3: Characterization of potential effects to caribou habitat.

Residual Effect Characteristic	General Definition	Rating
Description of Interaction	The Project will consist of work at 8 well sites plus access via 30.2 km of winter roads. This will result in direct habitat effects due to vegetation clearing along the access routes and well sites. It may also result in indirect habitat effects if caribou choose to avoid areas in proximity to the roads and well sites due to sensory disturbance or perceived predation risk.	
Direction	Effects to habitat will be adverse.	Adverse
Magnitude	The magnitude of effects is low, due to the small extent and narrow width of areas that are affected.	Low
Geographic Extent	Direct habitat will be limited to the footprint of the winter roads and well sites (approximately 60 ha). Indirect effects can extend out to 4000 m, depending on site conditions and variation in caribou behaviour. These extents are small relative to the herd's total winter range.	Low
Timing	The timing of the Project, during winter, is a season of lowest importance for the ecology of the Porcupine Caribou Herd and a period when the caribou are relatively tolerant of human disturbance	Low
Frequency	Direct effects will be continuous, though diminishing in magnitude, as vegetation regenerates. Indirect effects will be continuous when work activities are active.	Continuous

Residual Effect Characteristic	General Definition	Rating
Duration	Direct effects to the road and well site footprints will take years to regenerate (long-term). Indirect effects will cease once work activities are completed (short-term).	Short-term Long-term
Reversibility	The effects to habitat are fully reversible. Indirect effects will cease immediately upon stoppage of work activities. Direct effects along the winter roads will take several years for vegetation to regrow.	Fully reversible
Context	Work for this project will occur on previously disturbed sites. Measures to protect the duff layer and ground vegetation will maximize the resiliency of the site to regenerate to similar habitat.	Existing Disturbed/ Resilient
Probability of occurrence	Based on historic telemetry data it is likely that caribou will encounter areas affected by this Project at some point in the future. The likelihood that caribou will be present during the year the Project is active is moderate (over 24, years collared caribou occurred within 4km of the Project area in 17% of the years).	Likely

Table 6.4: Characterization of potential effects to caribou movement and distribution.

Residual Effect Characteristic	General Definition	Rating
Description of Interaction	The Project will consist of work at 8 well sites plus access via 30.2 km of winter roads. This work will result in sensory disturbance that could cause caribou to avoid the areas. Responses to sensory disturbance are mostly ≤4 km but vary in relation to site conditions and caribou behaviour. Effects are most likely to be expressed as temporary, localized avoidance of work areas. No effects to migration are expected because the extent of the Project area is small relative to the extent of winter range available for caribou to travel through.	
Direction	Effects to movement and distribution could be adverse.	Adverse
Magnitude	The magnitude of effects is low due to the limited consequence if caribou chose to avoid work areas. Alternative habitat is available, and avoidance of the area would not hinder migration or sub-regional movements within the winter range.	Low
Geographic Extent	Responses to sensory disturbance are mostly ≤4 km but vary in relation to site conditions and caribou behaviour. These extents are small relative to the herd's total winter range.	Low
Timing	The timing of the Project, during winter, is a season of lowest importance for the ecology of the Porcupine Caribou Herd and a period when the caribou are relatively tolerant of human disturbance	Low
Frequency	Potential effects to movement will occur daily, corresponding to periods when project activities are active.	Frequent
Duration	Project work will occur on a daily basis, for approximately a 12 h period, over an eight to 12-week work period in mid-January to mid-April.	Short-term
Reversibility	The potential effects to movement are fully reversible. Effects will cease immediately upon cessation of work activities.	Fully reversible
Context	Oil and gas exploration activities have occurred intermittently in the Eagle Plains area over the last 50 years. Responses of caribou have not been studied in detail, but use of the area by caribou has continued, demonstrating general resiliency to exploration activities.	Existing Disturbed/ Resilient

Residual Effect Characteristic	General Definition	Rating
Probability of occurrence	Based on historic telemetry data it is possible, but uncertain, that caribou will occur in the Project area when work is active. Over 25 years, collared caribou occurred within 4km of the Project area in 17% of the years.	Possible

Table 6.5: Characterization of potential effects to caribou mortality and injury.

Residual Effect Characteristic	General Definition	Rating
Description of Interaction	The Project will consist of work at 8 well sites plus access via 30.2 km of winter roads. Road use has the potential to cause direct mortality to caribou via vehicle collisions; however, that risk is negligible after mitigations. The project also has the potential to affect indirect mortality via packing of winter roads that could enhance travel rates by wolves or access to hunters. However, the potential for this effect is reduced by potential avoidance of work areas by both caribou and wolves due to human activity/sensory disturbance and hunter access management for safety.	
Direction	Effects to mortality or injury could be adverse.	Adverse
Magnitude	The magnitude of potential effects of direct mortality is negligible after mitigations. Effects of indirect mortality are estimated to be low due to potential avoidance of the work areas by both caribou and wolves and hunter access management.	Low
Geographic Extent	The winter roads total 30.15 km. This extent is small relative to the herd's total winter range, and the number of caribou that are likely to encounter the road is small.	Low
Timing	The timing of the Project, during winter, coincides with the potential occurrence of the Porcupine Caribou Herd in the area.	Moderate
Frequency	The potential encounter rate between caribou and wolves or hunters along or adjacent to winter roads is unknown, but is likely infrequent, due to factors listed above. Caribou would have the potential to encounter project traffic daily (i.e., frequent), but the risk of mortality is negligible after mitigation.	Infrequent
Duration	Project work will occur on a daily basis, for approximately a 12 h period, over an eight to 12-week work period in mid-January to mid-April.	Short-term
Reversibility	The potential effects to mortality are fully reversible. Potential direct effects will cease immediately upon completion of work activities. Vegetation regeneration will take several years to reach a stage that hinders travel by hunters and natural predators.	Fully reversible
Context	A network of winter roads and seismic lines exists in the area from past exploration. This work will not add new features, but it will clear some regenerating vegetation and temporarily pack snow that could temporarily enhance access by hunters and natural predators.	Existing Disturbed/ Resilient
Probability of occurrence	Based on historic telemetry data it is possible, but uncertain, that caribou will occur in the Project area when work is active. Over 24 years, collared caribou occurred within 4km of the Project area in 17% of the years. If caribou do occur in the area during the year that work occurs, there is low probability that the Project will contribute to indirect mortality.	Unlikely

6.1.4.2 Moose

With the mitigation measures listed in **Section 6.1.3** applied, it is predicted that Project activities will not result in significant effects to habitat, movement and distribution, and mortality or injury to moose. Detailed effects assessments are provided for each indicator in **Table 6-6**, **Table 6-7**, and **Table 6-8** for each indicator, respectively. Key factors that result in this significance determination are:

- Although the timing of the Project does occur during winter, which is a sensitive season for moose, the extent of the Project area, including a zone of influence, is a small proportion of winter range that is available to the species. If moose choose to avoid the work areas (i.e., due to sensory disturbance) alternative habitat is available.
- The most likely potential effect to moose is temporary, localized avoidance of work areas due to sensory disturbance.
- The Project will be reactivating existing winter access, not creating new access features, and will not result in a significant change in access for human hunters and natural predators.

Table 6.6: Characterization of potential effects to moose habitat.

Residual Effect Characteristic	General Definition	Rating
Description of Interaction	The Project will consist of work at 8 well sites plus access via 30.2 km of winter roads. This will result in direct habitat effects due to vegetation clearing along the access routes and well sites. It may also result in indirect habitat effects if moose choose to avoid areas in proximity to the roads and well sites due to sensory disturbance or perceived predation risk.	
Direction	Effects to habitat will initially be adverse but may switch to positive for several years if shrubs regenerate on the winter roads.	Adverse/Positive
Magnitude	The magnitude of effects to habitat is low, due to the small extent and narrow width of areas that are affected.	Low
Geographic Extent	Direct habitat will be limited to the footprint of the winter roads and well sites (approximately 60 ha). Indirect effects to habitat are mostly within 300 m, depending on site conditions and variation in moose behaviour. These extents are small relative to the total winter range available to moose.	Low
Timing	The timing of the Project, during winter, is a sensitive season for moose due to limited forage and higher energetic outputs due to snow and cold temperatures.	Moderate
Frequency	Direct effects will be continuous, though diminishing in magnitude, as vegetation regenerates. Indirect effects will be continuous when work activities are active.	Continuous
Duration	Direct effects to the road and well site footprints will take years to regenerate (long-term). Indirect effects will cease once work activities are completed (short-term).	Short-term Long-term
Reversibility	The effects to habitat are fully reversible. Indirect effects will cease immediately upon stoppage of work activities. Direct effects along the winter roads will take several years for vegetation to regrow.	Fully reversible

Residual Effect Characteristic	General Definition	Rating
Context	Work for this project will occur on previously disturbed sites. Measures to protect the duff layer and ground vegetation will maximize the resiliency of the site to regenerate to similar habitat. The extent of this project, and historic oil and gas disturbances, are small relative to natural disturbances (i.e., fire) that affect moose habitat. Approximately two thirds of the area along the Chance road has burnt in the last 30 years.	Existing Disturbed/ Resilient
Probability of occurrence	Moose are known to use the Project area in winter and some of the moose in the area will encounter the effects the Project has on habitat.	Likely

Table 6.7: Characterization of potential effects to moose movement and distribution.

Residual Effect Characteristic	General Definition	Rating
Description of Interaction	The Project will consist of work at 8 well sites plus access via 30.2 km of winter roads. This work will result in sensory disturbance that could cause moose to avoid the areas. Responses to sensory disturbance are mostly ≤1 km but vary in relation to site conditions and moose behaviour. Effects are most likely to be expressed as temporary, localized avoidance of work areas. Moose do not normally make seasonal movements in the Eagle Plains area.	
Direction	Effects to movement and distribution could be adverse.	Adverse
Magnitude	The magnitude of effects is low due to the limited consequence if moose chose to avoid work areas. Alternative habitat is available, and avoidance of work areas is unlikely to impair within-range movements.	Low
Geographic Extent	Responses to sensory disturbance are mostly ≤300 m but vary in relation to site conditions and moose behaviour. These extents are small relative to the total winter range available in the area.	Low
Timing	The timing of the Project, during winter, is a sensitive season for moose due to limited forage and higher energetic outputs due to snow and cold temperatures.	Moderate
Frequency	Potential effects to movement will occur daily, corresponding to periods when project activities are active.	Frequent
Duration	Project work will occur on a daily basis, for approximately a 12 h period, over an eight to 12-week work period in mid-January to mid-April.	Short-term
Reversibility	The potential effects to movement are fully reversible. Effects will cease immediately upon cessation of work activities.	Fully reversible
Context	Oil and gas exploration activities have occurred intermittently in the Eagle Plains area over the last 50 years. Responses of moose have not been studied in detail, but use of the area by caribou has continued, demonstrating general resiliency to exploration activities. The extent of this project, and historic oil and gas disturbances, are small relative to natural disturbances (i.e., fire that affect moose habitat and distribution).	Existing Disturbed/ Resilient
Probability of occurrence	Moose are known to use the Project area in winter and some of the moose in the area will likely encounter the work areas and be subject to sensory disturbance associated with those areas.	Likely

Table 6.8: Characterization of potential effects to moose mortality or injury.

Residual Effect Characteristic	General Definition	Rating
Description of Interaction	The Project will consist of work at 8 well sites plus access via 30.15 km of winter roads. Road use has the potential to cause direct mortality to moose via vehicle collisions; however, that risk is negligible after mitigations. The project also has the potential to affect indirect mortality via packing of winter roads that could enhance travel rates by wolves or access by hunters. However, the potential for this effect is reduced by potential avoidance of work areas by both moose and wolves due to human activity/sensory disturbance and hunter access management for safety.

Frequency	The potential encounter rate between moose and wolves or hunters along or adjacent to winter roads is unknown, but is likely infrequent, due to factors listed above. Moose would have the potential to encounter project traffic daily (i.e., frequent), but the risk of mortality is negligible after mitigation.	Infrequent
Duration	Project work will occur on a daily basis, for approximately a 12 h period, over an eight to 12-week work period in mid-January to mid-April.	Short-term
Reversibility	The potential effects to mortality are fully reversible. Potential direct effects will cease immediately upon completion of work activities. Vegetation regeneration will take several years to reach a stage that hinders travel by hunters and natural predators.	Fully reversible
Context	A network of winter roads and seismic lines exists in the area from past exploration. This work will not add new features, but it will clear some regenerating vegetation and temporarily pack snow that could temporarily enhance access by hunters and natural predators.	Existing Disturbed/ Resilient
Probability of occurrence	Moose are known to use the Project area in winter and some of the moose in the area will likely encounter the work areas. However, the probability of direct and indirect mortality associated with Project activities is low.	Unlikely

6.2 Vegetation

The Project falls within the Taiga Cordillera Ecozone and Eagle Plains Ecoregion. Descriptions of the ecoregion are drawn from the Ecological Stratification Working Group (1995) and Yukon Ecoregions Working Group (2004). The following sections describe the known baseline information for vegetation and wetlands in these regions, the likely Project interactions and potential effects resulting from Project

activities, mitigation measures to reduce or eliminate those effects, and a summary statement concluding the overall significance of the Project on vegetation and wetlands.

6.2.1 Existing Conditions

The Project falls within the Eagle Plains Ecoregion, a 20,400 km² region in north Yukon between the Richardson and Ogilvie Mountains. Most of the region is low altitude rolling topography, between 300 m and 600 m above sea level (asl), with few scattered peaks to approximately 1,000 m asl, outside the Project area. Most of the watercourses in the ecoregion drain north into the Yukon River via the Whitestone, Porcupine and Eagle rivers. The southeast corner of the region drains east to the Mackenzie River via the Peel, Wind and Ogilvie Rivers. The few lakes that exist in the region are generally oxbow or thermokarst lakes (Yukon Ecoregions Working Group 2004). The Eagle Plains Ecoregion is within the continuous permafrost zone where permafrost can be found up to 200 m thick. Several permafrost produced landforms and processes can be found across the region, including ice-wedge polygons, cryoturbation, solifluction, soil creep and active layer detachment slides on shale (Yukon Ecoregions Working Group 2004).

The Eagle Plains Ecoregion experiences a moderate amount of precipitation, with annual amounts around 400 mm. Most of the precipitation falls as rain throughout the summer months, averaging 50 to 80 mm per month, June through August. Precipitation is lighter through September to April and falls as snow. Average winter temperatures on the Eagle Plains Plateau are around -30°C and -25°C, with extremes as low as -60°C. Winter conditions usually last from October to May. Average summer temperatures are around 13°C, with extremes as high as 30°C. Due to its proximity to the Arctic Circle, this region experiences brief periods of continuous sun above and below the horizon (Yukon Ecoregions Working Group 2004).

The vegetation of the Eagle Plains Ecoregion is primarily boreal forest. The most common climax forest community is black spruce woodland associated with hummocks. Tree growth is often limited by the presence of permafrost in many areas of the Ecoregion, causing open, stunted forests and shrub-dominated communities at tall and low shrub structural stages. Upland black and white spruce forests typically have well-developed shrub communities, including Labrador tea, shrub birch, willow, alder, rose, spiraea and blueberry, with a ground cover of lichen and moss. Moderately well to well drained sites commonly have white spruce or deciduous stands with lichen ground cover. More poorly drained areas with low slope gradients and fine-textured soils are associated with overstory species such as black spruce, shrub birch, Labrador tea, and occasionally tamarack, and often have ground cover dominated by cottongrass tussocks. Deciduous or mixed stands are also often found in areas of recent anthropogenic disturbance, such as old roads, drill sites and gravel pits. Deciduous trees in the Eagle Plains Ecoregion include Alaskan paper birch, balsam poplar, trembling aspen, and willow (Yukon Ecoregions Working Group 2004).

Graminoid and shrubby fens, shrubby bogs and graminoid marshes are scattered throughout the Ecoregion. Several sedge species are dominate in both the graminoid fens and marshes, including narrow-leaf cottongrass, aquatic sedge, northern beaked sedge and mud sedge. Shrub species in fens include leatherleaf and bog rosemary. The ground cover of the shrubby bogs is dominated by sphagnum, sometimes with extensive lichen cover. Shrub species typically include low bush cranberry, bog cranberry, bog rosemary, cloudberry, Labrador tea, shrub birch, willow, black spruce and occasionally tamarack. Riparian forests of white and black spruce are found as narrow strips along most major watercourses in the Ecoregion (Yukon Ecoregions Working Group 2004).

Evidence of forest fires can be observed throughout the Project area, as fires are relatively common. Regenerating burns are dominated by shrubby vegetation, including willow, shrub birch, and alder. Alaskan paper-birch is commonly the first tree species to colonize burn areas. Occasionally, on well-drained sites trembling aspen and balsam poplar may be the first tree species to re-colonize. The extent of old burns can be recognized by the presence of the current black spruce – Alaskan paper birch woodlands (Yukon Ecoregions Working Group 2004).

Ecological and Landscape Classification (ELC) mapping was completed for the Eagle Plains Exploration Project in 2019 and 2020, which encompassed the Project area. The ELC mapping was based on manual delineation and attribution of digital ortho-imagery following the Yukon Ecological and Landscape Classification and Mapping Guidelines, Version 1.0. (Environment Yukon 2016c) and the Standard for Terrestrial Ecosystem Mapping in British Columbia (Resources Inventory Committee 1998). ELC mapping was further informed by extensive field sampling of vegetation communities across a diversity of ecosystems, slope positions, and moisture and nutrient regimes throughout the Eagle Plains Exploration Project.

Vegetation was examined at three scales to assess potential effects of the Project: Vegetation Regional Assessment Area (VRAA), Vegetation Local Assessment Area (VLAA), and the road footprint itself. The VRAA includes vegetation within a 2 km buffer on either side of the Chance and Blackie winter roads, and represents the vegetation communities surrounding the roads to provide context for more localized potential effects. The VLAA includes vegetation within a 100 m buffer on either side of the Chance and Blackie winter roads, and represents the extent where potential direct and indirect Project-related effects could occur. The footprint is the 20 m wide path of the access roads and the well sites where tree and shrub clearing will occur.

The ELC units (ecosites) comprising the VRAA and VLAA are summarized in **Table 6-9** (the footprint is not included because it is such a narrow strip that ELC mapping does not accurately reflect the previous disturbance along it at that fine a scale). Comparison of the VRAA and the VLAA indicates that the relative proportions of ecosites are similar across both study areas. Both areas are dominated by:

- Moist Spruce – Labrador Tea forest (shrub structural stage)
- Moist Spruce – Labrador Tea forest (mature forest structural stage)
- Moist Spruce – Alder – Labrador Tea forest
- Mesic White Spruce – Alaska Paper Birch – Alder

A small number of ecosites occur more frequently in the VLAA than the VRAA. These occur in two circumstances. The first are ecosites associated with prior anthropogenic disturbance along the roads and well sites: Mesic birch-willow, Anthropogenic, and Road. The second group includes sites associated with upper and crest topographic positions, where the existing winter roads were situated: Mesic black spruce – Labrador tea (conifer), Dry spruce – lichen (conifer).

One ecosite that occurs less frequently in the VLAA than in the VRAA is Moist Shrub \ Scrub Birch – Labrador Tea – Willow, which is associated with lower slope and valley bottom positions, which the Project access routes avoid.

Both the Chance and Blackie winter roads have been cleared and used for access in previous years. Their footprints are in early- to mid-seral stages and differ from the surrounding vegetation. Chance Road was last used in 2014, and is currently regenerating to low and tall shrub communities undergoing either normal or stagnated succession. Chance Road is dominated by dense shrub birch, willow, alder, and paper birch, ranging from 25% to 60% cover, and with thick herbaceous vegetation (i.e., graminoids and forbs), ranging from 40% to 75% cover (Photo 1). In burned areas, Chance Road is similar to the surrounding vegetation, while in unburnt areas, the surrounding vegetation consists of taller, more mature black spruce forest. Blackie Road has not been used in several decades and is more successionally advanced – dominated by fairly open (25% cover) black spruce and shrub birch at a tall shrub structural stage (Photo 2).This represents a similar vegetation community but a different structural stage than the surrounding vegetation, which is characterized by taller, mature black spruce forest with willow and paper birch shrub layers. There have been no rare nor invasive plants documented in the VRAA, VLAA, or footprint, although targeted rare and invasive plant surveys have not been conducted in the Project area.

As documented in the ELC mapping, wetlands and watercourses cover 49.9 ha in the RAA and include rivers and black spruce bogs. There are no wetlands nor mapped watercourses within 200 m of the road and well site footprints.

Photo 1. View of a typical section of Chance Road, regenerating to a low shrub vegetation community dominated by deciduous shrubs.

Photo 2. View of a section of Blackie Road, regenerating to a tall shrub vegetation community dominated by black spruce.

Table 6.9: Vegetation communities occurring within the Vegetation Regional Assessment Area and Vegetation Local Assessment Area.

Ecosite Code	Ecosite Name	VRAA		VLAA	
		Area (ha)	Area (%)	Area (ha)	Area (%)
02	Mesic birch-willow	66.6	0%	31.8	5%
04	Mesic White Spruce – Alaska Paper Birch - Alder	1111.0	8%	39.6	7%
05	Mesic Alaska Paper Birch (Deciduous)	654.6	5%	24.7	4%
06	Mesic Black Spruce – Labrador Tea (Conifer)	685.9	5%	40.8	7%
14	Dry Spruce-Lichen (Conifer)	138.9	1%	15.7	3%
15	Dry Aspen-Lichen (Deciduous)	2.3	0%	0.0	0%
16	Dry Spruce-Birch-Lichen (Mixedwood)	173.0	1%	1.6	0%
20	Shrubby Riparian Birch – Willow	8.0	0%	0.0	0%
22	Riparian Spruce – Birch - Willow	15.2	0%	0.0	0%
23	Drainage Shrubby Riparian	195.4	1%	4.6	1%
31	Moist Shrub \ Scrub Birch – Labrador Tea – Willow	590.3	4%	5.6	1%
33	Moist Spruce – Labrador Tea (shrub stage)	5422.9	40%	227.2	37%
33	Moist Spruce – Labrador Tea (mature forest stage)	1202.1	9%	67.0	11%
34	Moist Spruce – Alder – Labrador Tea	1446.1	11%	70.0	12%

35	Moist Spruce – Scrub birch – Labrador Tea	591.7	4%	23.2	4%
36	Moist Birch – Willow	2.7	0%	0.9	0%
41	Wet Shrub – Tamarack	1.0	0%	0.0	0%
42	Wet Shrub – Black Spruce – Tussock Cottongrass	654.3	5%	25.0	4%
43	Wet Shrub – Black Spruce - Sphagnum	28.2	0%	0.0	0%
44	Wet Shrub – Scrub Birch – Tussock Cottongrass	150.3	1%	0.0	0%
46	Wet Black Spruce – Labrador Tea – Cladonia	228.7	2%	20.5	3%

Total		13,638.5	100%	608.0	100%

6.2.2 Project Interactions and Potential Effects

Re-establishment and construction of the winter roads will result in alteration of up to 60.4 ha of vegetation within the road footprint. The footprint will be cleared of vegetation through mulching and manual felling. The cutters of the mulcher will be raised off the ground to minimize disturbance to hummocks, tussocks, and high spots, but will remove taller shrubs and trees to allow safe vehicle and equipment travel. Mulching will remove shrubs and trees while protecting the moss layer, soil and root systems of low-growing plants.

In addition to the direct loss of vegetation within the road footprint due to clearing, re-establishment, construction and travel within the road footprint may cause potential effects to vegetation by altering underlying soils. These potential effects include soil disturbance, soil compaction, root damage, altered soil moisture regime, and permafrost thaw. Soil disturbance and root damage would most likely be caused by physical interactions from machinery during clearing, while soil compaction, altered soil moisture, and permafrost thaw would most likely be caused by repeated travel of heavy equipment compressing underlying soils, which can lead to altered thermal and hydrological characteristics.

Vegetation clearing within the road footprint could have both direct and indirect potential effects. Potential direct effects including change to earlier successional stage, change of wildlife habitat and forage, loss of primary productivity and carbon sequestration, reduction of biodiversity, and aesthetic impacts. Potential indirect effects, which may extend into the VLAA and are generally attributable to edge effects, include altered light availability, altered temperature regimes, altered wind patterns, increased nutrient availability from cleared and mulched vegetation, altered seed dispersal, changes to vegetation composition and growth such as infiltration of early seral plants, and altered herbivory patterns.

Potential effects to rare plants include disturbance or destruction during construction if rare plants occur within the footprint, and changes to habitat characteristics caused by vegetation removal and edge effects in the VLAA. There are no tracked shrub or tree species occurring within the Eagle Plains Ecoregion, so only rare ground cover plants (e.g., forbs, graminoids, mosses, and lichens) would be at risk of physical disturbance (Yukon Conservation Data Centre 2019). Ensuring a minimum 10 cm snowpack on all areas to be cleared will greatly reduce the potential for physical disturbance or destruction of any rare plants occurring in the footprint.

Potential effects to invasive plants include introduction and spread of invasive plants via equipment or personnel brought in from infested areas.

All of the aforementioned effects have potential to effect wetlands within the footprint or VLAA, often with increased significance due to the sensitivity to wetlands (e.g., more sensitive soils, hydrological regimes, higher biodiversity and wildlife value, wetland-obligate species). However, as there are no wetlands documented within the footprint or VLAA in the ELC mapping, these effects are unlikely.

The construction phase of the Project could also result in degradation of vegetation due to spills (e.g., hydraulic fluid, fuel etc.) along the access roads.

6.2.3 Mitigation Measures

Mitigation measures related to vegetation and wetlands include:

- Existing and historic winter roads will be used as the primary access routes to minimize the amount of vegetation that is cleared.
- Winter roads will consist of packed and frozen snow and ice to maintain ground vegetation and to avoid site disturbance to the underlying duff layer, soil and permafrost. A minimum 10 cm snowpack will be required over all road surfaces.
- The extent of vegetation clearing, notably the widths of winter roads and areas at well sites, will be minimized. On the Chance Road, the width will not exceed the existing right-or way extent. This will minimize the direct loss of vegetation and reduce potential edge effects.
- Shrubby vegetation will be cut as high as possible, normally at least 30 cm above the ground. Where possible, shrubs will be pushed over instead of cut.
- The winter roads are located primarily on crest and upper slope positions which minimizes potential overlap with wetlands and riparian areas. If small wetlands or riparian areas along non-classified drainages are encountered, special efforts will be made to minimize effects by enhancing the thickness of the packed snow/ice base and minimizing the right-of-way width.
- To avoid the spread of invasive plants, equipment will be washed and inspected prior to transport to site.

6.2.4 Effects characterization and Significance Determination

With the mitigation measures listed in **Section 6.2.3** applied, it is predicted that the Project activities will not result in significant effects to vegetation and wetlands. Most of the effects are low to moderate in magnitude and considered unlikely to occur and/or reversible over the long-term.

Loss and Alteration of Vegetation

The loss and alteration of vegetation will be mitigated primarily by using existing and historic access roads to minimize the area to be disturbed, and by limiting use to winter. A maximum of 60.4 ha of vegetation will cleared within the footprint, which represents only 0.44% of the RVAA. Existing and historic winter roads in the area typically support early to mid-seral vegetation at a lower structural stage than the surrounding vegetation. Re-activating previously used roads avoids disturbance to mature forests and surrounding vegetation and the overall change in seral stage is minimized. By limiting activities to winter and maintaining a 10 cm snowpack overlying frozen ground, ground vegetation, along with its root structure and litter layer, will be protected from physical disturbance. Cutting vegetation as high as possible will similarly reduce the total amount of vegetation loss, reduce disturbance to root structure, and increase potential for regrowth from the root mass. This will accelerate regeneration after the winter roads have been decommissioned.

Overall, potential effects of loss and alteration of vegetation are low in magnitude and reversible with regeneration. The loss and alteration of vegetation will be limited to a small area that has been previously disturbed, will only remove trees and shrubs greater than 30 cm tall while leaving ground vegetation intact, and will facilitate regeneration. Potential effects are limited in geographic and temporal extent; they will only occur in the footprint of existing roads during a single winter and will start to regenerate the following spring. With mitigations applied, the potential effects of loss and alteration of vegetation are not considered significant.

Creation of Edge Effects

Creation of edge effects (e.g., light availability, temperature regime, wind patterns, vegetation composition and growth, seed dispersal) will be mitigated by using existing and historic access roads and by limiting use to winter. Using previously disturbed access roads that already experience some edge effects will minimize the creation of new edges and thus reduce overall edge effects. Limiting use to winter and minimizing disturbance to ground vegetation will preserve ground vegetation integrity, which will further reduce the potential effects of forest edges. Potential edge effects will decrease as the footprint regenerates once well maintenance activities are completed.

Overall potential effects of edge creation are low in magnitude and reversible with regeneration. The footprint and VLAA already experiences some edge effects from past disturbance along the proposed routes; the Project may reinforce pre-existing edge effects but will minimize new edge creation. Potential effects are limited in geographic and temporal extent; they will only occur in the footprint and VLAA and will diminish as regeneration progresses. With mitigations applied, the potential effects of edge creation are not considered significant.

Disturbance to Soils

The disturbance to soils will be mitigated by creating a frozen snow and ice surface on existing and historic winter roads which will avoid effects to soils and permafrost. Using previously disturbed access roads will avoid potential effects to undisturbed sites. Re-activating and using access roads during winter while the soil is frozen, and maintaining a 10 cm snowpack, will protect the duff layer, soil surface, and soil structure from disturbance, and minimize potential permafrost thaw.

Overall, potential effects of soil disturbance are low in magnitude and unlikely to occur. Potential effects are limited in geographic and temporal extent; they will only occur in the footprint, and work will only occur in a single winter. With mitigations applied, the potential effects of soil disturbance are not considered significant.

Disturbance to Rare Plants

Disturbance to rare plants will be mitigated by limiting road re-establishment and use to winter, and by minimizing ground disturbance. There are no rare shrub or tree species documented within the Eagle Plains Ecoregion; only rare ground vegetation species have the potential to be affected by the Project. Ground vegetation will be dormant in winter, and protected by a minimum 10 cm snowpack, so any rare plants occurring within the footprint will be protected. Potential changes to habitat characteristics affecting rare plants will be mitigated by minimizing the creation of edge effects and overall vegetation loss and alteration.

Overall potential effects to rare plants are low in magnitude and unlikely to occur. Potential effects are limited in geographic and temporal extent; they may only occur in the footprint and VLAA, and physical disturbance may only occur during road re-establishment and use in a single winter. With mitigations applied, the potential effects to rare plants are not considered significant.

Spread of invasive species

Spread of invasive species will be mitigated by limiting road re-establishment and use to winter and inspecting equipment for cleanliness. Vegetation will be dormant in winter, so potential for seed dispersal from plants within the footprint will be low. Potential introduction of invasive species from off-site will be minimized by inspecting equipment brought on-site for cleanliness, including any dirt wads or old vegetation that may be harbouring seeds.

Overall potential effects of invasive species are moderate in magnitude but unlikely to occur. Potential effects are limited in geographic and temporal extent; they may only occur in the footprint and VLAA, and introduction of plants may only occur during road re-establishment and use in a single winter. With mitigations applied, the potential effects of invasive species are not considered significant.

Alteration of Wetlands

Alteration of wetlands will be mitigated by using existing and historic access roads that follow upland topography such as ridges to avoid wetland areas. Although there are no wetlands or named watercourses documented within the footprint or VLAA, snowpack depth will be increased if small wetlands or riparian areas along non-classified drainages are encountered.

Overall potential effects to wetlands are low in magnitude and unlikely to occur. Potential effects are limited in geographic and temporal extent; they may only occur in the footprint and VLAA, and only during road re-establishment and use in a single winter. With mitigations applied, the potential effects to wetlands are not considered significant.

Degradation of Vegetation or Wetlands Due to Spills

Spills will be mitigated by implementing the Spill Contingency Plan which is currently in development.

Overall potential effects of spills are moderate in magnitude but unlikely to occur. Potential effects are limited in geographic and temporal extent; they can occur only in the footprint, and potential occurrence is limited to a single winter. Potential effects would be short-term and would be at least partially reversible. With mitigations applied, the potential effects of spills are not considered significant.

6.3 Heritage Resources

The human history of the Yukon, from the earliest Indigenous groups to the arrival of fur traders and prospectors in the 19th century and beyond, is preserved in the Yukon's heritage or historic resources.

Historic resources include historic sites, historic objects, and any work or assembly of works of nature or of human endeavour that is of value for its archaeological, palaeontological, pre-historic, historic, scientific, or aesthetic features (*Historic Resources Act*, RSY 2002, c 109).

Historical sites generally date to a time of written history (i.e., in the Yukon, the past 100 to 150 years) and typically contain examples of built heritage or structures (e.g., cabins, caches, graves, and brush camps) (Gotthardt and Thomas 2007). Archaeological sites are older (i.e., typically older than 150 years) and can be found on the surface (i.e., artifacts that have been exposed or were never buried) or buried in the ground (e.g., stone tools and chips, animal bone fragments, and remains of ancient hearths and campfires) (Gotthardt and Thomas 2007).

Archaeological sites and resources are culturally meaningful and connect community members to the past and represent a collective identity. These resources represent ways of knowing and generational knowledge which are passed on through the generations. Every Indigenous group manages their cultural heritage in a unique way, but always with respect for the past and future generations.

6.3.1 Existing Conditions

In 2013, a Historic Resources Overview Assessment (HROA) was conducted by Matrix Research Ltd. for the 2013 Seismic Program at Eagle Plains, on behalf of Northern Cross (Yukon) Limited. The intent of this assessment was to determine the heritage potential within the proposed development area and provide recommendations for heritage management.

The HROA determined that a "significant portion of the study area is considered to have low pre-contact heritage resources potential (Matrix Research 2013)." However, the HROA also identified several areas that are considered to have high heritage resources potential. These areas of high potential are associated with locations along streams and along the upland areas overlooking these tributaries. The HROA recommended that further heritage resources investigations, specifically a Heritage Resource Impact Assessment (HRIA), be conducted within the zones of high heritage resource potential prior to any potentially land-altering development activities (Matrix Research 2013).

An HRIA was then conducted later in 2013 by Matrix Research, in which the identified zones of high potential were further assessed (**Appendix C**). As indicated by a Letter Report dated May 15, 2014, to Northern Cross (Yukon) Limited, Matrix Research concluded that the proposed well sites and access roads do not conflict with any of the areas containing heritage values (**Appendix D**). Matrix Research did however identify areas within the study area containing heritage values, identified in **Appendix D**, as high potential areas to avoid and labeled as 'avoidance areas'. Matrix Research recommended that these areas, "be

avoided by any potential land-altering activities and that if avoidance was not possible further heritage assessment should be conducted prior to any development (Matrix Research 2014)."

6.3.2 Project Interactions and Potential Effects

Results of the 2013 HROA and HRIA, conducted by Matrix Research, indicate that no Project interactions and/or potential effects are anticipated for Heritage Resources. Should the Project development areas/locations be altered and fall outside of the currently assessed area, further Heritage Resource assessment will be undertaken.

6.3.3 Mitigation Measures

The following list describes the mitigation measures the proponent has committed to eliminate, reduce or control potential effects to Heritage Resources caused from Project activities:

- Develop and implement a Project specific Heritage Resources Chance Find Procedure to ensure that the discovery of any unanticipated Heritage Resources is addressed. In the event Heritage Resources are encountered, all development activities in the vicinity of the Heritage Resources will be suspended immediately. In such cases, the Cultural Services Branch, Department of Tourism and Culture, Government of Yukon, the Vuntut Gwitchin First Nation, and First Nation of Na-Cho Nyak Dun will be contacted immediately with information on the heritage remains and nature of the disturbance.
- The Project will avoid any land-altering activities in the avoidance areas identified in the Matrix Research 2014 Letter Report, as to protect Heritage Resources.

6.3.4 Effects characterization and Significance Determination

With the mitigation measures listed in **Section 6.4.3** applied, it is predicted that Project activities will not result in significant effects to Heritage Resources. Should the Project development areas/locations be altered and fall outside of the currently assessed area, or within areas identified as high potential and or avoidance areas, further Heritage Resource assessment should be undertaken in order to determine any potential effects to Heritage Resources.

7.0 SUMMARY OF MITIGATION MEASURES

The following sections describe the mitigation measures the proponent has committed to eliminate, reduce or control potential effects of the Project to the selected values components.

7.1 Wildlife and Wildlife Habitat

7.1.1 General Mitigation Measures for Wildlife and Wildlife Habitat

- All Project personnel will be required to complete formal orientation and training related to wildlife mitigation measures.
- Work will be scheduled to minimize the spatial extent across which work is concurrently occurring.
- Access to the well sites will utilize existing and historic winter roads to minimize the creation of new linear features.

- Project footprints, notably the widths of winter roads, will be minimized as much as possible. On the Chance Road, the width will not exceed the existing right-or way extent.
- Firearms are not allowed on-site by Project personnel.
- A no harassment of wildlife policy applies to all personnel. This includes attempts to chase, catch, divert, follow, photograph, feed, or otherwise harass wildlife, whether on foot, in on-road or off-road vehicles, heavy equipment, or aircraft.
- The use of on-road and off-road vehicles, including snowmobiles, will be restricted to essential Project access routes.
- Personal use of unmanned aerial vehicles (UAVs or drones) is prohibited.

7.1.2 Road Operations

The following measures are designed to mitigate the risk of vehicle collisions and effects of road use on wildlife movements.

- The maximum speed limit along the Dempster Highway is 90 km/h.
- The maximum speed along winter roads is 30 km/h.
- Wildlife will always have the right-of-way. This requires vehicle operators to stop when wildlife are observed on or beside the road, allowing them to cross safely. If wildlife stays on the road or right-of-way for >5 minutes, drivers may resume travel and pass the animals at <10km/h.
- Special rules apply to caribou.
    - For Caribou within 100 m from the road:
        - Stop as far back as possible;
        - Alert other drivers;
        - Wait until caribou have crossed and moved beyond 500 m from the road or are lost from sight before proceeding;
        - Proceed with caution.
    - For Caribou beyond 100 m from the road:
        - Proceed with caution;
        - Alert other drivers;
        - Watch for direction of movement and change in behaviour.
- When moose and caribou are on a road they will sometimes run down the road away from a vehicle. If this happens, stop and wait at least 5 minutes to allow the animal to move off the road. If the animal remains on the road, drive forward at 10 km/h, then stop again when the animal begins to run away. Wait 2 minutes and repeat this procedure. If the animal still does not leave the road, wait 10 minutes and repeat the procedure, alternating with a 2- and 10-minute stop between driving attempts.
- Drivers are required to use two-way radio communication. The location of any wildlife observed along Project roads is to be communicated to other road users on the radio.
- Drivers will not exit the vehicle to chase, catch, divert, follow, photograph, or otherwise harass wildlife.
- Along winter roads:

- snow banks will be maintained at heights <1 m to reduce the hinderance to wildlife crossing them;
- where snow banks exceed 60 cm in height, regular breaks (at least every 500) will be created to facilitate easier animal crossing and as 'escape routes' off the road.
    - Create matched breaks on either side of the road that animals can use to cross.
    - On corners, create run-outs, in each direction, that are obvious alternative routes for animals to use, instead of following the road.
    - Avoid breaks at seismic lines, which could provide human access.

7.1.3 Aircraft Operations

The following measures are designed to mitigate the effects of aircraft use on wildlife:

- Altitudes of greater than 300 m above ground level will be maintained at all times of the year.
- Altitudes of greater than 600 m above ground level will be maintained during sensitive times of the year.
- Areas where caribou have been observed in the past will be avoided.
- Flights paths will be designed to avoid important areas during sensitive times of the year.
- No caribou observed will be flown towards, circled, or harassed.
- If caribou are seen to be in a panic or startled the plane will ascend to a higher elevation.

7.1.4 Caribou

The majority of potential effects to caribou will be mitigated via measure for general wildlife, road operations and aircraft operations. Additional measure specific to caribou include:

- Packing of snow will not occur on any linear features that are not essential to Project work.
- Access to linear features off the winter roads will be minimized by avoiding creation of breaks in snow berms at junctions with linear features.
- All sightings of caribou will be reported to the Environmental Monitor.
- If more than a dozen caribou are observed, or if any number of caribou are observed in the same location for longer than a three-day period, a qualified environmental professional (QEP) will be consulted to determine if site-specific mitigations may be warranted.

Due to the variable nature of caribou occurrence and snow conditions from year to year, a pre-operations assessment will be conducted in December, prior to Project initiation, to assess local conditions (specifically including information about caribou occurrence and snow conditions) that could warrant tailored management measures. For example, if telemetry data indicated that several collared caribou were in the Project area, near work areas, additional measures may be put in place to mitigate potential effects.

7.2 Vegetation and Wetlands

Mitigation measures related to vegetation and wetlands include:

- Existing and historic winter roads will be used as the primary access routes to minimize the amount of vegetation that is cleared.

- Winter roads will consist of packed and frozen snow and ice to maintain ground vegetation and to avoid site disturbance to the underlying duff layer, soil and permafrost. A minimum 10 cm snowpack will be required over all road surfaces.
- The extent of vegetation clearing, notably the widths of winter roads and areas at well sites, will be minimized. On the Chance Road, the width will not exceed the existing right-or way extent. This will minimize the direct loss of vegetation and reduce potential edge effects.
- Shrubby vegetation will be cut as high as possible, normally at least 30 cm above the ground. Where possible, shrubs will be pushed over instead of cut.
- The winter roads are located primarily on crest and upper slope positions which minimizes potential overlap with wetlands and riparian areas. If small wetlands or riparian areas along non-classified drainages are encountered, special efforts will be made to minimize effects by enhancing the thickness of the packed snow/ice base and minimizing the right-of-way width.
- To avoid the spread of invasive plants, equipment will be washed and inspected prior to transport to site.

7.3 Heritage Resources

The following list describes the mitigation measures the proponent has committed to eliminate, reduce or control potential effects to Heritage Resources caused from Project activities:

- Develop and implement a Project specific Heritage Resources Chance Find Procedure to ensure that the discovery of any unanticipated Heritage Resources is addressed. In the event Heritage Resources are encountered, all development activities in the vicinity of the Heritage Resources will be suspended immediately. In such cases, the Cultural Services Branch, Department of Tourism and Culture, Government of Yukon, the Vuntut Gwitchin First Nation, and First Nation of Na-Cho Nyak Dun will be contacted immediately with information on the heritage remains and nature of the disturbance.
- The Project will avoid any land-altering activities in the avoidance areas identified in the Matrix Research 2014 Letter Report, as to protect Heritage Resources.

7.4 Fish and Fish Habitat

The Project has no direct interaction with fish and fish habitat. Potential indirect effects are also limited due to the location of winter roads and well sites at least 200 m from streams and waterbodies. The following measures are designed to further mitigate indirect effects relating to water quality.

- If non-classified drainages are encountered, special efforts will be made to minimize effects to downstream water quality and sedimentation risk. These include:
  - enhancing the thickness of the packed snow/ice base over and adjacent to the drainage area,
  - minimizing the width of the right-of-way through the area, and
  - ensuring that slash from vegetation clearing is removed from the area so it will not be transported downstream during spring run off.
- If any site disturbance occurs during winter road construction or operation (i.e., exposure of organic or mineral soil), the location and extent of the site will be documented during operations and the area will be treated for sediment control and vegetation regeneration the following summer.

- In the event of a hydrocarbon spill, follow measures described in the Spill Contingency Plan, to contain the spill and prevent the spill from affect adjacent water courses.

7.5 Regional Land Use Plans

The proposed Project is located within the boundaries of the North Yukon Planning Region and Peel Watershed Planning Region and is therefore subject to the North Yukon Land Use Plan and (NYLUP) Peel Watershed Land Use Plan (PWLUP). Locations of proposed Project activities are within Land Management Unit (LMU) 9 of the NYLUP and LMU 7 of the PWLUP. (**Table 7.1**). Both are located within the Eagle Plains basin, with the highest potential for oil and gas development. Details regarding how the Project will meet the requirements of the Northern Land Use Plan and Peel Watershed Land Use Plan is provided in **Table 7.2**.

Table 7.1 Landscape Management Units Overlapping the Project

Landscape Management Unit Number	Landscape Management Unit Name	Integrated Management Area (IMA)
9 (NYLUP)	Eagle Plains	4
7 (PWLUP)	Dalglish Creek	4

Table 7.2 Commitments and Mitigations to meet the requirements of the North Yukon Land Use Plan and Peel Watershed Land Use Plan

Topic	Recommendation		Best Management Practices		Commitment/Mitigation
	NYLUP	PWLUP	NYLUP	PWLUP	
Surface Disturbances	• Site closure/remediation plans should be developed and monitored that create significant disturbance. • To provide a benchmark for the monitoring of cumulative effects indicator levels, the status of existing surface disturbances should be documented.	• In the IMA, the amount of surface disturbance should be maintained below the cumulative effects indicator levels recommended in the plan.	• The size, intensity and duration of all surface disturbances should be reduced. • Native endemic plants should be used for active reclamation of disturbed sites	• Reduce size, intensity and duration of human-caused physical surface disturbances (e.g. utilize low impact seismic, winter roads and principle of full reclamation.	• The size, intensity, and duration of human caused physical disturbances will be mitigated primarily by using existing and historic access roads to minimize the area to be disturbed, and by limiting use to winter.
Wildlife Habitat	• Reduce size, intensity and duration of human-caused physical surface disturbances (e.g. utilize low impact seismic, winter roads and enhanced reclamation. • Reduce other human land use impacts such as noise, smell and light. • Avoid or reduce activities in significant wildlife habitats during important biological periods (e.g., utilize timing windows). • Coordinate, manage and minimize new road and trail access.	• In the IMA, the protection of Boreal caribou habitat should be given special consideration in the assessment of potential development. • Ensure adequate wildlife and habitat baseline data collection is completed prior to any development activities.	• Avoid or minimize the creation of new access roads and trails; utilize existing routes unless their use will cause additional long term environmental impacts. • Avoid or minimize the size, extent and duration and level of activities in concentrated seasonal use areas. • Use appropriate operational timing-windows in significant wildlife habitats to minimize activities wherever possible, during periods of wildlife use. • When new access creation is necessary: • Non-permanent winter access routes should be developed and utilized versus all-season access routes. • Gate or otherwise restrict hunting along new access routes. • Where possible, direct new access routes through less significant wildlife habitats.	• Coordinate, manage new road and trail access. ○ To the extent possible, avoiding routing new roads and trails through concentrated seasonal use areas and significant habitats. ○ Avoid using or crossing seasonal migration corridors. • Avoid or reduce activities in significant wildlife habitats during important biological periods (e.g. utilize timing windows). ○ Porcupine Caribou are typically in the region during winter period (December to March). ○ Avoid concentrated woodland caribou use areas. • Reduce other human land-use related disturbances such as noise, odours, light.	• The size, intensity, and duration of human caused physical disturbances will be mitigated primarily by using existing and historic access roads to minimize the area to be disturbed, and by limiting use to winter. • The timing of the Project, during winter, is a season of lowest importance for the ecology of the Porcupine Caribou Herd and a period when the caribou are relatively tolerant of human disturbance (Porcupine Caribou Technical Committee 1993). • Work will be scheduled to minimize the spatial extent across which work is concurrently occurring. • Access to linear features off the winter roads will be minimized by avoiding creation of breaks in snow berms at junctions with linear features. • Packing of snow will not occur on any linear features that are not essential to Project work. • All sightings of caribou will be reported to the Environmental Monitor. • If more than a dozen caribou are observed, or if any number of caribou are observed in the same location for longer than a three-day period, a qualified environmental professional (QEP) will be consulted to determine if site-specific mitigations may be warranted. • The use of on-road and off-road vehicles, including snowmobiles, will be restricted to essential Project access routes. • Personal use of unmanned aerial vehicles (UAVs or drones) is prohibited.
Focal Species Management – Porcupine Caribou Herd (NYLUP)	See recommendations for Wildlife Habitat.		• Avoid or minimize the size, extent, duration and level of activities in concentrated seasonal use areas. • Avoid using or crossing seasonal migration corridors with new access routes.	Not applicable	

Topic	Recommendation		Best Management Practices		Commitment/Mitigation
	NYLUP	PWLUP	NYLUP	PWLUP	

			• Define and implement safe operation distances from the herd.
			• Consider the following seasons when determining appropriate operational timing windows (seasons when Porcupine caribou occupy the region):
			  ○ Spring migration – April 1 to May 31
			  ○ Early summer – July 1 to July 15
			  ○ Mid to late summer – July 16 to August 7
			  ○ Fall migration – August 8 to October 7
			  ○ Rut – October 8 to
			  ○ Winter – December 1 to March 31		

Fish Habitat	• Water withdrawals in sensitive fish over-wintering areas should be prohibited.	• Ensure adequate fish, waterbird, aquatic habitat and water quality baseline data collection is completed prior to any development activities .	• The use of ice roads or winter roads as river/creek crossings is generally considered adequate to mitigate potential impacts to fish and fish stocks.	• Minimize surface and vegetation disturbance in riparian areas.
				• Avoid or minimize indurstrial land use activities in wetlands and riparian areas.
				• Prohibit significant levels of winter in-stream water withdrawals in sensitive over-wintering fishing habitat.
				• Avoid large scale-industrial and/or infrastructure projects within major river corridors.
				• Minimize stream crossings; if stream crossings are required ensure proper bridge and crossing structures are used, and are designed for ease of removal (i.e., temporary structure).
					The Project has no direct interaction with fish and fish habitat. Potential indirect effects are also limited due to the location of winter roads and well sites at least 200 m from streams and waterbodies. The following measures are designed to further mitigate indirect effects relating to water quality and fish habitat.
					• If non-classified drainages are encountered, special efforts will be made to minimize effects to downstream water quality and sedimentation risk. These include:
					  ▫ enhancing the thickness of the packed snow/ice base over and adjacent to the drainage area,
					  ▫ minimizing the width of the right-of-way through the area, and
					  ▫ ensuring that slash from vegetation clearing is removed from the area so it will not be transported downstream during spring run off.

8.0 CONCLUSION

The proposed Project requires an evaluation by a YESAB Designated Office because the *Assessable Activities, Exceptions and Executive Committee Projects Regulations* of YESAA identified three accessible activities:

1. The project location is in the Yukon;
2. The *Assessable Activities, Exceptions and Executive Committee Projects Regulations* identifies several triggers for the Project including:
    a. Schedule 1, Part 3, Oil and Natural Gas, Item 2:

    On other than an Indian reserve, drilling, operation, modification, decommissioning or abandonment of, or other activity in relation to, an oil or natural gas well or seismic shot hole, but not including a hole drilled to obtain geological information.

    b. Schedule 1, Part 13, Miscellaneous, Item 13:

    On Crown land or settlement land, levelling, grading, clearing cutting or snow ploughing of a route that provides access to land for the purposes of a geophysical, geological or engineering survey.

3. An authorization by a government agency is required for the activities to be undertaken.

The proponent understands that the purpose of the YESAB Designated Office evaluation process in Yukon is to inform planning and decision-making by governments to avoid or minimize significant environmental and socio-economic effects while realizing development objectives. The proponent also recognizes that the YESAB Designated Office evaluation process provides an integrated means of identifying, evaluating, and mitigating a proposed project's potential adverse environmental and socio-economic effects. Valued components for the assessment were selected based on the potential for Project activities for this proposal to interact with the identified VC and result in adverse effects. Where effects assessments indicated that adverse effects could occur to a VC, the assessment proposed technically feasible and appropriate mitigation measures to avoid or minimize those effects. With the implementation of the proposed mitigation measures, Project-related residual adverse effects to the selected VCs are likely to be not significant.

APPENDIX 2-A-25. *Spill Response Plan*

1.5.13 Spills

In any incident, the first priority is Life Safety. This includes the protection of the public and the safety of response personnel.

Life Safety will always be the top strategic priority

Public safety actions begin at the source of the release and are undertaken in a coordinated manner by Chance Oil and Gas Limited, the local authority and other responders as needed at the time of the incident.

The types of containment and recovery efforts depend on the type of spill. Containment and recovery response actions focus on minimizing the effects of the spill on the surrounding area.

Clean-up activities will be conducted after containment and recovery actions are completed. Clean-up and disposal of contaminated material and site remediation work will continue until the spill site is returned as nearly as possible to pre-spill conditions and company environmental specialists and the agencies are satisfied.

Chance Oil and Gas Limited is an active member of the Western Canadian Spill Services (WCSS). Chance Oil and Gas Limited is expected to assess the risk that its operation poses to the environment and be prepared to provide effective emergency response capability in the event of a spill.

1.5.13.1 Initial Spill Response Actions

- Follow First On-Scene Strategy (Section 1.2.1).
- Size up considerations for a spill site:
  - Is there a fire or explosion hazard? What is the ignition source?
  - Is there H_2S or other toxin present?
  - Are there any areas deemed hazardous? (Mark with flags).
  - What are the ground and weather conditions? (Snow, gravel, sand etc.)
  - Where is the location of the leak, the type of release and the volume released?
  - How long has the spill been taking place?
  - Is the spill into a watercourse, watershed or a water body?
  - Is the spill contained or migrating? Which direction? How far can it go?
  - If the spill is not contained, determine and prioritize the containment points and methods to be used.
  - What lands will be affected? (Farm, livestock, brush, drinking water, etc.)
  - How is it going to be contained and cleaned up?
  - How to access the spill site, the source of the spill and recovery points?
  - What equipment is required? Is oil spill equipment (oil spill co-op) required?
  - Where can spill responders park so as not to interfere with spill equipment? (Minimize vehicular traffic as much as possible at the spill site.)
  - Are there any residences in the area? Do they have water wells that could be affected?
  - Should the spill site be cordoned off to prevent wildlife / livestock from entering?
- Relay information to internal company contacts, government agencies and if required, landowner, spill response contractors and the designated Public Information Officer.

1.5.13.2 General Control and Containment

- If possible, immediately shut off the source of the spill ensuring your own safety.
- Prioritize and set up containment points
- Where possible, prevent a spill from entering a watercourse.
- Use safest and simplest method to get job done within resource and safety capabilities.
    - Isolate and depressurize (ESDs, manual block valves, manual valve isolation).
    - Plug and patch (e.g. fix faulty valve or hole in drum).
    - Absorb or adsorb (e.g. applying adsorbent pads to oil spill).
    - Transfer (e.g. removing product to waste truck or new container).
    - Containerize (e.g. put leaking drum into over-pack drum).
    - Reposition (e.g. upright or roll and chock leaking container).
    - Others (e.g. hot-tap, vent and burn, flaring).
- Contain the spill – containment is a priority for limiting environmental damage.
- Contain as close to source as safe and practical.
- Avoid excessive walking or driving on the spill area.
- Do not use absorbents on large spills.
- Consider ground disturbance guidelines.
- Determine where bell holes or trenches would be most effective.
- Keep trenches shallow and narrow as possible, to prevent additional clean-up.
- Use practical containment tools and equipment including shovels, dump trucks, sand bags, plastic bags, heavy earth moving equipment, "Plug and Patch", foam, salvage covers, adsorbents, booms, hose, redwood plugs, etc.
- If weirs are installed, they should be able to handle large flow rates and surges.
- Surface run off may have to be diverted from the spill site if wet conditions are present.

1.5.13.3 Recovery of product and/or clean-up of the spill

- Ensure the health and safety of the persons responding to the spill.
- Once containment has been achieved, recovery and clean-up operations begin immediately.
    - Recover as much product and saturated debris as possible.
    - Keep environmental disturbance to a minimum.

1.5.13.4 Land Spills

Land spills will spread outward from the initial spill point toward lower-lying areas. Penetration downward into the soil will also occur at a rate that is dependent on the soil type and the nature of the product spilled. During spills in winter, petroleum will spread under the snow making definition of the extent of the spill area difficult.

- attempt to restrict spills on land to as small an area as possible based on site conditions.
- prevent the spill from entering water bodies or flowing watercourses or flowing into manholes or culverts, within the bounds of safety and practicality.

The method chosen for land containment and recovery is dependent on site conditions and the equipment available. A summary of common options is presented in the following table:

Land Containment Options		
Containment Method	**Technique Description**	**Comments**
Earth or Sand Dike (All seasons)	Earth or sand at or near the site is used to contain spilled material on flat or sloped surfaces. Sandbags filled with soil or sand are used to contain spill.	Sufficient dry earth, gravel or sand must be available to contain spill. Earth may be frozen. Surface disturbance to remove earth or sand may result in erosion, especially on steep slopes. Work crews and/or earth-moving equipment are required to build dike.
Snow or Ice Dike (Winter only)	Snow or ice at or near the site is used to contain spilled material on flat or sloped surfaces.	Sufficient snow or water must be available to contain spill. Snow or ice dike will melt quickly in warm weather. Contaminated snow or ice may need to be removed or stored for treatment. Work crews and/or earth-moving equipment are required to build snow dike. Water spraying equipment may be required to construct ice dike.
Land Containment Options		
Containment Method	**Technique Description**	**Comments**
Sorbent Dike (All seasons)	Sorbent material is used to contain spill.	Useful only in small spills, as purchase of large quantities of sorbent is expensive and impractical. Contaminated sorbent may need to be replaced or squeezed out during incident. Contaminated sorbents must disposed in compliance with government legislation. Sufficient sorbent or sorbent boom, work crews and storage containers or a lined storage area for contaminated sorbents must available to build sorbent dike.
Trench or Sump (All seasons)	A trench or sump is excavated downslope on sloping terrain to limit surface or subsurface spill movement. Work crews and/or earth-moving equipment are required to build trench or sump, as well as plastic or other impermeable sheeting for a trench liner.	Clean topsoil should be removed before trench construction. Frozen soil, bedrock close to the surface or soil type (e.g. sand) may make this option impractical. Surface disturbance to remove earth or sand may result in erosion or further penetration in sandy soil.
Land Recovery Options		
Recovery Method	**Technique Description**	**Comments**
Vacuum Truck	A vacuum truck is used to recover spilled material from a dike or trench in areas accessible by trucks or heavy equipment.	The method depends on site access. Surface disturbance and soil damage may result from movement of the vacuum truck to and from the site. Topsoil may need to be stripped from the site before starting recovery activities.

Land Recovery Options		
Recovery Method	**Technique Description**	**Comments**
Pumping Spilled Material into Storage	A pump is used to recover spilled material from a dike or trench in areas not accessible by vacuum trucks.	Pumps must be safe for use at the spill site and compatible with the product to be pumped. Surface disturbance and soil damage may result from movement of the pump and storage equipment to the site. Skid tanks, tanker trucks, port-a-tanks, fuel bladders, permanent tanks, or a lined excavated area must be available to provide storage for the recovered material. A work crew and power supply for the pump must also be available.

1.5.13.5 Spills into a Watercourse

Petroleum products will spread outward from the origin of the spill, eventually achieving a stable thickness on the water. Spills on rivers, creeks, or streams will flow downstream, contaminating riverbanks and vegetation, affecting wildlife, fish and water users in the area of the spill.

The rate of spill movement will depend on the current speed of the water and the time of year. Current may flow faster in the deepest channels in the river and slower in shallower areas, due to varying volumes of water. Flow in a watercourse will also be faster in the spring, because of snowmelt entering the watercourse from the surrounding area. River currents in summer and fall will be generally slower than in the spring. Wind and wave action will also affect the rate and direction of spill travel.

Spill velocity on a watercourse may be estimated quickly by using a current velocity meter or by timing the movement of a floating object on the watercourse over a set distance.

The following table is used for estimating spill velocity based on a 30 metre (100 foot) distance:

Time Required For Object to Travel 100 meters (seconds)	Surface Current Speed		Boom Angle (degrees)
	(km/hr)	(m/s)	
720	0.5	0.14	60°
360	1.0	0.28	60°
240	1.5	0.42	60°
180	2.0	0.56	45°
143	2.5	0.69	45°
120	3.0	0.83	45°
103	3.5	0.97	15°
90	4.0	1.11	15°
80	4.5	1.25	15°
73	5.0	1.39	15°
60	6.0	1.67	15°

Note: In currents faster than 6.0 km/h, or in excessively turbulent waters, the use of containment booms may be impractical, and other containment or protection methods such as the use of diversion or exclusion booms may be required.

The velocity calculated will be an approximation only, as the watercourse velocity varies at different points across the river, due to changes in river depth and at various points upstream and downstream on the river. In the initial stages of the spill on a watercourse, lighter-end materials will tend to evaporate, especially in warm weather. Other processes that might affect spill behaviour include dispersion of the petroleum into the water, formation of stable oil/water emulsions and stranding or oil along the shoreline.

Containment of a spill on a watercourse should be completed as quickly as possible as the spilled material has the potential to travel a much greater distance and contaminate a larger area than spills on land. The Incident Commander and Incident Command System Operations personnel will implement appropriate containment actions based on the size of the watercourse and current velocity.

Watercourse Containment Options		
Containment Method	**Technique Description**	**Comments**
Containment Boom (Spring to Fall)	A containment boom is placed in the watercourse to prevent migration of the spilled material down-stream of the containment point.	The watercourse must be accessible to allow containment activities. If water is too shallow, or current is too fast, the containment boom may not be effective in containing the oil. Oil spill containment equipment, work and safety boats, and a work crew must be available to conduct this method.
Diversion Boom (Spring to Fall)	Diversion booms are used in large or swift rivers to divert spilled material to calmer water for containment and recovery. May be used in combination with containment boom.	The watercourse must be accessible to allow boom to be deployed. High current speeds or turbulence may make deployment impossible, or may cause deployed boom to fail, releasing spilled material downstream. Oil spill containment equipment, work and safety boats, and a work crew must be available to conduct this method.

Watercourse Containment Options		
Containment Method	**Technique Description**	**Comments**
Sorbent boom (Spring to Fall)	Sorbent booms may be used in narrow, low flow streams or rivers to remove small amounts of surface oil. Chicken wire or containment boom may be used to back up sorbent boom.	The watercourse must be accessible to allow boom to be deployed. Sorbent boom use is only viable in low flow watercourses, as boom is not very sturdy and breaks easily. (Chicken wire or containment boom may be used behind sorbent boom to reinforce sorbent boom and prevent breakage). Sorbent boom also has no skirt allowing large amounts of oil to easily flow under it. Sorbent boom will pick up sheen but not large amounts of oil. Sorbent boom is not very effective in cold weather. Large amounts of sorbent boom are expensive, and must be replaced in the watercourse when saturated. Used sorbent must be stored and disposed of in compliance with government legislation. Sorbent boom, work crew and possibly boats may be required.
Earth or Sand Dike (Spring to Fall)	Dikes are used across very shallow streams and intermittent creeks to contain flowing oil. Dikes can also be used to contain spilled materials along a shoreline.	Sufficient earth or sand is needed to construct the dike. Flowing may be caused if stream or creek is dammed (a containment weir may be used to alleviate this problem – see below) Damage may be caused by evacuation and construction in the watercourse and along the banks. A work crew with shovels, earth-moving equipment, earth or sand, sandbags and/or sheets of metal or wood may be required.
Containment Weir (Spring to Fall)	Containment weirs are physical dams with culverts or pipes constructed in the dam to allow free water movement from a site while containing surface oil.	Containment weirs are used in shallow streams and creeks and are suitable for maintaining a constant water level at the site and preventing flooding. Damage may be caused by excavation and construction in the watercourse and along the banks. A work crew with shovels, earthmoving equipment, earth or sand and piping or culvert material is required.

Watercourse Recovery Options		
Recovery Method	**Technique Description**	**Comments**
Vacuum Truck	A vacuum truck is used to recover free petroleum from water in areas accessible by trucks or heavy equipment.	A vacuum truck and operator are required. Use of this method is subject to site access. Surface disturbance and soil damage may result from movement of the vacuum truck to and from the site. Topsoil may need to be stripped from the site before conducting recovery activities.
Pumping of Spilled Material into Storage	A pump is used to recover free oil from the watercourse in areas not accessible by vacuum trucks.	Pumps must be safe for use at the spill site and be compatible with the product to be pumped. Surface disturbance and soil damage may result from movement of the pump and storage equipment to the site. Technique will generate large volumes of contaminated water that will require storage. Skid tanks, tankers, port-a-tanks, fuel bladders, permanent tanks or a lined excavated area must available to provide storage for the recovered material. A work crew and power supply for the pump must also be available.
Skimmers	Mechanical devices are used to skim oil from water surface or remove oil/water mixture for storage.	Skimmer will need sufficient water depth to float. Weir skimmers work best on thicker layers of oil in flowing water. Will generate large quantities of water/oil mixture. Drum or disc skimmers will pick up thinner layers of oil on slow moving water. Debris and vegetation may clog skimmer making oil pickup difficult. A suction, floating weir, disc or drum skimmer, pump and work crew are required. A secure storage facility (tanker, portable tanks, fuel bladders or excavated, lined storage site) is also required.

1.5.13.6 Spills into Water bodies

In the absence of any current or wind, spills on water bodies such as lakes will spread out in all directions from the site of the spill until a uniform stable thickness is reached. If a wind and/or current is present, the spill will move with the wind or current until it reaches the shoreline.

Wave action in the water body may also affect the spill causing oil-in-water or water-in-oil emulsions to form, making recovery and clean-up efforts more difficult.

Response personnel should attempt to contain the spill to as small an area as possible on the water body near the spill source. Dispersion of the spill over a large area on the water body could cause widespread impacts when the spill reaches the shore. If the spill can be contained on the water body, the spilled material is moved toward shore for recovery.

Containment options for spills on water bodies use a containment boom to surround the spill. See the local Oil Spill Contingency Plan for a discussion of containment booms and for boom configurations used to contain a boom in open water. If the area that may be impinged by the spilled materials is environmentally sensitive, appropriate shoreline protection measures may be implemented as recommended by company Environmental Specialists.

1.5.13.7 Spills into Wetlands or Muskeg

Wetlands are areas with high organic content, which contain large amounts of water in the soil. Wetlands may be continuously covered in water or water levels may fluctuate throughout the year. Muskeg is a land area that contains a high moisture content and is boggy in the summer because of large quantities of peat, moss, or other vegetative material in the soil. In winter, muskeg will freeze making excavation extremely difficult.

Spills in wetlands or muskeg can be some of the most difficult spills to contain, recover and clean up because of limited site access for both manpower and equipment. Because of the sensitive nature of these ecosystems, more damage may be caused by emergency response operations than was caused by the original spill. The Incident Commander may consult with government officials or environmental specialists before conducting emergency response operations in wetlands or muskegs. This will ensure that containment, recovery, and clean-up operations represent the most viable option for the spill, based on the type of product, size of spill and site specific safety, operational or environmental concerns.

If all other options are considered unviable, natural recovery may be approved by environmental protection agencies. Natural recovery uses micro-organisms already present in the ecosystem to degrade the oil. Degradation of the oil may be enhanced by addition of other nutrients required by the micro-organisms, to ensure sufficient levels of these nutrients are present to allow degradation to continue.

Natural recovery may be preferable to recovery and clean-up depending on:

- the amount, type and persistence of the oil
- the location of the site
- the nature and uses of the area
- whether the impacts of various clean-up methods are greater than damage related to the actual spill

Natural recovery should be considered if:

- clean-up activities will cause more harm than leaving the site to recover naturally
- leaving the area to recover naturally will not cause further harm to environmentally sensitive areas

Containment operations for wetland or muskeg spills in winter are similar to those for spills on land or ice. If containment operations are conducted at the site in the summer, a combination of land containment and water containment options will be used as appropriate.

Wetland or Muskeg Containment Options		
Containment Method	**Technique Description**	**Comments**
Containment Boom	A containment boom is placed in wetland to prevent migration of oil into non-contaminated areas.	If water is too shallow, or the current is too fast, the containment boom may not be effective in containing the oil. Oil spill containment equipment, work and safety boats and a work crew must be available to use this method.
Containment Weirs	Containment weirs are physical dams with culverts constructed in the dam to allow free water movement from a site while containing surface oil. Containment weirs are used to maintain a constant water level at spill site for easy oil recovery.	Access to the site by manpower and equipment may be limited. Building of containment weirs may be labour-intensive and time-consuming if done manually. Damage may be caused by excavation and construction in the watercourse and along the banks. A work crew with shovels, earthmoving equipment, earth or sand and piping or culvert material is required to use this method.
Vacuum Truck	Muskeg or wetland areas must be accessible. A vacuum truck can recover from a trench or water surface.	Surface disturbance and soil damage may result from movement of the vacuum truck to and from the site. Topsoil may need to be stripped from the site before undertaking recovery activities.
Pumping of Spilled Material into Storage	A pump is used to recover free oil from wetlands or muskeg.	The wetland or muskeg area must be accessible for equipment. Pumps must be safe for use at the spill site and be compatible with the product to be pumped. The technique will generate large volumes of contaminated water that will require storage. Skid tanks, tanker trucks, port-a-tanks, fuel bladders, permanent tanks or a lined excavated area must be available. A work crew and power supply for the pump must also be available.
Skimmers	Used to skim oil from water surface or remove oil/water mixture for storage. Drum or disc skimmers will pick up thinner layers of oil on slow moving water.	The wetland or muskeg area must be accessible. Skimmer will need sufficient water depth to float. Debris and aquatic vegetation may clog skimmer, making oil pickup difficult. A suction, floating weir, disc or drum skimmer, pump and work crew are required to undertake method. A secure storage facility is also required.

Wetland or Muskeg Containment Options		
Containment Method	**Technique Description**	**Comments**
Fresh Water Flushing	Water is flushed through an area to push oil that is in vegetation or on the water surface toward a collection point for recovery. The method can be used in conjunction with trenches.	The wetland or muskeg area must be accessible for equipment to allow recovery activities to be conducted. The method is not suitable for areas with extensive vegetation or obstructions. Physical damage may be caused to sensitive environmental areas. Pumps, a power supply, hoses, hot or cold water, and a work crew are required. A lined, excavated area or storage tanks may be required to hold water for treatment or testing.

1.5.13.8 Spills on Ice

Spills on ice will tend to spread out from the spill source toward lower-lying areas. Surface depressions, cracks and pockets in the ice will cause the spilled material to pool. A significant volume of some oils can be absorbed into ice.

The presence of oil on or in ice increases solar heating and the rate of melting. Subsequent freezing and melting may eventually cause the oil to migrate throughout the surface of the ice. Openings in the ice may allow the spilled material to migrate into open water or allow the spill to be swept under ice, making response operations more difficult.

The information presented should be used as a guideline only in determining typical load-bearing capacity of ice. The Incident Commander and Incident Command System Operations personnel must determine whether it is safe to work on ice based on actual site conditions.

The ability for ice on a river, stream or lake to support the weight of workers and equipment is determined by effective ice thickness which is based on the thickness of clear ice and presence of white ice.

Clear ice (sometimes called blue ice) is translucent and well compressed with few air pockets. This ice is very strong and has a high load-bearing capacity.

White ice (or snow ice) is very porous, with many air pockets and is much weaker. White ice has approximately half the load-bearing capacity of clear ice. White ice is formed by constant melting and freezing of the top layer of ice due to solar heating or mild temperatures and is normally found on top of clear ice.

Holes should be drilled in the ice at the work site, before starting any on ice operations, to determine the average thickness of white and clear ice.

Effective ice thickness then can be calculated, using the formula in the following table:

Effective Ice Thickness = clear ice thickness + ½ white ice thickness
Example: The spill site has 20 inches of clear ice and 10 inches of white ice 20 inches clear ice + ½ x 10 inches white ice = 25 Effective Ice Thickness
Note: If water lies between layers, use the depth of only the top layer of white ice

Based on the effective ice thickness, a determination can be made as to the stationary and moving loads that may be supported by the ice. Normally less ice is required for continuous movement on the ice than for stationary loads as less pressure is exerted on any one point on the ice during movement.

LOAD-BEARING CAPACITY OF ICE THICKNESS FOR CONTINUOUS TRAVEL [1]		
Permissible Load	**Effective Ice Thickness inches (centimetres)**	
	Lake	**River**
One person on foot	2.0 (5.0)	2.5 (6.3)
Group, in single file	3.2 (8.0)	3.5 (8.8)
Passenger car 4,400 lbs. (2000 kg)	7.1 (17.8)	8.3 (20.8)
Light Truck 5,500 lbs (2500 kg)	7.9 (19.8)	9.1 (22.8)
Medium Truck 7,700 lbs (3500 kg)	10.2 (25.5)	11.8 (29.5)
Heavy Truck 15,000 – 17,500 lbs (6800 – 8000 kg)	13.8 (34.5)	16.1 (40.3)
20,000 lbs (9000 kg)	15.0 (37.5)	17.3 (43.3)
50,000 lbs (23,000 kg)	24.8 (62.0)	28.7 (71.8)
99,000 lbs (45,000 kg)	31.5 (78.8)	36.2 (90.5)
150,000 lbs (68,000 kg)	39.4 (98.5)	45.3 (113.3)
240,000 lbs (109,000 kg)	49.2 (123.0)	56.7 (141.8)

WEIGHT-BEARING CAPACITY FOR STATIONARY LOADS AND WORKING ON ICE		
Permissible Load	**Effective Ice Thickness inches (centimetres)**	
	Lake	**River**
2,200 lbs (1000 kg)	8.0 (20.0)	9.1 (22.8)
4,400 lbs (2000 kg)	12.0 (30.0)	14.0 (35.0)
8,800 lbs (4000 kg)	18.0 (45.0)	21.0 (52.5)
17,600 lbs (8000 kg)	24.0 (60.0)	27.0 (67.5)
50,000 lbs (23,000 kg)	44.0 (110.0)	50.0 (125.0)
99,000 lbs (45,000 kg)	59.0 (147.5)	68.0 (170.0)
150,000 lbs (68,000 kg)	71.0 (177.5)	82.90 (205.0)
240,000 lbs (109,000 kg)	91.0 (227.5)	105.0 (262.5)

Note: These tables are guidelines only for determining the typical load-bearing capacity of ice.

[1] Does not apply to parked loads, or where ice faults are evident.

Temperature may affect the load-bearing capacity of ice on a water body. Air temperatures must remain below the freezing point of water (0°C) for a sufficient period to allow the ice to adequately support a stationary or moving load. Temperature effects are dependent on ice thickness, as follows:

- less than 50 centimetres (20 inches) of ice: temperature must be constant for 3 days
- between 50 and 100 centimetres (20 and 40 inches) of ice: temperature must be constant for 4 days
- over 100 centimetres (40 inches) of ice: temperature must be constant for 5 days

Sudden drops or increases in temperature can also cause thermal stressing or cracking of ice requiring temporary load restrictions for 3 to 5 days following the change. Thawing due to warm temperatures may also significantly affect ice conditions. On-site personnel should take extreme care when evaluating ice conditions during a thaw and limit work on or near ice under these conditions.

Containment and clean-up options for spills on ice are similar to those on land and are summarized in the following tables:

On-Ice Containment Options

Containment Method	Technique Description	Comments
Earth or Sand Dike (All seasons)	Earth or sand at or near the site is used to contain spilled material on flat or sloped surfaces. Sandbags filled with earth or sand are used to contain spill.	Effective ice thickness must be sufficient to support the weight of manpower and equipment required to build dike. Sufficient dry earth, gravel or sand must be available to contain spill. Earth may be frozen. Surface disturbance to remove earth or sand may result in erosion, especially on steep slopes. Earth or sand placed on ice must be removed before spring break-up. Work crews and/or earth-moving equipment are required to build dike.
Snow or Ice Dike (Winter only)	Snow or ice at or near the site is used to contain spilled material on flat or sloped surfaces.	Effective ice thickness must be sufficient to support the weight of manpower and equipment required to build dike. Sufficient snow or water must be available to contain spill. Snow or ice dike may melt quickly in warm weather. Contaminated snow or ice may need to be removed or stored for treatment. Work crews and/or earth-moving equipment is required to build snow dike. Water spraying equipment may be required to construct and maintain an ice dike.

On-Ice Containment Options		
Containment Method	**Technique Description**	**Comments**
Sorbent Dike (All seasons)	Sorbent material is used to contain spill.	Useful only in small spills, as purchase of large quantities of sorbent is expensive and impractical. Contaminated sorbent may need to be replaced or squeezed out during incident. Contaminated sorbents must be disposed of properly to comply with government regulations. Sufficient sorbent or sorbent boom, work crews and storage containers or a lined storage area for contaminated sorbents must be available to build sorbent dike.

On-Ice Cleanup Options		
Clean-up Method	**Technique Description**	**Comments**
Manual Removal by Work Crew and/or Equipment (Winter)	A work crew or earth-moving equipment are used to remove thick oil or contaminated snow and ice.	Effective ice thickness must be sufficient to support the weight of manpower and equipment required. All necessary safety precautions should be undertaken for personnel who work near any open water. Manual removal may be a difficult and time-consuming process. A work crew with hand tools or earth-moving equipment (e.g. backhoe) and operators, as well as ice cutting equipment, may be required. Lined storage area or storage drums are required to store contaminated material before treatment or disposal. Oil present in snow may be skimmed off during spring thaw.
Steaming of Ice Surface	Steam is used to melt ice surface to aid in spill clean-up. The technique may be used in association with other clean-up and recovery techniques.	Effective ice thickness must be sufficient to support the weight of manpower and equipment required. All necessary safety precautions should be undertaken for personnel who work near any open water. A work crew with steaming equipment is required to undertake this method.

On-Ice Cleanup Options		
Clean-up Method	**Technique Description**	**Comments**
Sorbents (Spring to Fall)	The method is used in isolated areas to clean up small amounts of oil.	Clean-up is labour-intensive and time-consuming. Limited access to site may make this method difficult or impossible. Sorbents are not very effective on weathered oil or in cold weather. Sorbents may freeze to the surface. Sorbents must be disposed of properly to comply with government regulations. Sufficient sorbent, work crews and storage containers or a lined storage area for contaminated sorbents must be available.
Snow or ice melting	Snow or ice is removed from the clean-up site and melted in heated tanks to allow spilled material to be skimmed off the surface of the melt water. The technique may be used in association with other clean-up and recovery techniques.	Contaminated snow or ice must be removed from clean-up site and placed in melting tanks. The method may be labour-intensive and time-consuming, as melting is not be very efficient for clean-up of large volumes of petroleum-contaminated ice. In very cold temperatures, sufficient heat may not be available in the tanks to melt ice. A work crew, heating tanks, skimming equipment, transfer vehicles and operators are required. A lined storage facility for storage of contaminated ice or snow before melting may also be required, as well as storage tanks for storing recovered petroleum.

1.5.13.9 Spills Under Ice

Spills of petroleum under ice will spread and will travel under the ice at a velocity that is less than the current speed of the watercourse. The spill will tend to follow the path of the main current flow. The spill product may become trapped in crevices, cracks, pockets, and other irregularities under the ice and may freeze from the underside of the ice anywhere downstream or outward from the original spill. This will make recovery and clean-up operations extremely difficult.

Before conducting any response operations to contain, remove and clean up oil under ice, the Incident Commander should ensure that the response personnel have calculated the effective ice thickness to ensure it will support the weight of personnel and equipment.

For spills under ice, the Incident Commander and response personnel should attempt to determine the location of the spilled material and bring the spill to the surface of the water for containment and recovery. Spill movement under the ice is normally located by drilling holes through the ice using an ice auger downstream of the spill source on a flowing watercourse or outward from the spill source on a non-flowing water body. Alternately, aerial reconnaissance may be used to attempt to locate spilled material in cracks at the surface or under thin ice. Once the spill has been located, containment operations can be conducted to bring the spilled product to the surface.

Containment operations are normally accomplished by constructing slots in the ice. Ice slots allow petroleum products trapped under the ice to rise to the surface for recovery.

The slot is normally constructed at an angle in relation to the shore toward the area of strongest current flow in the river. If the slot is constructed correctly, the spilled material will rise into the slot and flow along it toward the shore for recovery.

The angle of slot construction in relation to the shore depends on the current velocity, similar to a containment boom placed in a flowing river. For higher currents in the river, a shallower angle is used for the ice slot, while a larger angle may be used for lower current flows.

If a slot is constructed at too great an angle to the current, turbulence may occur, sweeping the spilled material under the ice on the downstream side. Plywood or other types of sheeting may be placed on the downstream side of the slot and frozen in place to facilitate containment of the spilled material. The ice slot should be 0.5 to 1.0 metres (1.6 to 3.3 feet) wide, to aid in containment. Ice blocks may be cut using a ditch witch or backhoe if the effective ice thickness is sufficient to allow stationary equipment on the ice. [If ice is too thin for equipment but safe for personnel, crews equipped with chainsaws and proper safety gear can cut the ice.] Ice blocks can be removed to clear the slot or pushed under the ice downstream of the slot if sufficient water depth is available.

Ice blocks are extremely heavy (one cubic foot of ice weighs 24 kilograms (53 pounds). Blocks should be cut to a size that will allow the crews or equipment to remove them easily. To aid in block removal, the ones nearest the shore should be removed first and remaining blocks should be floated toward shore for removal. Plywood or other sheeting can be used upstream of the slot to divert oil into the slot for recovery. Narrow slots may be cut into the ice with a chain saw and sheeting may be wedged into the slots to channel the main current toward the ice slot in a manner similar to a diversion boom in open water.

Under-Ice Containment Options

Containment Method	Technique Description	Comments
Ice Slotting	Ice slots are cut into ice on rivers to collect oil moving under the ice. The technique is best used for rivers with current, as oil will be moved toward slot by current.	Effective ice thickness must be sufficient to support the weight of manpower and equipment required to build slot. All personnel working near any open water must take all required safety precautions. The location of the spill must be confirmed by drilling holes downstream of the spill source before constructing the ice slot. Total containment of spilled petroleum in an ice slot is unlikely, due to material trapped under ice. Snowmobiles, communications gear, and ice augers may be required to determine the location of the spill. Work crews, chain saws and/or a backhoe or ditch witch are required to construct an ice slot. A recovery device such as a heat-traced ice skimmer is required to recover spilled material. Storage tanks or a lined excavated storage area may be required to store recovered oil/water mixture.

1.5.13.10 Spills in Broken Ice

The risk to Life Safety of the personnel attempting spill response in broken ice conditions using existing technology is extreme. Emergency operations in broken ice conditions during spring thaw or winter freeze-up are extremely difficult. When oil is mixed with floating ice or covered by a very thin ice cover, ice interferes with the collection of the oil and could damage containment and recovery equipment. The presence of ice also makes the use of boats difficult.

Before authorizing any spill response operations in broken ice conditions, the Incident Commander and response personnel, along with the appropriate regulatory agencies, will evaluate whether it is safe or feasible to undertake containment and recovery operations and what methods should be used.

Containment options for spills during freeze-up or break-up are similar to those for spills on a river and on ice. If containment operations are determined to be feasible based on site conditions, response personnel will attempt to deflect ice away from the containment site.

Deflection of ice may be achieved using log booms or ice dams. A log boom consists of logs cabled together with chain, anchored upstream of a conventional containment boom. An ice dam is constructed upstream of the oil spill site and containment site, to attempt to divert upstream ice away from a containment site.

Log booms are deployed at an angle away from the containment site. Logs are spaced to allow spilled materials and water to move directly toward the containment site, while diverting the ice toward the opposite shore, allowing the ice to pass around the containment site.

1.5.13.11 Spill Control Point Descriptions

Control points are pre-identified locations on watercourses that allow for the staging and deployment of oil spill containment and recovery equipment in response to oil spills that have occurred upstream of the control point. Control point selection is critical to an effective oil spill response and part of your risk assessment and development of site-specific emergency response plan information.

Each oil spill cooperative conducts control point evaluation for the whole geographic co-op area.

Chance Oil and Gas Limited may decide to provide additional control points in the site-specific sections of this Emergency Response Plan.

An ideal control point should have:

- quick access to the watercourse in all seasons, using clear ground, a road or a trail
- adequate work space to conduct operations and to store required equipment with minimal need for clearing of brush and vegetation
- sufficient space to deploy containment and recovery equipment quickly with minimal effort or obstructions (i.e. trees, rocks, steep banks, etc.) and minimal environmental impact
- boat launch location(s) for boats assisting in containment and recovery operations.

Selection of control points with public access is preferred.

For control points on private property - landowner approval and necessary permits for emergency access should be obtained in advance.

Designated site specific control points need to be reviewed at least annually. Each control point site should be visited periodically to evaluate suitability and to ensure information is accurate and complete. Old unsuitable control points should be removed and new control points added, as a part of revisions to site specific information, as required. Control point listings should include a site description, site diagram, access description, landowner/occupant phone number, site suitability and any other information related to the site.

Disposal and Remedial Operations

The proper disposal of contaminated materials as well as site remediation options is outside the scope of this Emergency Response Plan. Site restoration will be determined by consultation among the Incident Commander, company Environmental staff, environmental protection agency personnel and any external environmental consultants that are contracted by Chance Oil and Gas Limited

Re: Eagle Plains Oil and Gas Exploration Planning: Surficial Geology/Permafrost and Exploration Development Suitability Mapping

1. Introduction

Palmer is pleased to submit this report to Chance Oil and Gas Limited (Chance) to accompany and explain the interpretive surficial geology/permafrost and exploration development suitability mapping in a priority area of its Eagle Plains property in northern Yukon. Our work provides a basis for Chance to effectively plan upcoming maintenance programs for its abandoned wells and the next phase of its exploration, by distinguishing areas well and poorly suited to road and well pad construction, and mix-bury-cover (MBC) drill cuttings disposal. It also aims to help streamline Chance's exploration permitting process by proactively characterizing the distribution and relative ice content of permafrost in anticipation of related information requests from the Yukon Environmental and Socio-economic Assessment Board (YESAB).

Following provision of important background information (Section 1), we provide an overview of the physical setting (Section 2) and describe the methods used to produce the interpretive mapping and derivative products (Section 3). Key results portrayed by the maps, including the areal distribution of distinct areas and implications for exploration development, are highlighted in Section 4. Recommended follow-up investigations are highlighted in Section 5.

1.1 Background

Chance is interested in expanding its exploration for oil and gas reserves within its property near Eagle Plains. Exploration is planned in phases across a 2,400 km^2 area within its property. To support exploration planning and associated permitting, Chance is seeking insight into the distribution, characteristics, and sensitivity of permafrost terrain within its exploration area as a basis for optimizing initial ground testing and ultimate site selection for its exploration wellpads, access roads and MBC disposal sites. A number of key characteristics are particularly important for assessing site-specific sensitivities to disturbance, including: permafrost extent (laterally) and depth (active layer thickness) with consideration of potential talik (unfrozen) zones; relative ice content (e.g., ice-rich or ice-poor); and past or present instabilities expressed by

thermokarst, gullying, shallow landslides and ice-wedge polygons. Indicators of concentrated and seasonally prolonged shallow groundwater flow, such as slopewash runnels and the margins of existing or recently abandoned water bodies, are also important considerations for site selection and land management as these may increase construction costs and maintenance requirements.

Palmer previously completed surficial geology/permafrost and derivative suitability mapping for a 440 km^2 subset of the Chance Eagle Plains property, located approximately 40 km southwest of Eagle Plains. This study builds on and refines the previous work to complete seamless mapping expanding from the 440 km^2 subset into the surrounding area. In addition, this study takes advantage of the previous reporting by Palmer (2015a), which has been adapted for the current objectives, updated based on limited field observations, and revised where necessary.

1.2 Study Area

The study area is located approximately 20 km southwest of Eagle Plains, and measures approximately 2,400 km^2, inclusive of the 440 km^2 subset mapped in 2015 (Figure 1). The Dempster Highway diagonally crosses the southern half of the study area between kilometres 300 and 347. The northern edge of the study area roughly coincides with the Arctic Circle at 66°30’00” N, while the southern edge is approximately 8 km north of the Peel River valley at 65°55’00” N.

1.3 Objectives

The overall objective of this study is to expand the existing understanding of terrain and permafrost distribution and will ultimately provide Chance with advance knowledge of permafrost sensitivity and development suitability across its 2,400 km^2 Eagle Plains study area. To accomplish this main objective, Palmer completed the following:

- A field reconnaissance program to calibrate the terrain and permafrost characteristics with limited helicopter- and ground-based observations;
- Surficial geology mapping for the study area, including delineation of terrain features through the newly added 1,960 km^2 expansion area and review and refinement of the original 440 km^2 subset;
- Classification of permafrost conditions across the study area, with a focus on describing relative active layer thickness and permafrost ice content; and
- Derivation of an Exploration Development Suitability map with a focus on highlighting regions where constraints related to terrain and permafrost conditions are most likely to affect road routing and design, wellpad siting and layout, and future construction and maintenance activities. The Exploration Development Suitability map also draws attention to areas potentially suitable for MBC disposal of drill cuttings.

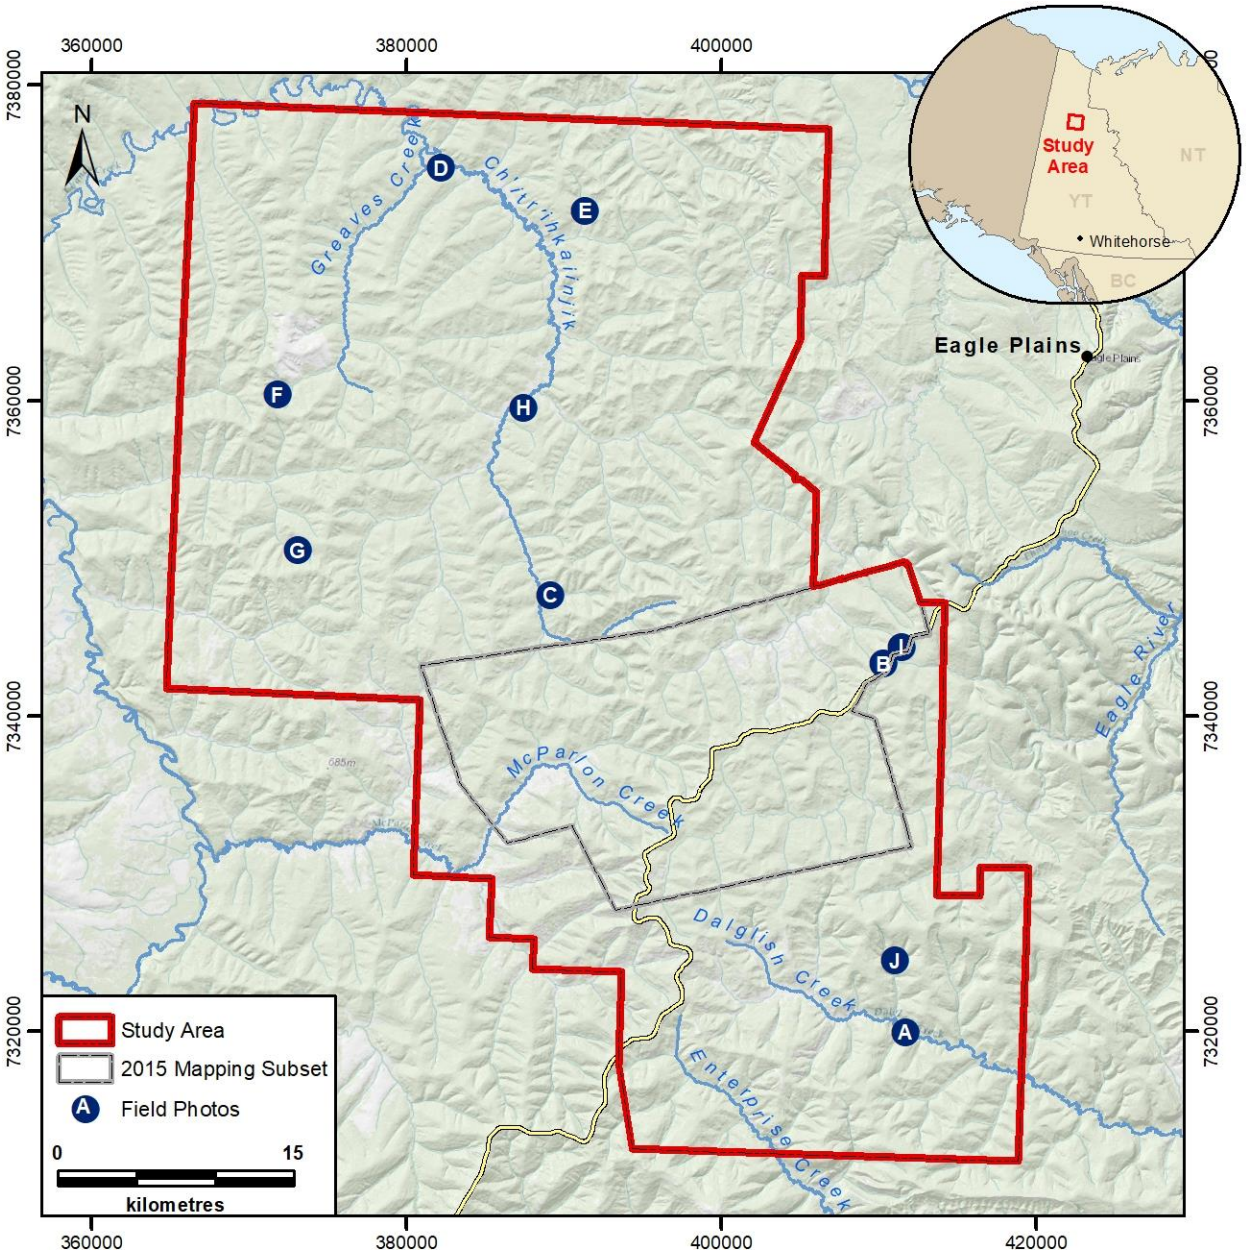

Figure 1. Eagle Plains study area and locations of representative field photos included below.

2. Physical Setting

The study area lies within the Eagle Plains Ecoregion, an area of modest relief in the lowlands between the North Ogilvie and Richardson mountain ranges (Yukon Ecoregions Working Group, 2004). Elevation ranges between 350 m asl at the base of the northernmost river valleys to 750 m asl at high points along the broad ridge system followed by the Dempster Highway. Climate is characterized by prolonged winter conditions which persist up to eight months of the year. Mean annual temperature is near -7.5ºC, with mean July temperatures around 13ºC and mean January temperatures slightly colder on the valley floors (-31ºC) than over higher terrain (-25ºC) due to strong temperature inversions associated with Arctic high pressure.

Annual precipitation is approximately 400 mm, falling mostly as rain during the summer months (Yukon Ecoregions Working Group, 2004). Most surface water drains into the northern-flowing Porcupine River, via major tributaries such as the Eagle River and Whitestone River; in the southeastern corner, Dalglish Creek and Enterprise Creek drain into the Peel River, which flows east to the Mackenzie River.

2.1 Bedrock Geology

The bedrock geology of the study area is dominated by the Upper Cretaceous rocks of the Cody Creek, Burnthill Creek, and Eagle Plain formations (Yukon Geological Survey, 2020). These rocks comprise fine- to medium-grained sedimentary sequences including sandstone, shale, siltstone, bituminous shale, mudstone, and coal. The easternmost edges of the study area intersect the mixed carbonate and clastic rocks of the Hart River and Ford Lake formations.

Differential weathering of these lithologies has contributed to the unique landscape in the study area. Broad ridges are formed by comparatively erosion-resistant sandstone beds. The Dempster Highway and Chance Road generally follow a network of these more resistant ridges. Isolated knolls along the ridge crests are likely remnants of the more competent bedrock in the area.

2.2 Landscape Evolution

Much of Yukon has been repeatedly glaciated during the Pleistocene, causing multiple episodes of erosion and deposition of thick and extensive glacial sediments. Beyond the maximum limit of glaciation, however, surficial deposits generally comprise deeply weathered bedrock and soils on plateaux and slopes, organic-rich soils and peat in depressions, and fluvial silts, sands, and gravels along river valleys (Hughes, 1972). During the last glaciation, the Laurentide Ice Sheet reached its all-time limit occupying the region surrounding the lower Mackenzie River Valley and reaching as far west as parts of the Richardson and Mackenzie Mountains. The study area lies within an unglaciated region to the west of this limit (Duk-Rodkin, 1999), and is generally unaltered by glacial processes. However, Laurentide ice obstructing the Peel River valley and impounding Glacial Lake Hughes diverted meltwater flow northward through the Eagle River valley (Duk-Rodkin and Hughes, 1995). Thus, glacial processes may have had an indirect effect on the study area by lowering the base level of the Eagle River and increasing the rate of incision of its upstream tributaries.

The lack of glacial erosion has resulted in broad, rolling uplands that are typically covered by veneers of relatively fine-grained colluvium or weathered bedrock and commonly bounded by well-drained scarps where more resistant bedrock transitions into fluvially incised, V-shaped valleys. The valley sides are covered by thick, fine-grained colluvium, locally overlain by organics. Thick, fine-grained to gravelly fluvial deposits occupy the valley bottoms. Remnant terraces perched above the floodplains within some of the larger valleys are composed of peat overlying fine sands and silts (Thomas and Rampton, 1982). The lower permeability and valley bottom position of these thicker sediments results in the preservation of ice-rich permafrost, which can introduce challenges for exploration and infrastructure development in these areas.

2.3 Permafrost and Periglacial Processes

Permafrost is ground, including both unconsolidated sediments and bedrock, that remains below 0°C for more than one year. Chance's Eagle Plains property is entirely within the zone of continuous permafrost,

based on property-specific geological and geophysical field data, ground surface expression visible in aerial photography, and regional-scale permafrost mapping compiled by Heginbottom et al. (1995) (Palmer, 2015b).

The depth to permafrost (or active layer thickness) varies spatially at regional and local scales, and temporally with changing seasons. The active layer is generally <1 m thick in the study area, even at its late summer maximum, although it may reach around 2 m in particularly well drained, elevated sites. Active layers may be even thicker, locally reaching bedrock at a depth of 3-4 m, following wildfire (Coates, 2008; Kryotek Arctic Innovation, 2015). At a local scale, active layer thickness primarily depends on elevation, aspect, slope position and shape, soil texture and drainage, snow pack and vegetation cover (Williams and Burn, 1996; Bonnaventure et al., 2012; McKillop et al., 2013). Well drained soils insulated by thick annual snow cover tend to have thicker active layers (deeper permafrost table) than wind-swept, poorly drained areas (shallower permafrost table). In areas of thick, mossy organic cover, permafrost may be encountered at depths as shallow as just a few tens of centimetres even at the end of summer. Active layer thickness increases following snowmelt in spring, and typically peaks in late summer.

Permafrost may or may not contain ice, depending primarily on the material within which it exists and its hydro-geomorphic setting. Most commonly, ice is restricted to the pores or fractures within surficial materials or bedrock, respectively. Such ‘ice-poor’ permafrost is widespread in the study area and most common in areas of exposed or shallow bedrock, along ridges of weathered bedrock, and on relatively well drained colluvial slopes. Where soil textures and drainage conditions permit, thin seams or small lenses of ice may form, representing a more moderate volumetric content of ice. Broad valley bottoms, which have been infilled with mixtures of fine-grained colluvium, fluvial deposits and organic matter, may contain ‘ice-rich’ permafrost. In addition to pore and lens ice, massive bodies of ice may exist within the unconsolidated material. Such bodies grow and shrink in response to changing climatic conditions and ground thermal regime (e.g., organic cover thickness, local drainage conditions). They may form ice wedges, which commonly form geometric networks well expressed at surface by interconnected, linear furrows. Ice-wedge polygons also occur on some gentle slopes, including broad ridge crests and shoulders within portions of the study area.

The sensitivity of permafrost to disturbance depends on a variety of factors, including its temperature, ice content, insulating ground cover (e.g., organics) and the material within which it is held. Relatively warm permafrost (i.e., warmer than -2°C) is more susceptible to thaw due to localized and even minor disturbances to the ground surface, whereas cooler permafrost is able to withstand minor disturbances without appreciable effect. Permafrost that is decoupled from current climatic conditions and only persists in areas of thick, mossy organic cover is more sensitive to disturbance through ground disturbance (e.g., stripping or compaction of organics). Permafrost within fine-grained materials is more likely to contain discrete bodies of ice and, thus, is more sensitive than that within weathered bedrock or coarse-grained colluvium.

Permafrost has a strong influence on soil and drainage conditions, the rates and mechanisms of colluvial (mass movement) processes, and overall hillslope and valley bottom morphology. An appreciation for periglacial processes is important to exploration planning. Permafrost acts as a barrier to water flow, in the absence of any taliks (unfrozen areas bounded by permafrost), so unconsolidated materials within the

active layer commonly become saturated during the summer. On level ground, differential frost heave may occur in the snow-free season, resulting in frost (mud) boils, irregular micro-topography and the formation of earth hummocks. Ice-wedge polygons may form under certain conditions. In areas of ice-rich permafrost, even minor ground disturbances may trigger thermokarst activity (e.g., natural windthrow ripping the surface organic mat and exposing underlying sediments), through which the ground subsides and slumps in response to the melting of buried ice bodies. Thermokarst commonly continues for extended periods of time (i.e., years to decades), once initiated, through a positive feedback cycle between increases in thaw and increases in water ponding. Retrogressive slumping is common along the shores of thaw ponds and along the banks of thermokarst gullies, which incrementally enlarges the area of subsidence.

On slopes, summertime saturation reduces the shear strength of the soil and promotes solifluction, the gradual, downslope creep of material on the permafrost table; or active-layer detachment, the rapid, downslope slide and/or flow of material on the permafrost table. Both processes increase in frequency and magnitude shortly after wildfire (Coates, 2008), mainly due to the loss of rooting strength and insulating organic cover (thaw rate and depth increase). Solifluction is best recognized at surface by conspicuous ‘lobes’ of organics and sediment, defined by a steep, rounded front and a gradual tail. Areas of active solifluction can destabilize roads through irregular settlement and mounding. Certain slopes are commonly prone to active-layer detachments; their histories of landslides are commonly indicated by conspicuous fall line-oriented ‘stripes’ of deciduous trees.

Slopewash is another widespread and important process on slopes underlain by permafrost, through which material is transported downslope through a combination of sheetwash (entrainment in surface runoff) and piping (entrainment in water percolating through the active layer). Shallow ‘runnels’ (also known as ‘water tracks’) are a surface manifestation of slopewash, formed by the repeated and preferential downslope transport of sediments along natural drainage paths. As slopewash runnels deepen, they concentrate and prolong the conveyance of surface runoff and shallow groundwater, resulting in a local depression in the permafrost table (thickening of the active layer). The interception of slopewash runnels by roads necessitates cross-ditching or drainage culvert installation; still, such sites may form ‘icings’ during the winter and spring months, which increase maintenance requirements on road surfaces and embankments.

3. Methods

3.1 Field Reconnaissance

A one-week field reconnaissance program was completed between July 1 to 7, 2019. Weather conditions were generally clear and sunny with brief periods of light rainfall. The program was undertaken with the support of a helicopter and included reconnaissance flights over much of the study area as well as ground-based assessments. The program was completed with a focus on characterizing a diversity of landforms, surficial materials, and permafrost conditions across the study area. Ground-based field observations were made through a series of foot traverses to document changes across the landscape. Field assessment involved examining sediments and visible ice in hand-dug soil pits and natural exposures (e.g., landslide scarps, gullies, stream cut-banks); measuring depth to frost (which may not have represented the true depth to permafrost at the start of the summer); determining material textures, origins, and expressions; and describing geomorphological processes. The program was completed in parallel with an ecological field program undertaken by Environmental Dynamics Inc. (EDI). Where possible, terrain interpretations were

supplemented by opportunistic field observations made and shared by EDI's ecologists as part of their field program.

3.2 Terrain Mapping

Palmer completed surficial geology/permafrost mapping for the 2,400 km^2 study area as a basis for communicating the distribution of distinct ground conditions. The mapping represents the seamless integration of the previously mapped 440 km^2 area (Palmer, 2015a) with the expanded interpretations within the surrounding 1,960 km^2. The 440 km^2 subset was reviewed and standardized for consistency with the surrounding area. Terrain interpretations were completed using a combination of multiple stereo-imagery sources in combination with high-resolution LiDAR-derived elevation data. Aerial photographs were acquired by Chance over the northern and southern regions of the study area, but smoke from wildfires precluded acquisition within the central portion of the study area. Satellite imagery acquired between 2014 and 2019 were overlain onto a digital elevation model to generate pseudo-stereo imagery and were used as a substitute for stereo aerial photographs in this region. Terrain interpretations were refined based on LiDAR-derived elevation data, available across the study area at a resolution of 2 m. Surficial mapping was digitized directly into a geographic information system (GIS) using DAT/EM's Summit 3D mapping software in conjunction with Esri's ArcMap.

Surficial geology/permafrost mapping was completed at a view scale of 1:20,000 using the standardized Yukon surficial geology mapping protocols (Lipovsky and Bond, 2014), which are an adaptation of the *Terrain Classification System for British Columbia* (Howes and Kenk, 1997), with modifications to accommodate project-specific objectives. Terrain polygons were delineated based on internally homogenous combinations of surficial materials, textures, surface expressions, drainage classes, and geomorphological processes. Under this system, up to two surficial materials were identified in each polygon as either a primary or secondary material, or in stratigraphic relation to each other. Relative depth to, and relative ice content of, permafrost were estimated for each map polygon using the terrain characteristics and calibrated based on ground observations made during the field reconnaissance program. Relative depth to permafrost refers to the approximate maximum (end of summer) depth of the permafrost table (active layer thickness) and is an inferred average value for the polygon (Table 1). Relative ice content is an inference of the amount of pore ice, segregated ice, massive ice, and/or excess ice (Table 2). Terrain and permafrost interpretations are limited by the mapped scale, and represent the average conditions within each map unit (polygon). It is possible that ground ice is more or less extensive than its mapped representation due to a necessary generalization of the terrain characteristics or geomorphological processes of the map unit. Polygons have been symbolized based on the primary surficial material. Discrete terrain features and geomorphic processes too small to be mapped as individual polygons, such as thermokarst subsidence and active-layer detachments, have been identified using on-site point and line features. All codes used in the mapping are defined in the legend.

3.3 Exploration Development Suitability

The Exploration Development Suitability maps represent the general suitability of distinct areas for the establishment and maintenance of access roads and wellpads, and for disposal of drill cuttings using MBC techniques. The general characteristics of terrain suitable for wellpads and access roads were assumed to be similar in the study area, so these suitabilities have been considered together.

Table 1. Inferred relative depth to permafrost.

Depth Classification	Definition	Description
Near-surface	Permafrost table located less than 0.4 m from the ground surface.	Permafrost is typically found within or at the base of surface organics. Includes map units overlain by organic blankets and veneers; very poorly to imperfectly drained fluvial fans, terraces, veneers; and inactive floodplains.
Shallow	Permafrost table located between 0.4 and 1.0 m from the ground surface.	Applies to relatively fine-grained and matrix-supported sediments and is considered the typical permafrost depth class through the study area. Includes most imperfectly to moderately well drained deposits, active floodplains and most deposits with mapped ice-wedge polygons or thermokarst subsidence.
Deep	Permafrost table located more than 1 m from the ground surface.	Typically applies to relatively coarse-grained and clast-supported deposits. Includes bedrock and most moderately to well drained colluvium and weathered bedrock along convex ridges and scarps.

Table 2. Inferred relative ice content of permafrost.

Ice Content Classification	Pore Ice	Segregated Ice	Massive Ice	Excess Ice[1]	Description
Ice-rich	Continuous	Extensive	Indicated (Xw), Inferred (Xt), or likely; widespread	Major	Typically includes sediments overlain by organic blankets and veneers; poorly to very poorly drained, mostly inactive fluvial deposits; and map units affected by ice-wedge polygons or thermokarst subsidence.
Ice-moderate	Continuous	Widespread, in seams and lenses	Possible, locally	Moderate	Includes fluvial deposits not previously classified as ice-rich; fine-grained colluvial aprons and blankets; imperfectly to poorly drained matrix-supported colluvial blankets; and map units affected by sheetwash or solifluction.
Ice-poor	Discontinuous to Continuous	Local, mostly in seams	Unlikely, except in isolated areas	None to minor	Applies to most moderately to well drained terrain throughout the rolling uplands and colluvial slopes and is considered the typical ice content class in the study area.

[1] Excess ice refers to the volume of ice that exceeds the total voids (e.g., pore space) that would be present under natural, unfrozen conditions.

The road and wellpad suitability and MBC disposal suitability classifications were derived from the 1:20,000-scale surficial geology interpretations and are specific to (and relative within) the project area. Map units (polygons) were categorized into five road and wellpad suitability classes (ranging from Very High to Very Low) and two MBC disposal suitability classes (Potentially Suitable and Probably Unsuitable) based on terrain characteristics, site drainage, and permafrost conditions, also considering field observations and professional experience in unglaciated Yukon (e.g., McKillop et al., 2013; McKillop et al., 2016). Definitions, explanations and implications of each class are outlined in Section 4.3 in association with the presentation of results. A lower suitability rating does not necessarily mean suitable terrain is not present in the map unit; localized portions of these polygons may be suitable for exploration development or MBC disposal based on site-specific terrain characteristics. Similarly, a higher rating does not necessarily mean the entire polygon is suitable for exploration development or MBC disposal. Field investigations remain warranted to evaluate suitability classifications at a site-specific level.

4. Results and Discussion

4.1 Key Field Observations

Ground observations were made at 103 field reconnaissance sites and supplemented by opportunistic observations and photographs taken along foot traverses and helicopter flights. An overview of representative photograph locations is shown in Figure 1, and examples of common terrain units and processes are presented in Figure 2. Most of the study area consists of gently sloping uplands dissected by stream valleys punctuated by bluffs at the crests of slopes (Photos A to C). Geomorphological processes related to ice-rich permafrost are visible by surface expressions including ice-wedge polygons (Photo D) and thermokarst subsidence (Photo E). Mass movements such as active-layer detachments were observed on gentle to moderate gradients along valley walls (Photo F).

Representative photographs of permafrost conditions and sediments in the study area are presented in Figure 3. Measurements of the active layer thickness at the time of site inspection (July 1 to 7, 2019) are estimated to be slightly thinner than the late summer maximum. In general, depth to frost was less than 1 m throughout the study area. Measurements were generally deeper near active streams and were assumed to be relatively deep on well drained, weathered bedrock ridges where high clast content typically restricted measurements using a frost probe. Permafrost was near-surface (<0.4 m) beneath areas of thick organic cover, such as fluvial terraces and inactive floodplains. Typically, ice content increases toward lower valley positions, and was noticeably higher within inactive floodplains. In one such environment, an eroding stream bank exposed massive ground ice in wedges >2 m high (Photo G). Excess ice was also observed within thick, fine-grained colluvial deposits (Photo H).

Competent bedrock rarely outcrops at surface through most of the study area, but several conspicuous outcrops of sandstone and conglomerate were observed near the Dempster Highway (e.g., Figure 3 Photo I). Most ridge crests appear as weathered bedrock and consist largely of well drained sands and angular clasts (Photo J).

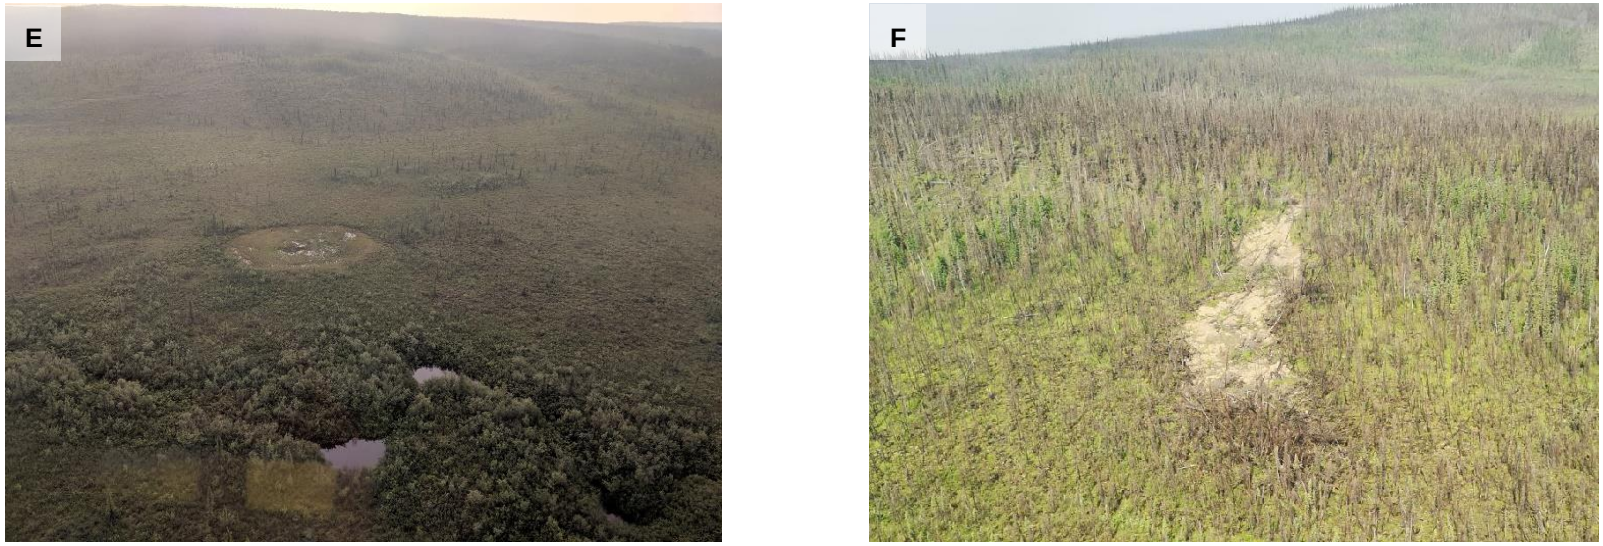

Figure 2. Field photographs representative of common landforms and geomorphological processes within the study area: A) View of the Dalglish creek valley, showing an irregularly meandering channel and several areas of lateral erosion where the creek has cut into the valley walls; B) Convex, mid-slope composed of more-resistant bedrock mantled by a veneer of weathered bedrock and colluvium; C) Gentle fluvial fan exhibiting a triangular- or wedge-shape, transitioning into a modern stream valley (lower right); D) Geometric surface expression of ice-wedge polygons over an inactive region of the floodplain; E) Thermokarst depression in an inactive region of the floodplain; and F) Recent active-layer detachment initiated at the crest of a gentle colluvial slope.

Figure 3. Field photographs representative of typical surficial material characteristics: G) Ice wedge exposed in freshly eroded stream bank (1.9 m-tall person for scale); H) Ice lens within fine-grained, colluvial sediment; I) Outcrop of more-resistant conglomerate exposed in a bluff near the Dempster Highway; J) Sandy, clast-supported veneer of weathered bedrock, typical of deposits found in weathered bedrock bluffs and knolls.

4.2 Surficial Geology and Permafrost

The results of the surficial geology/permafrost mapping are presented in the series of maps shown in **Appendix A**. Most landforms and materials in the study area are interpreted to have originated prior to the last glaciation. Apart from organics, recent fluvial deposits, and areas recently affected by active geomorphological processes, the landscape is dominated by deeply weathered sediments that have developed on slopes and ridges over many millennia.

Colluvial deposits (aprons, veneers, blankets, and mantles of variable thickness) are the most extensive surficial material, located ubiquitously on slopes and ridges and comprising 71.8% of the study area (Table 3). Fluvial deposits comprise 8.4% of the study area and are generally identified along the bottoms of broad valleys, although fans and veneers of fluvial sediments are mapped at confluences and within narrow ravines, respectively. Organic material accumulates on most imperfectly to very poorly drained deposits throughout the study area, but it is only identified in the terrain code when its thickness exceeds about 0.5 m. Organic veneers and blankets are generally mapped in low valley positions near active streams, and comprise 1.6% of the study area. Bedrock within the study area is commonly fissile and deeply weathered, located along ridge tops and convex slope-breaks along the crests of valley walls. Weathered veneers of bedrock cover 17.3% of the study area. Intact bedrock is rare at surface and is limited to exposures in steep scarps lining the broad ridge tops, covering 0.9% of the study area. Areas significantly disturbed by human activity (excluding road networks) have been mapped as anthropogenic landforms, and cover <0.1% of the study area

Table 3. Areal distribution of surficial materials and landforms by primary surface material.

Surficial Material and Landform	Terrain Code	Areal Extent	Areal Percentage
Anthropogenic	A	1.41 km^2	< 0.1%
Organic Veneer	Ov	10.24 km^2	0.4%
Organic Blanket	Ob	28.85 km^2	1.2%
Colluvial Apron	Ca	188.77 km^2	7.9%
Colluvial Veneer	Cv	816.12 km^2	34.0%
Colluvial Blanket	Cb	401.01 km^2	16.7%
Colluvial Mantle of Variable Thickness	Cw	315.50 km^2	13.2%
Weathered Bedrock Veneer	Dv	414.07 km^2	17.3%
Fluvial Plain (active and inactive)	FAp; Fp	111.80 km^2	4.7%
Fluvial Veneer (active)	FAv	49.53 km^2	2.1%
Fluvial Fan (active and inactive)	FAf; Ff	36.29 km^2	1.5%
Fluvial Terrace	Ft	2.87 km^2	0.1%
Bedrock	R	20.47 km^2	0.9%
Total		**2,396.93 km^2**	**100%**

Relative depth to permafrost is estimated to be shallow (0.4-1 m) across the majority of the study area (86.2%), and is found on most broad ridges, colluvial slopes, and around active floodplains (Table 4). Relative depth to permafrost is estimated to be near-surface within poorly drained valley bottoms and beneath organic deposits, comprising 3.6% of the study area. Relative depth to permafrost is estimated to be deep (> 1 m) across 10.2% of the study area and is commonly mapped in association with coarse colluvial or weathered bedrock deposits typically found along convex ridges and bluffs, and bedrock scarps.

Permafrost is estimated to be ice-rich across 12.9% of the study area, and is commonly found below poorly drained, inactive fluvial deposits and below organic cover (Table 4). Ice-rich permafrost may also be found along fine-grained colluvial slopes and even along some ridges where the surface expression of ice-wedge polygons is visible in LiDAR data or aerial imagery. Ice-moderate permafrost comprises 40.8% of the study area, and is commonly found below imperfectly drained fluvial deposits and thick, fine-grained colluvial deposits. Ice-moderate permafrost is also inferred in regions affected by sheetwash or solifluction. Nearly half the study area has been estimated to contain ice-poor permafrost (46.3%), which applies to most moderately to well drained terrain along ridges and upper valley slopes.

Table 4. Area distribution of permafrost conditions by relative depth and relative ice content.

Permafrost Condition Classification		**Estimated Relative Ice Content**			
		Ice-poor	**Ice-moderate**	**Ice-rich**	**Total**
Estimated Relative Depth	**Near-surface (<0.4 m)**	0% *(0 km²)*	0.1% *(2.2 km²)*	3.5% *(84.1 km²)*	**3.6% *(86.3 km²)***
	Shallow (0.4 – 1 m)	37.0% *(885.8 km²)*	39.9% *(955.6 km²)*	9.4% *(224.7 km²)*	**86.2% *(2,066.1 km²)***
	Deep (>1 m)	9.4% *(224.3 km²)*	0.8% *(20.2 km²)*	0% *(0 km²)*	**10.2% *(244.5 km²)***
	Total	**46.3% *(1,110.2 km²)***	**40.8% *(977.9 km²)***	**12.9% *(308.8 km²)***	**100% *(2396.9 km²)***

4.3 Exploration Development Suitability and Associated Implications

The series of Exploration Development Suitability maps is provided in **Appendix B**. The maps combine the results of the road and wellpad suitability classifications with the MBC disposal suitability classifications.

Road and wellpad suitability are presented as a five-class system (Table 5). A total of 17.4% of the study area has been classified as Very High or High suitability. These areas comprise ice-poor, isolated topographic highs and moderately to well drained ridge systems, which form sinuous networks through the landscape. Conversely, lower valley terrain such as floodplains and fine-grained colluvial aprons are generally prone to higher ice contents, and active permafrost and periglacial processes, including active-layer detachments, solifluction, thermokarst, and sheetwash. A total of 54.2% of the study area was classified as Low to Very Low suitability, due to one or more development constraints. The remaining 28.4% of terrain was considered moderately suitable for development and may be reasonable for road and wellpad establishment by employing proactive mitigation measures where necessary.

Table 5. Road and wellpad suitability classification and implications for construction and maintenance.

Road and Wellpad Suitability	Description	Implications for Construction and Maintenance	Percent of Study Area
Very High	Moderately well to well drained, isolated topographic highs with deep or shallow, ice-poor permafrost. Generally considered to be stable terrain, and typically located along wide, rounded ridge crests.	Favourable conditions for access road and wellpad establishment through standard best management practices. Minimal expectation for maintenance requirements.	8.1%
High	Generally, moderately well to well drained areas with deep or shallow, ice-poor permafrost. Typically associated with ridges of weathered bedrock or shallow colluvium over convex topography.	Generally favourable conditions for access road and wellpad establishment through standard best management practices. Low to moderate expectation for maintenance requirements.	9.3%
Moderate	Imperfectly to moderately well drained colluvial slopes with deep to shallow permafrost, commonly with poor to moderate ice content; Convex weathered bedrock bluffs, typically at moderate slope gradients; and fluvial terraces above the influence of modern stream processes.	Generally reasonable conditions for access road and wellpad establishment. Where necessary, employment of mitigations may be to proactively manage natural concentrations of surface runoff and to protect thaw-sensitive permafrost. Moderate expectation for maintenance requirements. Field reconnaissance would help inform route/site selection and mitigation requirements.	28.4%
Low	Poorly to imperfectly drained, thick colluvial slopes with shallow permafrost, commonly with moderate to rich ice content; imperfectly drained fluvial fans and veneers. Regions affected by sheetwash, gully erosion, and ice-wedge polygons are typically included in this category. Surface runoff becomes concentrated.	Generally unfavourable conditions for access road and wellpad establishment, except through mitigations to proactively manage natural concentrations of surface runoff and to protect thaw-sensitive permafrost. Moderate to high expectation for maintenance requirements. Field reconnaissance is necessary to inform route/site selection and mitigation requirements.	32.8%
Very Low	Very poorly to imperfectly drained areas with shallow or near-surface permafrost, commonly with rich to moderate ice content. Includes most floodplains and steep bedrock scarps. Thermokarst subsidence and ice-wedge polygons are common on level to gently sloping ground, and slopes may be subjected to mass movements including solifluction and active-layer detachments.	Unfavourable conditions for access road and wellpad establishment. Any necessary crossings will require comprehensive mitigations to protect thaw-sensitive permafrost and manage surface runoff and compressible, fine grained sediments. Road construction through steep bedrock scarps would require earthworks and potentially localized blasting. Maintenance expectations are high. Field reconnaissance is critical to inform route/site selection and mitigation requirements.	21.4%

Most moderate terrain can be found over mid- to upper-valley slopes and is mantled by imperfectly drained colluvial veneers and convex, moderately sloping weathered bedrock ridge crests. A summary of the implications for construction has been presented in association with typical constraints expected within each class (Table 5). Design, construction and maintenance of exploration infrastructure generally require greater effort and more complex mitigative solutions as road and wellpad suitability decreases.

The MBC disposal suitability serves to highlight ice-poor, gently-sloping, and relatively stable regions of the landscape set back from significant watercourses as potentially suitable for MBC disposal (Table 6). These criteria were generally met along broad ridge systems and isolated knolls. A total of 13.2% of the study area has been classified as potentially suitable for MBC drill cuttings disposal, most commonly in association with areas classified as High or Very High suitability for road and wellpad suitability. Runoff may be variable at the mapped scale such that different areas within a polygon may have less or more interaction with surface water. For example, polygons affected by slopewash may show discrete runnels where runoff is concentrated. As a result, field investigations are suggested to refine the MBC disposal suitability classifications at a site-specific scale which would better determine target areas for cuttings disposal within each map unit (polygon).

Table 6. Mix-bury-cover (MBC) disposal suitability classification.

MBC Disposal Suitability	Description	Percent of Study Area
Potentially Suitable	Generally geomorphologically isolated regions on level or near-level, elevated areas with minimal or no receipt of surface runoff (i.e., 'shedding sites'). Areas are typically located along broad to rounded ridge crests and knolls that are set back from significant watercourses.	13.2%
Probably Unsuitable	Includes moderate to steeply sloping regions; areas with ice-rich permafrost; and areas exhibiting evidence of geomorphological instability such as fluvial erosion, thermokarst subsidence, solifluction, and active-layer detachments.	86.8%

5. Recommendations

Palmer recommends Chance consider a number of logical follow-up initiatives based on the results of this mapping project to help optimize its upcoming multi-year, multi-well drilling program:

- **GIS-based road routing optimization analysis** – To minimize design, construction, maintenance, and rehabilitation costs, project elements and infrastructure should be site to minimize exposure to low Exploration Development Suitability terrain to the extent possible. This may be accomplished through a collaborative GIS-based road routing analysis between Palmer and the Chance project team, whereby effort and cost are attributed to distinct terrain units, and optimized for development.

- **Incorporation of environmental discipline perspectives into suitability** – The Exploration Development Suitability classification was prepared with a focus on terrain and permafrost constraints. Combining this with the perspectives of other environmental disciplines would yield a more robust suitability classification by accounting for additional environmental values (e.g., vegetation, wildlife habitat, First Nations land uses, archaeological resource potential, etc.).
- **Road alignment delineation** – Following determination of an approximate road route at the polygon-scale (two bullets above), more precise delineation of an actual road alignment would help enable avoidance of local terrain and permafrost constraints (e.g., drainage runnels, thermokarst).
- **Targeted field investigations of complex terrain and areas for MBC disposal** – Complete avoidance of terrain with low or very low Exploration Development Suitability may not be feasible given its abundance in lower valley and floodplain positions. Targeted field investigations in these locations would serve to fine-tune the alignment and confirm the interpretations, site conditions, and cost implications. As local permafrost and runoff conditions may show slight variability at the mapped scale, targeted field investigations would also benefit the selection of specific sites for MBC disposal within polygons identified as Potentially Suitable for MBC disposal.
- **Proactive identification of rehabilitation plans** – It may be productive for Chance to proactively identify its planned approaches for site, road, and wellpad rehabilitation following the completion of work, in anticipation of comments by YESAB, First Nations, and other stakeholders. Rehabilitation plans are best tailored to existing ground and runoff conditions.

6. Statement of Limitations

This report has been prepared by Palmer for Chance in accordance with the agreement between Consultant and Client, including the scope of work detailed therein (the “Master Service and Supply Agreement”). The report and the information it contains may be used and relied upon only by Client, except (1) as agreed to in writing by Consultant and Client, (2) as required by-law.

The extent of this study was limited to the specific scope of work for which Palmer was retained and is described in this report. Palmer has assumed that the information and data provided by the client or any secondary sources of information are factual and accurate. Palmer accepts no responsibility for any deficiency, misstatement or inaccuracy contained in this report as a result of omissions, misinterpretations or negligent acts from relied-upon data. Judgement has been used by Palmer in interpreting surficial geology, geomorphological processes, and exploration development susceptibility based on desktop analysis and limited field reconnaissance. Interpretations of subsurface conditions have been made based on surface observations and limited subsurface exposures and may not fully capture the variability in the study area or within a given map unit (polygon).

Palmer is not a guarantor of site conditions or potential hazards or risks but warrants only that our work was undertaken and our report prepared in a manner consistent with the level of skill and diligence normally exercised by competent geoscience professionals practicing in Yukon. Our findings, conclusions and recommendations should be evaluated in light of the limited scope of our work.

7. Certification

This memorandum was prepared and reviewed by the undersigned.

1 INTRODUCTION

The proposed Eagle Plains Exploration Project (Project) is located in the Eagle Plains area, between the Ogilvie and Richardson Mountain ranges in the Yukon**.** The Project encompasses a 2,386 square kilometre (km²) area in north-central Yukon, centred approximately 605 kilometres (km) north of Whitehorse and 40 km south and west of the Eagle Plains Hotel, along the Dempster Highway (**Map 1-1**).

Chance Oil and Gas Ltd. (Chance) is the Project Proponent. The Project consists of two phases:

1. Exploration Phase; and
2. Reclamation and Closure Phase.

Within the Exploration Phase, there are three principal components:

1. a seismic exploration program.
2. an oil and gas exploration drilling program; and
3. a drill stem test (DST) and extended flow testing (EFT) at select wells.

1.1 PROJECT LOCATION

The Project is located within the southern part of Eagle Plain Sedimentary Basin in northern Yukon, northeast of Dawson City and southwest of the Yukon/Northwest Territories (NWT) border (**Map 1-1**). The main camp (Chance Camp) is located at km 325 of the Dempster Highway.

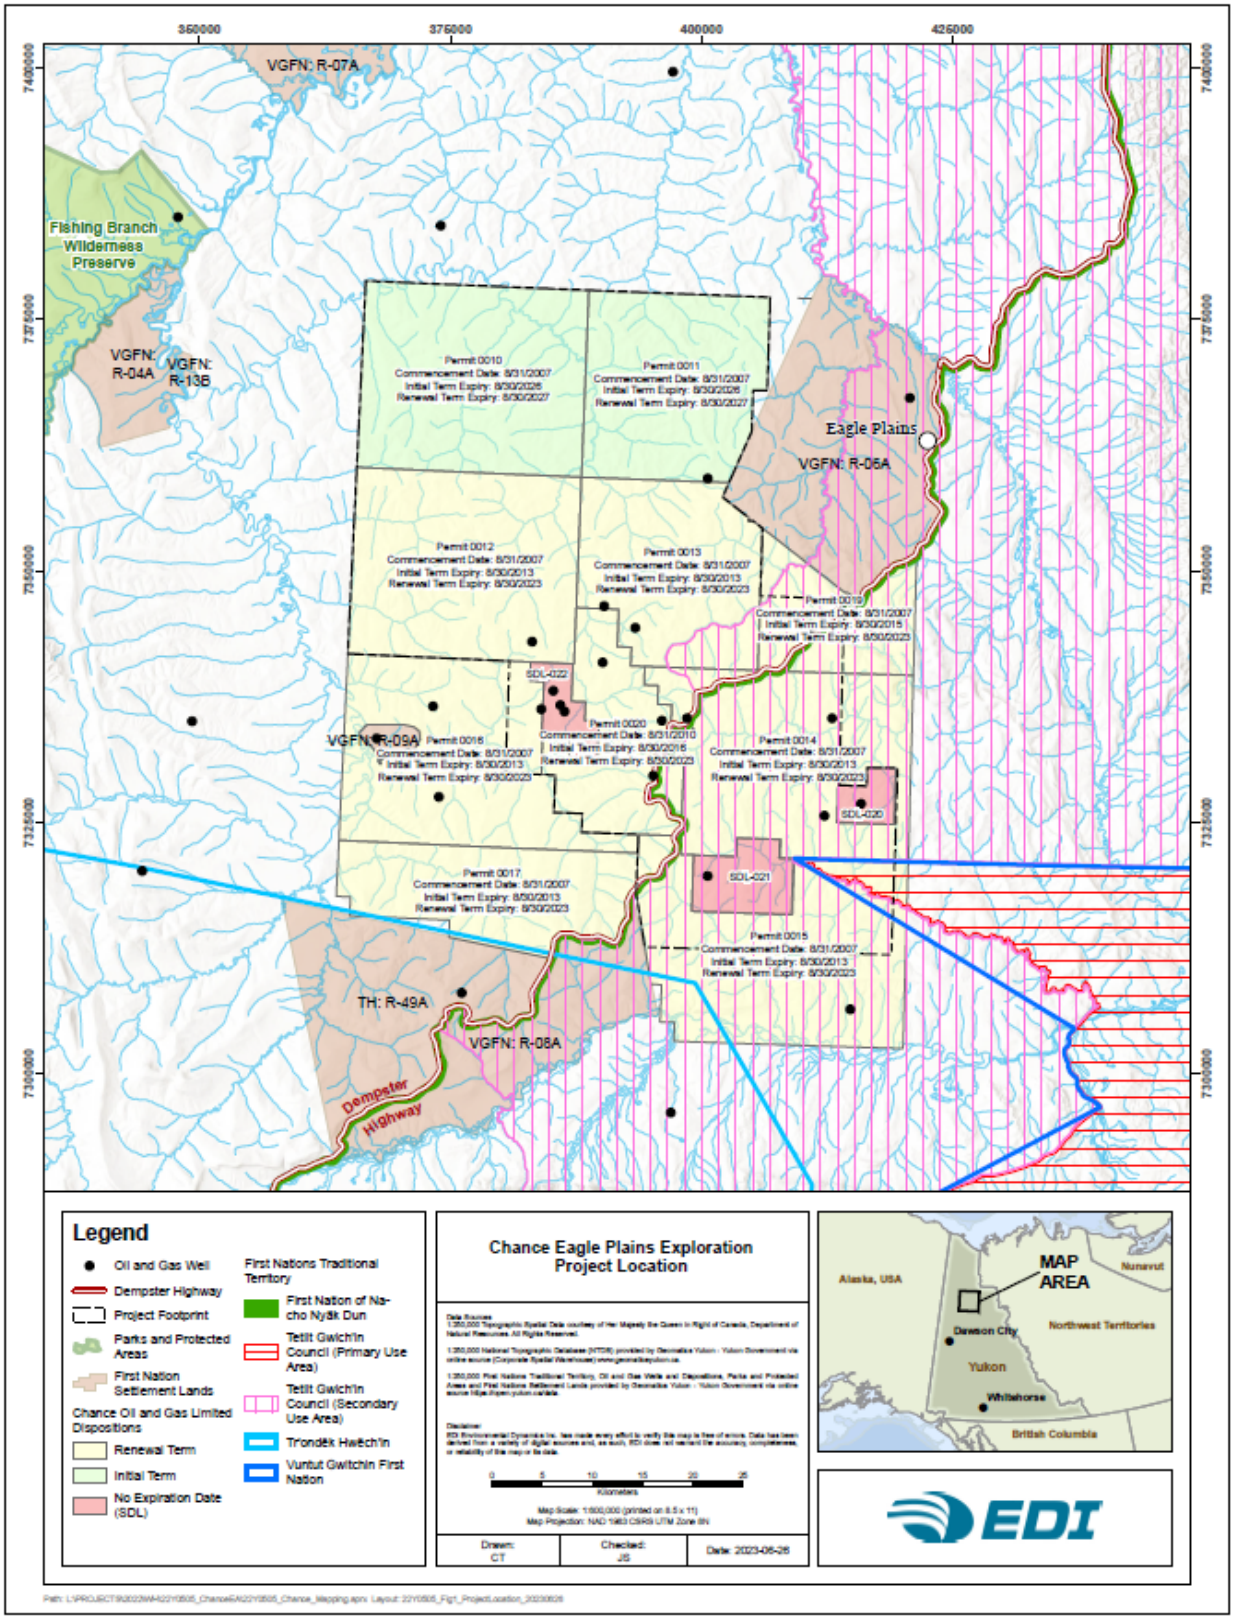
The Project overlaps the Traditional Territories of four First Nations. Most of the Project is within the Traditional Territory of the Vuntut Gwitchin First Nation. The southeastern portion is in an area of overlapping Traditional Territories of the Tetlit Gwich'in Council, Tr'ondëk Hwëchin, the First Nation of Na-Cho Nyäk Dun, and Vuntut Gwitchin First Nation. The Project does not fall within any First Nation Settlement Lands and borders the east and southwest portions of the Vuntut Gwitchin First Nation Settlement Lands.

1.1.1 Exploration History

The Project occurs within the Eagle Plains sedimentary basin, north of the Ogilvie River and west of the Richardson Mountains. The basin contains proven natural gas and oil reserves (Government of Yukon 2019), including 4.6 billion cubic metres (m³) of gas and 3.2 million m³ of oil (Hannigan 2014).

The Project area has had intermittent periods of oil and gas exploration since the 1950s. That activity has established winter roads, seismic lines, and exploratory well sites across parts of the current RSA. Approximately 40 exploration wells have been drilled in the Eagle Plains sedimentary basin. Eight wells are currently being maintained in suspended status, and the remaining wells have been plugged and abandoned. Seismic exploration has included approximately 10,000 km of two-dimensional (2D) lines (mostly before 1985), and about 325 km² of three-dimensional (3D) seismic was conducted in 2013/2014 (Northern Cross (Yukon) Ltd. 2014).

Chance has completed Project-related baseline studies, including surface and groundwater, permafrost, aquatics and fish, vegetation, wildlife, socio-economic, and heritage resources.



Map 1-1. Eagle Plains Exploration Project location.

1.2 DOCUMENT PURPOSE

This document provides an overview of the Project, its location and details about the phases, principal and accessory components, and scheduling. The Draft Project Description outlines a proposed program that will build on past exploration to better define the extent, amount and quality of oil and gas deposits in the area. Under the program, Chance proposes conducting additional 2D and 3D seismic data acquisition programs and drilling up to 30 exploratory wells over ten years. Depending on the drilling program results, EFT, lasting up to two years, may be conducted at wells where crude oil or natural gas are discovered to determine the quantity, quality and extent of the oil and gas deposit(s). The existing winter road network will be expanded to support the seismic, drilling, and flow testing programs. Most of the work and all the new land disturbance will occur in the winter (e.g., seismic line clearing and drilling). Work outside of the winter includes aerial-supported seismic recordings, and EFT may also occur during summer.

The information in this document is conceptual and intended to provide a level of detail supporting discussions on the draft Project Description with potentially affected First Nations, residents of local communities, and stakeholders. Development of this draft document is based on the *Proponent's Guide to Information Requirements for Executive Committee Project Proposal Submissions* (YESAB 2005), specifically Part 1, Section 5.0 Project Description.

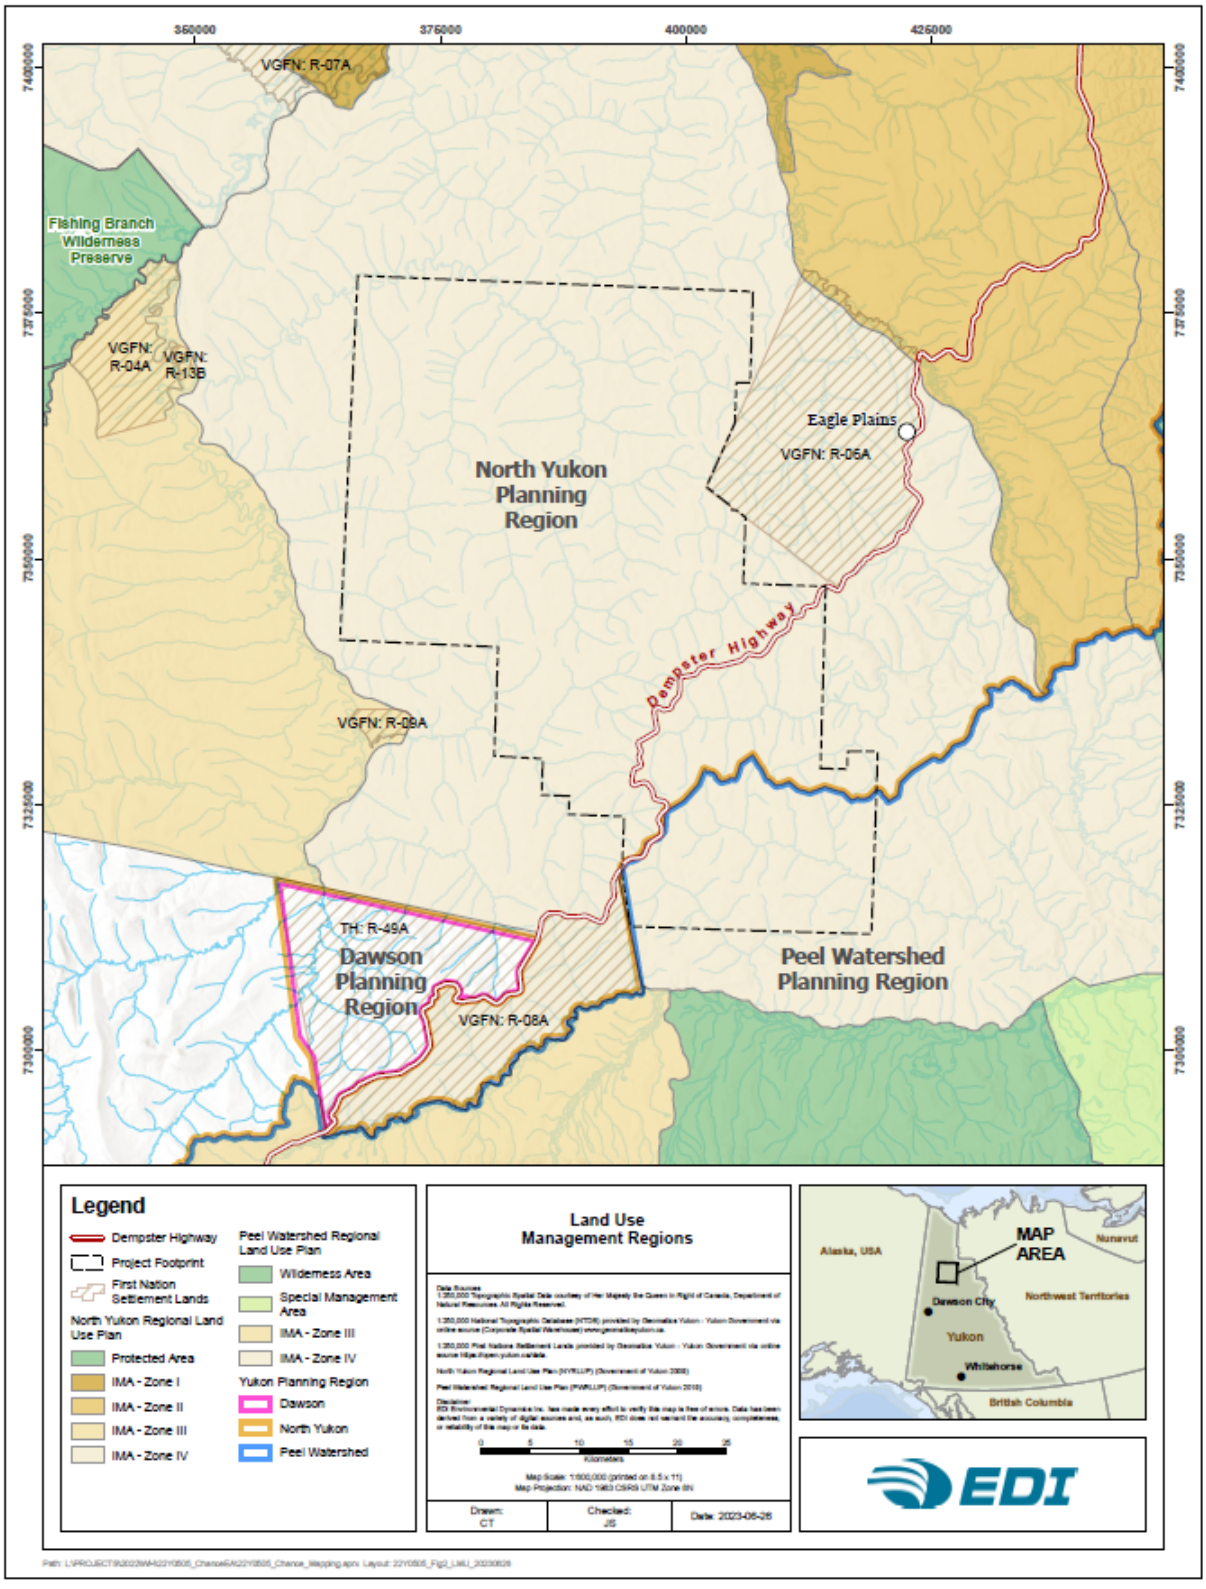
1.3 REGULATORY CONTEXT

The Project is subject to a screening by the Yukon Environmental and Socio-economic Assessment Board (YESAB) Executive Committee, as stated in the *Designated Office Evaluation Report* issued on February 9, 2016 (Project Number: 2014-0112). Development of this draft Project Description is based on the *Proponent's Guide to Information Requirements for Executive Committee Project Proposal Submissions* (YESAB 2005), specifically Part 1, Section 5.0 Project Description. Given that the regulatory framework and process, as developed by YESAB, has changed since the issuance of the Evaluation Report, Chance will collaborate with the Executive Committee on determining the appropriate regulatory process and required project information going forward, including potential environmental and socio-economic effects assessment information.

Detailed Project design and implementation procedures will be developed following Project approvals. Design, methods, or procedural changes will conform to the commitments made by Chance and the terms and conditions stated in Decision Document(s) resulting from the YESAB Executive Committee screening process, once defined. A complete list of required federal and territorial permits, licences, approvals, and assessments will be clarified with the appropriate regulatory agencies as the Project proceeds through the defined permitting and regulatory process.

1.4 RELEVANCE TO LAND USE PLANS

The Project is located within the North Yukon Planning Region and Peel Watershed Planning Region. The Project is, therefore, subject to the approved *North Yukon Regional Land Use Plan* (NYRLUP) (Vuntut Gwitchin Government and Yukon Government 2009) and the *Peel Watershed Regional Land Use Plan* (PWRLUP) (Peel Watershed Planning Commission 2019) (**Map 1-2**).



Map 1-2. Eagle Plains Project and Land Use Planning Units (LMUs).

Each First Nation government has provided input to and approved the Regional Land Use Plan(s) on their Traditional Territory under the respective First Nation Final Agreements.

1.4.1 North Yukon Regional Land Use Plan

The Project lies mainly within the North Yukon Planning Region and is subject to the North Yukon Regional Land Use Plan (NYRLUP). The NYRLUP was created to protect the natural and cultural resources of the region while allowing sustainable economic development opportunities (Vuntut Gwitchin Government and Yukon Government 2009). It provides management direction for using public and settlement lands based on four principles: sustainable development, precautionary principle, conservation, and adaptive management. The NYRLUP divides the Planning Region into 23 Landscape Management Units (LMU), classified into three categories: protected area, integrated management area (IMA), and community area. IMAs are further classified into four zones: Zone 1 (lowest development), Zone II (low development), Zone III (moderate development), and Zone IV (highest development). IMA zones are classified based on the area's sensitivity to landscape disturbance, ecological and cultural values, risk of significant impacts, and level of acceptable change. The RSA is a Zone IV IMA with lower ecological and cultural values in a moderately sensitive biophysical setting. Subsequently, Zone IV IMAs allows for the highest development level to occur.

The NYRLUP encourages results-based management and uses cumulative effects indicators to determine if goals and objectives are met. Results-based management allows for innovation and creativity in land-use strategies and approaches. The two cumulative effects indicators included in the NYRLUP are direct surface disturbance and linear density. The NYRLUP guidelines for Zone IV IMAs are 0.75–1.0% surface disturbance and 0.75–1.0 km/km² linear density (Vuntut Gwitchin Government and Yukon Government 2009). However, as surface disturbances and linear features reach a level of functional recovery and become part of the continuous landscape, they can be subtracted from the total amount of disturbed area (Vuntut Gwitchin Government and Yukon Government 2009). The NYRLUP suggests using a height of 1.5 m for woody vegetation in forested areas, as vegetation above this height would likely no longer allow for travel or access by humans or wildlife and is, therefore, considered functionally recovered. Activities considered exempt from functional disturbance restrictions are (1) new linear features less than 1.5 m wide; (2) land-use activities that occur on frozen water bodies; (3) winter work with no required clearing of trees; and (4) winter work that uses existing disturbances and linear features.

1.4.2 Peel Watershed Regional Land Use Plan

The southeastern corner of the Project lies within the Peel Watershed Planning Region (PWPR) and is subject to the Peel Watershed Regional Land Use Plan (PWRLUP) (Peel Watershed Planning Commission 2019). Like the NYRLUP, the PWRLUP was established to provide management direction and ensure long-term sustainable development in the Planning Region. The PWRLUP was founded on three main themes: environmental protection, social considerations, and economic development. It follows a similar framework as the NYRLUP. The PWPR is divided into 16 LMUs, each with similar ecological characteristics, planning issues, and management intent. Each LMU is categorized by a land-use designation system. Conservation Areas are managed to protect ecological and cultural resources, while IMAs are 'working' landscapes where new development and surface disturbance may be allowed. IMAs are further classified into Zones, which correspond to the level of allowable development with comparable justification as the NYRLUP. The RSA

is part of LMU 7 (Dalglish Creek), classified as an IMA Zone IV, allowing for the highest level of development.

Like the NYRLUP, the PWRLUP encourages results-based management and uses the same cumulative effects indicators, surface disturbance and linear density to inform decisions. The PWRLUP cautionary and critical indicators are identical to the NYRLUP: 0.75–1.0% surface disturbance and 0.75–1.0 km/km² linear density. As surface disturbances reach a level of functional recovery and no longer enable travel or access by wildlife and people, they can be subtracted from the total amount of disturbed area. The PWRLUP suggests using a 1.5 m woody vegetation height as a threshold for functional recovery in forested or shrubland areas. In areas dominated by low-growing vegetation, a feature could be considered functionally recovered when covered by native species roughly the same height and composition as the surrounding vegetation. To be considered as "functionally recovered," features must have similar sediment and run-off compared to background levels, roughly match original contours, and have no human-brought materials on the site. Exceptions to the linear density calculation are identical to those outlined in the NYRLUP.

1.5 BASELINE DATA AND MANAGEMENT PLANS

Baseline environmental information and data are required for proposed oil and gas projects submitted to the YESAB Executive Committee for screening under the *Yukon Environmental and Socio-economic Assessment Act, S.C. 2003, c.7* (Government of Canada 2003) (*YESAA*), and applications submitted for other permits and licences. To receive authorization for the Eagle Plains Project to proceed, the Project must be evaluated under *YESAA*.

Environmental baseline reports describing current conditions and outlining specific objectives, as identified in YESAB's *Proponent's Guide to Information Requirements for Executive Committee Project Proposal Submissions* (YESAB 2005), have been prepared and will be included in the Project proposal submission and following the regulatory process moving forward, once defined. A series of management plans are under development by Chance to provide additional information on infrastructure design and component-specific activities, including follow-up monitoring. These plans will be further developed to include any input from potentially affected First Nations, residents of communities, territorial and federal government departments, and recommendations from the YESAB Executive Committee.

1.6 COLLABORATION WITH FIRST NATIONS AND COMMUNITIES

Chance is committed to developing collaborative working relationships with potentially affected First Nations through the ongoing consultation and engagement process, including the Tetlit Gwich'in Council, Tr'ondëk Hwëchin, the First Nation of Na-Cho Nyäk Dun, and Vuntut Gwitchin First Nation, and residents of nearby communities. The Draft Project Description is one of the multiple opportunities for leadership, individuals, and groups within these communities to share comments, concerns, and recommendations regarding Project activities. Chance will work to incorporate feedback shared on the Project to maximize Project-related benefits for potentially affected First Nations and residents of communities, to address concerns and mitigate potentially adverse effects.

2 PROJECT OVERVIEW

This section provides a summary of the proposed program. Subsections provide additional details on the seismic and exploratory drilling programs, the DST and EFT, accessory Project components, reclamation and closure information, and an overview of Project components and schedule.

The Project area comprises approximately 2,400 km² of oil and gas claims on either side of the Dempster Highway south and west of the Eagle Plains Hotel. The Project and its principal components are exploratory and have been designed to confirm the quality, quantity, and areal extent of any accumulations of hydrocarbons. Hydraulic fracturing is not proposed as part of the Project. Chance intends to conduct Project activities over ten years, primarily during the winter, from winter 2025 to winter 2035.

The Project consists of two phases:

1. Exploration Phase; and
2. Reclamation and Closure Phase.

The key Exploration Phase activities are outlined in **Table 2-1** and the key Reclamation and Closure Phase activities are outlined in **Table 2-2**

Table 2-1. Summary of key Exploration Phase activities.

Project Activity	Key Construction Phase Activity
Engagement	Ongoing engagement with First Nations.
	Ongoing engagement with community residents.
Main Camp	Opening the camp — mobilization of equipment and personnel
	The camp will house the drilling and seismic crew and other support services.
	Construction of the Central Processing Facility (CPF) (once extended flow tests [EFTs] are proposed)
Tree Clearing and Grubbing	Salvage during the winter, before the construction of the winter access roads
Winter Road Construction	Winter roads are required for seismic and well drilling, so will be the first activities of a winter operation.
Seismic Exploration	Access road construction
	Seismic line construction, hazard identification, cutting, surveying, etc.
	Line preparation and drilling
	Data acquisition and recording
Exploration Well site Construction	Well site pads will be constructed using snow, water to freeze the site, a protective liner and rig mats.
Drilling	Up to 30 pads will be constructed and used for exploration drilling over the 10-year life of the Project.
	Remote sump access for drilling mud and rock cutting disposal
	Stripped drilling fluid will be disposed of at deep zone injection wells located at Eagle Plain.
	Completing drill stem tests

Project Activity	Key Construction Phase Activity
	Acid stimulation and completion of wells for testing
Well Testing	Facilities to be installed, as needed, for testing and extended well tests.
	Routine maintenance of facilities, production equipment and well bores, as needed
	Gas is to be flared off, and oil is placed in storage tanks. Recovered formation water (if any) will be disposed of in deep zone injection wells.
Accessory Activities	Winter road construction
	Construction of a winter-use airstrip
	Vehicle traffic related to drilling and construction activities
	Water use permit for lease and winter road construction and waste disposal at the camp
	Baseline data collection and environmental monitoring
	Maintaining and snow-clearing roads and leases
	Water permit use for boilers during winter drilling

Table 2-2. Summary of key Reclamation Phase and Closure Phase activities.

Project Activity	Key Reclamation Phase Activity
Engagement	Ongoing engagement with First Nations.
	Ongoing engagement with community residents.
Seismic Lines	Low impact seismic, narrow construction, stem bending, natural regeneration
Well Suspension	Wells that have successfully undergone EFT will be suspended pending future development approval.
Well Abandonment	Unsuccessful wells and wells not used for disposal will be abandoned when testing or production phases are complete.
	Testing facilities are to be removed from each site.
Mix Bury Cover (MBC) Sump Site Reclamation	The site will be reclaimed as per AER *Directive 050 Drilling Waste Management* (Alberta Energy Regulator 2023)
Central Processing Facility	Upon complete field decommissioning activities, the removal of the Central Processing Facility will occur.
Well Site Reclamation	Well site equipment will be removed.
	Area will be allowed to revegetate naturally.
Accessory Activities	Discussions with regulators (as necessary) before reclamation work to determine whether there should be changes to the Plan
	Annual monitoring until vegetation regrowth is deemed satisfactory
	Conduct a Phase 1 Environmental Site Assessment (ESA) for each location.
	Obtain Regulatory Closure approval.

2.1 EXPLORATION

2.1.1 Seismic

Seismic exploration uses a compressional seismic p-wave (like an ultrasound) to remotely image rock layers beneath the surface. The technology measures the reflected energy waves (p-waves), akin to multiple echoes from each rock layer, to identify geological settings where oil and natural gas might be located. This imaging allows geophysicists and geologists to map the subsurface structure of rock formations that could contain hydrocarbons and help pinpoint areas of the greatest potential for drilling a successful well.

Small dynamite charges in shallow holes, called shot holes, are used to create the p-waves that reflect off the various rock layers underground; the reflected p-waves are recorded by very sensitive devices called geophones (that can even detect wind or the footsteps of people passing by). The small dynamite charges within each shot hole force the explosive energy downward through the various rock layers. A seismic detonation of one kilogram (kg) is comparable to the sound of a passing diesel truck and is only 0.5 seconds in duration. The time it takes to receive the reflected sound wave from the detonation tells geophysicists and geologists where the rock layers are, based on where the sound-conducting properties of the rocks change. Very little sound or vibration is perceptible at the surface by anything other than the geophones.

The seismic exploration program will consist of up to 1,500 km² of 3D Low Impact Seismic (LIS) data acquisition and up to 2,000 km of 2D LIS data acquisition. Seismic exploration relies on the geophones placed in a single line (2D) or along multiple, usually parallel, lines (3D). The 2D program may be undertaken as a single program or several smaller programs; the 3D program will be conducted as several programs of 400–700 km² areas. The winter seismic programs will minimize terrain, terrestrial and aquatic environmental effects. The seismic recording will take place in summer to minimize ground disturbance and allow for decreased Health, Safety and Environment (HSE) concerns.

2.1.2 Drilling

The exploratory drilling program consists of up to seven wells, drilled sequentially each year, to a maximum of 30 wells over 10 years. The well locations will be selected based on existing geological and geophysical data, data from previously drilled wells, data from the seismic program, and data from the wells drilled as part of this program.

The exploratory drilling program is planned to begin in winter 2025/2026. Three to five wells may be drilled during the winter, depending on their proximity to the Dempster Highway. Access to initial well sites will be via winter access roads. The well sites will be prepared using winter access methods and rig matting. The winter timing and access location will minimize ground disturbance and potential effects on permafrost and vegetation.

The sequence in which wells are drilled for the exploration program depends on previous drilling success, EFT results, data collected from the seismic exploration program, weather, and road conditions. The ongoing process of interpreting seismic data will allow Chance to understand better the geological setting and size/geometry of potential prospects.

If crude oil or natural gas are discovered in sufficient quantities, Chance will conduct EFT at that well. A maximum of 30 wells may have EFT. The EFT at an individual well can last from several months to several winter seasons, depending on the well and whether the discovery is principally crude oil or natural gas. At a maximum annual drilling rate, with all drilled wells deemed suitable for EFT, 10 wells could be undergoing EFT at any time for this Project.

Once a well has been drilled and tested to determine whether oil and gas reservoirs were encountered, Chance will decide whether to complete the well[1] and conduct EFT or safely and securely abandon the well and reclaim the well site. Once the well completion determination has been made, the drill rig will be removed from the well site and proceed to the next exploratory drilling location.

2.1.2.1 Extended Flow Testing

The EFT provides data on fluid composition, reservoir properties, areal extent, and pressure, both during the EFT and as it builds up following the flow period of the EFT.

If Chance decides to proceed with EFT at a well site, it will be reconfigured to support EFT. A completion, or service rig, will be moved to the site to install the EFT equipment in the well. At the depth where oil or gas has been identified, the cemented in-place steel casing is perforated for fluid to flow out of the geologic formation and into the well.

Some combination of natural gas, crude oil, and formation water (i.e., very deep non-potable groundwater that is usually saline, located in the same rock formation as the oil and gas deposit) are usually extracted during EFT. Fluids produced during EFT will be separated and measured in mobile units on the well pad. Natural gas may be flared but preferentially used as fuel for process heating, mechanical power, and onsite power generation. Formation water will be disposed of by re-injecting it into a compatible and approved geological formation via an existing Eagle Plains well converted to a deep injection well. Existing suspended wells may be converted to deep-injection wells as needed.

2.2 RECLAMATION AND CLOSURE

Progressive reclamation and closure activities are ongoing during the Exploration Phase. This includes the reclamation of winter roads, abandoned well pads, seismic lines, and clearings due to accessory activities. As this Project primarily involves winter activities (except for seismic recording), reclamation will mostly rely on low impact seismic, stem bending, and natural regeneration, intending to minimize ground surface disturbance. A Conceptual Reclamation and Closure Plan will detail reclamation, abandonment, and closure activities.

2.3 ACCESSORY PROJECT COMPONENTS

Additional activities required to support the principal Project components are as follows:

[1] Completion of the well at this stage involves inserting steel pipe, referred to as casing, into the well bore and injecting cement into the annular space between the outside of the casing and the native rock formations to set the casing in place and to prevent any fluids in the rock formation from flowing to surface uncontrolled, and capping the well with a series of valves, referred to as the wellhead, or Christmas Tree.

- Construct a series of Mix Bury Cover (MBC) sumps covering an area of up to approximately 6.4 hectares (ha) to dispose of drill cuttings. These sumps are in an area adjacent to the existing Devon sump (which pre-dates Chance) at km 336 of the Dempster Highway, which has been identified as a suitable location.
- Construct winter access roads.
- Construct an airstrip for seasonal (winter) use on the Chance Winter Road location west of the Dempster Highway.
- Mobilize equipment, supplies, and personnel to the Project and Project area.
- Use the existing Chance Camp at km 325 of the Dempster Highway to house up to 75 workers on a rotational shift basis, and occasionally use the Eagle Plains Hotel,.
- Use a remote fly-in camp near the proposed East Greaves and West Greaves Winter Trails, roughly 40 km from the Chance Camp, to accommodate approximately 25 operations personnel.
- Construct a Central Processing Facility (CPF) at the existing Chance Camp, which will allow Chance to store, further treat/separate fluid produced during EFT and transfer it to trucks for disposal. The additional processing enabled by the CPF will stabilize the crude oil, as required for future truck transport to an appropriate approved crude marketing point.

2.4 SCHEDULE

The Project will enter the YESAB Executive Committee Screening Process by 2024, aiming to have all necessary permitting and approvals by mid-2025. Chance plans to begin exploration activities as early as late 2025, and the Project is planned for up to 10 years. The progress of each component and accessory activity will be scheduled, located, and timed to accommodate factors such as remoteness, weather, seasonal operations, and lack of resourcing, including finding qualified oilfield staff in the region. Certainty around schedule and outcome will be gained as initial data is analyzed from the first few wells that are drilled and had EFT and subsequently from the seismic program. The timing of the three principal Project components and accessory activities is shown in **Table 2-3.**

Exploration activity can start as early as December 2025 and continue for up to 10 years. Scheduling detail is provided for the first three years. The data collected during those initial years will strongly influence future activities' timing, location, and intensity. The schedule only generally accounts for operational interruptions such as severe weather, geological re-interpretation, equipment breakdown or other delays beyond the operator's control.

Chance will engage potentially-affected First Nations and residents of communities throughout the life of the Project.

In summary, Chance will conduct a seismic program staged over five to eight years and drill up to 30 wells over the course of the 10-year Project starting the winter of Project approval. Due to the limitations of the camp and the Eagle Plains Hotel, the exploration work will be undertaken in a logical sequence alternating between drilling and seismic. If a well is successful (i.e., if there is a discovery of crude oil or natural gas in sufficient quantities), Chance will conduct an EFT for up to two years on that particular well.

Table 2-3. Project component and accessory activities timing.

Component	Timing	Details (as needed)
Seismic Exploration Program	except for seismic data recording, the seismic programs will occur during the winter and alternating with the drilling activities due to capacity constraints at the camp.	Subject to this limitation, seismic programs could occur during the 10-year exploration period.
Drilling Exploration Program	alternating with seismic programs initially, starting during the winter months (October through April).	Drilling may be interspersed with accessory activities such as preparing/decommissioning access to well sites, mobilizing/demobilizing equipment, and reclamation activities.
EFT program	timing will depend on the exploration drilling results, primarily the discovery of crude oil or natural gas, and the capacity of the 75-person camp to accommodate the necessary crews.	The EFT will be staggered across the Project area, but it is expected that one or more EFTs will happen in the Project area during the winter operating season.
MBC sumps or pods construction	will occur in every season that drilling is happening, and sumps will be built on an as-needed basis to dispose of drill cuttings	
Airstrip and CPF construction	will likely occur within the first or second winter season.	
Reclamation	will be ongoing throughout the Project's life.	

3 PROJECT DETAILS

Information provided below for each Project component includes its location, key design features, and the results of any relevant investigations to establish site conditions (e.g., seismicity, geotechnical parameters), where applicable. An overview of each Project component and associated activities is described in **Table 3-1.**

The principal Project components in the Exploration Phase are:

1. seismic exploration program.
2. drilling exploration program; and
3. extended flow testing program.

All three components are intended to operate simultaneously, sequentially, or alternatively. The data collected during each program contributes to a more robust characterization of the geological setting in the Project area. A better understanding of the geological setting allows Chance to identify prospects showing potential for oil and gas reserves to accumulate. A combination of existing data and data from seismic exploration, new drilling, and EFT will evaluate these prospects.

The proposed seismic exploration program, consisting of up to 1,500 km² of 3D LIS seismic and up to 2,000 km of 2D LIS seismic, is intended to further identify and map oil and gas prospects where the potential for hydrocarbons to accumulate exists in the Project area. The 3D seismic program will likely be undertaken in a series of smaller areas of 400–700 km² areas and undertaken in a sequential, alternating program with drilling activities. The 2D seismic program could be conducted at once, or as a series of smaller areas connected to a broader program execution strategy.

The exploration drilling program will occur 24 hours per day, seven days per week, once underway, during the winter. When using one drilling rig, Chance will drill one well at a time and up to seven wells per year. Additional wells could be drilled if two rigs are being used. When hydrocarbon resources are discovered (either natural gas or crude oil), Chance will conduct EFT to gather data about the nature of the resource accumulation and its productive capability, which will be used to determine future development plans for each location. EFT timelines vary between wells with a primarily natural gas discovery and wells with a primarily crude oil discovery as follows:

- EFT on wells with a primarily natural gas discovery: maximum of one to two months; and,
- EFT on wells with a primarily crude oil discovery: maximum of two years.

EFT is typically conducted continuously (i.e., 7 days a week, 24 hours a day) until complete; once EFT has begun on a well, pausing or ceasing EFT is logistically challenging and time intensive. Up to 10 wells may be undergoing EFT concurrently, based on the proposed exploration drilling schedule, and up to 30 wells may undergo EFT over the life of the Project, depending on hydrocarbon resource discovery.

The Project does not include hydraulic fracturing.

Table 3-1. Project components and activities overview.

Project Component	Activities

General Project Overview	• Exploration activities for crude oil and natural gas in the Eagle Plains area:
	  ▫ 2D and 3D seismic exploration
	  ▫ Exploration well drilling, flow testing, suspension, decommissioning, and abandonment.
	  ▫ Successful wells will be suspended but may be brought forward in future development project proposals.
	• Use of existing Chance camp to store equipment and supplies and to house personnel:
	  ▫ Water use up to 20 cubic metres per day (m³/day) (for washing, showers, toilets, etc.). Bottled drinking water will be supplied to the camp
	  ▫ Use and maintenance of existing wastewater treatment facilities
	  ▫ 75-person capacity
	• Transport of goods, materials, and personnel to/from the Project area and within the Project area.
	• Project components will occur sequentially at each new well site over the 10-year Project term as follows:
	  ▫ Initial mobilization of equipment to the Project site.
	  ▫ Construction of required infrastructure.
	  ▫ Well site development, drilling, testing, decommissioning, and abandonment.
	  ▫ Progressive reclamation.
	  ▫ Final closure and reclamation.
	• Ongoing engagement with First Nations.
	• Ongoing engagement with local community residents.

Seismic Exploration	• Establishment of seismic line mulching areas:
	  ▫ Up to 1,500 km² of 3D seismic (2.75 m wide source lines, 1.75 m wide receiver lines all mulched)
	  ▫ Up to 2,000 km of 2D seismic (2.75 m wide)
	• Global Positioning System (GPS) Survey of receiver points and source points
	• Low Impact Seismic (LIS) tracked air hammer drilling of seismic shot holes
	• Explosives storage (magazines), transportation, and use (1 kilogram [kg] per source point)
	• Recording with wireless system. Helicopter use for deployment and recovery of recording equipment and conducting data recording.

Drilling Exploration	• Winter establishment of up to 30 well sites, each approximately 1.44 hectares (ha) within the Project area
	  ▫ Site levelling using packed snow or ice and rig matting as required
	• Installation of surface infrastructure on drill sites including:
	  ▫ Drill rig
	  ▫ Mud tanks, pumps, and mud mixing and separation systems
	  ▫ Power generators
	  ▫ Boilers
	  ▫ Flare tanks and flare stack
	  ▫ Blowout preventer accumulator system
	  ▫ Fuel storage

Project Component	Activities
	▫ Cement mixing and storage ▫ Storage bins for rock cuttings removed from the drilling mud ▫ Trailers for offices, first aid, rig crew sleeping quarters, water storage and treatment, sewage storage, and food waste incinerator. • Drilling wells up to 2,500 m deep ▫ Wells drilled sequentially, one to two wells at a time, up to seven wells per year ▫ Use of low-toxicity, water-based mud system ▫ Use of an average of 15 cubic metres (m^3) and up to a maximum of 100 m^3 of water per operating day for drilling ▫ Disposal of drill cuttings into individual Mix Bury Cover (MBC) sumps or pods approximately 300 m^3 over an area of 800 square metres (m^2) (estimated volume of drill cuttings for one well) ▫ Disposal of approximately 200 m^3 of drilling mud in MBC • Drill Stem Tests (DST): one or more on each well at depths where formations with the potential to produce crude oil or natural gas were encountered. ▫ Potential acid stimulation using approximately 5–10 m^3 of a weak concentration of hydrochloric acid (10-20 percent [%]) ▫ Production and separation of fluids recovered from the well during the DST(s). ▫ Flaring natural gas, separation of crude oil and any produced formation water. • Disposal of formation water, saline fluids, liquid faction of drilling fluids and rig wash underground in deep-injection wells converted from existing suspended wells or wells drilled as part of this Project.
Extended Flow Testing (EFT)	• Installation of surface and subsurface equipment and facilities to enable EFT including: ▫ Casing of entire wellbore and perforation of the casing at zones of interest ▫ Packer, tubing, and downhole measurement gauges ▫ Wellhead valve assembly ▫ Flare tank and flare stack ▫ Separator vessel, treating vessel, and storage tanks ▫ Appropriate artificial lift systems (e.g., pumps) ▫ Heaters ▫ Dehydrators ▫ Flow lines ▫ Metering equipment ▫ Portable generators • Conduct EFTs on up to 30 wells ▫ May be completed within a few weeks at a predominantly natural gas bearing zone or may require up to 2 years for a predominantly crude oil-bearing zone. ▫ Separation of natural gas, crude oil, and formation water ▫ Production of crude oil and transportation of produced crude oil from the site to markets. ▫ Using natural gas on site for process heating, storage tanks and other vessels used, fueling artificial lifting to assist crude oil production, or compression of natural gas to be used in other areas of the operation such as fuel to heat the camp. ▫ Flaring natural gas during EFT if unable to use on site.

Project Component	Activities
	• Disposal of formation water, saline fluids, liquid faction of drilling fluids and rig wash underground in deep-injection wells converted from existing suspended wells or wells drilled as part of this Project.
Well Maintenance (Workovers)	• Suspended wells are inspected annually, and active wells are subject to servicing on an as-needed basis to address operational issues that interrupt the EFT, requiring mobilization and installation of a service rig to the well site to remedy the problem. • Maintenance activities include: ▫ Wellhead Inspection Pressure Test of surface wellhead valves ▫ Surface Casing Vent Flow test ▫ Gas Migration test ▫ Repair or replace pumping equipment ▫ Clear blockages to fluid flow that can develop during EFT ▫ Replace worn-out downhole equipment ▫ Set up EFT in other formations within the same wellbore ▫ Suspend or abandon wells after EFT
Access Roads	• Construction of winter trail access for exploratory well drilling, DST, EFT, and seismic program access and execution. • Clearing woody vegetation along identified route above the surface of the snow. • Minimum of 10 centimetres (cm) of packed snow accumulation, packing snow and, in some sections, spreading water to create ice on the ground surface. • 8–10 m wide with wider pullouts of 16–20 m spaced every 5 kms to allow for passing traffic. • The total length of winter access roads per season will vary based on locations identified for exploration drilling each winter; new well sites will be accessed using existing/previously used routes as much as possible to minimize new clearing and linear disturbance. ▫ Each season, a maximum of 125 km of new (previously uncleared or used more than ten years ago) winter access roads will be created. ▫ Approximately 15% of the roads will be built on previously disturbed ground (old roads, cutlines, etc.) ▫ A maximum of 200 km of winter access roads (new winter access + previously cleared winter access) will be active each season. • Clearing of vegetation.
Mix Bury Cover (MBC) Construction and Operation	• Construction of MBC sump approximately 6.4 ha total in area to dispose of drill cuttings and drilling by-products. ▫ The sump will be excavated as disposal volume is required to minimize potential permafrost exposure (possibly in narrow compartments oriented east-west to maximize shading). ▫ Each MBC “pod” will be 800 m^2 and contain the drill cuttings from one well; only one pod at a time will be active/excavated. ▫ A typical well produces up to 300 m^3 of drill cuttings for disposal; development of the MBC would parallel the rate of exploration drilling (i.e., typically 1,500 m^3 of drill cuttings for disposal each year) • Removal and stockpile of organic cover material and silts for use in reclamation.
Central Processing Facility (CPF)	• Construction of CPF adjacent to the camp, which would include: ▫ Multi-stage and multi-phase separators ▫ Heat treatment

Project Component	Activities
	▫ Vapour and gas collection system for flares or to provide fuel for camp use ▫ Processing of crude oil to stabilize and meet specifications for truck transport ▫ Storage of approximately 3,180 m³ of crude oil ▫ Storage of approximately 119 m³ of formation water • Fuel storage facility ▫ 151,000 L diesel fuel ▫ 24,000 L propane • Storage and use of chemicals and reagents: ▫ Hydrochloric acid (10% to 20% concentration) ▫ Methanol ▫ Additives to prevent corrosion of oilfield processing and handling equipment ▫ Demulsifiers to be used in treating fluids to better separate oil from formation water • Bulk explosive compound to store dynamite for seismic exploration.
Airstrip	• Construction of an airstrip approximately 1,500 m long located at about km 4 along the Chance winter road from the Dempster Highway intersection • Airstrip use throughout the Project life, approximately two flights per week. • Aviation fuel storage
Water Use	• Use of up to 300 m³ of water per day (or per permitted limits) for making snow to build winter trails, ice roads and temporary well sites, not exceeding 10% of the instantaneous flow from the following extraction points: ▫ Year-round extraction from the Eagle River, Ogilvie River, and Whitestone River. ▫ Seasonal extraction from Glacier Creek and Fly Camp. • Use up to 20 m³ of water daily (for washing, showers, toilets, etc.); bottled drinking water will be supplied to the camp. • Construction of a water reservoir at the camp for water storage and use during low water periods.
Transportation	• Use Dempster Highway, North Klondike Highway, and Alaska Highway to access Project site. • Approximate offsite traffic on public roads between the site and supply points is estimated to be: ▫ 7–10 water trucks and up to 3 fuel trucks per week. ▫ 8–9 lightweight service vehicles per week as needed. • Onsite traffic on Proponent-controlled roads is estimated to be: ▫ Fuel and water deliveries at a rate of 5-8 trucks per week. ▫ Lightweight service vehicles daily to transport personnel and gear from camp to well sites.
Camp and Workforce	• Up to 75 people on-site during all Project components. • Continued use of existing 75-person Chance Camp, located at km 325 of the Dempster Highway. ▫ Existing waste management and disposal facilities. ▫ Existing wastewater treatment infrastructure. • Use Eagle Plains Hotel to accommodate personnel overflow for short periods, if required.

Project Component	Activities

Reclamation and Closure	• Progressive abandonment and reclamation of unsuccessful wells.
	  ▫ Installation of cement plugs across all porous/permeable zones within the wellbore, across the base of each casing section and including an overlapping portion below the surface casing with the base of the surface casing.
	  ▫ Cutting a surface portion of well casing(s) off at least 1 m below ground level and welding steel plates to cap the casing.
	• Progressive decommissioning and reclamation of access routes when they are no longer necessary.
	• Well suspension or abandonment at the end of Project.
	• Decommissioning and reclamation of the MBC sump area and airstrip at the end of the Project.

3.1 SEISMIC EXPLORATION PROGRAM

3.1.1 Seismic Data and Drill Locations

Seismic uses a compressional seismic p-wave (like an ultrasound) to remotely image layers of rock beneath the surface. The technology measures the reflected energy waves to identify geological settings where oil and natural gas might be deposited. This imaging allows geophysicists and geologists to map the subsurface structure of rock formations that could potentially contain hydrocarbons. The placement and orientation of these layers help to pinpoint the area with the greatest potential to drill a successful well.

Source points use small dynamite charges in shallow holes to create the p-waves that reflect off the various rock layers underground like an echo to be recorded by highly sensitive recording devices called geophones. The detonations used to create the seismic wave are contained within the hole to force the energy downward through the various rock strata. A seismic detonation of 1 kg creates a dull thud that can be heard only near the hole. It is comparable to a passing diesel truck for ½ second duration. As the energy bounces back to the surface, the geophones detect the seismic waves and record the data **Figure 3-1.** The time it takes to receive the sound wave from the detonation tells geophysicists and geologists where the rock properties change, helping to find the oil and gas deposits. Very little reflected energy is perceptible at the surface by anything other than the highly sensitive geophones.

Once all source points have been detonated in sequence, the data are processed and analyzed. The interpretation of the seismic data can give geophysicists detailed cross-sections (2D seismic lines) and multi-dimensional graphics (3D seismic programs) of the sub-surface area. This information is combined with previously known information about the rock types within the area and their properties, such as hardness, density and porosity, to support drilling locations for wells. The decision to drill wells or acquire additional seismic is determined by the amount and quality of the data available (**Figure 3-2**).

Decisions to drill wells or acquire additional seismic data is an ongoing process to define the resource potential in a particular geological formation or geographic region and is a combination of geological and geophysical efforts. The process includes ongoing seismic acquisition and geological evaluation as the wells are drilled and production capabilities are examined.

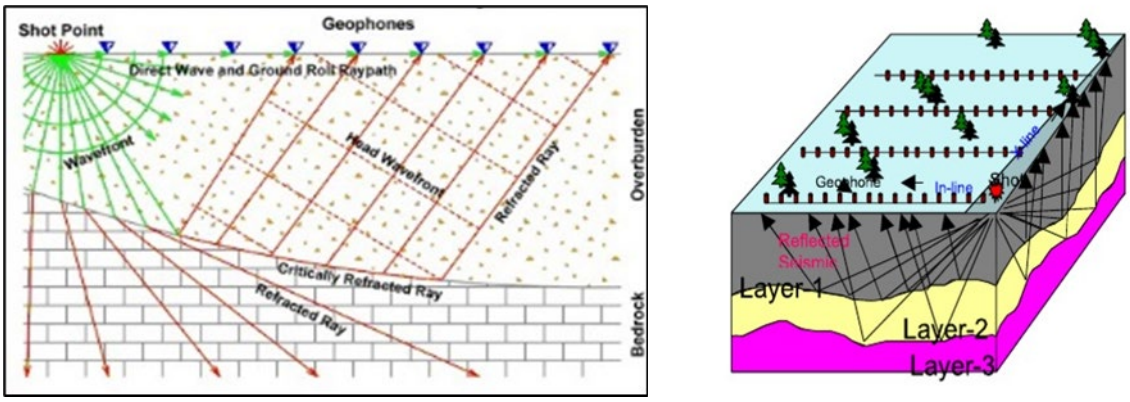


Figure 3-1. A graphic example of the reflection seismic exploration data collection process.

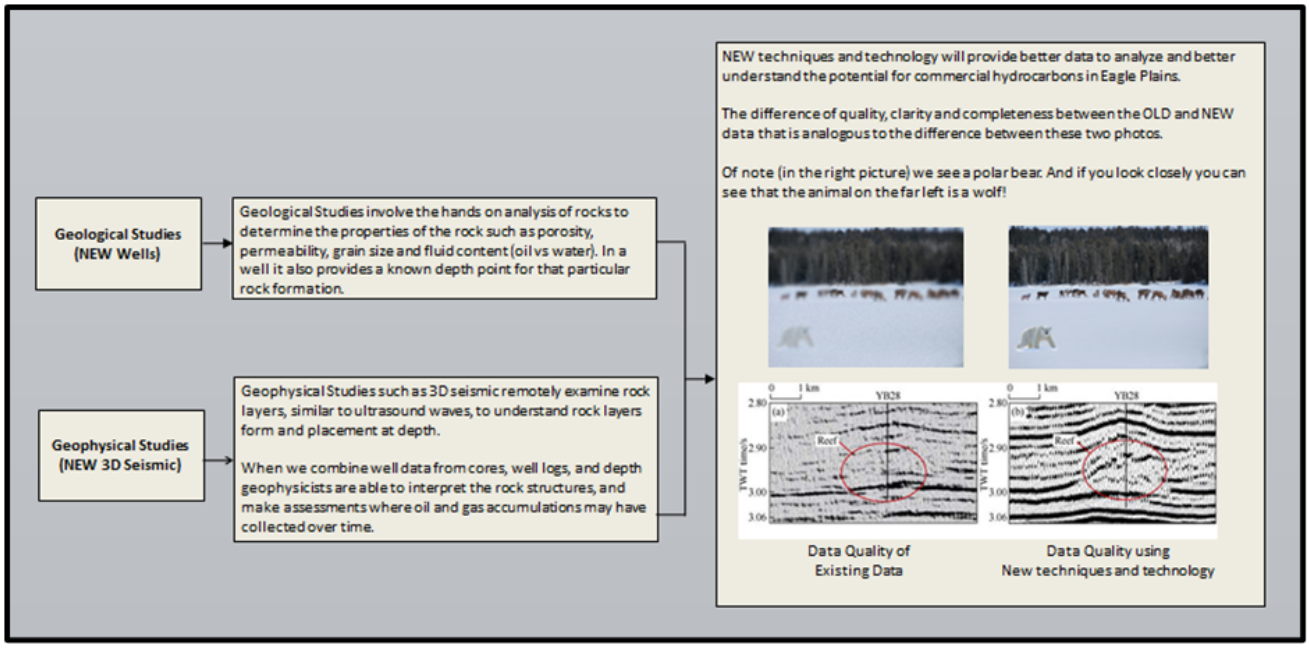

Figure 3-2. Example geological and geophysical studies.

3.1.1.1 Seismic Data

Seismic data is required in the Eagle Plains Basin to understand the area's complex geology. Modern seismic techniques will provide high-quality information about the geology of Eagle Plains while minimizing environmental effects. The proposed area for seismic exploration consists of about 1,500 km² of new 3D and 2,000 km of new 2D reflection seismic exploration within Chance's exploration permit area. **Map 3-1** illustrates the extent of the exploration area. However, the location of each annual seismic program, whether 2D or 3D, will be determined by analyzing the exploration drilling results and how seismic may help determine the knowledge of the basin. Low Impact Seismic 2D programs can be used to determine the extent or edge of a prospect, and LIS 3D will show more detail.

Depending on available accommodations, personnel, and equipment, the seismic data will likely be acquired in several discrete programs of approximately 400–700 km² areas. Year-round operations will enable resource allocation by completing line preparation during the winter and conducting the recording activities during the summer using heli-portable operations. Lines will be prepared in winter when snow is present, and the ground is frozen. Winter ground preparation will protect the active layer and underlying permafrost and preserve saplings and small shrubs. Year-round operations will enable larger portions of the seismic program to be completed with reduced disruption within the Project area.

For LIS 3D, a design is created by a professional 3D designer. For the Eagle Plains area, receiver lines will have an east/west orientation, and source lines will be oriented north/south. The spacing between points is determined by the level of data resolution required to image the shallowest rock formation of interest. It is estimated to vary between 40 and 50 m since the geology at Eagle Plains dips from the northeast (NE) to the southwest (SW). For a given layer of rock, it will be physically shallower in the NE part of the basin and deeper in the SW. The receiver lines will be mulched with the narrowest mulch head size (1.75 m wide), allowing for safe travel by foot, snowmobile or ATV and will run roughly parallel to other meandering receiver lines spaced approximately 200 m apart. The north-south source lines will be mulched (2.5 m wide) to allow access for the tracked drills that make the shot holes. The source lines run roughly parallel to other meandering source lines approximately 300 m apart. For LIS 2D, the geophones and sources are located within the same meandering, about 2.5 m wide, line.

During the recording process, each source point is detonated separately upon the initiation of a radio signal directed by the field operator called a “shooter”. The shooter is positioned at least 30 m from the active station and can survey the surrounding environment to observe detonation safety. The source point that will be detonated is in the source “swath” area and provides a center point for the recording patch. A recording “patch” is the area of live (active) geophones that are closest to the source point swath area (within 3,000 m). Upon detonation of the source point within the swath, the geophones in the recording patch collect the data. For the Eagle Plains area, the patch size is comprised of 16 lines containing 140 geophones each (**Figure 3-3**). The patch ensures that far offset distances are greater than the depth of target formation; therefore, the data will encompass areas large enough to prevent gaps in the data. The patch is moved digitally and physically as the shooter travels from east to west and then north to south. Geophones are continually picked up from the recorded area and moved to the next area ahead of the recording patch.

As seismic program data will be acquired over several years, naturally occurring fires are likely in the area. Several fires have occurred in the Eagle Plains basin, and approximately 60% of the Project area has been burned. The most recent wildfire occurred in 2017, burning 294 km² within Chance’s exploration permits 0010 and 0012 (**Map 3-2**).

Each year that a seismic program with be conducted, an analysis of mitigation strategies is undertaken, and appropriate strategies are implemented to reduce the environmental effects in the area. One example is using existing burn areas rather than clearing new vegetation where possible. The proposed first-year seismic program was designed considering the existing open meadow and burn areas. Lines traversing these areas will not disturb live vegetation and should not be regarded as a functional disturbance. Regrowth in these areas will also be monitored to gauge the natural regeneration conditions in the area. Previous LIS seismic line disturbances will continue to be, analyzed to ensure that current methods of line

preparation provide optimal conditions for regrowth in the Eagle Plains area. Ecological, permafrost and historical data have been extensively gathered and incorporated into the operations plan.

Seismic operations are planned for year-round operations in the year that they are to be conducted, based on length of time required to conduct each component of the program and the limited personnel, equipment, and accommodations available in the Eagle Plains area. The line preparation (access trail construction, line cutting, surveying, and drilling) will be conducted during the winter months (December through April) under frozen ground conditions and recording would then follow in the summer months (July through September) (**Figure 3-3**).

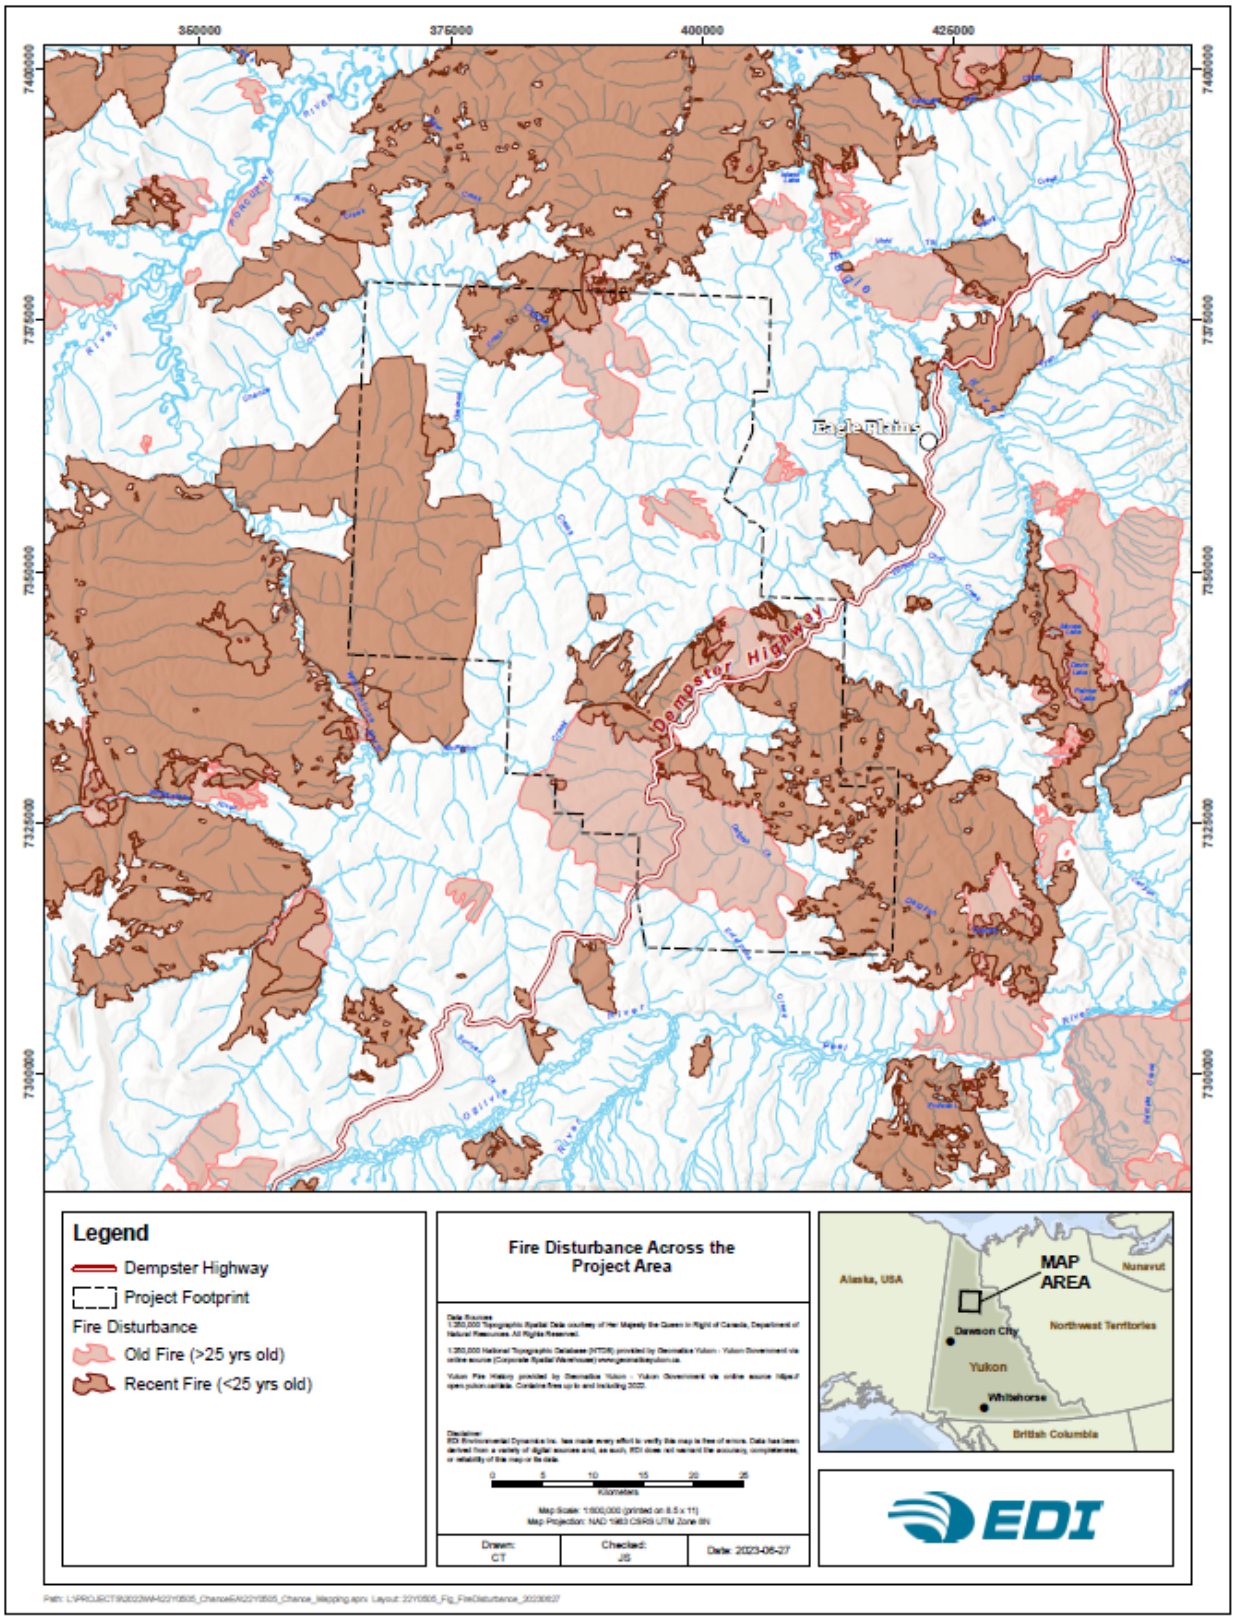

Map 3-2. Forest fire burn areas in Eagle Plains.

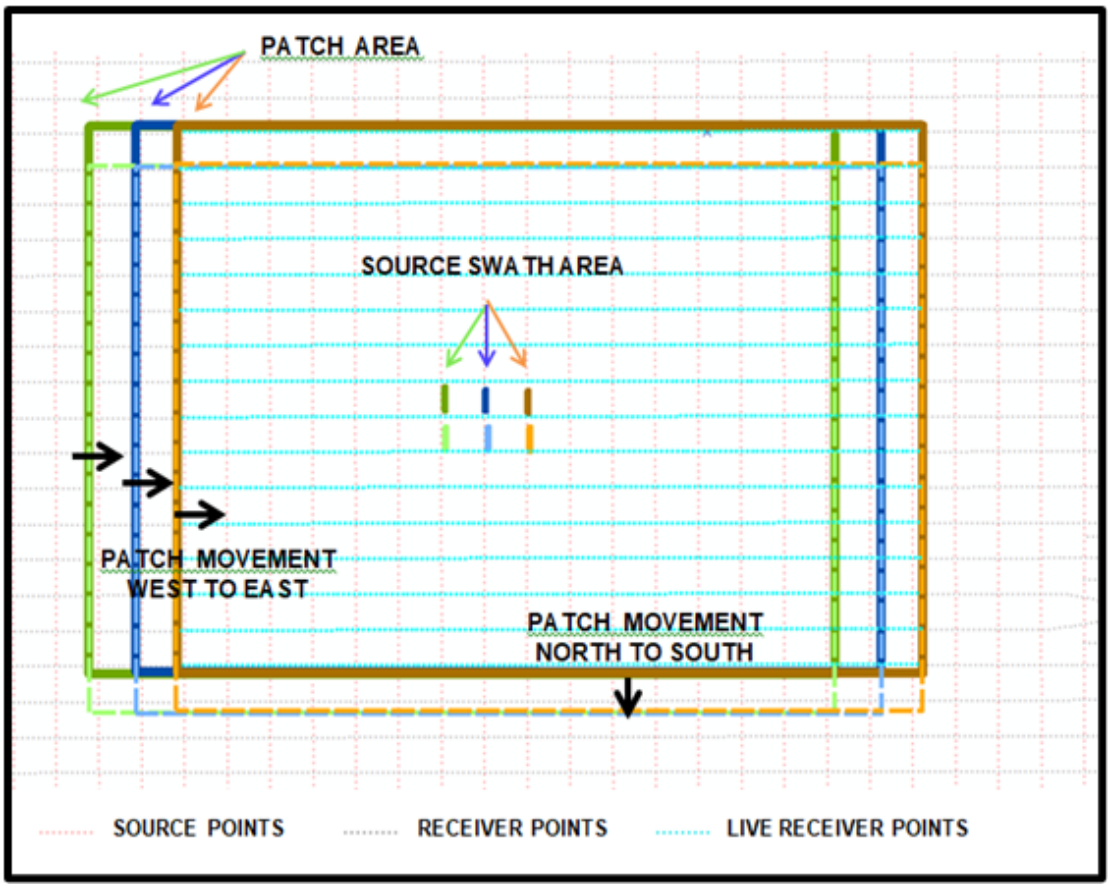

Figure 3-3. Proposed seismic patch size and movement throughout the Program area.

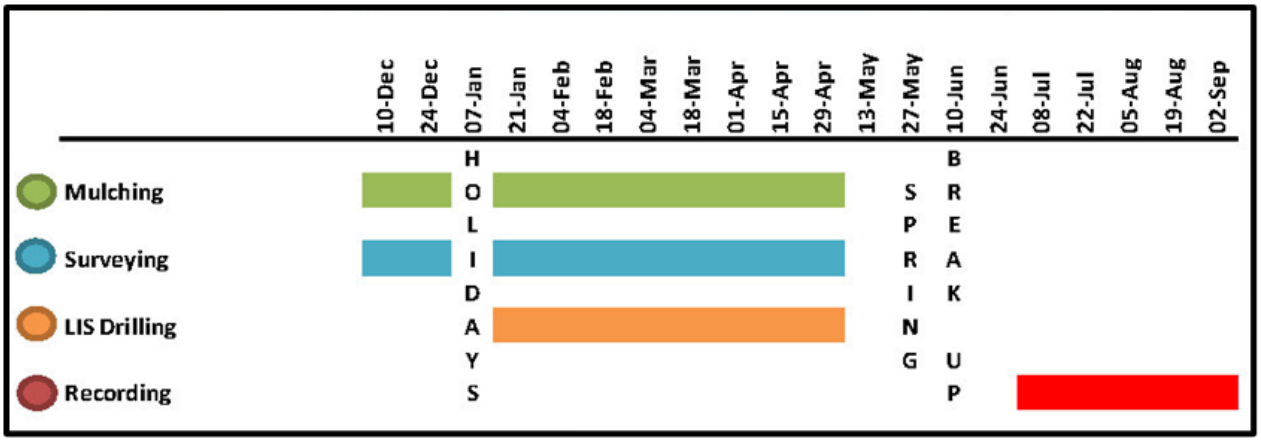

Figure 3-4. Proposed year-round schedule in Eagle Plains.

3.1.1.2 Seismic Line Construction

The historical seismic data in the Eagle Plains area consists of “Legacy” 2D seismic lines and the “Modern” LIS 3D seismic program conducted in 2013–2014. The methods used to construct the Legacy 2D lines included 6–10 m wide lines in straight (linear) patterns that cross the landscape. These lines are visible today mainly due to the use of bulldozers to remove over/understory — clearing methods and wider lines that are not required in modern LIS practices. Modern LIS line construction methods use narrow line widths that meander and create non-linear line disturbances. Bulldozers are no longer used in seismic line construction; smaller and narrower mulchers are now used to support the preservation of the active layer and reduced vegetation removal.

Line preparation will use the LIS methods, reducing the landscape footprint. This technique creates meandering source and receiver lines that limit the line of sight to less than 70 m, which minimizes any predator (e.g., wolf) line of sight for prey. The LIS method also ensures that the line can avoid removing larger timber that shelters under canopy vegetation by adjusting the meander of the line to avoid larger trees and mature vegetation.

3.1.1.3 Constraint and Sensitive Habitat Identification and Mitigation

Before line preparation, a detailed line-by-line spatial analysis (area examination) is performed using a combination of air photos, Light Detecting and Ranging (LiDAR), field scout information, Geographic Information System (GIS) information, First Nation cultural inputs and heritage studies, permafrost studies and flora and fauna assessments. Existing disturbances, burn areas, and natural open areas will be used rather than create new cutting where possible. Topography, natural drainage, and runoff patterns will be considered when developing the seismic design to prevent impediments to water flow. All lines will have offsets to protect sensitive habitats. Streams and rivers will be avoided except for crossings at access points. Doglegs will be used where lines intersect major access routes to reduce visibility and use as access.

Planning the seismic, winter access, and well pad sites considered water, landscape, landform (e.g., permafrost), vegetation and habitat sensitivities to disturbance. A “Constraints Map” exercise was conducted to identify especially sensitive or high quality environmental and heritage values where project work should be avoided. Constraints include areas that are sensitive for environmental, cultural, or safety reasons. In seismic exploration, the term “constraints” is often referred to as “hazards”. Examples of environmental values in Eagle Plains include permafrost areas, high-value wildlife habitat, wetlands, riparian areas, and heritage sites. Management measures applied with the constraints map include complete avoidance of project development/activities within the mapped areas and a range of other types of mitigations where avoidance is not possible — examples include rig matting, winter work, LIS, etc.

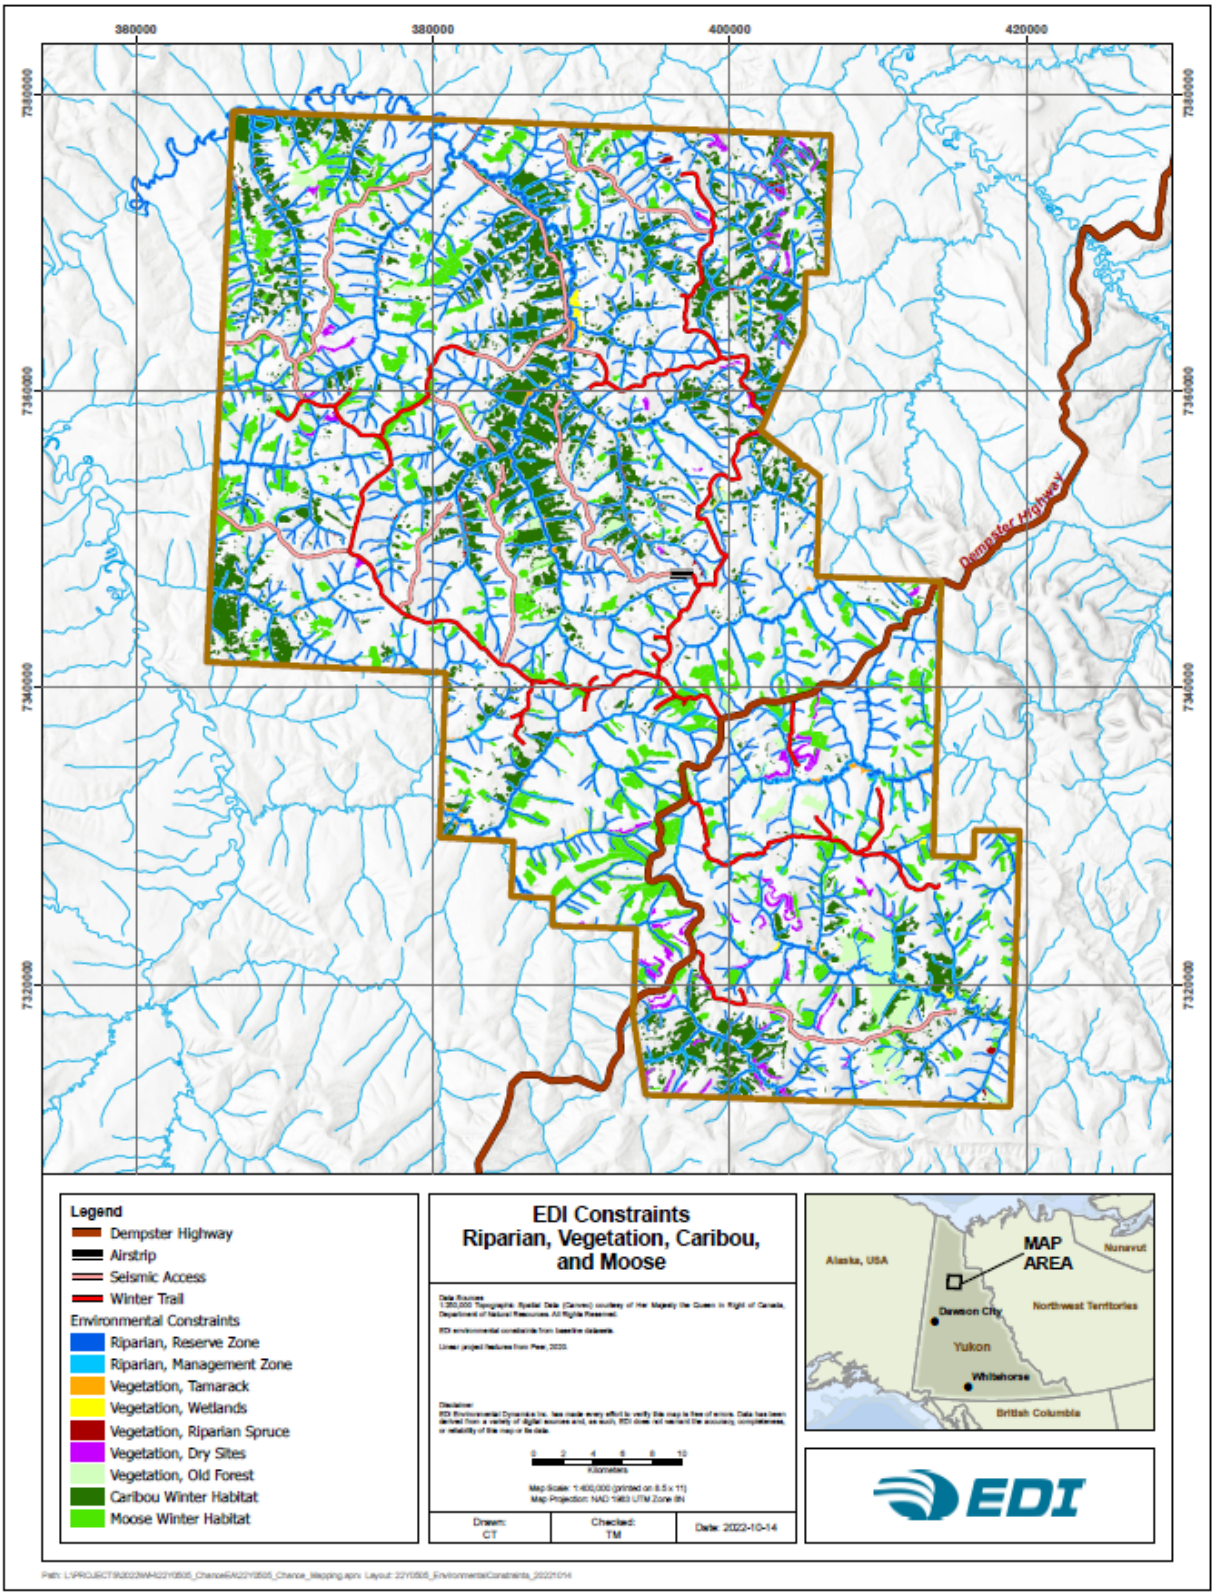
Developing and applying a constraints map for environmental and heritage sites is especially useful when certain project features cannot be preplanned (i.e., mapped), which is the case for multiple features in the Eagle Plains Project. Since Chance cannot plan exactly where Project features will occur as exploration proceeds, identifying high value areas where Project features cannot occur is a good approach to mitigating potential effects.

Details of the constraints mapping approach will be provided in the environmental assessment portion of the Project Description. Several important landscape and ecological features were considered, but the key features built into the constraints map (**Map 3-3**) included the following:

- Surface water and fish were considered by creating no-disturbance buffers in riparian areas to higher order streams where fish are likely present in the summer.
- Vegetation was considered by identifying sensitive Ecological Landscape Classification units including dry sites, riparian spruce sites, tamarack sites, and unique wetland sites.
- Moose habitat included high-rated forage sites.
- Heritage sites and high heritage potential identified by the Yukon Government, First Nations, or site-specific surveys.
- Caribou high value forage habitat.

The avoidance priority considering all constraints is as follows:

1. Heritage sites;
2. Permafrost/terrain sensitive areas;
3. Riparian management areas;
4. Priority ELC units;
5. Caribou habitat; and,
6. Moose habitat.



Map 3-3. Constraints Riparian, Vegetation, Caribou, and Moose.

Pre-flagging may be conducted to identify Pand mark line locations containing riparian areas, difficult terrain, hazards or constraints, historical/archeological areas, animal features and facilities. This is done by personnel on the ground marking the line locations and areas of concern for the mulchers and chainsaw operators to follow or avoid. These areas will be added to the Project map and used to plan each area's activities strategically. Decisions can be made to delay progress in certain areas due to wildlife presence or to employ different equipment that would be better suited to the terrain in that area. In addition, geofences can be created to monitor activities near “Hot Spots” which are areas of concern that personnel must avoid. Handheld GPS units support accurate line placement and automatically notify management when the mechanical equipment approaches a “Hot Spot” or stations encroach on any buffered zones or areas. Personnel trained to monitor the production crew’s location based on the GIS data gathered during the pre-flagging stage to ensure designated equipment and personnel in the area are safe.

3.1.1.4 Line Preparation — Cutting

A combination of mulchers and operators with chainsaws will prepare source and receiver lines that will be closely monitored and quality controlled. Mulchers (**Photo 3-1)** are equipped with GPS units with seismic line data to allow the operator to follow a pre-planned course. Mulcher operators have detailed information on the area’s pre-identified hazards or constraints, culturally sensitive locations, flora and fauna setbacks, and course derivations, and the operator takes care when approaching these areas of concern. Lines will be doglegged (or bent) at locations crossing any major access trails and open clearings to reduce the visual identification of access points into the program area. Meandering line construction chooses the path of least resistance and avoids timber larger than 20 to 30 cm in diameter (**Photo 3-2** and **Photo 3-3**). This technique reduces the line of sight down line to less than 70 m. Studies conducted on the 2014 3D seismic program found that the average off-line sight line was 46 m due to the region's sparse tree density and large burn areas.

Source lines will be mulched to 2.5 m wide (**Photo 3-2**) to accommodate tracked LIS drill vehicles, and receiver lines will be 1.75 m wide (**Photo 3-3**) to accommodate snowmobiles, ATVs and personnel. A minimum of 10 cm of packed snow will be left online to mitigate possible damage to vegetation or permafrost. Riparian areas and lines containing pokers or leaners will be hand cleared with chainsaws.

The seismic line preparation will be done using rough mulching: a technique that removes the branches but leaves the tree's stem intact. This technique is useful in leaving evenly distributed coarse, woody debris allowing for more rapid decomposition of the fallen timber while enabling the new vegetation to propagate through the mulch (**Photo 3-4**). The mulcher heads are set to high blade, leaving the active layer undisturbed and soil or permafrost unaffected. The mulch also protects the root system of young timber from heat, cold, drought and erosion. Rough mulching makes lines narrower, creating more natural lines with weakly defined cut-width edges.

The Eagle Plains Basin has few watercourses of substantial size. Most watercourses are intermittent and have little or no year-round fish-bearing potential as they freeze to the bottom in winter. The most notable watercourses are Chance Creek and Greaves Creek (in the North), McParlon Creek (Central) and Dalglish and Enterprise Creeks (in the South). The Whitestone River is west of and outside of the Project area.

Since creeks in the program area freeze to the bottom in winter, no “major” watercourse crossings will be required. A major watercourse crossing is any stream or river that will not freeze to the bottom or the water flow is too great to sustain a snow fill crossing. Crossings are categorized as mechanical (equipment crossing) or foot crossing. The mechanical crossings (**Figure 3-5)** will be constructed using snow fills and may require a water truck to make snow and freeze in the crossing. Water crossings are first packed with clean snow pushed from the creek surface to the crossing location. This prevents woody debris from contaminating the creek during spring melt. The snow is then hardened using a water truck to form ice to strengthen crossing integrity with the weight of the equipment. Snow fills in both creeks and drainage areas will preserve the integrity of the banks for adequate water flow and run-off. All crossings will be removed before spring break-up to allow obstruction-free drainage. All snow fills will be constructed following the Department of Fisheries and Oceans (DFO) *Code of Practice: Ice Bridges and Snow Fills* (September 2022) (Government of Canada 2022).

Riparian areas are also examined and added to the program map. Since riparian areas provide key resources for wildlife and bank stability, mechanical equipment is restricted to a 55 m setback from the bank edge. This setback protects vegetation disturbance in the area and makes sure source holes terminate at a safe distance to avoid flowing holes (**Figure 3-6)**.

Photo 3-3. A 2014 3D receiver 1.75 m wide line.

Photo 3-4. 2019 photo showing 2014 3D source line construction and deadfall from wildfire.
Note: minimal disturbance to the active layer and minimal mulch produced.

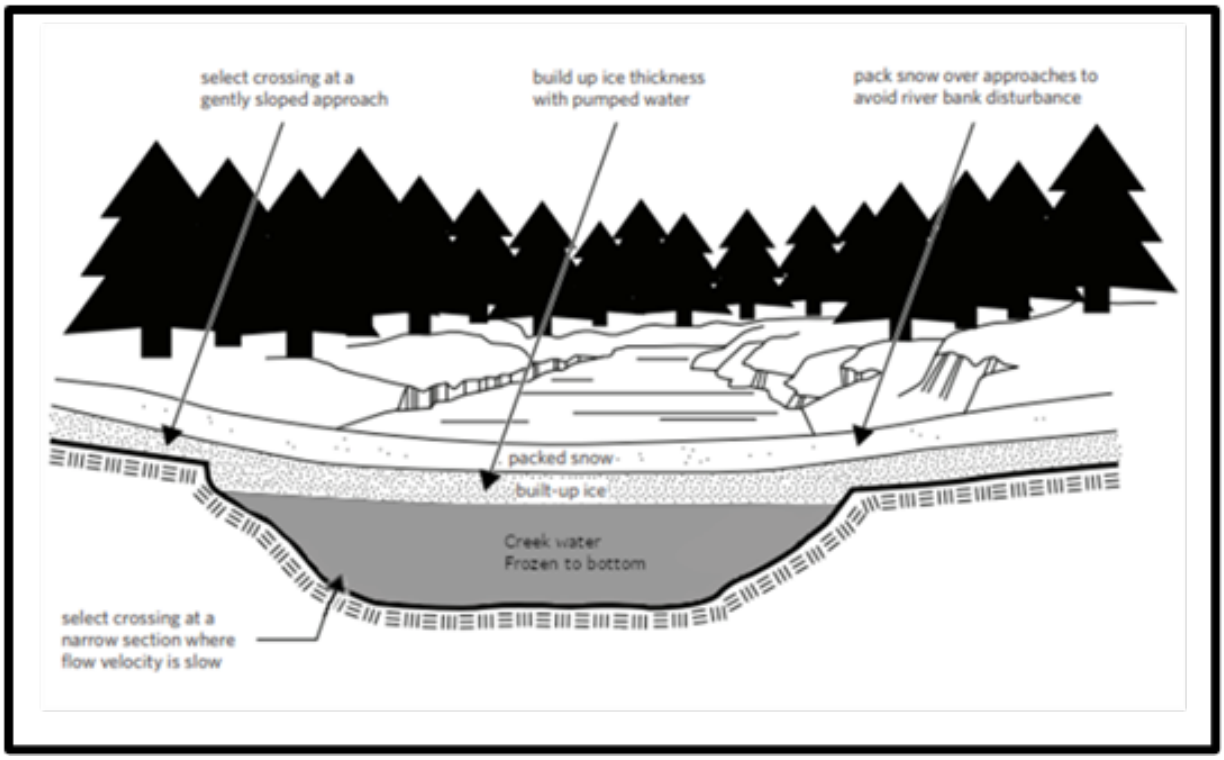

Figure 3-5. Typical creek crossing in Eagle Plains. Creeks are crossed at a 90-degree angle to banks to preserve bank stability.

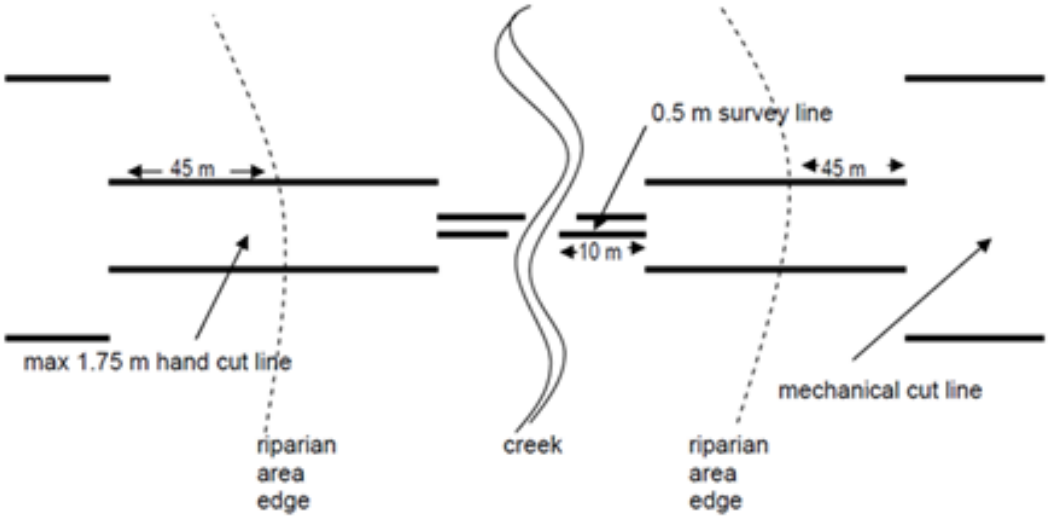

Figure 3-6. Riparian area diagram with cutting and mechanical equipment setbacks.

3.1.1.5 Line Preparation — Surveying

Once there are a sufficient number of source and receiver lines cut to allow the next stage of the seismic program to occur, surveyors then travel the source lines using all-terrain vehicles (ATVs) and snowmobiles to survey and mark each drill location of the source holes; and on receiver lines they mark the receiver points where the recording crew will place the wireless geophones.

Surveyors also add to the hazard/sensitive site assessment map as they record their GPS data. These data include:

- riparian areas;
- difficult terrain;
- historical/archeological areas;
- animal sites/features;
- facilities;
- hazard identification;
- proper line placement;
- movement around thick bush;
- refining cutting requirements; and,
- flag all hazards or constraints and riparian areas.

3.1.1.6 Line Preparation — Drilling

Once source points are surveyed, narrow-tracked LIS drills (**Photo 3-5)** are deployed to drill a 10 cm diameter, 6 m deep hole at each location. For the proposed seismic programs in Eagle Plains, the source points will be spaced along the source lines at approximately a 50 m interval.

No water was required to drill the source holes during the 2014 seismic program, and cuttings were easily reloaded into the hole chamber after the dynamite was placed at the bottom of the hole. Source holes are loaded with 1 kg of dynamite to be later detonated by the recording crew (this is called pre-loading). As

provincial/territorial and federal legislation requires, each source point is plugged with drill cuttings (soil, rocks, etc.) brought up to the surface from the drill stem). An industry-approved plug is inserted into the hole at a minimum depth of 30 cm below the surface and then filled to the surface with more drill cuttings.

Peer and the industry's explosive providers are aware of the regulations under the federal *Transportation of Dangerous Goods Act, S.C. 1992, c. 34* (Government of Canada 1992) and strictly adhere to those regulations. Explosives will only be transported in approved magazines and by individuals trained in transporting dangerous goods. Natural Resources Canada (NRCAN) regulates and controls all aspects of explosive possession and transportation through magazine licenses which are renewed annually. The new Electronic License Management System (eLMS) allows up-to-date management of all explosive purchases, transport, and incidents to ensure explosives are tracked and safely stored. The two types of magazines that will be used to store explosives are as follows:

Maxam Type 9 Magazines (Photo 3-6):

- There are two compartments — dynamite and detonator.
- Type 9 magazines are lined with 7/8" Armortex (Bullet Proofing and Blast Resistant). Dimensions are 58" wide x 144" long x 66" high.
- Doors are high security and built as per NRCAN Regulations and issued a Federal Tag #.
- There will be two different sizes of skidded Type 9 magazines which will store up to 3,000 kg of explosives and 5,000 detonators, depending on packaging. There are also wheeled Type 9 magazines built to the same specifications but with reduced capacities.
- Construction from the outer skin to inside is:
  - ¼" steel plate;
  - 7/8" Armortex; and,
  - ¼" plywood interior.
- Weight is 7,500 pounds (lbs).
- These magazines are transported by either small custom-built tandem axle trailers, tandem axle recovery/tow truck with a flat bed or any truck trailer unit such as a low boy.

Maxam Type 4 Magazines:

- Single-compartment magazine;
- Various sizes — 8' wide x 12' long x 7' high with a capacity 7,500 kg;
- High-security door construction as per NRCAN Regulations and issued a Federal Tag #;
- Construction from the outer skin to inside is:
  - ¼" steel plate;
  - 3" gravel;
  - ¾" plywood interior.
- Weigh 18,000 lbs; and,
- These magazines are transported with either a tandem axle recovery/tow truck with a flat bed or any truck unit such as a low boy.

Photo 3-5. Narrow Low Impact Seismic (LIS) drills.

Photo 3-6. Explosives magazine storage (Maxam Type 9).

3.1.1.7 Data Acquisition — Recording

Recording the seismic program consists of two stages: laying out and picking up equipment on the receiver lines; and detonation at each source hole.

Geophone "Lay-out"/ "Pick-up" — Line crew members place the geophones (**Photo 3-7**) and associated equipment at each receiver point location. Using a long line and heli-bags, a helicopter will place and retrieve recording equipment along the receiver lines at predetermined intervals. Recording personnel will access the equipment in the heli-bags and place a series of geophones approximately every 40 m along the receiver lines. The recording crew will be using a cable-less recording system. Cableless recording systems are ideal for gathering seismic data because they reduce the constraints on geophone placement, eliminate downtime for cable repair, and reduce the number of crew members required to deploy the equipment. Once in place, the geophones record the seismic waves created by the charges detonating on the source lines. Once the section of geophones is recorded, personnel and a helicopter return to retrieve the equipment and any debris used to mark the surveyed receiver locations. The geophones are returned to the staging site, downloaded, cleared and deployed back to the program to be laid out again to record the next section of line.

Photo 3-7. Example of a geophone.

Source Point Detonations — This stage begins after the first section of geophones has been laid out on the receiver lines. Specially trained personnel called "shooters" traverse the source lines on foot, via ATV or snowmobiles, to each source point. The shooter examines the area around the source point for any possible hazards, constraints, or wildlife and inspects the condition of the leads. They connect the detonation device to the leads and signal to the Observer (located at the staging site) that the charge is safe to detonate. The shooter stands clear of the source hole (approximately 30 m) but remains within

viewing distance to watch the area remains clear. A specific radio signal initiates the detonation, and the shooter returns to the hole to remove the detonation device, the leads, and any flagging or markers in the area. The shooter then proceeds to the next source point and repeats this procedure.

Once the program is complete, a crew may be deployed to clean up any remaining material used online for the seismic program. The garbage is returned to a staging point and discarded in an approved bin to be transported to a waste facility. The crew also reports issues that may require further reclamation to be immediately addressed.

During the recording stage, the equipment on the source and receiver lines is accessed by foot, ATV or snowmobile or by helicopter. The helicopter will be based out of the Chance Camp at km 325, and the use of the helicopter will be minimized as much as possible. Where possible, the helicopters will be sourced from local operators familiar with the environment and the Flying in Caribou Country guidance document (Government of Yukon 2010); however, specialized long-lining operators will be required outside Yukon for the recording operation. The addition of helipads will also be required for safety and medevac reasons but will be selected in naturally open and sparsely treed areas.

Staging sites will store some or all of the following equipment throughout the seismic program. All equipment is moved to the next staging site as the equipment is required in the next area of the program:

- Trucks (1/2, 3/4, and 1 ton);
- ATV and snowmobiles;
- Trailers (flat decks and covered);
- Double-walled fuel tanks (diesel 145,228 L, Gas 83,825 L and Jet-A 35,000 L) The fuel will be contained at the main camp in double-walled tanks and transported to the staging sites in a 2,000 L tank trailer for use during operational activities in each area.
- Helicopter & fuel tanker;
- Picker trucks (1-ton trucks with equipment);
- Recording bags;
- Garbage bins to temporarily store garbage before incineration;
- Magazine;
- Survey and drill supplies;
- Canvas tents;
- Medivac unit;
- LIS drill units;
- Seacan for storage and tools;
- Snow cats;
- Water truck;
- Battery truck; and
- Mulchers.

3.1.1.8 Program Access and Remote Camp

Access Trails & Road Crossings — Access routes will be created in strategic corridors to maximize HSE Occupational Health and Safety (OH&S) requirements and to minimize environmental effects. Proposed access trails will be developed using a combination of existing trails, historical seismic lines, or on new cut lines. All access trails will be developed and used to minimize disturbances to the soil, permafrost and vegetation. Where possible, trails will be positioned to follow the shortest and flattest routes, sharing existing linear features or open and burned areas. Construction will follow minimum disturbance techniques, such as mulcher high-blading, to keep the active layer intact. Most trails will be frozen-in or allowed to freeze up naturally.

The width of the access trails will be a maximum width of 6 m wide and will also have a minimum of 10 cm of packed snow. Proposed access is classified as “Winter Trails” and “Seismic Access”. The Winter trails are primary access routes and are expected to be used for seismic, drilling operations and potentially EFT activities with an upgrade to year-round access status. They must be 8 m wide to accommodate two-way traffic and large trailers. Seismic access is only required to be 6 m wide as these trails are only needed for the seismic programs and will be less used. There are potentially 120 km of new “Winter Trail” access and 158 km of new “Seismic Access” to be prepared.

Few new crossings will be required off the Dempster Highway as less seismic is proposed. The areas of the seismic program that encroach on the highway will be managed in two ways. The source and receiver lines will terminate 10 m from the Dempster Highway. Access to the source and receiver lines will be via access trails (connecting the source and receiver lines with the Dempster Highway). The width of access trails will be kept to a minimum while allowing safe access. Access trails will also be doglegged 30 m back from the highway (per the Department of Highways and Public Works guidelines for a 90-degree entry to the highway) (**Figure 3-7**). This will allow personnel an unobstructed view of the traffic on the highway so that safe entry from the access trail to the highway can be made. It also creates an obstructed view from the Dempster Highway users, which will assist in minimizing aesthetic concerns and use as access.

To the extent possible, the intention of the Dempster Highway Development Area (DHDA) will be a primary consideration during line placement of seismic lines near the highway. Travellers also use the Dempster Highway to gain access to the remote regions of the North Yukon and NWT. Chance understands that tourism is an important industry for the area. Since most seismic activity will be conducted during the winter and in remote areas, the effects on tourism are expected to be minimal.

Winter Seismic Transportation — During winter seismic operations, approximately 30 one-ton or ½-ton 4x4 trucks will transport personnel to and from the Chance Camp to their specific job site location daily. It will include mobilization/demobilization and crew transport to and from the main Chance Camp. Using a remote camp will reduce vehicular travel on all roads, including the Dempster Highway, as the proposed remote camp locations are 40 km closer to the seismic program area than the Chance Camp. This will reduce the environmental effects on the roads and surrounding areas and limit the likelihood of accidents or incidents due to travel.

The vehicles will primarily be travelling on the Chance and Blackie roads and other proposed winter access trails, as well as a small section of the Dempster Highway. Any use of the Dempster Highway will occur during specific times of the day as crews will be transported to and from their work site at daybreak, and sundown. Although the proposed project will increase traffic along the Dempster Highway, it is not anticipated to substantially affect users of adjacent Settlement Lands and traditional uses of the area. During the winter, a low number of vehicles (40 to 50 per day) travel the Dempster Highway; therefore, it is anticipated the added traffic for the seismic program will not interfere with regular highway users.

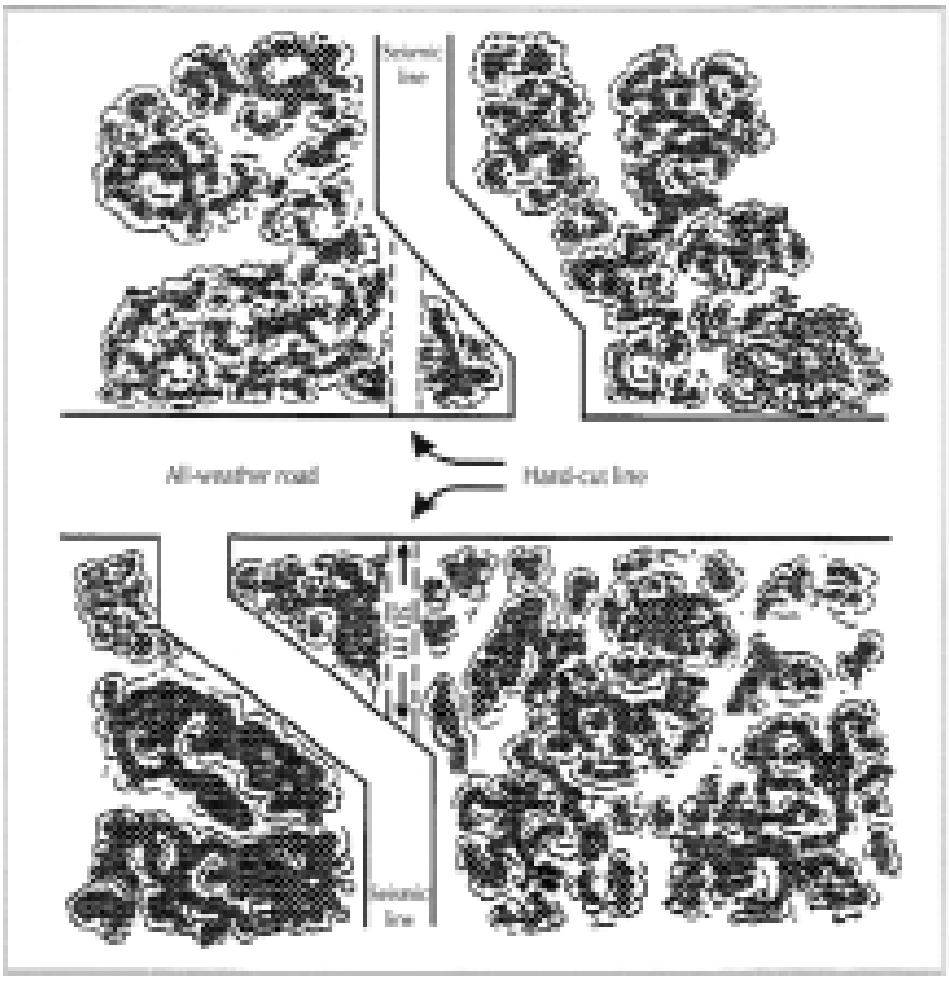

Figure 3-7. "Dogleg" seismic line at access points to limit visibility.

Source: (Yukon Energy Mines and Resources 2006)

Signs stating "Seismic Activity" will be erected in areas where the program is near the Dempster Highway. To avoid possible crew encounters, these signs promote awareness by regular users of the area where the workers are present. The potential for vehicular and hunting conflict will likely be minimal due to the remoteness of the seismic programs; however, crews working on the seismic program are mandated to wear brightly coloured safety vests and hard hats to improve visibility. Seismic crews must also give the right-of-way to all traffic and users of the area. Considering other Dempster Highway users, signage will be posted in communities (i.e., Dawson, Stewart Crossing, Carmacks and Inuvik) one month before the project starts to notify potential highway users that additional traffic may be encountered. Additionally, the Yukon Department of Highways and Public Works will be notified. With these measures, it is anticipated that potential effects on other highway users will be reduced or eliminated.

Summer Seismic Transportation — The summer operations will be limited to seismic recording. Two helicopters (Bell 412 type, capacity of 13 people) will transport workers to and from the program area. This will consist of approximately three trips in the morning and three trips returning to camp in the evening. The recording equipment will be deployed via A-Star type helicopter and long line. Aerial access protects the active layer and underlying permafrost, preserving saplings and small shrubs along the access routes as vehicular traffic will be limited. As caribou are not usually present in the Eagle Plains area during the summer, it is unlikely that they would be affected by the activity in the area. The proposition of year-round activities will also enable larger seismic program areas to be completed in one year, reducing the number of seismic programs needed to acquire the desired dataset.

3.2 DRILLING EXPLORATION PROGRAM

Chance may establish up to 30 well sites during the 10-year Project life, each approximately 1.44 ha. Total approximate disturbance due to well sites throughout the Project is anticipated to be a maximum of 43.2 ha if all 30 wells are drilled.

Initial drilling results will inform subsequent areas of investigation and well site locations. Chance will continue interpreting seismic and exploratory drilling data throughout the Project to understand better the geological setting, size, location, and geometry of potential prospects.

3.2.1 Well Site Locations

Well sites will be preferentially located on heights of land, and will consider the following:

- Avoidance of areas with challenging permafrost conditions.
- Avoidance of ecologically sensitive areas such as riparian corridors (i.e., within 45 m of a perennial watercourse), wetlands, steep slopes, old forest, sensitive wildlife habitat and permafrost features.
- Avoidance of areas with identified or potential heritage values (noted as “avoidance areas”) in Heritage Resource Overview Assessment and Heritage Resource Impact Assessment studies conducted for lands within the Project area (Matrix Research Ltd. 2008, 2013, 2014, Bennett 2022, 2023).
- Requirements from the Yukon *Oil and Gas Act*, RSY 2002, c.6 (*YOGA*) (Government of Yukon 2002) and the *Oil and Gas Drilling and Production Regulations* (Government of Yukon 2004).

3.2.1.1 Pre-Drilling Preparation

The first exploratory wells will be drilled in the winter of Year 1. Pre-drilling preparation will require preparation of winter roads to the selected well sites, and preparation of the well sites. Winter road and well site preparation require a minimum of 10 centimetres (cm) of packed snow cover (including the highest hummocks) to prevent damaging the surface vegetation (Stanley Associates Engineering Ltd. and Sentar Consultants Ltd. 1993). At least 30 cm of snowfall is required to produce 10 cm of compacted snow (Stanley Associates Engineering Ltd. and Sentar Consultants Ltd. 1993). Snow packing via snowmobile or snowcat earlier in the season (potentially as early as November or December) is usually undertaken to facilitate freezing in the winter trail and well site locations and assist with full construction before drilling operations. Based on historical trends (i.e., when 10 cm of packed snow accumulation has been achieved in past

years), actual construction of the winter roads could occur as early as December or as late as mid-to-late January. Additional details are provided in **section 4.3.1**.

3.2.1.2 Preparing Winter Well Sites

Well site set-up typically requires approximately five days, during which 15 to 20 truckloads are required to mobilize the drill rig and other equipment/materials/infrastructure. Once established, well sites will be approximately 1.44 ha for single well pads and up to 2.5 ha for multiple well pads and will contain the drill rig, flare stack, rig trailers, and office trailers. There will also be trailers to provide sleeping capacity for key personnel required to stay at the rig full-time.

Vegetation clearing at each well site will be minimized as much as possible; well sites will be levelled by packing snow at the site and then icing to form a level pad, or, if not enough snow is available, using water to freeze well pads or making snow artificially. An impermeable liner will be laid on the pad, followed by interlocking wooden rig mats, where required. Rig mats are approximately 16 feet by 8 feet and may be used to cover the entire well site, the area around the drilling rig, or both.

Matting is used at well sites in northern locations to provide insulation and protection to the underlying snow and ground surface, distribute the weight of equipment, and minimize ground disturbance while using the site. Matting will be used when, a) the ground is uneven and leveling the well site with snow and ice is not possible or b) the ground may not be competent enough to support the heavy rig loads and the dynamic loading that is typical of a drilling operation. At winter well sites constructed without densified fill material as the base of the pad, equipment will always remain on matted surfaces in case of early thaw conditions.

3.2.1.3 Well Site Surface Infrastructure

Figure 3-15 illustrates the general layout of equipment, storage, and structures at a proposed well site. The planned 1.44 ha (120 m × 120 m) area is designed to accommodate the drilling operation and associated setback distances from surrounding vegetation, a separation between pieces of equipment, and personnel working and sleeping quarters. It should be sufficient to accommodate the well completion and EFT equipment. As presented in past assessments, Chance plans to use a drill rig with similar capabilities to Chance Rig #1. The drilling rig will be capable of drilling to depths of up to 2,500 m (vertically). The final area of each well site may not be square since the area will depend on topographical constraints.

The rig layout depicted is for a winter drilling operation (distinguished by the number of boilers onsite). Boilers are used extensively in very cold climates to prevent equipment and drilling fluids from freezing.

Table 3-2 describes the drill rig components identified in **Figure 3-8**. Well sites are defined as industrial areas and are therefore restricted entry areas; only appropriately trained, authorized personnel wearing all required personal protective equipment (coveralls, steel-toed boots, hard hat, gloves, and safety glasses) are allowed access. **Photo 3-8** shows a typical example of a Chance rig and is shown at night. **Photo 3-9** shows a typical Chance rig set up at the end of a constructed winter access road.

Table 3-2. Well site components shown in Figure 15 general layout of a well site.

Component	Description
Boilers	Used extensively in very cold climates to prevent equipment and drilling fluids from freezing.
Cement	Cement storage and mixing for use in wells to secure casing and seal off porous and permeable formations to prevent fluid inflow.
Medic, Offices, and Sleeping Trailer	Essential personnel trailers which serve as offices or sleeping quarters and include a multi-room sleeper for some of the personnel at the drilling location.
Flare Tank and Flare	Flare used to incinerate combustible fluids from the well. The flare tank is a reservoir to ensure the flare does not starve of combustible fluids.
Fuel Storage	Fuel used at the site for equipment including drill rig, pumps, light towers, accommodation trailers, boilers, generators, etc.
Garbage and Incinerator	Storage area for waste and incinerator to dispose of food waste.
General Storage	Storage and laydown area for equipment needed onsite.
Mud Tanks	Tanks where drilling mud is stored (drilling mud is a viscous fluid mixture, water based for this operation, used in oil and gas drilling operations to lubricate/cool the drill bit, to carry rock cuttings to the surface and to provide hydrostatic pressure within the drill hole to prevent fluid inflow from porous and permeable rock formations). The tanks are usually upright, fully enclosed, and pressurized, storing bulk materials for drilling mud. Section 31 of the *Oil and Gas Drilling and Production Regulations* (Government of Yukon 2004) under *Yukon Oil and Gas Act*, SY 2019, c.6 (*YOGA*) (Government of Yukon 2002) stipulates that the "combined capacity of the drilling fluid tanks of every fluid system must not be less than the greater of 120 m^3 and 50% excess of the volume of the wellbore." Cement materials both prior to and after mixing are stored in similar tanks.
Main Mud Storage	Location where all the drilling mud materials are stored. Normally these materials are delivered on pallets stacked and shrink wrapped to protect them during transport and storage.
Drill Pipe Storage	Racks in which drill pipe is stored until required to be run in the hole.
Mud Mixing	Tank in which drilling mud products are first mixed with water to facilitate further mixing with drilling mud already mixed and in use. Products such as bentonite clay, for example, require a caustic soda solution to facilitate good mixing and preserve good flow characteristics
Mud Pumps	Pumps used to circulate the drilling mud down the drill pipe, around the drill bit, and up the annular space between the drill pipe and the open hole or casing to surface.
Return Mud Separator	The area where the return mud separator, known as a shale shaker, separates rock cuttings from the drilling mud. The rock cuttings are then centrifuged to separate residual liquid from the cuttings so the cuttings can be disposed in a Mix Bury Cover (MBC) sump. The centrifuge is also used at the end of the drilling operation to recover water for use in the next well and the spent mud is also disposed of in the MBC sump.
Drill Structure	Components required to drill the well, include: • Sub-structure, or base, on which the derrick is fixed. • Derrick that supports the draw works and top drive which hold drill pipe before it is run into or retrieved from the well and the equipment used to rotate the drill pipe during the drilling operation.

Component	Description
	• Top drive that is a mechanical, electrically powered linking device that attaches to the pipe in the hole and rotates it when drilling while simultaneously pumping drilling mud through the drill pipe and out of the drill bit at the bottom end. • Draw works that lifts and lowers the travelling block in the derrick/mast to run pipe in and out of the hole. • Blowout preventers are a series of closing valves that can hydraulically shut in a well in the event of unplanned influxes of formation fluids into the wellbore and prevent blowouts.
Water Storage and Water Treatment	Water storage tank and treatment containers to provide potable water for the rig crew and personnel.

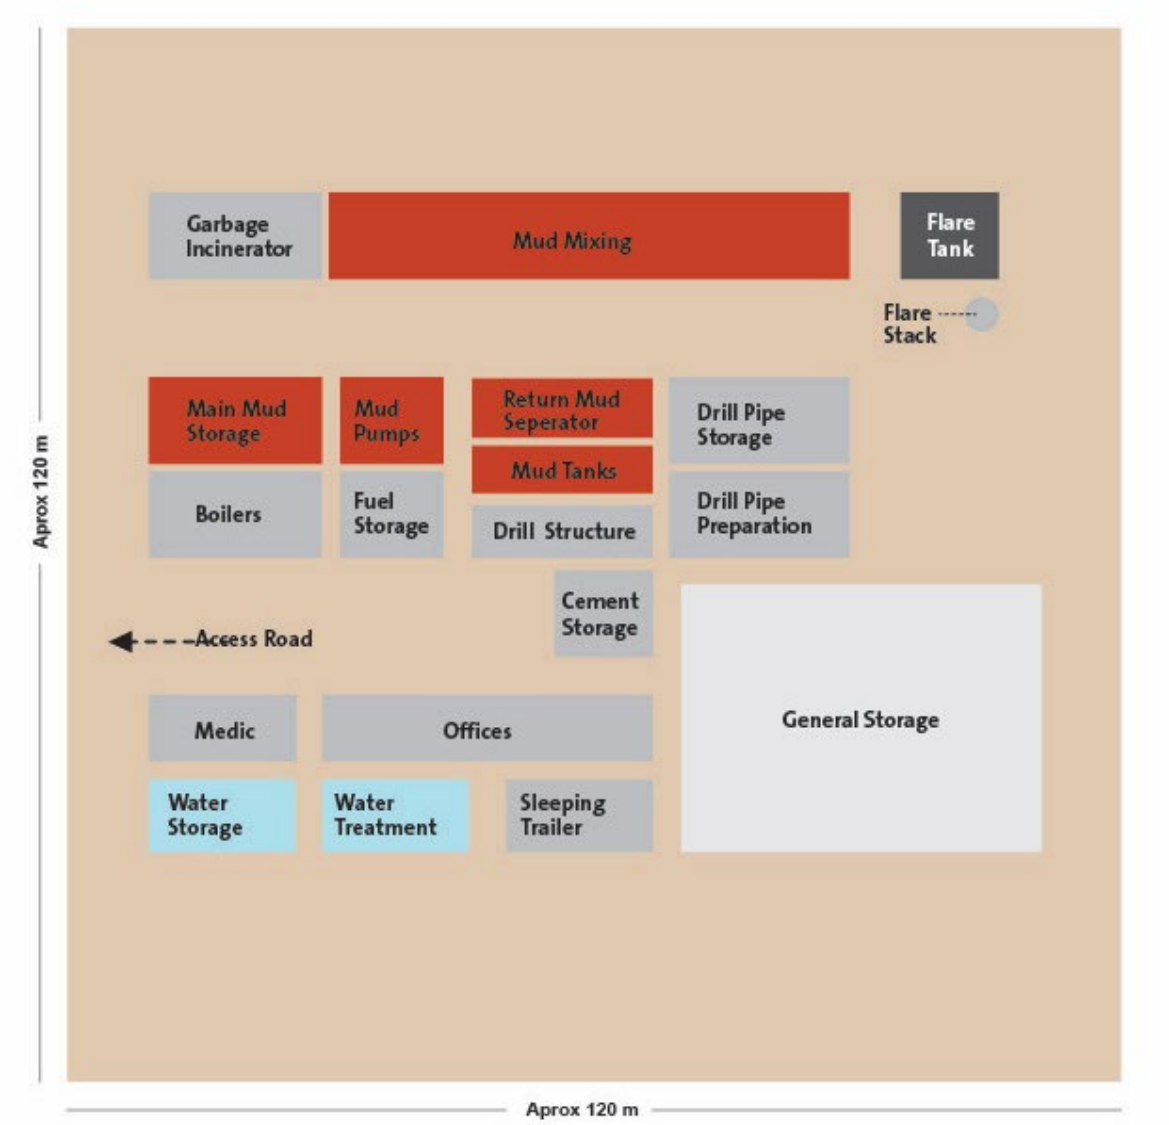

Figure 3-8. General layout of a well site.

Photo 3-8. Example of typical Chance rig at night.

Photo 3-9. Example of typical Chance rig at end of constructed winter access road.

3.2.1.4 Drilling Operations

Eagle Plains well sites and well design will incorporate the following key features to enhance efficiency, reduce waste, and minimize general effects on the surrounding environment.

- The rig will use sufficient casing pipe to reach the projected total depth of up to approximately 2,500 m (vertical depth). For reference, the well casing program will typically comprise the following elements:
  - Conductor of 13-3/8-inch diameter to approximately 25 m below ground level, cemented to surface.
  - Surface casing of 9-5/8-inch diameter to approximately 25% of the planned, measured depth of the well below ground level, cemented to surface.
  - Production or intermediate casing of 7-inch diameter either to total depth or within Yukon's Oil and Gas Drilling and Production Regulations requirement of not more than 25% of open hole remaining uncased at any time (Oil and Gas Drilling and Production Regulations Section 55-(1) (c) (i)) (Government of Yukon, 2004). This casing will also be cemented to surface.
  - 4-1/2-inch liner to a depth of 2,500 m, cemented with a minimum 100 m overlap into the previous casing.
- The nominal diameter of the various casing strings (all selected to meet industry standard dimensions) will reduce the size of the hole drilled and of drill cuttings generated as the well is deepened. For example, a 3,500 m exploratory well typically produces 400–500 metric tons of cuttings. Less than 150 metric tons will be produced for the typical exploratory well depth of 2,500 m proposed at Eagle Plains.
- A water-based mud system will be developed and managed by a specialized service contractor with comprehensive knowledge of the Alberta Energy Regulator (AER) *Directive 050 Drilling Waste Management* (AER 2023) requirements as they pertain to the Yukon jurisdiction regulations.
- All requirements in Sections 26 to 65 of the Yukon *Oil and Gas Drilling and Production Regulations* (Government of Yukon, 2004) (covering well design, casing design, groundwater protection, mud products, blowout prevention and choke/kill systems, fire detection and gas detection systems, safety of personnel, mitigation of operations effects, and more) will be either met or exceeded in the design, selection, and deployment of materials.
- Proposed drilling design planned operations procedures, relevant health, safety, and environment plans; oil spill contingency plans; and emergency response plans will be provided to the regulator for review at least six months before planned mobilization to site. Any perceived or identified deficiencies will be discussed and addressed with the Yukon regulator to confirm what is required before operations.
- Chance will enforce compliance on all third-party service suppliers to ensure that (1) their health, safety, and environment management systems address regulatory requirements in personnel training and skill development; (2) personal protective equipment provided to workers meets Canadian Standards Association (CSA) and international safety standards; and (3) supervisors are knowledgeable about operational standards related to health, safety, and environment. Chance company representatives will perform periodic inspections and audits during mobilization and operations.

- All wells will be drilled initially as “keepers” to facilitate EFT or to become early producers if the Project progresses to full development. The only wells likely to be abandoned would be unsuccessful (dry) wells with no potential to be used as water or natural gas disposal wells.
- Well sites will be designed and constructed with purpose-built collection berms to recover and contain for disposal any fluid not otherwise contained by the operation’s process control. During well site/well pad construction, an impermeable layer will be laid to prevent seepage into the ground below the fill material pad.
- Rig drilling, cementing, or DSTs fluids will be contained and recovered until disposal following regulations.

Drilling contractors must provide training and have operational procedures certified by a recognized professional or regulatory body in blowout prevention and well control. Crews undergo simulated safety drills at each shift on a 2-shift, 24-hour work rotation. During these safety drills, the response and efficiency of drill crews are evaluated. The equipment is also evaluated, and deficiencies are corrected immediately following the drills. Drill crew and well supervisor well control/blowout prevention/hydrogen sulphide certificates are normally inspected by a visiting inspector to confirm compliance when operating.

3.2.1.5 Drilling Mud

Drilling mud is a viscous, heavy liquid used in drilling oil and gas wells to lubricate and cool the drill bit, to carry the rock cuttings out of the drill hole and back to the surface where the cuttings are separated from the mud, and the mud is recycled for reuse in the drilling operation. The drilling mud system currently under consideration for the Project is a low-toxicity water-based drilling system; Chance is assessing systems and suppliers based on several factors, including ease of disposal at the end of its use.

The main function of drilling mud is to over-balance the well pressure to ensure that the pressure in the wellbore is higher than the pressures expected to be encountered from the various geological formations as the drill bit penetrates them. The drilling mud prevents formation fluids from entering the wellbore. It keeps the drill cuttings in fluid suspension when drilling is paused or the drilling assembly is cycled in and out of the hole for bit changes, well logging, DST work, or any other downhole activity. Drilling mud is selected to provide operational efficiency, minimize formation damage, reduce corrosion, and minimize the environmental effects of handling and disposal.

Project operations will minimize the volume of drill cuttings and drilling waste generated by drilling smaller-diameter holes. Drilling waste is composed of rock chips and cuttings. The drilling fluid returned to the surface is sent through a shale shaker to separate rock cuttings, and the drilling mud is returned to the well to continue drilling. The recovered cuttings are put through a centrifuge, where the drill cuttings are further separated from any residual water before being disposed of in an MBC sump. At the end of the drilling operation, the mud slurry is run through the centrifuge to separate the water for future use in the next well. Recovered mud is disposed of in the MBC sump.

3.2.1.6 Cement Plugs and Permafrost

When mixed with water and begin to set, typical oilfield cements produce heat, known as the heat of hydration. This heat can thaw the permafrost adjacent to the wellbore. Permafrost cements are a specific mixture of typical oilfield cement (Portland Cements) with additives such as gypsum (calcium sulphate) to

eliminate the heat of hydration. Calcium and sulphate are naturally occurring molecules at Eagle Plain and are environmentally benign. Use of permafrost cements will minimize the risk of permafrost degradation.

Permafrost cement usually is only used for the surface casing installed to isolate the wellbore from the rock formations and protect permafrost. Chance plans to install surface casing to a depth of 400 m at minimum.

3.2.1.7 Drill Stem Testing (DST)

Depending on the analysis of rock cuttings, measurements made of drilling fluids during the drilling operation, the well log results, and any core samples taken, it may be desirable to test prospective zones before drilling deeper or running casing. In these cases, a DST is commonly done. Drill stem tests are conducted through a special string of drill pipe that includes two packers, which are devices that, when inflated, serve to isolate the zone (the geological formation) of interest from the rest of the well and are set in place just above and below the zone undergoing DST. A special annular pressure-operated valve is placed inside the drill pipe near the zone to be tested. This valve is opened, and in a controlled manner, fluids in the formation are allowed to flow into the drill pipe and up to the surface for separation, measurement, and sampling.

At the surface, the drill pipe is connected through a series of valves allowing the operator to control the flow of fluids from the well and direct them through a pipe system, called flowlines, to the separator and the separator for measurement and sampling.

Figure 3-18 shows the DST process on the surface. Surface flow lines carry the fluids to a test separator. The separator splits the fluid mixture into component elements, which could combine crude oil, natural gas, and formation water. Each fluid stream is measured by flow meters to confirm the volume, pressure, temperature, and rate of flow. From the separator, the crude oil stream would be directed into a holding tank, the natural gas to the choke manifold on the derrick, and then sent to the flare stack or another pre-determined place (e.g., burned for heat, power generation or mechanical power). The separated formation water would be collected and hauled away for disposal; in an existing deep injection well located in the Eagle Plain area.

The exploration wells may encounter several hydrocarbon-bearing zones that could be evaluated by conducting a DST (or DSTs). Before DSTs are conducted, a well site-specific plan and DST procedures will be developed by Chance. Plans for all DSTs will be based on well results and will be discussed with the Oil and Gas Resources branch of the Yukon Department of Energy, Mines and Resources.

A well site-specific plan will be specific to the formation to be tested and the existing wellbore conditions. This plan will protect the safety of personnel, equipment, and the environment and provide for handling any fluids that may be recovered. Enform *IRP 4 Well Testing and Fluid Handling - An Industry Recommended Practice* guidelines (Enform Canada 2015) are one of the sources that will be referenced in preparing the plan. The formal project proposal will include a sample plan with information on how the plan will be assembled.

Flaring of gases during DST is a widely applied activity. The process, however, can only be undertaken in compliance with *YOGA Oil and Gas Drilling and Production Regulations* section 128 (Government of Yukon 2004), which is provided below for reference. Additionally, DST guidelines outlined in Enform *IRP 4 Well*

Testing and Fluid Handling – An Industry Recommended Practice (Enform Canada 2015) are intended to ensure that safe work procedures are in place and to "minimize the probability of either the mechanical or human systems failing during a test, as well as establishing minimum health, safety and operating standards". In addition, they are "designed to allow flexibility and must be used in conjunction with competent technical judgment".

As required, the flare line must be positioned downstream of the derrick's choke manifold, designed to prevent fluid accumulation within the line, and installed and anchored as specified by regulation. Gas encountered during DST is circulated through a degasser system to separate it from the drilling mud, rendering the mud safe to pump back into the wellbore. Larger volumes of gas may be control-burned through the flare stack according to the flare permit issued by the Oil and Gas branch of the Yukon Government.

An example of a typical well site flare process layout is illustrated in **Figure 3-9**, a typical flare stack and gas/vapour recovery flowsheet is illustrated in **Figure 3-10** and a typical portable flare stack is shown in **Figure 3-11**. Normally the flare line from the choke manifold is connected to the flare stack inlet to permit the direction of the gas to the flare for total control. The flare stack will be a minimum of 18 m high and a maximum 30 m high depending on surface conditions to assist in air dispersal of combustion end products and mitigate effects on permafrost.

Following the regulated spacing requirements, the flare stack will be positioned on the well site. If flaring is necessary, the flare will be higher than the surrounding vegetation or trees (as required by the *Oil and Gas Drilling and Production Regulations* [Government of Yukon, 2004]). Noise from flaring typically only occurs when very large volumes of high-pressure natural gas are being flared. During DST, flaring would only occur for a maximum of one day at the end of a drilling program for one well.

YOGA Oil and Gas Drilling & Production Regulations Part 9 (Government of Yukon 2004) specifies these parameters.: The flare stack will meet the requirements as follows:

> *128. Flare requirements*
>
> *Unless otherwise approved or directed by the Chief Operations Officer, any gas that is flared will be discharged from a flare stack that:*
>
> *(a) is at least*
>
> *(i) 50 metres from any well, treater, separator, compressor, crude oil storage tank or any other unprotected source of ignitable vapours*
>
> *(ii) 80 metres from any right-of-way, easement, road, public utility, building, installation, works, place of public concourse or any reservation for national defence, except only when there may exist special circumstances that, in the opinion of the Chief Operations Officer, justify the positioning of the stack at a greater or lesser distance*
>
> *(b) is adequately anchored and suitably protected against freezing*
>
> *(c) is designed to ensure flame stability and efficient combustion*
>
> *(d) is of sufficient height and diameter to ensure*
>
> *(i) that the average concentrations of hydrogen sulphide and sulphur dioxide in the ambient air do not exceed limits specified under the Occupational Health and Safety Act*

(ii) that vegetation combustion is prevented by maintaining an area free of vegetation and combustible debris around the base of the flare stack or the end of the flare line to the following minimum distances:

(A) 10 metres or 1.5 times the stack height, whichever is greater, in cultivated areas

(B) 30 metres or 2.5 times the stack height, whichever is greater, in forested areas

(C) 1.5 times the stack height, in any other area

(iii) that a minimum stack height of 2.5 times the height of the highest third-party building located within a distance equal to 5 times the height of the building is maintained

(iv) that any heat generated around the base of the stack does not exceed the manufacturer's specifications for any equipment situated there, to a maximum of 4.73 kW/m²

(e) has a sufficient exit velocity and is provided with guards or other features to prevent extinction of the flame.

(f) if the gas flow is intermittent, is provided with an ignition device to ensure continuous ignition of any gases.

To minimize potential deposition of residual chemicals produced via flaring on vegetation and soil, the site design will include an appropriate spacing between the flare stack and vegetation. Vegetation and soil adjacent to and downwind (prevalent) of each flare stack will be sampled before an activity that could result in gas production to provide a baseline of identified substances of concern at the site. Samples will then be taken during flaring for comparison with the baseline to monitor potential deposition. Visual monitoring will occur throughout flaring to observe nearby vegetation's safety and protection.

A typical operational sequence of DST is:

1. Wellbore is drilled to a depth of interest.
2. Well is logged using various diagnostic tools, and depth intervals for testing are selected.
3. Test equipment is connected to the end of a drill string and run into the well bore. The test equipment generally consists of two packers set above and below the geological formation being tested to isolate the formation to be tested from the rest of the wellbore. Inside the drill pipe between the packers, an annular pressure-controlled downhole valve to open and close at the beginning and end of the DST, respectively, and pressure gauges to measure the bottom flowing and shut-in pressures.
4. A cushion of fluid may be contained in the drill pipe to initially provide back pressure on the formation being tested, which may be required to control initial flow rates out of the formation, into the drill pipe, and up to the surface.
5. Once the test string is positioned at the zone to be tested, the packers are set, and the downhole valve is opened to allow formation fluids to flow into the drill string.
6. Fluids produced during the test are carried from the wellhead to a test separator as described above, where any natural gas, crude oil or formation water are separated for individual measurement, sample collection for further laboratory analyses, and either flared (natural gas), recovered for eventual disposal at a terminal in NEBC (crude oil) or disposed of (formation water) into one of the disposal wells designated by Chance.

7. Initially, the valve is opened and the well flows relatively quickly to clean up the wells (normally, this period may be a few hours). Following this period, flow is temporarily shut in the downhole, and a pressure buildup is recorded (with the initial shut-in period lasting 2 or 3 times the initial flow period).
8. The test zone is then flowed at constant or variable rates by opening the valve located in the packer and allowing formation fluids into the drill pipe and flow up to the surface. Each constant flow period is normally followed by a shut-in period to record how long it takes for the pressure to build back up inside the well.

- Before concluding the series of test rates, bottom hole and surface samples are collected. Samples are taken of all fluids for analysis (both Pressure Volume Temperature samples under the flowing reservoir pressure, temperature conditions and atmospheric samples to check for “base sediments and water characteristics of the produced fluid”).

After the DST, the tools are closed, packers unset (removed) and any samples within the drill pipe are reverse circulated to surface. A normal DST takes a few hours, not including the time required to prepare the tools, run pipe to depth and do the reversed process on completion.

Well log results, sample analysis and DST results are used to decide whether to abandon or insert casing into the well, pending further evaluation. To abandon the well, cement plugs are inserted using an open-ended drill pipe across all porous/permeable zones and the base of each casing string. At the surface, the well casing(s) are cut off 1 m below ground level and steel plates are welded across the top of the casing. A well sign is erected and the well site re-contoured and re-vegetated, all pursuant to the relevant *YOGA Oil and Gas Drilling and Production Regulations (Government of Yukon 2004).*

At least one DST per successful well will be conducted unless several zones require testing. If more than one prospective/productive formation is encountered in a well and is separate from other formations, DSTs will be conducted on those separate formations independently of each other. Sometimes, a DST may be re-done if there is a mis-run, or if the DSTs were not done in a steady sequence. The order in which DSTs are conducted will depend on where the zones of interest are found in relation to the various casing strings that could be set as the well is being drilled.

All well testing will be performed with the guidance of AER *Directive 034: Gas Well Testing, Theory and Practice* (Alberta Energy Regulator 1979) and in consultation with the Oil and Gas branch of the Yukon Government. Chance will follow related legislation, such as the *Oil and Gas Drilling and Production Regulations* (Government of Yukon 2004). Part 5 of this regulation provides detail on well evaluation and testing requirements.

Specific details of past drilling experiences can be found on the Yukon Oil and Gas Online Information Site: (http://maps.gov.yk.ca/imf.jsp?site=OilandGas_wells). Chance’s comprehensive casing designs and rig and blow-out prevention system conform to *YOGA* and the *Oil and Gas Drilling and Production Regulations* (Sections 33-61 (Government of Yukon 2004). Additional details of Chance’s system configuration are confidential as per Section 176 (4) of the *Oil and Gas Drilling and Production Regulations* (Government of Yukon 2004).

3.2.1.8 Further Testing Details

Swabbing — Swabbing is usually conducted to help initiate fluid flow from the formation into the well and flow to the surface. Wells will only be swabbed if the well is drilled, cased, and a potential reservoir has been:

- identified;
- perforated;
- testing reveals that reservoir pressure is insufficient to flow liquids to the surface without swabbing; and/or,
- if well stimulation results in wellbore liquids that prevent flow to the surface.

Swabbing reduces in-well bore pressure that otherwise prevents a potentially productive formation from flowing to the surface naturally.

Acid Stimulation — Eagle Plains' previous oil and gas exploration activities indicate that small-volume acid stimulation treatments effectively remove scale and other impedances to allow or improve fluid flow into the wellbore. Acid stimulation entails pumping discrete amounts of hydrochloric acid at varying depths.

The acid is trucked to location in specially sealed tanks in compliance with regulations under the federal *Transportation of Dangerous Goods Act, S.C. 1992, c. 34* (Government of Canada 1992) and transferred to the cement pumping unit for pumping downhole. Treatment batches of 10 to 25 barrels (approximately 1.6 to 4.0 m^3) are pumped at controlled pressure until complete. The weak acid serves to dissolve scale

(calcium carbonate) or cement. The chemical reaction of the hydrochloric acid with carbonates forms non-toxic and pH-neutral calcium chloride salt and water as by-products.

The application of acid is for a new well and not used for an existing one that has been in operation for some time. Acid cleans up a newly drilled well to improve initial flow rates. It is also used as a remedial tool to improve production where there is evidence of flow impairment. For an exploration project, this improves production in a setting where little prior information or data exists and is therefore undertaken on a trial basis.

The product's Safety Data Sheets (SDS) describe the toxicity limits for oilfield hydrochloric acid. Oilfield concentrations are normally 10%, 15%, or 20% hydrochloric acid. In winter, if acid is spilled, like water, it would freeze and can be recovered from the surface snow or a thin soil layer.

3.2.1.9 Drilling By-Products Disposal

Eagle Plains is a sedimentary basin, and drill cuttings will consist of sandstone, shale, and carbonate rock none of which are significantly sulphide-bearing. Drill cuttings from wells drilled in 2012 were examined by Chance geologists; based on this examination and previous exploration / geological work in the area, the potential for acid rock drainage (ARD) from drill cuttings was determined to be remote to non-existent.

Naturally occurring radioactivity will be measured by gamma ray (GR) or spectral gamma ray wireline logs, a regulatory requirement in the *Oil and Gas Drilling and Production Regulations* (Government of Yukon 2004). Gamma ray is a radioactivity detection device (similar to a Geiger Counter) that detects radioactive Uranium, Thorium or Potassium isotopes in the rock formations drilled. No abnormal detections have been made other than that attributed to natural rock formation radioactivity. Therefore, radioactivity appears absent or undetectable in the fluid of the Eagle Plains sedimentary formations.

The Oil and Gas branch of the Yukon Government has adopted the AER *Directive 050: Drilling Waste Management* (Alberta Energy Regulator 2023) procedures for the disposal of drilling wastes within the Yukon. Chance will manage the operation following the MBC requirements of the Directive for the remote sump locations.

Solid Drill Cuttings — Drill cuttings are a direct by-product of the drill bit grinding through rock. Cuttings are brought to surface with the drilling mud and separated via shale shakers and centrifuges, as described in **section 4.3.2**.

“Stripping” is running the drilling mud through centrifuges as it returns to the surface to separate the water from any solids suspended in the fluid stream. Cuttings are separated during stripping and stored separately on the well site until they can be disposed of. The fluid is then either recycled back into the mud system in the drilling operation or retained for use in future drilling locations.

Close attention to the dryness of the cuttings moving across the shale shakers and collected in the shale bins are required for the following reasons:

- Less total weight in the cuttings equals less cost associated with future handling of the drill cuttings.

- In the winter, handling and moving dry cuttings is easier as they do not freeze and create large blocks of material.
- Recycling more fluid separated from the cuttings reduced the need for additional make-up drilling fluid.

Drill cuttings will be removed from the well sites for disposal at the MBC, as described in **section 4.3.3**.

Drilling Mud — Chance is proposing to use water-based drilling fluid systems. After drilling a few wells using recycled drilling fluids, the mud system may need to be partially or fully reconstituted (disposal of the current fluid and mixing fresh water and new drilling fluid products). This ensures the drilling fluid is fresh and capable of drilling through the different rock types found in the proposed wells and is performing to meet operational needs. Chance has successfully re-used drilling fluid systems across multiple wells to reduce the overall need for make-up water and the total fluid volume for disposal at Eagle Plains.

The proposed drilling system and the site conditions present at the drilling locations and in the Eagle Plains general area have directly influenced the disposal options for waste drill fluid. Accordingly, the following conditions were established for the selection of the drilling mud system:

- Low-toxicity mud system confirmed through laboratory analysis;
- Meets operational requirements (maintain formation stability, hole cleaning and well control, etc.); and,
- Suitable for disposal via the MBC disposal process at a nearby location.

Any drill fluid selected must satisfy Section 32 "*Approved Drilling Fluid*" of *YOGA*'s *Oil and Gas Drilling and Production Regulations* (Government of Yukon 2004). The type and chemistry of the drilling fluid is described further in this section.

Injection Well — AER *Directive 050 Drilling Waste Management* (Alberta Energy Regulator 2023) covers the disposal of drilling fluid. Drill cuttings will be mixed with the required amount of soil following AER *Directive 050 Drilling Waste Management* and disposed of in the MBC sump. Drilling fluid will be stripped back to the clear portion and disposed of in one of the injection wells.

Disposal requires further injectivity and suitability investigations. This cannot occur until the wells are re-entered and ready for the investigation trials. Chance candidate wells could be one or more of the following suspended well(s): Chance J-19, Chance M-08, Chance G-08, Blackie M-59, McParlane A-25 and Chance E-78 all of which are located within the Chance licence areas. Any well that is not a preferred EFT or future production candidate could be an injection well if strategically located near a usable well or wells and if it exhibits the required characteristics for injecting fluids. For this exploration project, the priority wells for disposal are A-25 and E-7, however others could be part of the disposal mix depending on the outcome of well maintenance assessment activities.

The *YOGA Oil and Gas Drilling and Production Regulations* (Government of Yukon 2004) require that any produced water not be disposed of at the surface unless its quality and/or salinity is equal to or greater than the quality limits set out in producing field facility licence.

Any plans or intention to dispose of produced water from reservoir fluids separation must be submitted to the regulatory authority and must meet the environmental standards as well the oilfield waste disposal standards and limits (reference *YOGA Oil and Gas Drilling and Production Regulations* Sections 122. 123. 124, 130 and 165) (Government of Yukon 2004). Produced water disposal is only authorized when the operator demonstrates legislation requirements have been met and that good oilfield and reservoir management practices are satisfied.

Once their disposal suitability is established, the following liquid materials (treated with bactericide) and their volumes may be disposed of:

- Produced water per well (water cut 20% to 60% for 200 barrels of oil per day (BOPD)) = approximately 40 to 120 barrels water/day but dependant on field conditions;
- Workover fluids: Maximum 7" casing volume full = 276 barrels;
- Rig wash: hose flowing at five gallons per minute (gpm) water for one hour = ±seven barrels per day in summer;
- Saline fluids (completion brines) same as workover fluids = 276 barrels; and
- Liquid fraction of drilling fluids = approximately 200 m^3 at end of Project.

The zone must have an impermeable barrier above it to prevent migration of the injected fluid and be deeper than 750 m. The rock's Permeability and porosity must permit fluid pumping at low surface pressure and well below formation breakdown pressure. Testing must determine injection fluid compatibility between the rock and native reservoir before injection. The injection pressure and rate are measured, indicating the porosity and permeability of the formation and reservoir used for injection.

Disposal of highly saline-produced water at surface disposal sites may be greatly restricted in quality and quantity. To support best reservoir management practices, the re-injection of produced formation water back downhole may sometimes be required.

3.2.2 Extended Flow Testing

As noted above, well testing will be performed following the guidance of AER *Directive 034: Gas Well Testing, Theory and Practice* (Alberta Energy Regulator 1979) and in consultation with the Oil and Gas branch of the Yukon Government. Chance will also follow related legislation, such as the Yukon *Oil and Gas Drilling and Production Regulations* (Government of Yukon 2004). Part 5 of this regulation provides detail on well evaluation and testing requirements.

Petroleum or natural gas reserves identified through DST are expected to undergo EFT to gather important information about the nature of the resource accumulation and its productive capability. Duration of EFTs at each well where petroleum or natural gas is identified may occur during successive winters for up to two years. The information obtained from EFTs is critical to determining the future development plan for each discovery. The planned wells are exploratory; any flow testing will be contingent on identifying formations potentially containing hydrocarbons. Part 8, Section 103 (1) of the *Oil and Gas Drilling and Production Regulations* (Government of Yukon 2004) requires:

> *"The Licensee of a well shall obtain sufficient well tests, formation flow tests, wireline logs, analyses, surveys, conventional cores, cuttings and samples during the drilling of the well to ensure that a comprehensive geological and reservoir evaluation can be made."*

EFTs will be undertaken if preliminary results from DST are encouraging, and the following criteria have been met:

- The well is drilled and cased;
- A potential reservoir is:
  - Identified;
  - DST has been conducted; and,
  - Test analysis of the DST concludes sufficient hydrocarbons present to proceed to further evaluation of the hydrocarbon bearing formation.

Table 3-3 outlines the sequence of activities in developing the well site areas.

The same regulatory constraints apply to fluids produced by EFT as to recovery by any other means.

EFT operates on a similar principal as DST. The main difference is that EFTs are undertaken after the well has been cased. In an EFT however, the drilling rig would be removed to drill another well while the drilled well is prepared for testing. As each well is drilled and drill stem tested to evaluate its candidacy for extended testing, it is left in a safe, secure state for further testing after removing the drilling rig. Mobilizing a service rig to complete the work may become necessary before turning the well to extended testing. A well service rig has very similar capabilities and equipment to a drilling rig except that it generally has fewer modules and is lighter equipment. If a service rig is required, it would be incremental equipment to the drilling rig.

Table 3-3. Sequence of well development activities.

	Remove all surface infrastructure.	Remove all surface infrastructure.
	Remediate well site area and allow to regenerate naturally	Remediate well site area and allow to regenerate naturally

To allow the zone of interest to flow into the wellbore, the casing is perforated which is a routine procedure achieved by either using a wireline from surface or attached to the end of the production tubing from the surface to the zone of interest. In this case, the well is first completed with a packer attached to a tubing string and have downhole gauges to record flowing temperatures and pressures in real time. The surface would have the necessary “Christmas Tree” wellhead equipment and be flow line connected to the test separator through a choke manifold. Well fluids (gas, oil and water) would then be handled similarly.

Several wells at different locations could undergo EFT simultaneously, depending on drilling success/DST outcomes.

Extended flow testing is normally performed by specialists who provide the equipment, supervise the EFT operation, administer the safety protocols, and have the required certifications to perform the associated tasks. Extended flow testing however would be handled in the same fashion as production operations and still be conducted by trained professional operators under the direct supervision of a Production Superintendent.

EFTs will require installing surface and subsurface equipment and facilities at each well site to measure, process and store produced fluids. There is the potential to undertake more than one EFT per well if more than one zone is suitable for testing. The specific details of this equipment is subject to the nature of the discovery and could include:

- Casing of entire wellbore and perforate casing at zone of interest;
- Packer, tubing and downhole gauges;
- Wellhead valving assembly;
- Flare systems;
- Separator vessel;
- Treater to do additional separation of the produced fluids;
- Storage tanks;
- Appropriate artificial lift systems;
- Heaters;
- Dehydrators;
- Flow lines;
- Metering equipment; and,
- Portable generators.

Chance anticipates a delay (e.g., the following winter season) between completing DST, completing the well/removing the drill rig, and commencing EFT to allow time to design the flow test, secure the equipment and operating personnel, ship the equipment to site, install the equipment, and commence the operations. This program would include ancillary services to set up and perform the EFT (e.g., service rig). EFT will be undertaken on a maximum of 30 wells drilled during the exploration well drilling program. EFT may require up to a month to complete for a predominantly natural gas well or up to 2 years for a predominately crude oil well. Chance anticipates that up to 10 wells may undergo EFT simultaneously (based on the planned drilling schedule).

Fluids produced during EFT will be some combination of natural gas, crude oil and possibly formation water, which will be separated, measured, processed, used, sold, or disposed of as follows:

- Natural gas could be flared for short periods of time but would be preferentially used for process heating, fuel for mechanical power or possibly onsite power generation. Heaters are used to provide heat to vessels treating the produced fluids or keeping stored fluids warm; they can include heating an intermediate fluid such as glycol at the heater and circulating the glycol in a network of raised or insulated pipes (to prevent thawing ground surface) to the places where heat is required. The mechanical or power generators would likely be small engines fuelled with natural gas and sized according to the location's needs.
- Crude oil produced during the EFT would be preferentially stored temporarily for potential future shipment to market. This will require some processing at the well site or the CPF to

stabilize the crude oil for truck transport to a suitable, approved crude oil marketing point (i.e., terminal).
- Formation water produced with crude oil or natural gas will be separated from the hydrocarbon streams and disposed of via existing deep injection wells at Eagle Plains.

EFTs involve the flowing of a well or wells under human supervision, while wells flow unimpeded for the duration required for the test. In a multi-well producing field, for example, a maximum of three persons can manage the production operator tasks of a field with 50 or more producing wells (double that number when working a 24-hour day). Field production operators visit each well at least once daily unless there is a need for remedial work. They record flowing well pressures, ensure fluid pumps operate properly, have enough fuel to continue operating and visually inspect the facility for anything unusual.

Chance plans to use up to three operators to manage the EFT wells in any 12-hour cycle. A second set of up to three will form the cross-shift for a total number of six operators.

3.3 ACCESSORY PROJECT COMPONENTS

The following activities are required to support the principal exploration drilling and EFT:

- building and maintenance of winter access roads;
- other project facilities (i.e., remote camps and fuel storage);
- some surface facilities (e.g., flare stacks, flow lines, storage, processing, injections);
- airstrip construction and operations (estimated two fixed-wing aircraft flights per week); and,
- water use for drilling and camp needs, and for short periods to make snow and freeze in access trails.

Chance Camp at km 325 will be the main accommodation facility for the exploration program. During drilling operations, there will be some accommodation for essential staff in a mobile camp at the well location. This mobile camp will be occupied 24 hours per day, 7 days per week, to house essential personnel (rig supervisors, medic, geologist, etc.).

3.3.1 Well Maintenance

Any well completed for EFT, or not completed for EFT and suspended, may require maintenance during the 10-year term of the Project. Well maintenance is required on any suspended well before abandonment, conversion to an active well, or annually if it remains suspended. Well-maintenance equipment may include a service rig, wireline truck, cement trucks, and associated support equipment. Under the *Oil and Gas Drilling and Production Regulations* (Government of Yukon 2004), a well is deemed suspended when it is safely secured, but not producing oil or natural gas.

Well maintenance activities, also known as workovers, generally include the following:

- pressure testing to confirm integrity of the casing and well head valves;
- removal of equipment in the well bores such as tubing and plugs;
- wireline investigations to measure temperatures and cement integrity and convey any perforating equipment;
- remedial work such as cement squeezes; and,

- wellbore integrity assessment.

3.3.1.1 Pressure Test and Surface Casing Vent Flow Test and Gas Migration Test

A pressure test will be conducted at each well to evaluate the integrity of the wellhead and the existing wellbore casing. The well (or Legacy well) will then be tested for surface casing vent flow (SCVF) and gas migration. Chance reports that no SCVF has ever been detected in existing suspended wells during annual inspections. If SCVF is identified, the well will be inspected and test results logged using various tools (e.g., noise tool, temperature tool, bond log tool) to determine the source of the SCVF and/or gas migration. The logs will be analyzed, and a plan will be formulated to complete a downhole shut-off at the source of the SCVF or gas migration if required. This is only done for significant vent flow events or when abandoning a well. Non-significant vent flows are normally left until end-of-life for newly producing or suspended wells. Depending on the status of the well (e.g., cased or completed with perforations) and the nature of the problem, the equipment needed to fix the problem will involve some combination of a service rig, wireline services and possibly cementing services.

3.3.1.2 Temperature Log and Cement Bond Log

Once SCVF and gas migration testing is complete, the service rig, support equipment, and wireline will be moved to the well site. A temperature log will be recorded from the surface to 300 m Kelly-Bushing below the surface (mKB) to identify anomalies or departures from the reference gradient. Most anomalies are related to fluids entering the formation through the borehole or fluid exit. If there is no anomaly, this work will be a good measure of the depth and thickness of permafrost.

A cement bond log will be run after the analysis of the temperature log. The cement log uses the variations in the amplitude of an acoustic signal travelling down the casing wall between a transmitter and receiver to determine the quality of a cement bond on the exterior casing wall. The acoustic signal will be more attenuated in the presence of cement than if the casings were uncemented. The cement log is used to identify sections of the well bore that will need intervention to isolate porous formations from adjacent formations.

3.3.2 Access Roads

Winter roads will be used for the exploration program. There will be no permanent roads within the exploration stage of the project. Temporary drilling pads created from snow on cleared but undisturbed ground will be used and will only exist during winter. **Figure 3-12** below shows the maximum potential winter road network to the exploration sites. Each winter road's number, location and length will be determined as the exploration program develops. As the program unfolds, the access road network's ultimate size will depend on drilling results (success). If drilling results are discouraging, the road network may be less than shown.

This project's proposed winter road construction method will be a compaction of the natural snow cover. Water may be needed in some areas to reinforce the packed snow. Some snow may be hauled to low areas or areas that are wind-blown. The natural vegetation cover will be preserved and remain undisturbed as much as possible. Compacted snow roads are appropriate to serve low ground pressure geotechnical field programs or winter roads with low traffic volumes. This method will suit this exploration program, as the expected traffic on this road will be the transport of a drilling rig with anticipated one to two moves (this

number could be up to 5 depending on the time needed to drill and evaluate a given well) per season, and a small number of support vehicles.

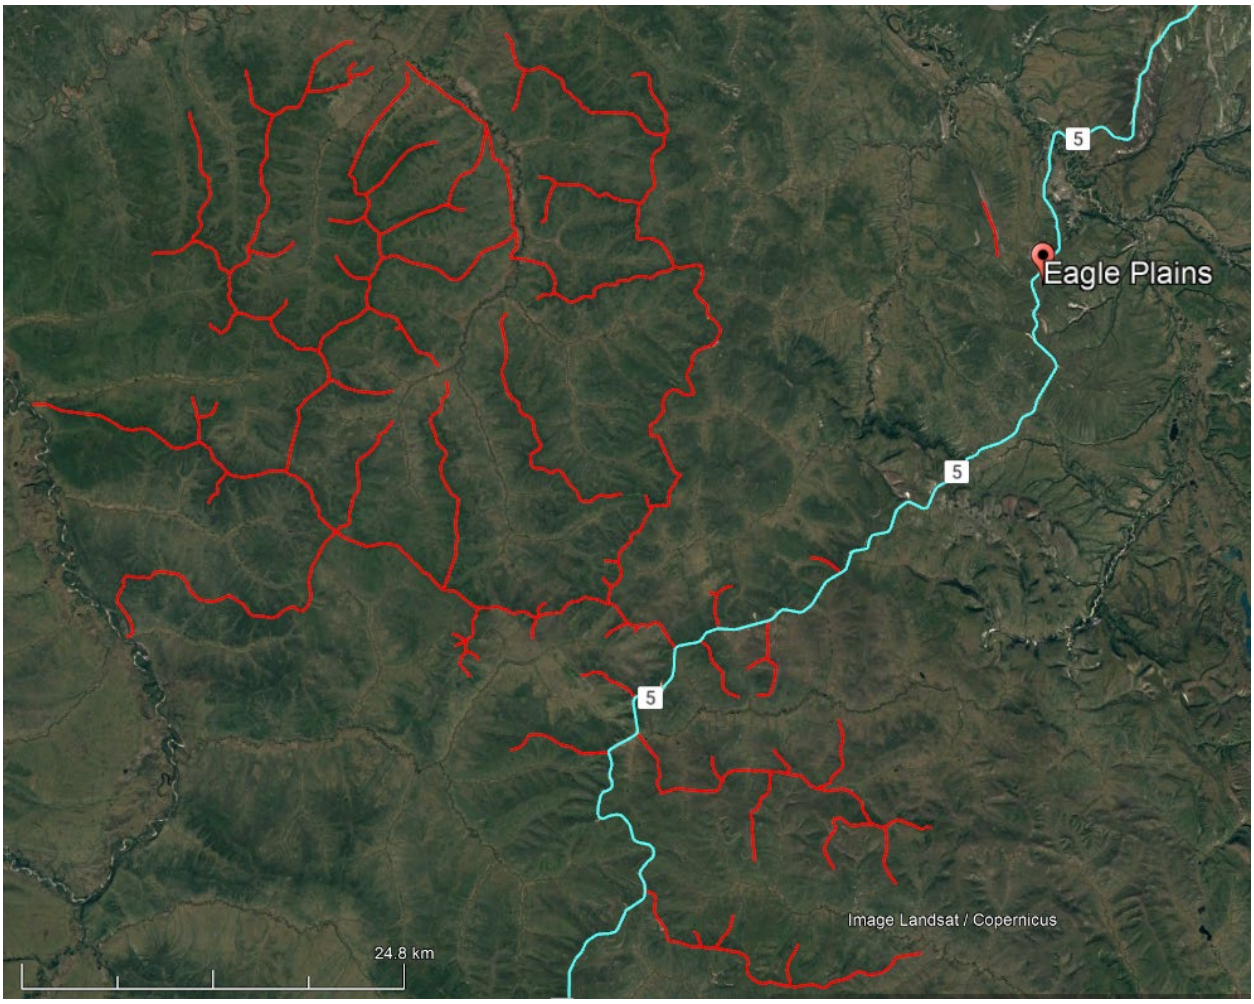

Figure 3-12. Conceptual winter road network.

3.3.2.1 Routing Rationale for the Winter Roads

The routing of a winter road needs to consider the following criteria (discussed in detail below):

- road geometry, such as grades and curves to suit the intended vehicles;
- number and width of water crossings;
- avoidance of unfavorable terrain;
- avoidance of selected areas determined by historical resources, vegetation, wildlife habitat, etc.; and,
- sensitivity of permafrost terrain to the construction of a winter road.

Road geometry — Ideally, for vehicle safety and operations, the maximum gradients on the road should be 6% or less, with only short sections up to 10%. The routing developed for this Project generally falls within this range, although route adjustments will likely be undertaken in the field if these desirable gradients are met.

Number and width of water crossings — Selecting routes that minimize the number and width of water crossings reduces the complexity of the winter road construction and the uncertainty or risk during operation. For this Project, there is only one wide crossing, and all crossings are expected to be completely frozen during the operating season.

Avoidance of unfavorable terrain — Chance has undertaken terrain mapping of the area. The route is located on bedrock, weathered bedrock and colluvial sediment where possible.

Sensitivity of permafrost terrain to constructing a winter road — Chance has undertaken permafrost mapping in combination with terrain mapping. The route, where possible, is generally located on ice-poor to ice-moderate permafrost. Ice-rich permafrost is sensitive to the activities associated with the construction and operation of winter roads and should be avoided to the extent possible. Specific mitigation to preserve permafrost will be undertaken in situations where it must be crossed.

The development of the routing for the potential winter road network has considered these criteria. The potential routes have been selected to minimize the effect of unfavorable terrain and thaw sensitive permafrost terrain while balancing the need to access sites.

3.3.2.2 Construction Considerations and Operating Season

The winter road will not be constructed until the ground is sufficiently frozen and has adequate snow cover to limit disturbance to the ground and vegetation.

Winter road construction will commence when the depth of snow cover is approximately 10 cm and sufficient to cover low-lying vegetation thereby minimizing effects to the ground. The winter road will be constructed with dozers supplemented with steel frame drags. Other equipment may be required to haul snow as necessary.

The winter road widths will be dependent on the size of vehicles to be used each season. Single-lane winter road for smaller lighter equipment and very low traffic volumes will be as narrow as 5 m. Wider two-lane winter roads, approximately 9 to 10 m in width, will be constructed for larger equipment and greater numbers of vehicles.

Closing a winter road is based on observed depletion of snow cover and current and forecasted weather. Once the insulating snow softens and disappears and the daily air temperatures rise above 0°C for a few days, the winter road will be operated only at night, and eventually closed before the ground thaws. Diligent and ongoing observations of the conditions and the forecasts will be undertaken to ensure that equipment is moved off site and the winter roads are closed appropriately.

The general operating season for a winter road in this area is estimated to be from the end of January to the end of March. Still, it could last longer depending on the timing of opening and the end of winter.

3.3.2.3 Mix Bury Cover (MBC) Sump Access Road

Chance also proposes constructing a 400 m long, 6 m wide winter road to the proposed MBC sump area. This road will be built as early in the operating season as possible (soon after mid-January as snow and weather permit) and will take approximately two weeks to complete. It will be reopened each winter season that drilling occurs. The proposed route follows an existing access trail; no major clearing will be required. The proposed route includes no watercourse crossings and is 800 m from the nearest surface water body.

3.3.2.4 Access Road Maintenance

Maintenance of winter access routes may include low-ground-pressure vehicles, a road grader equipped with a wing snow plough, some water application, and use of matting where required. Grading may be required over certain stretches of the route, and depressions along the roads will be filled with snow to smooth the surface. If required, water will be withdrawn from approved water sources using adequately sized intakes and screened to prevent debris blockage and fish mortality; refer to Interim *Code of Practice: End-of-Pipe Fish Protection Screens for Small Water Intakes in Freshwater* (Government of Canada 2020).

3.3.3 Mix Bury Cover (MBC) Sump

As described and detailed in AER *Directive 050 Drilling Waste Management* Section 13 (Alberta Energy Regulator 2023), and accepted in the Yukon, MBC is a method of disposing of drilling waste (both drill cuttings and drilling mud) by which the by-products and spent mud are mixed with a local receiving soil at a specific mix ratio, deposited into a sump area, and then covered with clean subsoil.

A typical MBC sump design consists of three distinct layers:

- A clean subsoil layer 1 to 1.5 m deep on top of the drill cuttings and soil mix; this layer acts as an insulator between the subsoil/drill cutting mix and the vegetative layer to ensure that, after final reclamation, the site is returned to its original state.
- The subsoil/drill cutting mix layer is where the receiving subsoil is mixed at a specified mix ratio with the disposed of material (e.g., drill cuttings, spent drilling mud, etc.).
- Clay-rich material exceeding 1 m depth below the drill cuttings and soil mix, or alternative impermeable liner, acts as a hydraulic isolator.
- The identified MBC sump location will be investigated for suitability via drill cores to confirm the following conditions are present and at what depth:
- Sump soil has appropriate deposits of clay-rich soils.
- Appropriate clay-rich material of 1 m is beyond the horizontal and vertical dimensions of the sump to ensure hydraulic containment.
- There is an absence of hydraulic defects or ways for fluid to leak out of sump.
- A composite sample, made up of five subsamples, is required for every 3,000 m³ proposed to be used for MBC.

Before Chance begins exploratory drilling, a test sample of the drilling fluid will be analyzed and compared against the receiving soils at the proposed MBC site to estimate the soil/waste mix ratio to ensure the final soil composition complies with AER Directive 050 Drilling Waste Management Section 3 (Alberta Energy Regulator 2023). While an MBC sump is actively being used, Chance will monitor and inspect the site to evaluate sump integrity, volumes of material involved, and if further work is needed to the sump location.

For the proposed Project, drill cuttings will be transported to and disposed of at the identified MBC sump site, while drill fluids will be reused until the end of the Project or the end of the season. Chance plans to construct a new MBC sump (see **Figure 22**). The Devon sump location has not been used by Chance to dispose of drill cuttings or drilling fluid, and there are no plans to do so. The preferred MBC location for this Project is an adjacent, previously undisturbed area of approximately 63,910 m².

Figure 3-13 shows the proposed area with several 800 m² MBC pods representing an estimated area required to dispose of 300 m³ of drill cuttings, approximately one well's worth. The additional area is to accommodate spacing between MBCs for truck access and to stockpile excavated material. Typical operational practice is to have only one MBC pod open at a time to minimize potential permafrost exposure to ambient air temperature.

As per the AER directive, sampling drill waste will undergo the following sampling procedures:

- During drilling, the environmental monitor will be onsite to conduct sampling in compliance with AER *Directive 050 Drilling Waste Management* (Alberta Energy Regulator 2023) to ensure that drilling waste is compliant and accurate records are being kept, and to respond to any spills.
- The environmental monitor will take soil samples at the MBC site before use for MBC and after closure and reclamation.

If drilling by-products do not meet AER *Directive 050 Drilling Waste Management* (Alberta Energy Regulator 2023), the disposal materials will be transported to an appropriately permitted facility for disposal. Chance has previously used permitted facilities that can accept specified waste in Whitehorse and northeast BC.

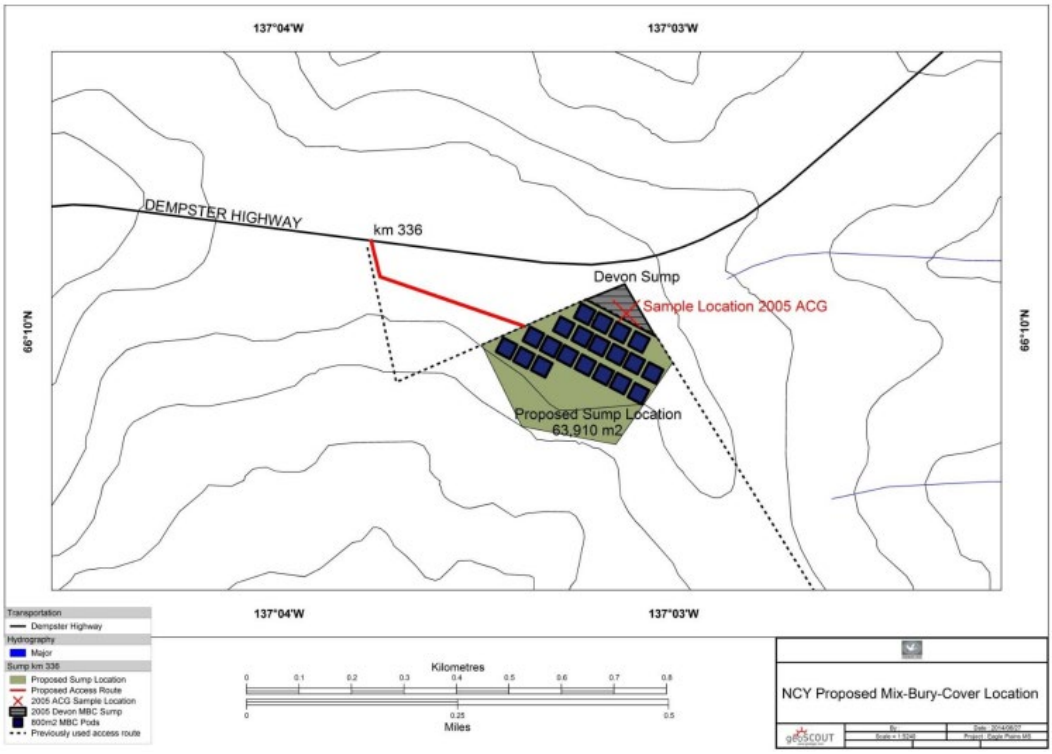

Figure 3-13. General location and plan of the proposed Mix Bury Cover (MBC) sump.

3.3.4 Central Processing Facility (CPF)

The Chance Camp's Central Processing Facility (CPF) will be located at the southernmost end of the camp area, furthest from other camp structures and personnel. The CPF will comprise multi-stage and multi-phase separators, heater treaters (to remove any remaining emulsified formation water and residual natural gas still in solution), a vapour and gas collection system, and a possible central power generation facility to charge all discrete well batteries. Trucks will transport fluid produced during EFT or (occasionally) DST from exploration wells for further processing at the CPF. Separated water will be further treated to remove any hydrocarbons, scale, anaerobic bacteria, and other colloidal or suspended solids ready for disposal in a nearby deep injection well.

Crude oil produced during the EFT would be preferentially stored temporarily for future shipment to market. This may require some processing at the well site or the CPF to stabilize the crude oil for truck transport to a suitable, approved crude oil marketing point (i.e., terminal). The volume (stored in up to five surface tanks in full compliance with Yukon and Canadian standards and regulations) also ensures safe crude stabilization before loading onto southbound trucks. In terms of maintenance, the only treatments appearing necessary at this stage of design are fluid separation (to separate oil from gas and water into three distinct streams), heat treating the crude to remove water remnants from the separated crude, and gas dehydration to make the gas useable as a fuel.

3.3.5 Airstrip

Chance will construct an airstrip along the existing Chance winter trail approximately 4 km off the Dempster Highway. The airstrip will be about 1,500 m long and part of the road network west of the Dempster Highway. This airstrip will be used only during the winter when the surface can be levelled using winter road construction techniques. If sufficient air traffic support is required, Chance may upgrade the airstrip to year-round usage. Until the Chance Road airstrip becomes serviceable each winter or at the end of the winter season operations when trail conditions deteriorate, Chance will continue to use the Dempster Highway adjacent to the camp as a periodic airstrip.

At the beginning of an operating season, the 800-m stretch of the Dempster Highway adjacent to the camp will be used as an airstrip similar to previous periods. Once the Chance winter road airstrip is built, flights will move to that location.

3.3.6 Transportation

For most of the exploration program, Chance will attempt to limit traffic on the winter access roads to authorized personnel. Traffic will include approximately eight to nine light-weight service trucks daily (for supplies and personnel), one to two water trucks, and one fuel truck as frequently as operations dictate. The fuel and water trucks will come to the Project site approximately three times per week or as demand dictates, and there will be occasional transport of drill cuttings from the well sites to the sump location. Air traffic is estimated at two flights in/out per week (normal arrival times between 10:30 a.m. and 12:00 p.m.).

Most traffic volume on winter access roads will be related to mobilizing the drill rig and constructing the site infrastructure. Well site set-up will take approximately five days, including 15 to 20 loads, to mobilize the drill rig. Winter roads will be restricted from public access for safety reasons. Chance's contractors will be transporting crews between the camp and the well site using company vehicles; all vehicles will be equipped

with radio communication and, particularly during busy times (i.e., setup and demobilization), traffic will be radio controlled. For safety reasons, any personnel accessing the areas (i.e., winter roads) must notify the appropriate staff (i.e., security personnel or managers/supervisors) when they leave the Dempster Highway and arrive at the well sites. Chance staff hired as wildlife monitors and security personnel will monitor access to the winter roads.

A typical description of road traffic during the prime operating periods (January 1 to April 15; May 1 to December 1) is presented in **Table 3-4**, and road users will follow the schedule as indicated previously in **Table 2-3** and **Table 3-3.**

Table 3-4. Typical road traffic during operating windows.

	Activity Description	Peak Traffic	Normal Traffic
1	Early Season Mobilization (Winter)	High	Light /High
2	Rig Mobilization (Winter)	High	Light /High
3	Drilling (Winter)	Light/High	Light
4	Access Road Construction (Winter)	Light/High	Light
5	Extended Flow Testing (Winter)	Light/High	Light

Notes:

1. High: 20–40 vehicles per 24-hour day
2. Light: less than 20 vehicles per 24-hour day

Chance expects vehicle volumes on the winter access roads during exploration drilling activities will range between medium and light traffic volumes. Minimal additional traffic is expected to and from the site, except for the trips by the water truck and fuel truck, which will be on-demand, transportation of other supplies as needed and possibly transport crude oil produced during EFT to an acceptable market off-site.

Trucking a stabilized crude oil cargo in specially constructed transporting tanks presents the same risk as transporting the diesel fuel required and used in Yukon. The process of loading and dispatching trucks at regular intervals will be planned and handled by professionals who will also maintain constant communication and GPS tracking of trucks as they travel down the Dempster Highway and on other connecting routes to their destination.

Chance has practised Journey Management on its previous exploration drilling work at Eagle Plains. In this instance, any unit transporting materials to Chance's Camp at km 325 will be called and tracked periodically by the dispatcher. The exact location when reaching certain pre-determined checkpoints will be relayed to the Chance Camp Management and Logistics Coordinator; this will ensure road safety for the truck driver and other road users and the safety of the vital cargo. It also provides critical planning information for receiving staff to plan for offloading its cargo and possibly loading backhauls.

The journey distance is 1,029 km from Eagle Plains to Skagway. The journey duration is approximately 17.5 hours driving at an average speed 59 km/hr. Other options exist, including truck delivery to terminals in Fort Nelson and Fort St. John, BC, or Grand Prairie, Alberta. The driving times will vary depending on which of these options is used, but the management procedures will remain the same.

Chance and its trucking contractor(s) will develop a *Transportation Alert and Emergency Response Plan* to manage potential risks and provide a clear chain of communication and action in the event of an accident while in transit on Yukon roads and highways. The plan will address any other Provincial routes. All reputable trucking contractors versed with transporting flammable liquids and petroleum products generally are mandated to follow the *Transportation of Dangerous Goods Act* (Government of Canada 1992). Ensuring the truck is safety-checked and the drivers are qualified and adhere to their company's safety policies are the key to preventing an incident or accident. Tracking the drivers to check on transit speed on a real-time basis means the truck's progress is never neglected and the driver is on notice to observe all road traffic rules at all times.

All incidents affecting Chance's trucking contractor are reported to Chance Operations Management and form part of Chance's safety statistics. Every incident is investigated, and the causes for each occurrence are closely analyzed and discussed with the truck owner. Should any trucking contractor exhibit an undue number of close calls/near misses or a series of incidents with the same causes, they would be removed from the contract without delay and replaced with a more competent and safety-minded contractor.

3.3.7 Workforce and Accommodations

Workforce requirements will vary over the life of the Project and will ultimately be limited by the existing camp capacity. During past drilling and seismic exploration programs undertaken between 2012 and 2014, Chance had no more than 75 to 80 people on-site at any time. During drilling, Chance operated on a 24-hour clock with a 20-day-on and 10-day-off crew rotation cycle, meaning that one-third of the crew was off duty at any point. Chance operated on a 12-hour clock for the seismic exploration program and cycled the various services as the program unfolded with limited crew changes, mostly connected with the camp catering operation.

Chance's existing camp (Chance Camp), office, and storage yard was established in October 2011 and is located at km 325 of the Dempster Highway. It is accessible year-round unless the highway is closed due to weather or construction. For this Project, Chance plans to use the camp for storing and transporting equipment and supplies needed for operations and personnel accommodations. The Chance Camp is the Project's main accommodation facility, and it can house up to 75 people in trailers and kitchen, sanitary and potable water treating facilities. Camp waste management consists of an incinerator for burning non-toxic and food waste and a secure storage area for other forms of waste. All non-incinerated waste will be transported to an appropriate municipal waste facility for disposal.

Due to the remoteness of some well sites, a remote camp (fly-in) would be established near the proposed East Greaves and West Greaves Winter Trails, roughly 40 km from the Chance Camp, to accommodate approximately 25 personnel. It would be used as an operations camp with full services, including food, fuel, sleeper trailers, bathrooms, water storage, and project management and HSE offices. The fly camp is necessary for operations planned in the winter months as the cold temperatures approaching -50°C, nearly 24-hour darkness and the potential of "white out" snow storms pose a real threat to crew member safety.

In addition, a mobile camp will be established at each active well. This will be a trailer that accommodates sleeping and a small medical/first aid trailer equipped with heat, power, water, and sewer service that may be installed at the well site during workover operations to provide essential first aid supplies and refuge for

workers. All wastewater and sewage will be collected in tanks approved by the CSA and transported off-site for disposal at an approved facility in Fort McPherson.

Chance aims to offer training, employment and contracts to its First Nation/Yukon partners as identified in sec. 68 of *YOGA* (Government of Yukon 2002). During its last drilling/seismic program, Chance successfully hired a workforce from the communities from Old Crow, Fort McPherson, Dawson, Whitehorse, and Inuvik.

3.3.8 Project Water Use

Water for the drill rig, winter road construction and the camp operation will be primarily sourced from existing withdrawal locations on the Eagle River, with locations on the Ogilvie River and Whitestone River as an alternative source. Licensed allowances will determine water usage. All water withdrawals will follow the DFO's *Interim Code of Practice: End-of-Pipe Fish Protection Screens for Small Water Intakes in Freshwater* (Government of Canada 2020).

If natural snowfall is below the minimum required depth to construct and maintain the winter roads, snowmaking equipment may be used to make up the shortfall. This is a contingent consideration and could require up to 300 m³ of water per day for a short period (a few days to a week) in the early winter. The sources of water include the Eagle River and the Ogilvie River. The water used to make snow and ice for the winter road(s) will be trucked from the source to the point of use, with each truck expected to complete between one and three deliveries per day.

Potable water for the Project will be sourced from the Eagle River, Ogilvie River and potentially the Whitestone River at a maximum rate of 20 m³/day, as described in Water Licence MN12-061 and treated at the Chance Camp using a combination of ultraviolet (UV) treatment, chlorination, and filtration. Wastewater disposal at the Camp consists of a wastewater treatment plant, holding lagoon, and exfiltration system.

3.3.9 Fuel Storage

Operation of the camp will require diesel and propane for power, heating and cooking. Diesel will be stored on-site in 15,000 L Enviro Tanks. There will be four to six tanks at the camp and one to two at the rig site. The tanks are bulk fuel, double-walled storage tanks with built-in secondary containment. The drilling rig, boilers, and any light towers at the rig site will have their own built-in fuel storage tanks.

Propane will be used to fuel the furnaces, hot water tanks, and the kitchen at the camp and at the rig sites and will be stored in 1,500 L propane bullet tanks. There will be six at the camp and one to two at the rig camp.

3.4 RECLAMATION AND CLOSURE

3.4.1 Seismic Lines

In addition to the low impact seismic methodology, with reduced line width and meandering paths, a remediation plan involving access deterrence will be used. Although nominal, standing timber will be gently pushed across lines to create a Leaning Tree Stand (LTS) using a "Stem Bending" method to decrease

these sight lines. Although not expected to be required to a great extent in the Eagle Plains area, this technique is highly effective in reducing access and enabling sufficient cover for vegetation regeneration.

3.4.2 Mix Bury Cover (MBC) Sump Site Reclamation

The standard AER *Directive 050 Drilling Waste Management* (Alberta Energy Regulator 2023) of action prescribes the following closure and reclamation actions for MBC sumps:

- Upon completion of the Project, remote disposal locations will be covered with a minimum of 1.0 m of capping material and contoured to meet background topography.
- A Phase 1 Environmental Site Assessment (ESA) will be completed for each well and corresponding remote MBC location to identify any potential areas of environmental concern.
- If the Phase 1 ESA triggers a Phase 2 ESA, soil samples will be collected and analyzed at an accredited laboratory.
- If contamination is identified, a Remediation Action Plan will be prepared and upon approval, the remedial program will be completed. Once all contamination is addressed either in the Phase 1 ESA, Phase 2 ESA, or Remediation, a surface program including soil and vegetation will be conducted.
- Once vegetation is established, a Detailed Site Assessment; comparing soil lithology and vegetation onsite to offsite) will be completed.

The stockpiled vegetative layer and soil will be re-applied to the MBC sump area on top of the capping materials and after contouring has been completed.

Environmental monitors will follow the testing requirements in accordance with AER *Directive 050 Drilling Waste Management* (Alberta Energy Regulator 2023):

1. Receiving soil
    a. Electrical conductivity and sodium adsorption ratio
2. Waste (solids or total waste)
    a. pH, electrical conductivity, sodium adsorption ratio, sodium (Na)
    b. nitrogen (N), if additives/products added to the drilling mud/waste system contain any amount of N or if N content was unknown
    c. metals, if concentrations exceeding limits were added to the drilling mud system or if the metal content of additives/products is not known
    d. hydrocarbons, if a hydrocarbon flag was encountered
    e. toxicity, if toxicity data are unknown for any of the mud additives/products used in the drilling mud system or if concentrations used exceeded pass threshold for luminescent bacteria toxicity test
3. Waste/soil mix (post-disposal)
    a. conductivity (EC), sodium adsorption ratio (SAR), and Na, if drilling waste EC >10 decisiemens per metre (dS/m) or Na >3000 milligrams per litre (mg/L) (saturated paste extract or filtrate from oversaturated waste)
    b. metals, if concentrations in drilling waste exceed concentrations listed
    c. hydrocarbons, if concentrations in the drilling waste exceed concentrations

d. N, if the nitrogen concentration in the drilling waste (wet weight) is ≥6 milligrams per kilogram (mg/kg) for disposals in coarse soil or ≥120 mg/kg for disposals in fine soil.

The first task on any well site is constructing the well pad or preparing the surface on which matting can be safely placed. The next step is to lay the mats on the 10 cm of packed snow, moving snow as needed to create a flat surface. The final process, before deploying the drilling equipment, is a professional geotechnical check on the stability of the surface and its resultant ability to support the maximum anticipated loads with a suitable safety factor. Finally, the geotechnical engineer will provide a signed/stamped report attesting to the stability and strength of the facility for the work contemplated.

3.4.3 Well Abandonment

As mentioned, the 30 proposed wells are part of an exploration program to help determine the region's oil and gas resource potential. Depending on the outcome of results, a given well may be tested and additional plans developed to bring it into production or decommissioning and abandonment if determined to be unproductive. As the Operator, Chance will always be responsible for all wells deemed its property. This responsibility can never be delegated to any other party unless and until such time Chance relinquishes ownership according to *YOGA* and its regulations (Government of Yukon 2002, 2004).

The standard AER *Directive 050 Drilling Waste Management* (Alberta Energy Regulator 2023) of action prescribes the following closure and reclamation actions for well sites:

- A Phase 1 ESA will be completed for each well location to identify any potential areas of environmental concern.
- If the Phase 1 ESA triggers a Phase 2 ESA, soil samples will be collected and analyzed at an accredited laboratory.
- If contamination is identified, a Remediation Action Plan will be prepared and upon approval, the remedial program will be completed. Once all contamination is addressed in the Phase 1 ESA, Phase 2 ESA, or Remediation, a surface program will be conducted, including soil and vegetation.
- Once vegetation is established, a Detailed Site Assessment; comparing soil lithology and vegetation onsite to offsite) will be completed.

Wells required for further operational uses such as producing wells, water or gas injector wells will be maintained in a suspended state and can be converted for use in the future. The *Oil and Gas Drilling and Production Regulations* under *YOGA* (Government of Yukon 2004) have specific actions required from an operator to maintain a well in a suspended state; key among these actions is to periodically conduct inspections to ensure that the integrity of the well is intact. While a well is in suspended status, the regulator requires a sum of money to be placed on deposit to cover the cost of abandonment and remediation of the site. Once abandoned, the status becomes permanent, and re-entering such a well would not be possible.

The normal stages before decommissioning/abandonment of a well are as follows:

- The well is first determined to be unusable.
- The perforations are first cemented by placing a cement plug below and above them and squeezing cement into the formations to isolate them within the wellbore permanently. A

mechanical shut-off device called a bridge plug may also be wireline set above the cement plug to add protection or isolation.

- A second cement plug would be set higher in the production casing and below the estimated permafrost maximum depth. This plug is normally set on top of a bridge plug to ensure it does not leak down in the casing. The plug is also "felt" with a drill bit to confirm its existence and hardness.
- The casing at the surface is cut 1 m below the original ground and buried under the soil to remediate the location entirely. The soil will be left to achieve a frozen state naturally, and permafrost is expected to establish within it at the same depth as the surrounding area.
- The lease is remediated by removing all equipment and infrastructure to restore the location to its original status. The surface location is left to be revegetated naturally.

When appropriate, a decommissioning/abandonment plan for the well sites will be developed to comply with Part 7 of the *Oil and Gas Drilling and Production Regulations* (Sections 95, 96, 97, 99) (Government of Yukon 2004). Wells would require final well abandonment according to the *YOGA Oil and Gas Drilling and Production Regulations* (Government of Yukon 2004).

During winter work, sampling can be accomplished from the surface snow deposits around the well site. Chance has selected well site dimensions to ensure a sizable perimeter for containing liquid or solid waste from the Project. The well site will be lined to contain potentially released fluids. An outline procedure prepared by Chance in compliance with the *YOGA Oil and Gas Drilling and Production Regulations* (Government of Yukon 2004) is presented as follows:

- Seal off all perforations in the casings not already sealed with cement squeezes.
- Pressure test the casings to 7,000 kilopascals (kPa) to confirm isolated and sealed formations.
- Cut off the wellhead and casings to 1 m below ground level and weld/install plates to cover each casing string at the surface.
- Install well identification marker visible above ground level.
- Bury the cut casings to complete the abandonment.

If the entire Project had to be suspended but not completed, the infrastructure would be preserved and maintained until the Project resumes. If it is decided to terminate the Project, the infrastructure will be decommissioned. While operations are suspended, Chance would ensure access from the Dempster Highway would be barricaded and visually inspected periodically.

3.4.4 Winter Roads and Winter Well Sites

Reclamation activities will aim to enable sites to revegetate naturally as quickly as possible throughout the life of the Project. Well site and winter road reclamation activities will be designed to meet the following objectives:

- Leave the site uncontaminated following the completion of Project activities.
- Remove all garbage, petroleum products, and equipment.
- Prevent long-term erosion or slumping and promote successful natural revegetation of disturbed areas.

Given the winter road construction methods that will be employed (i.e., packing snow to a minimum thickness of 10 cm), no additional reclamation is anticipated to be required for the winter roads. Proposed Project activities will take place during winter, and the winter access roads and well site pads will be constructed using snow and ice to minimize damage to the vegetative layer or compaction/scarification of the organic soil layer. The proposed measures to promote successful natural revegetation are as follows:

- Complete removal of equipment, matting, materials and debris from well sites.
- Leaving the well sites and winter roads in such a condition that water ponding, slumping or soil erosion are unlikely outcomes – if (unplanned) soil disturbance takes place, the surface would be contoured to minimize erosion (depending on the area disturbed), roughened, and covered in a layer of mulch or cut vegetation.
- No stockpiles of snow or ice will be left at the well sites or along the winter roads, to minimize melt-related effects on vegetation.
- Existing shrub-stage vegetation will be pushed over, or cut as high as possible, during winter road construction.
- Trees and shrubs will be cleared but ground vegetation will be left intact and protected via minimum 6” packed snow or rig mats. Where trees and large shrubs exist, they will be hand cut and piled to form brush piles that will inhibit human travel and provide ongoing soil/non-woody vegetation protection post-melt.

Access to winter roads will be restricted during and after operations. Restricting access will ensure that the road can fully melt in spring, thus reducing the potential for additional disturbance from outside users and reducing risk to Chance employees and the public.

APPENDIX 2-A-28. *First Nation of Na-Cho Nyäk Dun and Chance Oil and Gas Limited Engagement and Communication Plan* (Version 2)

DRAFT 2021 ANNUAL REPORT

Implementation of the First Nation of Na-Cho Nyäk Dun and Chance Oil and Gas Engagement and Communication Plan

PLEASE NOTE: Chance Oil and Gas Limited has reviewed and approved this report. The First Nation of Na-Cho Nyäk Dun was provided a draft, but has not provided feedback. As Hemmera was unable to secure a signature from the First Nation, the signature boxes were removed from Page 5 and this document retains the DRAFT watermark.

1.0 INTRODUCTION

This report demonstrates implementation of the *First Nation of Na-Cho Nyäk Dun and Chance Oil and Gas Limited Engagement and Communication Plan* (Plan) (see **Appendix A**) finalized on August 8, 2018. It summarizes discussions held between First Nation of Na-Cho Nyäk Dun (FNNND) and Chance Oil and Gas Limited (Chance) between June 1, 2020 and May 31, 2021. The purpose, objectives, and outcomes of each discussion are described below in order to fulfill the requirements of Ministerial Order (MO) 2018/42 (see **Appendix B**) issued to Chance on August 30, 2018.

2.0 BACKGROUND

The development of communications and engagement plans began with Order in Council (OIC) 2016/169. OIC 2016/169 required Chance to file a First Nations communication and engagement plan with the Minister of Energy, Mines and Resources in order to extend tenure on their northern permits: 0005, 0006, 0007, 0008, 0009, 0010, and 0011. Chance complied with OIC 2016/169 and received their tenure extension.

Chance subsequently received MO 2017/37 when applying for tenure extension on six of eight southern permits: 0012, 0013, 0014, 0015, 0016, and 0017. MO 2017/37 required Chance to revise, in consultation with affected First Nations, the consultation and engagement plan filed under OIC 2016/169. The affected First Nations listed in MO 2017/37 were Vuntut Gwitchin First Nation, Tr'ondëk Hwëch'in, First Nation of Na-Cho Nyäk Dun, Gwich'in Tribal Council, and Tetlit Gwich'in Council.

FNNND and Chance collaboratively developed their Plan through a series of in-person meetings and conference calls. Hemmera was retained by Chance in November 2017 to facilitate the development and completion of the communications and engagement plans with the affected First Nations and facilitated all discussions between FNNND and Chance.

Chance and FNNND submitted their finalized Plan to Minister Ranj Pillai on August 28, 2018. To satisfy their obligations under MO 2017/37, Chance filed a total of four communications and engagement plans. All four plans were approved by the Minister and Chance received a five-year tenure extension on the six southern permits.

A condition of the five-year tenure extension, issued via MO 2018/42, required that Chance submit annual reports summarizing actions taken to implement each communications and engagement plan.

See **Appendix C** for a map of Chance's current permits.

3.0 ENGAGEMENT AND COMMUNICATION PLAN IMPLEMENTATION SUMMARY

3.1 Overview

Parties have advanced discussion on Chance's proposed Eagle Plains Exploration Project and Chance's proposed project for Well Maintenance and Extended Flow Testing. The following sections provide separate summaries of engagement activities that occurred for Chance's projects between June 1, 2020 and May 31, 2021.

DRAFT

3.2 Summary of Engagement – Well Maintenance and Extended Flow Testing Project

Initial notification was sent to FNNND on May 25, 2020. That package included a high-level overview of the project (e.g., project activities, components, goals, outcomes), the regulatory submissions Chance would be making, a brief introduction to Hemmera and its role, as well as a request to discuss any concerns the affected party may have and an offer to arrange a conference call should they so desire. Also included was a 4-page project summary and map of the project location.

Additional communications followed on June 9, June 24, and July 20, 2020. Chance did not receive feedback from FNNND while the project was being refined or when the project proposal was being drafted. A draft of the Project Proposal was shared with FNNND July 24, 2020.

Following additional conversations with the regulator (Government of Yukon), Chance was required to make changes to its project design. On August 7, 2020, FNNND was provided notice that revisions were being made to the project and that additional information would be forthcoming. A revised project proposal was provided, via email, to FNNND on August 28, 2020, along with a cover letter summarizing the revisions and providing a rationale for each.

Chance submitted an initial project proposal to YESAB on September 11, 2020. However, after further consideration, Chance determined that additional changes were required. On November 2, 2020, via email, Chance notified FNNND that it had decided to withdraw its project proposal from YESAB and submit a revised version. In that email Chance stated that once a revised proposal had been drafted, Chance would notify FNNND by sharing a draft and requesting a meeting to discuss the changes further, and Chance stated at that time that after it had the opportunity to discuss those changes with FNNND, the project proposal would be finalized and resubmitted to the Dawson Designated Office.

The revised draft project proposal was provided via email to FNNND on November 19, 2020, and in that email Hemmera indicated that Chance would be submitting the proposal to YESAB the following day. On November 20, 2020, Hemmera informed FNNND that Chance would delay submission until the following week. That same day, a FNNND representative replied indicating the draft was received and being reviewed.

New FNNND staff were assigned the Chance file, and, on November 25, 2020, they requested previous versions of the proposal in order to better understand the project's evolution. On behalf of Chance, Hemmera provided previous version of the proposal and an overview of changes/revisions that had taken place. Hemmera also provided additional context with respect to Chance's larger portfolio and proposed projects and engagement activities.

To allow for additional revisions, Chance's submission to YESAB was delayed until December 24, 2020.

3.3 Summary of Engagement – Eagle Plains Exploration Project

Between June 1, 2020 and May 31, 2021, Chance and FNNND have had only one meeting pertaining to the Eagles Plains Exploration Project.

3.3.1 Meeting Summaries

Date: May 5, 2021

DRAFT

Location: Microsoft Teams
Attendees: FNNND Consultant, Chance Management, Hemmera

Chance last engaged FNNND on the Eagle Plains Exploration Project in 2019 and the purpose of this meeting was for Chance to re-initiate engagement. Chance presented a high-level overview of exploration activities proposed for the Eagle Plain Basin. The presentation also highlighted any changes in project design that occurred since it had last been shared with FNNND in 2019. The presentation went over the layout of well sites, drilling methods, seismic program, and workforce. Chance also provided recent information and updates regarding baseline information gathered by Chance's consultants (Environmental Dynamics Inc (EDI), Peer Solutions, Palmer), and Parties discussed next steps regarding FNNND's preferences for community engagement and consultation (e.g., schedule, format).

Chance stated that their timeline was aiming for a Fall 2021 submission to Yukon Environmental and Socio-economic Assessment Board (YESAB) and that Chance was working towards getting into the communities in order to learn about, and address, any concerns related to ecological impacts. FNNND asked if more studies had been completed by EDI since Chance had last spoken to the community. Chance confirmed that EDI has conducted additional studies (e.g., fish sampling, linear features study) and that they would be shared with FNNND as they are completed.

Chance and FNNND discussed the proposed seismic program. Chance explained that current seismic data covers a broad area, but has limitations. Chance needs to investigate/target areas of interest and subsequently requires approximately seven times the 3D data that is currently available. Chance confirmed that none of its proposed activities would take place on settlement land. FNNND asked about heritage studies and Chance stated that it had completed a heritage study previously and that at the time Chance has worked with Joella Hogan from FNNND and Vuntut Gwitchin Citizens. Chance committed to sharing a copy of that previous report with FNNND. On the topic of regulations and submission to YESAB, FNNND asked if regulators were involved in the pre-screening. Chance replied that they have been in contact with Derek Fraser from Yukon Government.

Chance and FNNND discussed community engagement strategies. FNNND stated that they are very busy and requested that Chance share its proposed draft engagement schedule. FNNND suggested that Chance meet with the Mayo Renewable Resource Council and that the meeting potentially include FNNND Lands staff. FNNND stated they would speak with leadership to seek direction on engagement preferences moving forward. Chance was to send the revised project description and baseline studies as they become available.

3.3.2 Communication Log

The correspondence between Chance and FNNND is documented in the Engagement Log (see **Appendix D**).

4.0 PLANS FOR ONGOING ENGAGEMENT AND NEXT STEPS

No additional engagement activities are expected for the Well Maintenance and Extended Flow Testing Project while it is undergoing YESAB's review.

FNNND and Chance will continue to hold discussions at regular intervals as Chance develops its project proposal for the Eagle Plains Exploration Project.

DRAFT

Upcoming engagement activities for the Eagle Plains Exploration Project are expected to involve the following:

- Sharing baseline data
- Meetings between FNNND technical staff and Chance's technical consultants preparing the project proposal for proposed Eagle Plains Exploration Project
- Community engagement events for FNNND citizens

DRAFT

5.0 APPROVAL OF IMPLEMENTATION SUMMARY

FNNND and Chance have reviewed this report and agree to its contents as an accurate summary of the engagement activities carried out between June 1, 2020 and May 31, 2021.

Re: Submission of the First Nation of Na-Cho Nyak Dun and Chance Oil and Gas Limited Engagement and Communications Plan

Dear Minister [redacted]

I am pleased to inform you that the First Nation of Na-Cho Nyak Dun and Chance Oil and Gas Limited (Chance) have concluded our work to develop a framework to facilitate effective and meaningful communications and engagement between ourselves and Chance. The framework captured in the enclosed Engagement and Communications Plan establishes a foundation for a respectful relationship, that we will cooperatively address Na Cho Nyak Dun's capacity and resourcing needs to implement the framework as we continue to work together to ensure the environment is protected and development occurs in a sustainable manner.

Please accept the enclosed Plan for the purposes of Ministerial Order 2017/037. We trust that the Plan will be of satisfaction to the Minister.

I look forward to the next step in the process related to the government to government Consultation regarding the possible renewal or further extension of the oil and gas leases related to this project.

Sincerely,

[redacted]

Chief [redacted]

First Nation of Na-cho Nyak Dun and Chance Oil and Gas Limited Engagement and Communication Plan

1.0 Introduction

Chance Oil and Gas Limited (Chance) is an oil and gas exploration company that holds permits to perform oil and gas exploration activities in the Eagle Plain basin of Yukon Territory, Canada. As part of Chance's exploration program, Chance seeks to develop engagement and communication plans with all the First Nations that are potentially affected by Chance's exploration program activities. Permits 14, 15, 19, and 20 fall within or partially within the First Nation of Na-cho Nyak Dun Traditional Territory and Chance is seeking to engage the First Nation of Na-cho Nyak Dun (FNNND) on its activities within these permits.

2.0 Purpose

This document serves as an Engagement and Communication Plan (Plan) to provide a mutually agreed upon framework to support collaborative and effective engagement and communication between Chance FNNND now and into the future. This Plan incorporates and aligns with FNNND's *Cooperative Engagement Process*.

3.0 Relationship

Chance and FNNND will execute this Plan according to the following principles:

- Transparency and openness;
- Timeliness;
- Integrity;
- Adaptive Management;
- Mutual respect; and
- Working towards trust and understanding of one another.

These principles are adapted from the FNNND *Guiding Principles for Mining Interests* and from Chance's corporate values.

4.0 Key First Nation of Na-cho Nyak Dun and Chance Connections

Engagement and communication between Chance and FNNND will be generally associated with the proposed works and potential effects associated with Chance's oil and gas exploration program and potential opportunities (via training, employment, contracting, and other community investments), as well as any topics or issues identified through engagement and communication associated with Chance's proposed activities. This section of the Plan identifies the key contacts related to these overarching engagement and communication themes. Key representatives involved in engagement and communication are expected to be as follows:

- Chief and Council;
- FNNND Government department officials and advisors;
- FNNND Business Development agencies;
- FNNND Citizens and communities at large; and
- Proponent Management and designated staff and advisors.

The following table lays out the key engagement and communication topics, in no particular order, and associated key contacts for both Chance and FNNND:

Table 1 - Key Engagement and Communication Topics and Leads

Role or Subject Matter	FNNND Key Contact	Chance Key Contact
Project Lead	• Lands & Resources Manager (as described in the FNNND *Cooperative Engagement Process)*	• Vice President of Government and Community Relations
Culture and Community (includes Traditional Knowledge and Traditional Land Use, social, health, and other "human environment" subjects)	• Lands & Resources Manager	• Vice President of Government and Community Relations, Regulatory, Environmental and Community Relations Coordinator
Engineering and Geology	• Lands & Resources Manager	• Chief Executive Officer, President
Environmental	• Lands & Resources Manager	• Vice President of Government and

Role or Subject Matter	FNNND Key Contact	Chance Key Contact
(includes water, aquatic environment, wildlife, plants, and other environmental subjects)		Community Relations, Regulatory, Environmental and Community Relations Coordinator
Opportunities (includes community investment, training, education, contracting, employment, and other business opportunities)	• Lands & Resource Manager	• Chief Executive Officer, President
Agreements and Capacity Funding	• Lands & Resources and Negotiations Teams (as described in the FNNND *Cooperative Engagement Process*)	• Chief Executive Officer, President

5.0 Engagement and Communication Methods

Chance and FNNND will employ the following engagement and communication methods for specific correspondence:

- In person meetings;
- Email;
- Sharing Power Point Presentations (to support in person meetings);
- Sharing reports (as requested and as required) and;
- Telephone correspondence (teleconferences and less formal phone calls).

Engagement and communication methods that support general communication of Chance's activities are as follows:

- Chance newsletters; and
- The website for Chance Oil and Gas Limited.

Engagement and communication meetings will be executed in the following manner:

1. Chance or FNNND will request a meeting in writing to the other party according to the connections iterated in Table 1;
2. The parties to meet will develop the agenda collaboratively;
3. The party requesting the meeting will develop supporting materials (collaboratively, where possible), and share those in advance of the meeting; and
4. The meeting will take place in a mutually agreeable location.

The above general process applies to meetings with subject matter leads (Table 1) as well as meetings with Citizens and communities at large.

Through engagement with FNNND, Chance understands that there are existing communications protocols between FNNND, Tr'ondëk Hwëch'in, and Vuntut Gwitchin First Nation through the Northern Chiefs Accord. In keeping with the relationship principle of mutual respect, Chance will work within these existing communications protocols where applicable and as directed by FNNND.

The following documentation sharing and review protocols support the methods described above:

- Confidentiality of the meeting minutes will be discussed and established in advance of the meeting; i.e. if a meeting is to not be included in the record that will be submitted to regulators and assessors, it is the responsibility of both parties to discuss and agree to this prior to the meeting beginning;
- Meeting minutes taken by Chance will be sent to FNNND within two weeks via email; review and comment on these meeting minutes by FNNND through tracked changes, or some method agreed to by both parties, will be provided via email within 30 days of FNNND receiving the meeting minutes. Should FNNND require more time to review the meeting minutes, FNNND will notify Chance by email within two weeks of receiving the minutes. No response by FNNND to Chance's email providing meeting minutes within the 30 days will be interpreted as general acceptance of the meeting minutes by FNNND;
- Action items and meeting outcomes will be logged during meetings and reviewed by both parties at the end of the meeting to ensure that there is general agreement on the list of actions and parties responsible for those actions. The list of action items and meeting outcomes will be provided with the meeting minutes;
- Chance and FNNND will agree upon and use a file sharing platform to facilitate sharing of large files, such as Power Point presentations and reports; and,
- Should Chance or FNNND employ a third party for records development and management, the third party will follow the process iterated above for recording and providing meeting minutes.

6.0 Records Management

Summarized records of engagement and communication between Chance and FNNND will be kept in a records log. The Chance will ultimately submit the items below to regulators and assessors for review if and when a potential project is assessed in the future:

- Meeting agendas;
- Meeting minutes (finalized versions as described in section **5.0 Engagement and Communication Methods);**
- Invitee/Attendees lists and/or meeting sign-in sheets;
- Records log, which will include summaries of the following:
  - In person meetings;
  - Phone calls and teleconferences;
  - Incoming and outgoing emails between Chance and Chance's representatives and FNNND representatives;
  - Attachments to the above noted incoming and outgoing emails;
- Reports provided to FNNND by Chance and reports provided to Chance by FNNND for review and consideration for engagement and communication purposes; and
- Copies of Power Point presentations delivered by Chance to FNNND for engagement and communication purposes.

To ensure that there is a mutual level of comfort with the records log and materials to be submitted for assessment, Chance and FNNND will collaboratively review and agree to the records log and materials prior to submission to any regulator or assessor.

7.0 Adaptive Management of the Engagement and Communication Plan

Chance and FNNND will review and assess the effectiveness and success of this Plan on at least a 6-month basis. There will be a meeting to check in on the progress made by both parties in implementing the Plan within 3 months of the Plan first being agreed to and implemented, and a schedule for review of the Plan will be developed at that time.

APPENDIX B
Ministerial Order 2018/42

DRAFT

YUKON

CANADA

MINISTERIAL ORDER 2018/ 42

OIL AND GAS ACT

Pursuant to the *Oil and Gas Act*, the Minister of Energy, Mines and Resources orders

1 In this Order

"subject permit" means each of the following oil and gas permits held by Chance Oil and Gas Limited:

(a) oil and gas permit No. 0012,

(b) oil and gas permit No. 0013,

(c) oil and gas permit No. 0014,

(d) oil and gas permit No. 0015,

(e) oil and gas permit No. 0016,

(f) oil and gas permit No. 0017. « *permis visé* »

2 The renewal term of each subject permit is extended by five years (so that it ends on August 30, 2023).

3 The resulting total length of the initial term and the renewal term of a subject permit is 16 years.

ARRÊTÉ MINISTÉRIEL 2018/42

LOI SUR LE PÉTROLE ET LE GAZ

Le ministre de l'Énergie, des Mines et des Ressources, conformément à la *Loi sur le pétrole et le gaz*, arrête :

1 La définition suivante s'applique au présent arrêté.

« permis visé » Les permis suivants de pétrole et de gaz détenus par Chance Oil and Gas Limited :

a) permis de pétrole et de gaz nº 0012;

b) permis de pétrole et de gaz nº 0013;

c) permis de pétrole et de gaz nº 0014;

d) permis de pétrole et de gaz nº 0015;

e) permis de pétrole et de gaz nº 0016;

f) permis de pétrole et de gaz nº 0017. "*subject permit*"

2 La durée du renouvellement de chaque permis visé est prolongée de cinq ans, de façon à ce qu'elle se termine le 30 août 2023.

3 La durée totale d'un permis visé, y compris la durée initiale et la durée du renouvellement, est de 16 ans.

2018/42

4(1) In this section

"first nations communications and engagement plan" means the plan filed under O.I.C. 2016/169 and revised in accordance with M.O. 2017/37. *« plan de participation et de communication avec les premières nations »*

(2) It is a condition of this Order that Chance Oil and Gas Limited must file annual reports with the Division Head, in accordance with subsection (3) and to the satisfaction of the Division Head, about the implementation of the first nations communications and engagement plan.

(3) For the purposes of subsection (2), Chance Oil and Gas Limited must file

(a) the first annual report on or before July 31, 2019, in respect of the period beginning on September 1, 2018, and ending on May 31, 2019; and

(b) each subsequent annual report on or before July 31 of each year in respect of the period beginning on June 1 of the preceding year and ending on May 31 of the year in which the report is to be filed.

Dated at Whitehorse, Yukon,
~~Oc~~ August 30th 2018.

4(1) La définition suivante s'applique au présent article.

« plan de participation et de communication avec les premières nations » Le plan déposé en vertu du Décret 2016/169 et révisé en conformité avec l'Arrêté 2017/37. *"first nations communications and engagement plan"*

(2) À titre de condition du présent arrêté, Chance Oil and Gas Limited dépose des rapports annuels auprès du chef de division, en conformité avec le paragraphe (3) et à la satisfaction du chef de division, concernant la mise en œuvre du plan de participation et de communication avec les premières nations.

(3) Pour l'application du paragraphe (2), Chance Oil and Gas Limited dépose :

a) le premier rapport annuel au plus tard le 31 juillet 2019, pour la période débutant le 1er septembre 2018 et se terminant le 31 mai 2019;

b) chaque rapport annuel subséquent, au plus tard le 31 juillet de chaque année pour la période débutant le 1er juin de l'année précédente et se terminant le 31 mai de l'année au cours de laquelle le rapport doit être déposé.

Fait à Whitehorse, au Yukon,
le August 30th 2018.

E00246	May 9, 2019	Email	In	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Engagement/Consultation	Thank you for recognizing the economic opportunities in our traditional territory. We look forward to creating a solid relationship with industry and creating a template for future generations.
E00243	May 10, 2019	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	With election over, asking if possible to meet with Chief and new council next month to provide an update of exploration project status and plans going forward. Possibly June 10, in Mayo, also able to meet with members of Land and Resources Dept to give an update.
E00247	May 14, 2019	Phone Call	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	Richard called Simon to follow up email from last week requesting meeting on June 10th. Left a message.
E00249	May 21, 2019	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Site Visit/Field Work	Required to consult under geoscience license guideline to inform VGG, NNDFN and Tetlit Gwich'in Council that field work is planned July 10-24, 2019. Will be based out of Eagle Plains Lodge with helicopters. Will be flying to remote outcrop locations through out Eagle Plains Basin to extract rock samples with geological hammer. No mechanical tools will be used.

Reference	Date	Contact Type	In / Out	Organization	Author	Proponent/Proponent Rep	External Organization Names	Topic/Regarding	Meeting/Correspondence Summary
E00276	May 22, 2019	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Site Visit/Field Work Engagement/Consultation	Had sent e-mail to [redacted] but as she is no longer with NNDFN, was transferred to [redacted] by front desk, so assuming Josee has taken on responsibilities of [redacted] position. Following up about field work for summer. Working with Hemmera to set up a meeting with NNDFN to provide an update and present Project Description for June 10th. Required to consult under geoscience license guideline to inform VGG, NNDFN and Tetlit Gwich'in Council that field work is planned July 10-24, 2019. Will be based out of Eagle Plains Lodge with helicopters. Will be flying to remote outcrop locations through out Eagle Plains Basin to extract rock samples with geological hammer. No mechanical tools will be used.
E00277	May 23, 2019	Email	In	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	Josee is acting in position until further notice and appreciates communication about the project. June 10th marked on calendar. [redacted] can contact Colleen to make arrangements. Let [redacted] know if needing any field works for summer field work.
E00278	May 23, 2019	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	Thank you for your e-mail, will coordinate with [redacted] for June 10th Meeting.
E00454	June 3, 2019	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	Coordinating the June 10 meeting with Chance. I just want to confirm we have a room available. We will have handouts, so we won't need a projector. Could we arrange transportation to and from the airport for the meeting with you?
E00455	June 3, 2019	Email	In	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	Pick up at the airport is not a problem. I booked the Multi purpose room. What time is the meeting going to be at? And do you have posters to put up? Anything else I need to do?
E00456	June 3, 2019	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	Thank you for booking the room and arranging a ride from the airport. We will have a few posters to put up and will have hand out material. Greg, what time did we decide for the meeting?
E00459	June 3, 2019	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	The meeting will be 10-12. We're wondering if everyone who is joining us for the meeting would like to get lunch after. Is there a restaurant in town we could all go to or would it be possible to arrange catering?
E00460	June 3, 2019	Email	In	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	I could arrange someone to cater. Is there a poster you want me to post around town?
E00461	June 3, 2019	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	I don't think we need posters around town. We will host a community even later and then need to post posters around town. For lunch, it will be 5 of us from Chance, and then those that attend from FNNND. Do you think the restaurant can accommodate a large group and where is it? Do you think that group would rather go out for lunch or have it catered?
E00471	June 5, 2019	Email	In	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning Project Description/Activities	Catering would be best. I lined up a caterer for June 10.
E00265	June 6, 2019	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning Project Description/Activities	Finalizing agenda and calendar invite for meeting between Chance and First Nation of Na-cho Nyäk Dun the following week
E00293	June 6, 2019	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	Meeting invitation for June 10, 10-1. This meeting is for Chance to present a Draft Project Description of exploration activities proposed for the Eagle Plain Basin. Additional agenda items include next steps with YESAB and the process for reviewing Na-cho Nyäk Dun Project Effects as well as the annual reporting required on the implementation of the Engagement and Communication Plan.
E00297	June 6, 2019	Email	In	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	Thank you, looking forward to meeting on June 10th.
E00319	June 6, 2019	Email	In	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	Confirming the orange room is reserved for meeting on June 10.
E00295	June 7, 2019	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Project Description/Activities Meeting Coordination/Planning	Draft Project Description and presentation for meeting attached. Please distribute to those attending the meeting. Will bring paper copies. Please provide an estimate of attendees.
E00420	June 7, 2019	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	We have a little portable projector and I'm wondering if you think we should bring it?
E00259	June 11, 2019	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Information Sharing Engagement/Consultation	Sending background information following meeting.
E00477	June 13, 2019	Email	In	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Information Sharing	[redacted] - can you please invoice Geoscience for the catering of this meeting. [redacted]
E00269	June 14, 2019	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Site Visit/Field Work Engagement/Consultation	Attached details for First Nation's participation in Chance's fieldwork this summer. Still finalizing dates and logistics. Role profiles are in attachment, and aiming to have dates finalized next week. Please give thought to potential participants.
E00478	June 14, 2019	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Engagement	[redacted]

E00261	June 17, 2019	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Engagement/Consultation Site Visit/Field Work	Dates set for participation in Field Surveys. Proposing following logistics for First Nation participation: 1) Each FN with territory overlapping project area can have up to two members participate 2)Work will be physically demanding, require hiking steep, rugged terrain and thick bush, requiring average or above-average fitness to participate 3)Limited spots for participants due to helicopter constraints ad availability at Eagle Plains Hotel, so please respond as soon as possible to [redacted] Hemmera) to confirm availability 4) Participants should arrive on start date, but not mandatory to stay for duration of field study 5) all travel, including flights, vehicle travel to Eagle Plains Hotel, ad stay in Hotel must be booked by the First Nation and billed to Chance. Table of Opportunities by date. Purpose of participation will be to observe fieldwork and gain first hand understanding of the research. Deadline for Vegetation Survey # 1 is June 19th.
E00254	June 24, 2019	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Fish Information Sharing	Attached notice letter regarding DFO licence application for Environmental Dynamics Inc's fish studies
E00256	June 24, 2019	Email	In	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Engagement/Consultation	Thank you for information on DFO Application. Please copy [redacted] on any future communication between NND and Chance.
E00257	June 24, 2019	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Engagement/Consultation	Confirming instructions to copy [redacted] going forward.
E00266	June 25, 2019	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Information Sharing Engagement/Consultation	Draft Summary of June 10 meeting in Mayo between Chance and First Nation Na-cho Nyäk Dun
E00314	June 27, 2019	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Fish Information Sharing	Revisions from EDI for their DFO Application, see Attached
E00483	July 9, 2019	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	[redacted] Visit/Field Work	Have you had any interest for participation in the Chance field surveys? Below I've highlighted the surveys there's still time to participate in.
E00485	July 9, 2019	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Site Visit/Field Work	I corrected my highlighting below to include all the surveys at the end of July and early August. These are the surveys available to join
E00591	July 15, 2019	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning Engagement/Consultation	We would like to meet with you and other interested government representatives on Aug 12 in Mayo if that works for you. My colleagues and our Hemmera advisors will be returning from the GA in Old Crow on Aug 10 via Dawson so it might make sense for us to continue our engagement discussions as we advance towards a YESAB submission early in 2020. We would rent a vehicle in Dawson and drive to Mayo for the meeting. Please let us know if this will work.
E00488	July 16, 2019	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Engagement Reports/OIC Requirements	Hemmera has prepared draft reports on the Implementation of the Communications and Engagement Plan for both VGG and Chance to review. This report summarizes meeting we have had since completing the plan. Please make any desired revisions to the document in tracked changes and send back to me to finalize. Once I have incorporated the changes, I willl send final versions to both parties to sign. Please have revisions in by July 26, then I will finalize, get them signed and submit to Yukon Government for July 31.
E00491	July 24, 2019	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Engagement/Consultation Meeting Coordination/Planning	I am following up on 2 items for Chance: the draft Communications and Engagement Plan Implementation Report, and a proposed meeting on August 13 in Mayo. Would FNNND like to provide feedback on the draft report? I'm looking for feedback by Friday. Chance team in Dawson Aug 12 and proposing travel to Mayo Aug 13. Chance would like to discuss project updates and a Cooperation Agreement template. FNNND also mentioned that meeting with Chief and Council might be good. Please let us know.
E00320	July 25, 2019	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	Following up about meeting on August 12th to discuss the exploration project and related discussions such as cooperation and capacity funding arrangements. Would like to change to August 13th, as there is a conflict on August 12 meeting with TH in Dawson. Are you able to meet with us August 13, in Mayo?
E00321	July 25, 2019	Email	In	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Engagement/Consultation Meeting Coordination/Planning	Inquiring why they are not meeting together with the First Nations, instead of separately.
E00322	July 25, 2019	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Engagement/Consultation Meeting Coordination/Planning	Chance would love to meet collectively with all the affected First Nations, but have not had indications from the various First Nation governments that they wish to continue gathering in All Party meetings. I do feel there is merit in meeting all together where Value Components of the Eagle Plains area are in common. Is it possible to meet with you and your colleagues on August 13 in Mayo? Would be driving from Dawson and returning to Dawson the same day.
E00500	July 25, 2019	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Engagement Reports/OIC Requirements	Attached are Chance's edits to the Draft Plan Implementation report

Reference	Date	Contact Type	In / Out	Organization	Author	Proponent/Proponent Rep	External Organization Names	Topic/Regarding	Meeting/Correspondence Summary
E00536	July 30, 2019	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Engagement Reports/OIC Requirements	Following up on FNNND Comments on Draft Implementation Report. I left a voice mail, and also followed up with Ronaldo yesterday, but have not hear back. Final report is due to YG tomorrow. Hoping you could review and sign off on the content. Please let me know if you would like to provide revisions by noon tomorrow so we revise with your feedback, otherwise I will submit to YG tomorrow at 4 pm.
E00543	July 31, 2019	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Engagement Reports/OIC Requirements	Hemmera has prepared reports for YG on behalf of Chance on the implementation of the Communications and Engagement Plan that FNNND and Chance completed last summer. It was previously discussed that both FNND and Chance would review this report and sign to demonstrate both parties agree to the report's contents. I have not heard back, and will submit the report to YG as a draft, however we welcome your feedback.
E00544	July 31, 2019	Email	Out	First Nation of Na-cho Nyäk Dun YG	[redacted]	[redacted]	[redacted]	Engagement Reports/OIC Requirements	Attached annual report on the Implementation of the FNNND and Chance Engagement and Communication Plan. This report has been reviewed and signed by Chance, but has not yet been reviewed or signed by FNNND despite our best efforts to send the draft report and follow-up. I will let you know if I receive any feedback.
E00346	August 9, 2019	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	Great to connect by telephone this morning. Following up to bring awareness to colleagues and advisors at Hemmera of the potential to meet with you and your new council on Aug 13 in Mayo. This will be an opportunity to introduce ourselves to those unfamiliar with Chance and to summarize what our exploration plans are. We are presently in Old Crow attending the GA but travelling to Dawson on Saturday to meet with TH officials. If you are able to arrange to meet with us, we will drive to Mayo Tuesday morning, so could be there about 10 am. We have to be back in Dawson for 3:30pm. Thanks for setting this up on short notice and we look forward to meeting with you and members of your council.
E00388	August 9, 2019	Phone Call	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Engagement Meeting Coordination/Planning	Chance called NNDFN about meeting with Council at 10 am on August 13th, 2019. NNDFN said they would organize a group for the meeting and would call back on August 12th to confirm the meeting.
E00390	August 12, 2019	Phone Call	In	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	Chance called FNNND and FNNND confirmed they were unable to meet on August 13 and requested to meet at another time.
E00602	January 28, 2020	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Project Description/Activities Regulatory Process	Chance will be applying to the Yukon Government very shortly to extend the tenure of Exploration Permit 20. Application will be for maximum allowable under the Oil and Gas Act of 5 years. This permit has one suspended well at McParlon A-25 which we hope to use for fluid disposal of any produced water associated with the proposed exploration project. We are at an intermediate stage of discussions with the Manager of Oil and Gas Operations with Yukon to extend the suspended well status on the suspended wells at Eagle Plain. Manager has indicated hat Chance will need to do some physical assessments of the legacy wells to confirm the integrity of the wells before granting an extension. Assessments will require access to 3 suspended wells at SDL M-08, G-08, and J-19 and well as M-59 in order to do the work. A service rig, cement pumping equipment, and wireline services are expected to be used to conduct the assessments. Anticipate taking temperature measurements in wells to evaluate permafrost depth. The program is expended to take 1-2 months. This is a winter operation and will be done during the winter of 2020-2021 and may require Designated Office screening b y YESAB. We will provide more information as soon as we can.
E00646	March 23, 2020	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Information Sharing	Chance Oil and Gas (COG) has several initiatives on the go, some of which are time sensitive, and all require engagement with the affected First Nations. The following is a summary of these initiatives: 1.Application to the Yukon Government to get tenure extension on Exploration Permit 0020 which is set to expire on August 30, unless extended. This permit is located mostly in the Traditional Territory of the Vuntut Gwichin, but a portion is in the Secondary Use Area of the Tetlit Gwich'in and in the overlap area with the Na-cho Nyak Dun Traditional Territory. There is a suspended well in this Permit at McParlon A-25 which has ongoing value to COG. 2.There are several suspended wells at the Chance Significant Discovery License (SDL 022) and one at the Blackie SDL (SDL 021) which the Yukon Government requires COG to undertake some maintenance work. This activity will require an impact assessment by the Designated Office (DO) of YESAB in Dawson prior to permissions being granted by Yukon to undertake the work. The plan is to submit to the DO the program in the next month or so with the objective of being able to do the work over approximately a 6 week to two month period in the winter of 2020-2021. This is a regulatory requirement made by the Manager of Oil and Gas Operations with the Yukon Government. Importantly for your knowledge, there is no indication that these suspended wells have any problems, but they are wells that were drilled in the 1960's so the regulator has asked for work to be done in order to be able to continue the suspended status of these wells. 3.Continuing engagement with respect to the multi-well drilling and seismic data acquisition project that has been described to you in the past couple of years. A current map of COG landholdings is attached for your reference. In view of the COVID 19 outbreak, travel and face to face get togethers are not appropriate, if not prohibited, so we will have to make arrangements to exchange information in writing, electronically and by conference call. There is quite a geographic spread for all of us to manage and I look forward to hearing your preferences for engagement. Also, please forward this email to anyone I have missed who is working on the COG file.

E00673	May 25, 2020	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Project Description/Activities DO Project	Chance Oil and Gas Limited is preparing a proposal for well maintenance work in the Eagle Plains. Please see the attached letter meant to initiate engagement and to provide initial project information. Please let me know if you have any issues opening the attachment.
E00675	May 26, 2020	Email	In	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Project Description/Activities DO Project Engagement/Consultation	Your message [redacted] Subject: Chance Oil and Gas - Proposal for Well Maintenance Work (Initiation of Engagement with First Nation of Na-cho Nyäk Dun) Sent: Monday, May 25, 2020 2:13:19 PM (UTC-08:00) Pacific Time (US & Canada) was read on Tuesday, May 26, 2020 4:35:24 PM (UTC-08:00) Pacific Time (US & Canada).
E00818	May 26, 2020	Email	In	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Engagement/Consultation DO Project	Email read receipt
E00682	June 9, 2020	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	DO Project Meeting Coordination/Planning	I hope all is well, just following up from our program description from couple of weeks ago, if you have any question and comments, please contact us. if you would like us to arrange a call with your team, we would be happy to do so and provide you with an overview of the program.
E00796	June 9, 2020	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	DO Project Meeting Coordination/Planning	I hope all is well, just following up from our program description from couple of weeks ago, if you have any question and comments, please contact us. if you would like us to arrange a call with your team, we would be happy to do so and provide you with an overview of the program.
E00797	June 24, 2020	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Engagement/Consultation DO Project	I wanted to reach out and see if you had any questions about Chance's proposed well maintenance work. I've re-attached our May 25th letter that was sent via email. As [redacted] mentioned below, we'd be more than happy to set up a conference call to provide a brief overview of the project and answer any questions you might have.
E00819	June 25, 2020	Email	In	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Engagement/Consultation DO Project	Email read receipt
E00710	July 13, 2020	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Engagement Reports/OIC Requirements	Hemmera has prepared a draft report on implementation of FNNND and Chance Engagement and Communication Plan for FNNND and Chance to review. This report summarizes meetings/correspondance that have occurred between FNNND and Chance since completing the 2019 Annual Report. I have attached the draft as a Word Document, if both FNNND and Chance could make revisions to that document in tracked changes, that would assist me in creating a final version. If there are any issues that arise between parties' revistion, we can address them via e-mail or a quick call. Once revisions have been incorporated and the document is considered final by FNNND and Chance, I will send the final version to both parties to sign. I have also attached, as a pdf, a draft of FNNND and Chance's Engagement Log which functions as Appendix D for the report. Please complete reveiws by Friday, July 24th. Reminder that reports need to be signed and submitted to YG on July 31st.
E00741	July 14, 2020	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Engagement Reports/OIC Requirements	I'm noticing a discrepancy between an email address we used to have on file for you and one that I've received some read receipts from recently (and that's also on the FNNND website). Is this your correct address? If I don't hear from you today/tomorrow, I'll give you a call to confirm.
E00767	July 20, 2020	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Engagement/Consultation DO Project	Chance Oil and Gas (Chance) is nearing completion of its proposal for well maintenance in the Eagle Plains and hopes to submit to the Yukon Socio-Economic and Environmental Assessment Board within the next two weeks. Chance and Hemmera provided an introductory letter, project summary, and map via email on May 25, 2020 and again on June 24, 2020. Our original correspondence was to Chief [redacted]. However, I may have used an outdated emails address for [redacted] so I've included an updated address as well as the previous one. We value any feedback First Nation of Na-cho Nyäk Dun may have with respect to this proposed project and look forward to working with you during the assessment process.
E00742	July 24, 2020	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Engagement Reports/OIC Requirements	I wanted to check in and see how your review of the draft engagement report was going? My apologies for not doing this sooner in the week. Despite my typo below, these reports are due to Yukon Government July 31, 2020. Not 2019, there is no time travel involved.
E00766	July 24, 2020	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Engagement/Consultation DO Project	Attached is a draft copy of Chance Oil and Gas (Chance)'s YESAB Project Proposal for the Eagle Plains Well Maintenance Project. In order for Chance to get all its approvals in hand before thw winter season, Chance's application will need to be submitted very shortly after sending this draft to you. At this time, our goal is to submit the Project Proposal middle of next week. As this document has not gone through Hemmera's formatting procedure, it is absent some of the figures and appendices. However, I've attached the Spill Response Plan which will be Appendix B. Chance continues to be committed to engaging with the First Nation of Na-cho Nyäk Dun. Should you wish to discuss the proposed Project in more detail, please don't hesitate to contact Chance or Hemmera.

Reference	Date	Contact Type	In / Out	Organization	Author	Proponent/Proponent Rep	External Organization Names	Topic/Regarding	Meeting/Correspondence Summary
E00743	July 31, 2020	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Engagement Reports/OIC Requirements	Please see attached for the 2020 Annual Report on the Implementation of the First Nation of Na-Cho Nyäk Dun (FNNND) and Chance Oil and Gas Engagement and Communication Plan. This report has been prepared using meeting agendas and summaries drafted by Hemmera and subsequently reviewed and agreed to by the parties. This report has been reviewd by Chance, but not reviewed by FNNND, despite our best efforts. The signature lines have been removed and the Draft waterark remains. Should FNNND wish to provide edits at a later date, we would be happy to incorporate them and prepare a final report, including signatures, for submission to Yukon Government.
E00745	August 3, 2020	Email	In	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Engagement/Consultation	My correct email address is: landsmanager@nndfn.com
E00744	August 3, 2020	Email	In	First Nation of Na-cho Nyäk Dun YG	[redacted]	[redacted]	[redacted]	Engagement Reports/OIC Requirements	We will be reaching out for a potential meeting update with you upon my return after August 18th, 2020.
E00775	August 7, 2020	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	DO Project Engagement/Consultation	This email is intended to give you early notice that Chance Oil and Gas has not yet submitted our Well Maintenance Program Project Proposal to YESAB due to evolving discussions with the regulator. The amendments are being incorporated into the Project Description and effects assessment over the next week or two as we manage vacation absences. Once updated, we will share the updated YESAB submission with you to review. I suggest that a follow up conference call or Microsoft Teams meeting be arranged to address your questions or respond to your comments to the amendments.
E00999	August 21, 2020	Email	In	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	DO Project Project Description/Activities	Email read receipt
E00872	August 27, 2020	Email	In	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	DO Project Engagement/Consultation	Email read receipt
E00909	August 28, 2020	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	DO Project Project Description/Activities	Further to Richard's email dated August 7th (attached), Chance Oil and Gas (Chance) has made a few revisions to their Project Description for the Designated Office Evaluation of their proposed Well Maintenance Program. As a result of those changes, Hemmera has also revised the effects assessment sections of the Project Proposal. Below are the reasons for the revision that have been provided to us by Chance and a brief summary of the amendment itself: 1.Ongoing conversations between Chance and Yukon Government, Oil and Gas Branch (YG) have necessitated changes. While Chance was previously of the impression wells could continue to be suspended, YG is now directing Chance to conduct inspection and maintenance activities for all eight suspended wells and then abandon those wells or bring them into active status (i.e., end the period of well suspension). Chance is now proposing to abandon six wells (i.e., M-59, M-08, J-19, G-08, B-73, and H, 28) and to bring the remaining two wells (i.e., A-25 and E-78) into active status as deep-injection wells. Waste fluid produced during the abandonment of the six wells can then be disposed of via injection into the deep-injection wells. No oil or gas is expected to be produced from the two wells proposed to be activated; they would specifically be used for disposal of waste fluid from activities associated with these maintenance activities. (See sections 2.1.4 and 2.1.5 for further description) 2.At this time, Chance cannot confirm whether it will use the Eagle Plains Hotel or the existing Chance Camp for housing workers over the duration of the Project. The decision to utilize the Eagle Plains Hotel or the Chance Camp will be made when the Project schedule is finalized. It will also have to take into consideration the Hotel's ability to accommodate Chance workers over the full duration of the Project as well as COVID-19 related self-isolation requirements at that time. As a result both options are considered in the effects assessment for the housing of the project workforce. (See sections 2.2 and 2.3 for further description) 3.When the Chance field team were at Eagle Plain early August, they observed that the route used to access M-59 would require realignment of the final portion of Blackie Winter Road. The section of the original route that proceeds north for the final kilometer is not ideal for traffic due to steeper terrain. The steeper route would result in a significant risk to the trucks bearing heavy loads, fuel supply, and other fluid handling shipments. Chance is proposing shifting the final portion of Blackie Winter Road east of the original route in order to attain a much gentler gradient. (See section 2.1.1 and Figure 2-1 for further description) Each of the amendments above are described with additional detail within the attached revised Project Proposal. As previously, not all appendices are complete yet but will be
E00871	August 29, 2020	Email	In	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	DO Project Engagement/Consultation	Email read receipt
E00903	September 15, 2020	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	DO Project Engagement/Consultation Project Description/Activities	Since my email dated August 28th, Hemmera has been in the final stages of concluding the revised DO Project Proposal for Chance's Well Maintenance program. We have appreciated your feedback and worked to include that into the application. As you know, Chance's timeline for completing this work was tied to compliance with regulations, so in an effort to ensure that the maintenance activities could occur this winter Chance needed to submit the application last week. It was submitted late Friday evening and today Hemmera received confirmation that the project was on the YESAB registry. We acknowledge that you may have future comments on the project as it progresses through the YESAB process. We continue to look forward to hearing your views and are happy to hold additional meetings to discuss and answer any questions you may have. Please see the link to the registry here: Project 2020-0151 Eagle Plains Well Maintenance and Winter Activities

E00857	September 16, 2020	Email	Out	First Nation of Na-cho Nyäk Dun Vuntut Gwitchin First Nation YG	[redacted]	[redacted]	[redacted]	Engagement/Consultation DO Project Cooperation Agreement	Attached is the most recent agreement we have with signatures from all parties to section 68 of YOGA. Hope this helps with the start of our discussion on the Workover Project. Please feel free to let us know what would be the next steps to begin our discussion.
E00928	September 17, 2020	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Benefits/Capacity Agreement DO Project Engagement/Consultation	I am providing a short update to set the stage for discussions to begin as soon as possible regarding a Benefits Agreement among the First Nation of the Nacho Nyak Dun (NND), the Vuntut Gwitchin First Nation (VG), Yukon Government (YG) and Chance Oil and Gas (Chance) in accordance with Section 68 of the Yukon Oil and Gas Act. Hemmera, acting on behalf of Chance, filed a project description with the Designated Office of the Yukon Environmental and Socio-Economic Assessment Board in Dawson last week concerning required work on eight suspended wells operated by Chance at Eagle Plain. The project is small scale and is anticipated to be completed in a two to three-month period during the winter of 2020-2021. The plan is to prepare for and abandon six of these wells and convert two others to be used for disposal of well bore fluids used in the abandonment procedures and/or recovered in the process. The activities are governed by YG oil and gas regulations and are routine oilfield practices. Details are provided in the submission document, but if you have any questions or comments, please feel free to contact me or any of my colleagues. The project area is mostly in the traditional territory of the VG, but one of the wells to be abandoned is located in the overlap area on the east side of the Dempster at Blackie M-59 which is also in Significant Discovery License 021. Although small scale, the project triggers the need for a benefits agreement with the First Nations who are affected by the activities, YG acting on behalf of all Yukoners and the proponent, namely Chance. Please advise who from the NND will be negotiating this Benefits Agreement so arrangements can be made to begin discussions.
E00883	September 18, 2020	Email	Out	Vuntut Gwitchin First Nation YG First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	DO Project Engagement/Consultation Meeting Coordination/Planning	I just wanted to follow up and hope everyone had a chance to review the last BA agreement. I would suggest that we set up a call sometime soon to discuss on how we want to proceed with section 68 negotiations. As I am away all next week, however I have include[redacted] so they can be available if the parties do agree to discuss next steps. We look forward to your response.
E00955	September 21, 2020	Phone Call	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	DO Project	Phone message left
E01001	September 21, 2020	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	DO Project Jobs/Contracts Education and Training	I am sending some information for opportunities to work on the service rig. The attachments are all the forms that need to be completed. There will be a need to have some training prior to being able to complete these forms (H2S Alive, WHMIS, First Aid and TDG).
E00834	November 2, 2020	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Engagement/Consultation DO Project	After further consideration of the proposed Project (Eagle Plains Well Maintenance and Winter Activities) activities and the requirements of the Yukon Oil and Gas Act, Chance Oil and Gas Ltd. (Chance) has determined that changes are required to the Project submitted to the Dawson Designated Office on September 11, 2020 (Project #2020-0151). As such, Chance has decided to withdraw its Project proposal and will be informing the Yukon Environment and Socio-Economic Assessment Board today, November 2, 2020. Chance intends to incorporate changes into a revised Project proposal. Once the revised proposal has been drafted, Chance will notify you by sharing a draft and requesting a meeting to discuss the changes further. After Chance has discussed those changes with the First Nation of Na-cho Nyäk Dun, the Project proposal will be finalized and resubmitted to the Dawson Designated Office. Chance understands and appreciates that making changes to this Project a second time is requesting additional effort and capacity of the First Nation of Na-cho Nyäk Dun. Chance looks forward to continuing to work with the First Nation of Na-cho Nyäk Dun and will do its best to ease this process.
E00905	November 2, 2020	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	DO Project Engagement/Consultation	After further consideration of the proposed Project (Eagle Plains Well Maintenance and Winter Activities) activities and the requirements of the Yukon Oil and Gas Act, Chance Oil and Gas Ltd. E00835	November 17, 2020	Email	In	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	DO Project Meeting Coordination/Planning	We appreciated the[redacted]. I would like to take the time to introduce you to our new FNNND representative: [redacted] will now be the primary FNNND contact person on this project. Please add him (and keep me) on the email distribution list.
E00836	November 18, 2020	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	DO Project Meeting Coordination/Planning	I'll be sure to include[redacted] on all future emails.

Reference	Date	Contact Type	In / Out	Organization	Author	Proponent/Proponent Rep	External Organization Names	Topic/Regarding	Meeting/Correspondence Summary
E00837	November 18, 2020	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	DO Project Meeting Coordination/Planning	I will definitely include Skeeter on all future emails regarding Chance's DO project (Well Maintenance and Winter Activities). Should I also include him on future emails regarding Chance's Executive Committee project (Eagle Plains Exploration)?
E00838	November 18, 2020	Email	In	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	DO Project Meeting Coordination/Planning	Yes please and thank you.
E00890	November 19, 2020	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	DO Project Engagement/Consultation Project Description/Activities	Further to my email dated November 2nd (attached), Chance Oil and Gas (Chance) has revised its Project Proposal (including updated Project Description and Effects Assessment) for Designated Office Evaluation. Below is the key project component that has changed: •Extended Flow Testing: After maintenance activities are complete and depending on wellbore integrity (as confirmed through maintenance activities), Chance proposes to conduct Extended Flow Testing (EFT) on up to three of the wells which have the highest potential for natural gas reserve. The reason for this change is to allow Chance to gather important information about the nature of the natural gas resource accumulation and its productive capability. a.Wells proposed for EFT are M-59, M-08, and J-19 (see PDF attached for Figure 2-1). Please note, Figure 2-1 is currently being updated to reflect this change. b.Revert up to three wells to suspended status (if the EFT results prove to have sufficient resource). c.Abandon three to six wells (the three remaining wells (G-08, B-73, and H-28) will be abandoned and up to additional three wells may be abandoned if wellbore integrity is not confirmed or if EFT results prove insufficient resources). •Timelines: If work cannot be completed this winter season (due to low snow pack, COVID considerations, or permitting delays), Chance will complete the project during the winter of December 2021 to March 2022. Additional detail is within the attached revised Draft Project Proposal. While revisions were made throughout the document, Section 2.1.3 is the substantive addition with respect to EFT. We've attached both a clean version and a version with tracked changes to facilitate your review. Given the very short time frame for winter work, Chance will be submitting the application to YESAB on Friday, November 20th. Hemmera anticipates FNNND requiring additional discussions with Chance to review these changes and look forward to scheduling a meeting where we can discuss these matters further to support your future submissions to the YESAA process.
E01020	November 20, 2020	Email	In	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	DO Project Project Description/Activities Engagement/Consultation	[redacted] I'm reviewing the documents as well as some of the previous work by FNNND. As a recent addition to the FNNND representatives, I'll also be conferring with others at FNNND.
E01021	November 20, 2020	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	DO Project Project Description/Activities Engagement/Consultation	I need to amend my email sent yesterday. While Chance would like to submit as soon as possible, the submission will be delayed until mid next week. If the First Nation of Na-cho Nyäk Dun has any immediate concerns, please contact us and we'll make scheduling a meeting a priority.
E01022	November 23, 2020	Email	Out	First Nation of Na-cho Nyäk Dun	[redacted]		[redacted]	DO Project Project Description/Activities Engagement/Consultation	Let me know if there is anything you need from me.
E00839	November 25, 2020	Email	In	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	Engagement/Consultation DO Project	Further to the notes below, please send me the earlier YESAB submission and a list of changes in the next submission. It would allow me to do a faster review.
E00858	November 25, 2020	Email	In	First Nation of Na-cho Nyäk Dun	[redacted]	[redacted]	[redacted]	DO Project Engagement/Consultation	Email read receipt
E00840	November 26, 2020	Email	Out	First Nation of Na-cho Nyäk Dun	Calista Morrison	Hemmera	Skeeter Wright	DO Project Engagement/Consultation Project Description/Activities	I've attached an email Hemmera sent to FNNND June 2019. It includes the draft project description for Chance's Eagle Plains Exploration Project and a presentation that Chance gave to FNNND at that time. This project will go through a YESAB Executive Committee level screening. This is the project I was referring to with respect to including you on any future emails pertaining to Chance's Executive Committee project. However, Chance (and Hemmera) haven't been actively engaging on it on this project this year... We've been focused on Chance's Eagle Plains Well Maintenance Project (or subsequently called Eagle Plains Well Maintenance and Winter Activities) which will be going through the YESAB Designated Office (DO) in Dawson City. That is the proposal we've been engaging with FNNND on for the past few months. It's this project that has changed a couple times and which Chance withdrew from YESAB a couple weeks ago. I've attached a number of emails that "tell the story" and that I hope answer your question: 1.Email with original draft of the DO submission (Eagle Plains Well Maintenance Project). 2.Email fro [redacted] an stating the submission had been delayed because Chance was considering additional changes to the proposed project. 3.Email from myself with revised DO submission, including a high level overview of the changes and Chance's reasons for those changes. a.Note: This was the draft ultimately submitted to YESAB and which Chance then withdrew. 4.Email I sent last week. Contains the current version of Chance's DO submission. The email highlighted the main change (inclusion of Extended Flow Testing). The red-line version that was attached would be the best resource for seeing/reviewing the recent changes.

EXECUTIVE SUMMARY

The Eagle Plains Project (the Project) is an oil and gas exploration program in north-central Yukon, approximately 605 km north of Whitehorse along the Dempster Highway. Chance Oil and Gas Ltd. intends to conduct exploratory activities over a 10-year period to confirm the quality, quantity, and areal extent of hydrocarbons. Project activities will include seismic exploration and exploratory wells supported by an expanded winter road network.

The Project's Regional Study Area (RSA) is approximately 2,400 km² and is spatially bounded by the Peel River and Ogilvie River to the south and the northern reaches of Chance Creek to the north. The Project is within the Eagle Plains ecoregion, an intermontane basin underlain by sedimentary rock. The regional land cover comprises subarctic coniferous forest with mixed forest and arctic/alpine tundra while also lying within a continuous permafrost zone.

For the Project to proceed, it must be evaluated under the *Yukon Environment and Socio-Economic Assessment Act*, which requires baseline wildlife information. As such, wildlife baseline studies were conducted to provide information about birds, American marten, grizzly bear, moose, and caribou to meet the information requirements to support a project proposal to the Yukon Environmental and Socio-economic Assessment Board. The following subsections provide an executive summary of each baseline study completed for the Project.

Birds

The purpose of the birds baseline study was to document the potential occurrence, relative abundance, and habitat associations of birds across the Project's RSA. This study consisted of a combination of a desktop assessment and field surveys. The desktop assessment included identifying ecosystem units across the RSA using predictive ecosystem mapping, collecting, and cleaning historic bird survey data in the broader area, and developing a comprehensive list of bird species with the potential for occurrence based on range and habitat requirements. Two types of field surveys were conducted, each targeted at broad habitat associations in the Project area: point count surveys (transects for terrestrial habitats) and wetland/pond surveys. The survey design followed a targeted, stratified habitat design to provide representative survey coverage across the range of habitat types that occur in the RSA. Point count stations were established along walking transects for efficient survey implementation, and sites were selected using a targeted, stratified habitat design. Ecosystem units for predictive ecosystem mapping were reclassified with field data to produce 32 ecosystem units that captured site-specific differences in vegetation. An average of 23 survey stations were located in each ecosystem unit, with a minimum of eight stations in uncommon habitats. Field surveys were conducted during the 2019 breeding season (June 25 to 30) by two experienced biologists.

To better explain broad patterns of habitat occupation by species of birds in the RSA, the initial 32 ecosystem units were consolidated into ten broad avian habitat types: Herb, Deciduous/Mixed Shrub, Tall Shrub – Black Spruce, Deciduous/Mixed Forest, Spruce Forest, Riparian/Wetland Deciduous Shrub, Riparian Coniferous Shrub, Riparian Spruce Forest, Open Water, and a classification ("Unknown") for distant (>100 m) or flyover observations that prevented associating birds with habitat.

Based on range and habitat, 128 bird species potentially occur in or adjacent to the RSA. Forty-eight bird species were recorded in adjacent areas during North American Breeding Bird Surveys. Possible species include eight listed either under the federal *Species at Risk Act* or identified in the Yukon *Wildlife Act*, and 67 are considered a priority and management concern under the federal *Bird Conservation Region 4 Plan*. Species listed in the *Species at Risk Act* include (with those in bold observed in the RSA): Horned Grebe (*Podiceps auritus*), Peregrine Falcon (*Falco peregrinus*), Short-eared Owl (*Asio flammeus*), **Red-necked Phalarope** (*Phalaropus lobatus*), **Common Nighthawk** (*Chordeiles minor*), **Olive-sided Flycatcher** (*Contopus cooperi*), Bank Swallow (*Riparia riparia*), and **Rusty Blackbird** (*Euphagus carolinus*).

During field surveys, nine hundred and seventy-nine birds from 53 species were observed in the RSA. Point counts identified 743 birds of 42 species, and wetland surveys identified 231 birds of 37 species. Five Swainson's Hawk (*Buteo swainsoni*) were also identified as incidental observations. Patterns of species relative abundance and richness (number of species) varied among the different habitat types. These patterns were consistent with regional habitat and known bird range-use and habitat requirements. Average relative abundance and species richness were greatest in Spruce Forest, Deciduous and Mixed Shrub, and Riparian/Wetland Deciduous Shrub habitats; and lowest in Herb and Tall Shrub – Black Spruce habitats. These patterns were generally related to the structural complexity and productivity of these different habitat types. However, the number of unique species in a given habitat did not depend on structural complexity. Many unique species were found in the Herb and Open Water habitats.

The general patterns of bird occurrence and habitat associations observed in this study are consistent with the limited information available for birds in the area.

Marten

Marten were selected as a Valued Component for the Project due to their value as a furbearer to the Vuntut Gwitchin First Nation and as an indicator species for mature and old forest values. Marten are a good species for assessing potential effects on habitat because they are more closely associated with habitat (mature forest) than many other species of medium-sized carnivore. However, little is known about basic marten ecology in northern boreal forest and taiga ecosystems. The RSA is located entirely within the Eagle Plains Ecoregion, where tree growth is limited by the presence of permafrost and short cool summers that limit the structural development of forests. The most common climax forest community is black spruce woodlands with open canopies and relatively small trees. The size and number of mature forest structures that marten use, such as large trees, snags, and coarse woody debris is much smaller than in forests used by marten in more southern latitudes. Therefore, indices of marten habitat suitability were evaluated in a relative context in this northern setting.

A habitat suitability index model was developed for marten to examine the amount, quality, and habitat distribution for the species in the RSA. Habitat was assigned a suitability ranking of High, Moderate, Low, or Nil/Very Low, relative to the range of habitat quality across the RSA. The rating categories correspond to qualitative predictions of the relative suitability of the habitat for supporting five life requisites of marten: reproduction, thermal cover, escape cover, foraging, and dispersal. High-quality habitat supports all five life requisites. Moderate-quality habitat supports escape cover, foraging, and dispersal. Low-quality habitat only

supports limited foraging and dispersal. Nil/Very Low-quality habitat does not contribute significantly to any life requisites; however, herb/shrub structural stages and stunted disclimax forest areas likely function as permeable barriers and allow intra-territorial movements within marten home ranges. Key habitat associations include selection for mature/old conifer structural stages and avoidance of herb/shrub structural stages (mostly resulting from fire), natural openings, wetlands, and stunted black spruce stands. The model also accounts for avoiding anthropogenic linear features, with greater rating reductions for wider linear features. The model uses two types of source information to provide a spatially explicit quantification of marten habitat across the RSA: vegetation mapping (Ecological and Landscape Classification mapping) and human disturbance, including the Dempster Highway, winter roads, and two types of seismic lines.

The model indicates a patchwork of High (16%), Moderate (23%), and Low (60%) quality marten habitats across the RSA. High-quality marten habitat is associated with mesic, spruce-dominant ecosites in mature to old structural stages. Concentrations of High-quality habitat include the southern portion of the study area, in the Enterprise and Dalglish Creeks watersheds, a band running east-west, north of the Dempster Highway, and the western portion of the northern half of the RSA. Moderate-quality habitat is associated with wetter and/or younger ecosystem units than High-quality habitat and is widespread across the RSA. High and Moderate quality habitat is also concentrated in narrow strips of mature/old riparian forests along some of the major watercourses in the RSA, including Chance and Greaves Creeks in the northwest and McParlon Creek west of the Dempster Highway. Low-quality habitat is associated with regenerating burns, wetlands, and stunted, open, black spruce areas. Concentrations of Low-quality habitat include recent burns on both sides of the Dempster Highway and wetlands and open, stunted spruce areas in valley bottoms in the lower reaches of the Chance watershed in the northwestern portion of the RSA. Nil/Very Low habitat constitutes only 1% of the RSA.

Linear features had a relatively minor effect on overall quality, amount, and distribution of potential habitat for marten in the RSA. This was due to the narrow width of linear features and small overall extent they comprise relative to the overall RSA. Though existing linear features result in reduced habitat quality at the site-level, their effects on habitat supply for marten at the home range scale are very limited.

Grizzly Bear

Grizzly bears (*Ursus arctos horribilis*) were selected as a Valued Component for the Project due to their conservation status and social, cultural, and economic value. Grizzly bears are Special Concern on Schedule 1 of the federal *Species at Risk Act*. The grizzly bear section provides baseline information about population trends, distribution, sources of mortality, diet, and habitat selection within the RSA. This section draws from multiple sources, including published and unpublished literature, personal communications with biologists, and traditional knowledge where available. Few studies on grizzly bears have been conducted in the Project area. Literature from surrounding regions was consulted when local information was not available.

Grizzly bear densities are thought to be low throughout the RSA. The most current grizzly bear population estimate for the broader Eagle Plains Ecoregion (which encompasses the RSA) is 184 individuals, based on expert opinion of grizzly bear habitat capacity from the 1980s. Little is known about seasonal grizzly bear distribution and movements within the RSA and surrounding areas. However, the Richardson and Ogilvie

Mountains (north and south of the RSA, respectively) are thought to have higher grizzly bear densities than the comparatively flat Eagle Plains Ecoregion. Grizzly bears congregate at the Fishing Branch River (20 km west of the RSA) in the fall to feed on spawning salmon. Grizzly bears may also follow the spring and fall migration of the Porcupine caribou herd to take advantage of the seasonal abundance of caribou as a food source.

Key threats to grizzly bear populations in the Yukon are human-wildlife conflict and harvest mortality. Licenced grizzly bear harvest rates are low in the RSA relative to other parts of the Yukon. Annual grizzly bear harvest in Game Management Zone 1 (which encompasses the RSA) has historically varied from zero to three bears per year. Other potential sources of grizzly bear mortality in the RSA include the defence of life and property kills, collisions with vehicles, and predation from other bears or large carnivores.

Seasonal grizzly bear diets reflect the phenological progression of key food resources such as herbaceous plants, roots, ungulate calves, berries, and fish. Terrestrial wildlife are likely an important food source for grizzly bears in northern Yukon, particularly barren-ground caribou (*Rangifer tarandus groenlandicus*) and arctic ground squirrels (*Spermophilus parryii*). The distribution of available food strongly influences habitat selection by grizzly bears during spring, summer, and fall seasons and the supply of suitable den sites in winter. Grizzly bears in the RSA may select habitats with abundant herbaceous vegetation, roots, or berries, such as riparian valleys and slopes. Grizzly bears may also travel to nearby mountain ranges to feed on ground squirrels, particularly in fall, as berry availability declines. Grizzly bears may follow caribou during spring and fall as they migrate to and from their calving grounds, targeting calves or opportunistically preying on adults.

Grizzly bears in northern Yukon hibernate in winter from approximately October to May. They prefer to den in mountainous regions; however, in areas with relatively flat topography (such as the RSA), grizzly bars will select small topographic features such as hills, steep riparian banks, or lakesides to excavate their dens. Grizzly bears in the taiga of northern Yukon have large home range sizes (females: 442–750 km^2, males: 760–1,250 km^2). They travel long distances to find suitable winter denning habitats in the mountains.

Moose

Moose (*Alces alces*) were selected as a Valued Component for the project's environmental assessment due to their value as a game species and their cultural values to local First Nations. The purpose of the moose study was to summarize existing baseline information for moose and develop a habitat model for the species within the Eagle Plains RSA. The habitat model quantifies the suitability, amount, and distribution of potential habitat for moose in the RSA. This information can be used to assess the Project's potential effects on moose and develop measures to mitigate effects if required.

There is limited incidental knowledge about moose population levels, distribution and habitat use within the Eagle Plain RSA. Formal population surveys of moose have not been conducted, but local knowledge suggests that, while moose densities in Eagle Plains are relatively low compared to areas in southern Yukon, they are relatively high compared to other areas in North Yukon. Information from two historical aerial surveys examining the distribution of moose (and other large mammals) indicates that moose occur across the RSA throughout the year, consistent with the relatively low elevation, subdued topography, and moderate

snowpacks that occur in the area. Several large, regenerating burns and smaller extents of riparian and wetland shrublands offer shrubby browse that moose depend on during winter.

The habitat model was developed specifically for the winter season because winter is the most limiting season for moose — forage is most limited, and energetic demands are greatest due to cold temperatures and the extra effort required to travel through snow. The model explicitly focussed on forage availability, which was believed to be the most significant factor affecting habitat selection in winter. During winter, moose feed almost exclusively on the stems and branches of certain shrubs. Vegetation surveys in the area found that several species of willows (*Salix spp.*) were the most abundant potential forage species and the species with the most frequent evidence of browsing by moose.

The habitat model included three variables, ecosystem type, structural stage, and fire disturbance status, all from recent vegetation mapping (Ecological and Landscape Classification mapping) conducted in the RSA. Habitat suitability ratings were developed for each combination of ecosystem type, structural stage, and fire disturbance based on the observed or potential abundance of willow. The highest-rated areas included natural shrublands, regenerating burns in riparian areas, and small extents of deciduous and mixed-wood ecosystems on mesic and moist sites. Moderate-rated areas were predominantly regenerating burns on mesic to wet sites. Low-rated sites were mostly undisturbed stands of open, stunted spruce on mesic to wet sites, ranging from tall shrub to old forest structural stages. Differentiating ratings between Moderate and Low areas was often difficult. Many burned and unburned sites had an average willow cover less than 15%, with high variation in cover among sites in the same ecosystem units. Generally, 7% willow cover was used as the threshold to differentiate between Moderate and Low sites. This is a relatively low value of willow cover but using a higher threshold would have resulted in large areas of regenerating burn being classified the same (Low) as undisturbed areas.

The habitat model indicates that High-suitability moose winter habitat is quite limited across the RSA, and Moderate habitat is widespread: High (12%), Moderate (43%), Low (44%), and Nil/Very Low (1%). Due to the scattered occurrence of High-suitability habitat across the RSA, some moose are expected to occur across the RSA in winter. However, local densities are likely to vary with the portions of Low and Moderate suitability habitats that form the matrix of habitat at a larger scale. This pattern of having extensive areas in Moderate suitability winter habitat is different than occurs in other parts of Yukon, especially in more mountainous regions, where suitable winter habitat (i.e., High and Moderate) are often constrained by elevation and broad vegetation patterns to a relatively small proportion of the landscape (e.g., <25%). In Eagle Plains, a substantial amount of winter forage occurs within large areas with relatively low willow cover (i.e., the Moderate suitability areas).

Caribou

The Porcupine Caribou Herd (PCH) is a subpopulation of barren-ground caribou (*Rangifer tarandus*), known for large population aggregations, dramatic population fluctuations, lengthy migrations, and significant cultural and social value to northern Indigenous peoples. Within the North Yukon Land Use Plan, the PCH is considered "the most significant and culturally important wildlife resource in the planning region." The PCH has been assessed as Threatened by the Committee on the Status of Endangered Wildlife in Canada, but the

subspecies is not listed on Schedule 1 of the federal *Species at Risk Act*. Within Yukon, barren-ground caribou are considered Vulnerable/Apparently Secure.

The specific objectives of this study were to:

- summarize existing information about the ecology of the PCH,

and, use telemetry data and analysis outputs from the Porcupine Caribou Technical Committee to:

- quantify the degree of seasonal range overlap by the PCH with the Eagle Plains Oil and Gas Exploration Project RSA during late fall and winter, when seasonal range use overlaps the RSA.
- quantify habitat use patterns and selection by the PCH during late fall and winter.
- quantify movement rates and residency periods of the PCH during late fall and winter.
- quantify potential effects of exiting linear features on the occurrence and movements of the PCH.

There is a long history of co-management of the PCH among indigenous, state, territorial and federal governments in Canada and the United States. In Canada, management initiatives are led by the Porcupine Caribou Management Board with technical support from the Porcupine Caribou Technical Committee. The Porcupine Caribou Technical Committee leads most monitoring and research work on the PCH, including population and demographic monitoring, seasonal movement monitoring (via GPS telemetry tracking), caribou body condition monitoring, habitat and human disturbance assessments, and annual snow surveys. The portion of the PCH annual range that occurs within Yukon is protected by a network of parks, special management areas, conservation areas, wilderness areas, protected areas, ecological preserves, habitat protection areas, and Integrated Management Area zones within the North Yukon Regional Land Use Plan and the Peel Watershed Regional Land Use Plan. In total, 54% of the annual range of the PCH within Yukon falls within some type of protected area where industrial activity is prohibited, 36% of the annual range occurs within regional land use plan Integrated Management Area zones where development is limited, and 9% of the annual range is not covered by any land management zonation.

Although most barren-ground caribou subpopulations are declining, the PCH numbers have increased over the last two decades. Since the first survey in 1972, the PCH has had two periods of population growth, with an interceding decline. The last successful population survey in 2017 estimated a record high of 218,457 caribou.

Like most barren-ground caribou subpopulations, the PCH has a large annual range and makes long-distance migrations, hundreds or thousands of kilometres, among different seasonal ranges. After calving on the north slope and Arctic coastal plains, the PCH typically splits in two, with portions of the herd moving southwest in Alaska and southeast in Yukon. Animals in the Yukon typically follow a clockwise movement through the seasonal ranges from the calving grounds on the north slope, to the British Mountains in summer, to the Richardson Mountains in late summer, dispersing widely and variably across northern Yukon (as far south as the Ogilvie Mountains) in fall and winter, before returning north to the coastal plains in spring. The PCH has historically overlapped the RSA in the rut/late fall and winter periods. However, the RSA overlaps a small

portion of those ranges — 6.0% of the late fall range and 6.5% of the winter range, and the RSA does not overlap with the most frequently used portions of those ranges.

Habitat selection by the PCH for late fall and winter was estimated using resource selection functions using GPS collar data from 2012 to 2021 for 164 caribou in late fall and 172 caribou in winter. Spatial habitat data included a set of plant functional type layers (light macrolichens, graminoids, forbs, evergreen shrubs, deciduous shrubs, and conifer trees), elevation, aspect, slope, terrain ruggedness, and distance to waterbodies >1 ha. PCH caribou tended to select and avoid similar resources in both late fall and winter. Key covariates in models for both seasons that were statistically significant (i.e., $P < 0.05$) included macrolichen cover (positive coefficient), conifer tree cover (negative coefficient), slope percent (negative coefficient), elevation (variable in fall and winter), and aspect (greater selection for south- and west-facing). Coefficients associated with lichen cover were of the greatest magnitude, suggesting that the selection of lichen is the primary driver of habitat selection in late fall, especially in winter. The resource selection function models were used to derive habitat quality maps with four ratings (Very Low, Low, Moderate, and High), which were determined by assessing selection ratios across resource selection function predictions. The distribution and proportion of selected habitat (Moderate and High) was then examined within the RSA and broader seasonal ranges. The proportion of selected habitat was equivalent between the RSA (0.404) and the broader range during late fall (0.415 ± 0.025) but was less in the RSA (0.265) than the broader range during winter (0.411 ± 0.026). Selected habitat, especially areas of High quality, were mostly dependent on the amount and distribution of macrolichen cover.

The potential for linear features (i.e., the Dempster Highway, winter roads, 2D seismic and 3D seismic) to mediate the base habitat model via avoidance of those features was assessed using a zone of influence (ZOI) framework. Although ZOIs were determined for some features, confidence in the outcomes was low because (i) the magnitude of the ZOI effects were weak (i.e., including the ZOI effects in the habitat models had little effects on the habitat predictions); (ii) the ZOI distance estimates were sensitive to the data and analytical methods used; (iii) the pattern of ZOI effects were not consistent with other studies and basic understanding of the PCH ecology. Developing ZOIs for assessment and management purposes will integrate results from other studies adapted to the Eagle Plains setting and the ecology of the PCH.

To better understand factors affecting PCH caribou movement, two analyses were conducted: (1) a comparison of daily movement rates and residency times of caribou in the Project RSA relative to the broader landscape, and (2) a delineation of movement paths to assess broad-scale movement patterns and the potential for caribou to interact with the Project. The PCH typically exhibits movements of several kilometres per day in late fall and winter. Late fall daily movements (8.7 km/day in the RSA) were substantially greater than during winter (4.4 km/day), and caribou tended to occupy portions of the landscape for shorter periods during late fall than during winter. Caribou residency times in both seasons were two-fold greater in the broader landscape than within the Project RSA, suggesting that, on average, the RSA is used as more of a transitory area than other portions of the seasonal ranges. There were relatively few collared caribou that travelled through the RSA during late fall. However, in the fall of 2015, 14 collared caribou made clear, directed movements along the height of land parallel to the Dempster Highway, from the northeast to the southwest. Most caribou appeared to avoid crossing the Dempster Highway while travelling through the Eagle Plains

region, but all animals eventually crossed the highway farther south, in the Ogilvie Mountains. The movements through Eagle Plains crossed numerous 2D seismic lines, winter roads and a large 3D seismic grid within the RSA.

1 INTRODUCTION

Baseline wildlife information and data are required for proposed oil and gas projects submitted to the Yukon Environmental and Socio-economic Assessment Board (YESAB) Executive Committee for screening under the *Yukon Environment and Socio-Economic Assessment Act* (YESAA), as well as applications submitted for an Industrial Licence and Type A Water Licence from the Yukon Water Board, among other permits and licences. To receive authorization for the Eagle Plains Project to proceed, the Project must be evaluated under YESAA. Specific wildlife objectives, as identified in YESAB's Proponent's Guide to Information Requirements for Executive Committee Project Proposal Submissions (2005), are to:

- describe the abundance and distribution characteristics of major wildlife species within the project area and vicinity;
- describe the habitat classifications used in the project area and any implications concerning the distribution and abundance of habitat types that may influence the project;
- provide a map showing the spatial arrangement of habitats of special interest, if applicable;
- identify and describe the transportation corridor and critical, key, and sensitive habitats;
- identify any species listed on the Committee on the Status of Endangered Wildlife in Canada (COSEWIC) and Species at Risk lists;
- describe any special management requirements due to vulnerability, threatened, or endangered status; and,
- identify and describe any ongoing studies and monitoring programs concerning wildlife in the project area and vicinity.

1.1 PROJECT OVERVIEW

The Eagle Plains Project (the Project) encompasses a 2,386 km² area in north-central Yukon, centred approximately 605 km north of Whitehorse and 40 km south and west of Eagle Plains hotel, along the Dempster Highway. The Project occurs within the Eagle Plains sedimentary basin, north of the Ogilvie River and west of the Richardson Mountains. The basin contains proven natural gas and oil reserves (Peel Watershed Planning Commission 2019), including 4.6 billion m³ of gas and 3.2 million m³ of oil (Hannigan 2014).

The Regional Study Area (RSA) has had intermittent periods of oil and gas exploration since the 1950s. That activity has established winter roads, seismic lines, and exploratory well sites across parts of the current RSA. Approximately 40 exploration wells have been drilled in the Eagle Plains sedimentary basin. Eight (8) wells are currently being maintained in suspended status, and the remaining wells have been plugged and abandoned. Seismic exploration has included approximately 10,000 km of two-dimensional (2D) lines (mostly before 1985), and about 325 km² of three-dimensional (3D) seismic was conducted in 2013/2014 (Northern Cross (Yukon) Ltd. 2014).

The current exploration program will build on past exploration to better define the extent, amount and quality of oil and gas deposits in the area. Under the current program, Chance Oil and Gas Ltd. proposes conducting additional 2D and 3D seismic data acquisition programs over large extents of the RSA and drilling up to 30 exploratory wells. Depending on the drilling program results, extended flow testing lasting up to two years may be conducted at wells where crude oil and/or natural gas are discovered to determine the quantity, quality and extent of the oil and gas deposit(s). The existing winter road network will be expanded to support the seismic, drilling, and flow testing programs. Most work is expected to be conducted in the winter (e.g., seismic line clearing and drilling); however, seismic recordings and extended flow testing may also occur during summer or year-round.

1.2 STUDY AREA

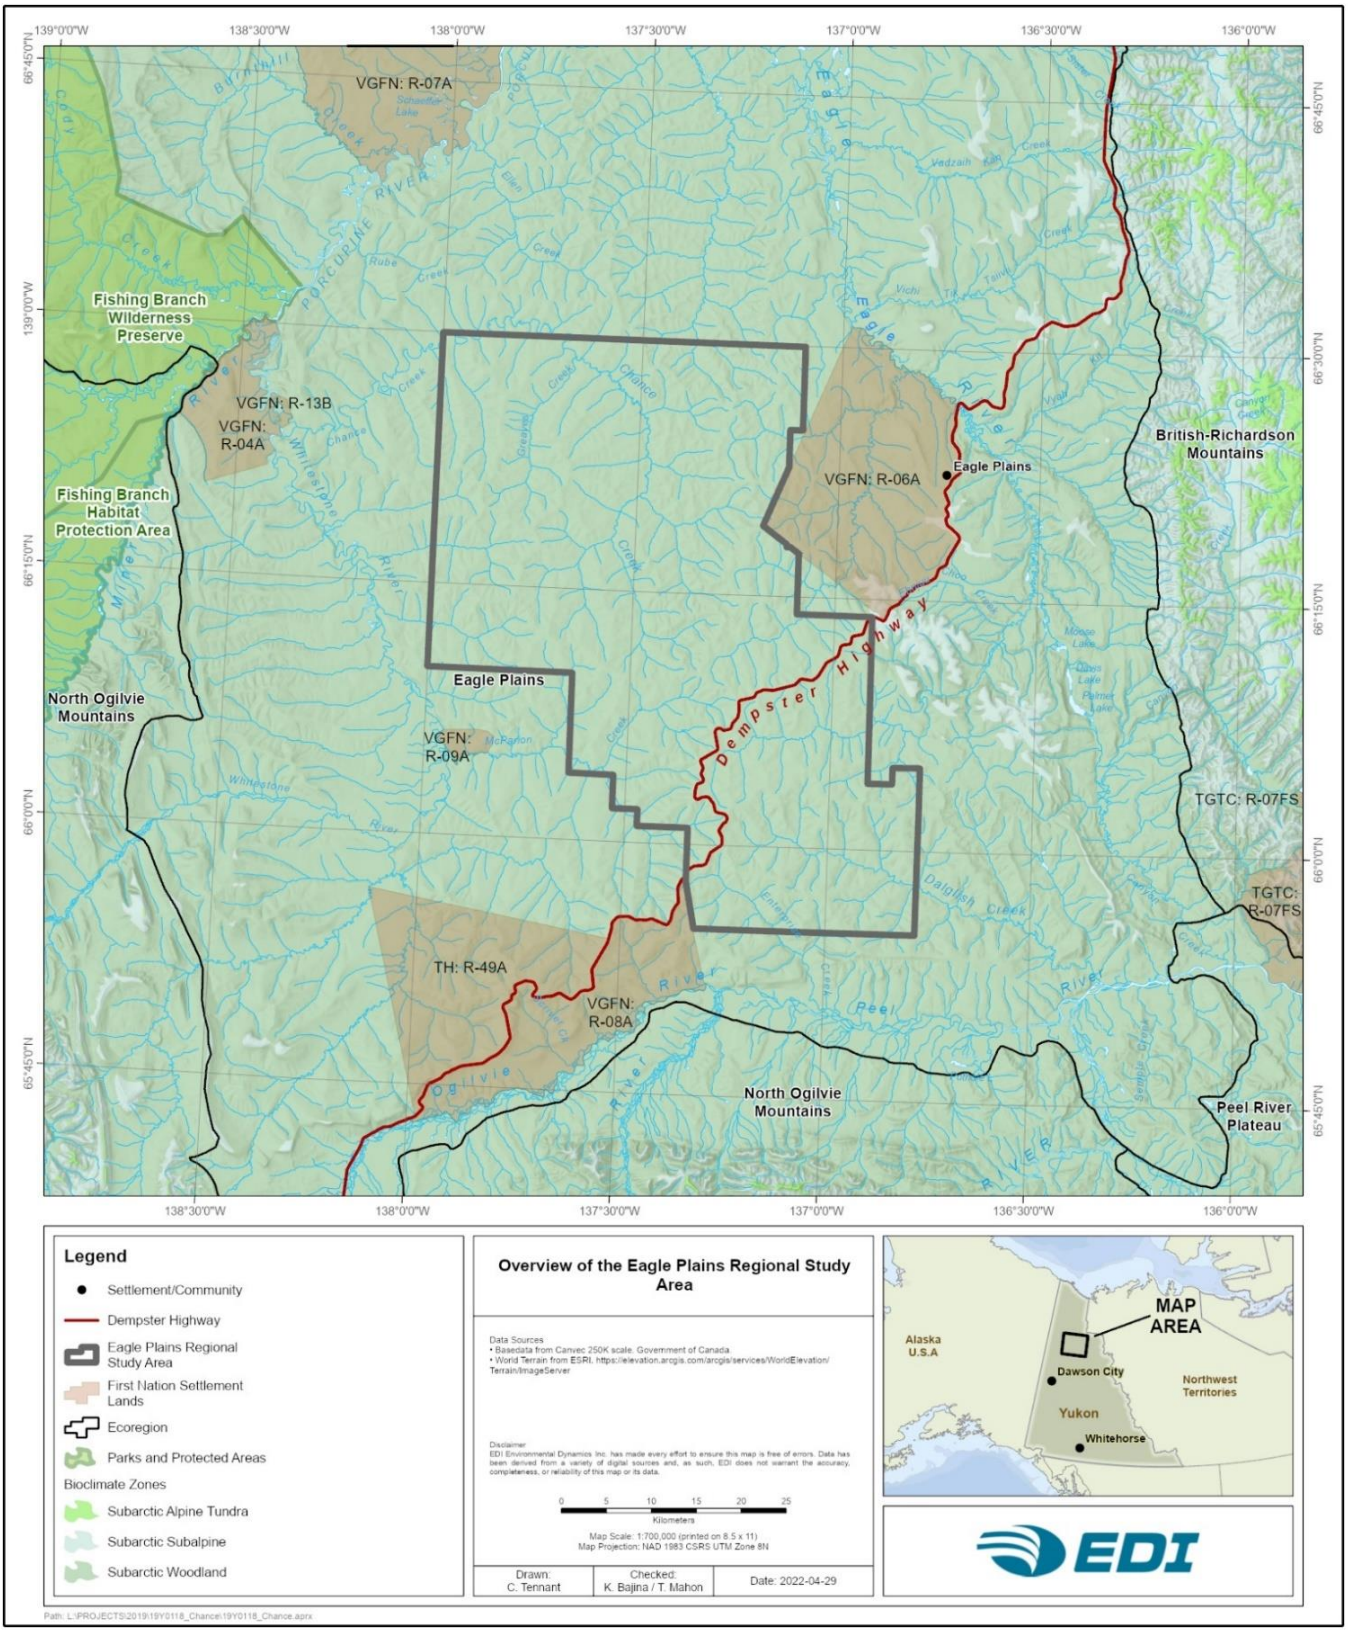
The Eagle Plains Project Regional Study Area (RSA; Map 1-1) is 2,386 km² (238,566 ha), centred in the Eagle Plains Ecoregion in north Yukon. The area consists of subdued topography of rolling hills and sloping plains. The Dempster Highway crosses the RSA along the local height of land. From there, the area drains into the Porcupine River watershed to the north (via Chance Creek) and west (via McParlon Creek and the Whitestone River) and into the Peel River watershed to the southeast (via Dalglish Creek).

The RSA overlaps four First Nation Traditional Territories. Most of the RSA is within the Vuntut Gwitchin First Nation (VGFN) Traditional Territory. The southeastern portion is in an area of overlapping Traditional Territories of VGFN, the Tetlit Gwich'in Council (TGC), the First Nation of Na-cho Nyäk Dun (NND), and Tr'ondëk Hwëchin First Nation (THFN). Although the RSA is outside any First Nation Settlement Lands, it adjoins VGFN Settlement Lands on parts of its east and southwest borders.

Development in the RSA and the surrounding Eagle Plains is low. The Dempster Highway is the main vehicle access corridor, running from approximately Dawson City, Yukon in the southwest to Inuvik, Northwest Territories (NWT) to the northeast and transiting the RSA along the way. Several winter access roads also branch off the Dempster Highway. A network of seismic lines (Photo 1-1) from historical exploration are found in the RSA. The Eagle Plains settlement is located on the Dempster Highway, approximately 30 km east of the RSA boundary and consists of the Eagle Plains Hotel and the Government of Yukon's Highway Maintenance camp.

The Project is within the North Yukon Planning Region and Peel Watershed Planning Region. Therefore, it is subject to the North Yukon Land Use Plan (NYLUP) and Peel Watershed Land Use Plan (PWLUP). The project falls within the Integrated Management Area (IMA) Zone IV of both plans, a zone with lower ecological and cultural values and the highest permissible development of the four IMA zones.

Photo 1-1. Seismic lines from historical exploration activities within the Regional Study Area.



Map 1-1. Overview of the Eagle Plains Regional Study Area.

1.3 ECOLOGICAL OVERVIEW

The Project falls within the Eagle Plains Ecoregion (Map 1-1), a 20,400 km² region in north Yukon between the Richardson and Ogilvie Mountains. The ecoregion consists of low-altitude rolling topography between 300 m and 600 m above sea level (masl), with few scattered peaks above and around 1,000 masl (Ecological Stratification Working Group 1995).

The Eagle Plains Ecoregion experiences moderate precipitation, with annual amounts around 400 mm. Most precipitation falls as rain throughout the summer, averaging 50 to 80 mm per month, from June through August. Precipitation is lighter through September to April and falls as snow, with average winter snowpacks of 80 cm peaking in April. The climate in this region is strongly affected by its latitude, with extended winter conditions that usually last from October through to early May. There is a substantial variation in seasonal temperatures in the Eagle Plains, with cool short summers and long cold winters. Average winter temperatures are between −30°C and −25°C, with extremes as low as −60°C. Average summer temperatures are around 13°C, with extremes as high as 30°C. Due to the northern latitude, this region experiences brief periods of continuous sun above and below the horizon in summer and winter, respectively.

Most of the Ecoregion, including the northeast portion of the RSA, drains north into the Yukon River via the Whitestone, Porcupine and Eagle rivers. That part of the RSA includes the headwaters of the Eagle River and several other tributaries of the Porcupine River, along with the Chance and McParlon Creek subdrainages of the Whitestone River. The southeast corner of the Ecoregion drains east to the Mackenzie River via the Peel, Wind and Ogilvie Rivers. Dalglish and Enterprise creeks flow directly into the Peel River. The few lakes in the Ecoregion are generally oxbow or thermokarst lakes (Yukon Ecoregions Working Group 2004a). Several wetland complexes are found to be associated with larger creeks in the RSA.

The Eagle Plains Ecoregion is dominated by the Crysolic soils that occupy much of the northern third of Canada, characterized by near-surface permafrost. Turbic Cryosols predominate, exhibiting patterned ground formations and hummocks, and are often associated with open stands of black spruce (*Picea mariana*), tamarack (*Larix laricina*) and birch (*Betula* spp.). The active permafrost layer in these ecosystems generally ranges between 20 cm and 90 cm below the surface. The active layer depth is generally deeper under hummocks and shallower under inter-hummock areas (Yukon Ecoregions Working Group 2004a).

The RSA is entirely within the Subarctic Bioclimate Zone (Environment Yukon 2014a). Vegetation in the RSA is characterized by open-canopy, spruce-dominated habitats where permafrost generally limits tree growth and results in stunted, disclimax vegetation communities (Environment Yukon 2016a). Hummocky, black spruce and white spruce (*Picea glauca*) woodlands with well-developed shrub communities are common in upland areas, with white spruce and ground lichens increasing in abundance in well-drained sites. Areas with low slope gradients and fine-textured soils often have ground cover dominated by cottongrass tussocks beneath a shrub layer of birch, black spruce, Labrador tea (*Rhododendron groenlandicum*), and occasionally tamarack (Yukon Ecoregions Working Group 2004a).

Evidence of forest fires can be observed throughout the RSA (Photo 1-2 and Photo 1-3). Alaskan paper-birch (*Betula neoalaskana*) is often the first tree species to colonize burn areas, and the extent of old burns is generally

correlated with young black spruce – Alaskan paper birch woodlands (Yukon Ecoregions Working Group 2004a). Fires increase the depth of the active permafrost layer, causing slope failures and changes in ecosystem moisture regimes.

Photo 1-3. Example of a recently burnt area of the RSA.

2 BIRDS

2.1 PURPOSE AND OBJECTIVES

This section documents the occurrence, relative abundance, and habitat associations of birds occurring or likely occurring in the RSA. It includes a desktop assessment to collect and summarize existing information about birds; and field surveys to document the occurrence, relative abundance, and habitat associations of birds within the RSA. Field surveys were recommended by the regulator responsible for migratory birds (Environment and Climate Change Canada — Canadian Wildlife Service [CWS]) because no systematic bird surveys have been previously conducted in the Project area. Surveys in adjacent areas were limited and mainly were road-based surveys, which had limited or no coverage of particular habitat types. Two field survey types were used to provide representative coverage of broad avian habitat types and associated avian communities: (1) point count surveys and (2) pond and wetland surveys.

2.2 BIRD HABITAT OVERVIEW

The Project falls within Bird Conservation Region 4 (BCR 4), the Northwestern Interior Forest (Environment Canada 2013a). BCR 4 is home to 211 regularly occurring bird species, including 31 waterfowl species, 19 water bird species, 23 shorebird species, and 138 land bird species (Environment Canada 2013a). Most species are breeding season migrants, few are year-round residents. The Project is also within ~30 km of two other bird conservation regions: region 3 (BCR 3), the Arctic Plains and Mountains, and region 6 (BCR 6), the Boreal Taiga Plains. BCR 3 habitats are influenced by a short growing season and continuous permafrost; upland habitats range from heavily vegetated heath communities to sparse cryptobiotic crusts, lichens, and moss; in the southern end, dwarfed spruce trees are often found in restricted patches (Environment Canada 2013b). BCR 6 is primarily characterized by gently rolling or undulating landscapes, vegetation dominated by the boreal forest and interspersed with wetlands and several major river systems (Environment Canada 2013c). In total, BCR 3 has 159 species of birds, while BCR 6 has 288. This current study did not find species uniquely associated with either of these two conservation regions.

The RSA has three predominant bird habitat types: black spruce upland, willow and scrub birch shrubland, and scrub fens and bogs. Upland forests provide potential breeding habitat for resident Northern Goshawk (*Accipiter gentilis*), Spruce Grouse (*Canachites canadensis*), Northern Hawk Owl (*Surnia ulula*), American Three-toed Woodpecker (*Picoides dorsalis*), Canada Jay (*Perisoreus canadensis*), Boreal Chickadee (*Poecile hudsonicus*), White-winged Crossbill (*Loxia leucoptera*), and Common Redpoll (*Acanthis flammea*) (Frisch 1987, YEWG 2004, Environment Canada 2013). Migrants that breed in upland forests include Swainson's Thrush (*Catharus ustulatus*), Gray-cheeked Thrush (*Catharus minimus*), Varied Thrush (*Ixoreus naevius*), Bohemian Waxwing (*Bombycilla garrulus*), Yellow Warbler (*Setophaga petechia*), Yellow-rumped Warbler (*Setophaga coronata*), American Tree Sparrow (*Spizelloides arborea*), and Dark-eyed Junco (*Junco hyemalis*) (Frisch 1987, YEWG 2004). American Kestrel (*Falco sparverius*), Say's Phoebe (*Sayornis saya*), American Robin (*Turdus migratorius*), Orange-crowned Warbler (*Leiothlypis celata*), and Chipping Sparrow (*Spizella passerina*), as well as other species of thrush, warbler,

and sparrow, can be found in more open forests with a well-developed shrub layer, or shrublands with tall shrub and dwarfed spruce (Frisch 1987, YEWG 2004). A frequently occurring species in the Eagle Plains ecoregion, though rare elsewhere in Yukon, is Swainson's Hawk (*Buteo swainsoni*). This species is associated with isolated stands of productive white spruce for nesting habitat, mostly found in narrow riparian strips surrounded by open bogs and shrublands where they regularly forage.

Aquatic habitats for birds consist of open bodies of water (e.g., ponds, lakes), wetlands (mostly bogs and fens) and riparian zones dominated by sedges and shrubs. Open water bodies are limited in the RSA and are thus potentially inhabited by relatively few Tundra Swan (*Cygnus columbianus*), Greater White-fronted Goose (*Anser albifrons*), Canada Goose (*Branta canadensis*), American Wigeon (*Mareca americana*), Green-winged Teal (*Anas crecca*), and Bufflehead (*Bucephala albeola*) (Frisch 1987, YEWG 2004, Environment Canada 2013). Shorebirds such as Lesser Yellowlegs (*Tringa flavipes*), Solitary Sandpiper (*Tringa solitaria*), and Wilson's Snipe (*Gallinago delicata*) remain along the water's edge and in riparian zones consisting of coniferous and deciduous vegetation. Riparian zones also provide potential breeding habitat for Willow Ptarmigan (*Lagopus lagopus*), Alder Flycatcher (*Empidonax alnorum*), Yellow Warbler, Wilson's Warbler (*Cardellina pusilla*), American Tree Sparrow, and Lincoln's Sparrow (*Melospiza lincolnii*) (Frisch 1987, YEWG 2004). Spotted Sandpiper (*Actitis macularius*), Herring and Short-billed Gulls (*Larus argentatus* and *L. brachyrhynchus*), Belted Kingfisher (*Megaceryle alcyon*), Bank Swallows (*Riparia riparia*), and Cliff Swallows (*Petrochelidon pyrrhonota*) can be found along rivers (Frisch 1987, YEWG 2004).

Alpine/subalpine areas are absent from the RSA. Species that inhabit the alpine/subalpine in other parts of the ecoregion include Golden Eagle (*Aquila chrysaetos*), Rock Ptarmigan (*Lagopus muta*), Horned Lark (*Eremophila alpestris*), American Pipit (*Anthus rubescens*), Gray-crowned Rosy Finch (*Leucosticte tephrocotis*), Upland Sandpiper (*Bartramia longicauda*), and Townsend's Solitaire (*Myadestes townsendi*) (Frisch 1987, YEWG 2004).

The Project RSA does not include cliffs or bluffs that could be used by cliff-nesting raptors, such as Golden Eagle, Peregrine Falcon (*Falco peregrinus*) or Gyrfalcon (*Falco rusticolus*). These species' nearest suitable nesting cliffs are along the Porcupine River and Eagle River (Hayes and Mossop 1978).

Data on birds in the Project area are currently limited. The first evaluation of bird occurrences in Eagle Plains was *Birds by the Dempster* (Frisch 1987). Birds of the Yukon Territory (Sinclair et al. 2003) provided a more detailed description of species occurrences, habitat, and relative abundances. More recently, a general account of birds within the region was presented by Environment and Climate Change Canada in their report, *Bird Conservation Strategy for Bird Conservation Region 4 in Canada: Northwestern Interior Forest* (Environment Canada 2013a). The North American Breeding Bird Survey (NABBS) is the best local data source. Two NABBS routes along the Dempster Highway (routes 78 and 79) are close to the Project.

2.3 METHODS

This study consisted of two components: a desktop assessment to collect and summarize existing information about birds relevant to the Project area and field surveys to document the occurrence, relative abundance, and habitat associations of birds across the Project RSA. This approach, field survey design, and methods details

were discussed with CWS representatives during the project planning stage. The methods used considered specific recommendations provided by CWS representatives and a broader set of recommendations in *A Framework for the Scientific Assessment of Potential Project Impacts on Birds* (Hanson et al. 2009). The methods selected and reporting herein also comply with the the ten key considerations identified in the DRAFT updated guidelines *Canadian Wildlife Service Guidance Regarding Information Needed to Support Assessment of Project Effects on Birds* (ECCC-CWS 2022).

2.3.1 DESKTOP ASSESSMENT

A list of bird species that had the potential to occur in the Project RSA was developed from a combination of historical occurrence data in adjacent areas, a territorial field guide, and a national bird conservation assessment.

Historical data were gathered from the NABBS database for two routes (routes 78 and 79) that run along the Dempster Highway in the Eagle Plains region (Pardieck et al. 2019). The NABBS is a long-term, large-scale monitoring program that began in 1966 to track trends in avifauna. It consists of annual (one day a year) standardized roadside surveys, during the peak breeding season, by skilled observers making 50 stops spaced 0.8 km apart, along 39.4 km long routes. Observers record the number of bird species heard from any distance or seen within a 0.4 km radius of each stop during a three-minute observation period. These data are then compiled and made freely available to analyze trends in relative abundance and species composition. From 2014 to 2018, NABBS identified 48 species along Eagle Plains' two routes (above) (Pardieck et al. 2019).

General information about bird species occurrences was obtained from *Birds by the Dempster* (Frisch 1987), *Birds of Yukon* (Sinclair et al. 2003), and the Federal conservation assessment, *Bird Conservation Strategy for Bird Conservation Region 4 in Canada: Northwestern Interior Forest* (Environment Canada 2013a). These sources ranked species as 'Likely' or 'Possible' in the RSA based on habitat requirements, range boundaries, and occurrence information. Likely species were those whose range overlapped with the RSA, and suitable habitat occurred in the RSA. Possible species included (1) those with suitable habitat in the RSA, but whose range was on the edge of the RSA, and (2) those whose range overlapped with the RSA, but for which the availability of suitable habitat was in question.

2.3.1.1 Conservation Status

The conservation status of bird species was identified based on the most recent recommendations by COSEWIC (COSEWIC 2018) and current lists in the *Species at Risk Act* (SARA) registry (i.e., the most recent amendment, Environment and Climate Change Canada 2019) and BCR 4 plan. The SARA registry groups species into one of three schedules:

- Schedule 1 — the official list of species at risk in Canada includes species that are either Extirpated, Endangered, Threatened or of Special Concern;
- Schedule 2 — species designated as Endangered or Threatened, but that have yet to be re-assessed by COSEWIC under the revised criteria; and,

- Schedule 3 — species designated as Special Concern but have yet to be re-assessed by COSEWIC under the revised criteria.

Birds that fall under conservation categories of Special Concern or higher were identified. All bird species of conservation concern, identified through the designation and ranking processes described above, were evaluated against their species conservation status assessment found in the national bird conservation strategy for BCR 4 (Environment Canada 2013a). The BCR 4 strategy outlines conservation planning and priorities to support the implementation of migratory bird conservation programs. The BCR species assessment considered population size, population trend, regional abundances and densities, and species and habitat threats to designate species warranting "Concern and Stewardship at the Regional, National, or Continental level". Stewardship species are based on "having a large proportion of their world population within BCR 4". Species managed by Environment Yukon under the Yukon *Wildlife Act* were also noted.

2.3.2 HABITAT STRATIFICATION

A broad avian habitat classification system was developed to provide representative survey coverage across the RSA. A habitat stratification approach was applied to site selection for all survey sites before field surveys. Avian habitat types were initially developed using Predictive Ecosystem Mapping (PEM), later verified with Ecological and Landscape Classification (ELC) mapping for habitat-related analyses. Two key components of the initial PEM mapping to define avian habitat types were: ecosystem units and structural stage, described below.

2.3.2.1 Ecosystem Units (Ecosites)

The North Yukon PEM was used to classify 16 ecosystem units in the Project RSA. However, the PEM model was unsatisfactory when assessing ecosite predictions in the field because of its low accuracy. The PEM ecosite codes were used to guide each survey location, but adjustments were made to the classifications according to the dominant vegetation. These changes were supplemented with detailed notes and descriptions of plant and tree species (i.e., lichen cover, percent shrubs, tree height and canopy closure), as well as photographs, with the intent of reclassification.

The purpose of reclassifying PEM ecosystem units was to describe site-specific vegetation at a finer resolution and, ultimately, develop more accurate associations between species of birds and habitat in the Project RSA. A detailed review was conducted of all point count and wetland survey forms, including a review of notes on species of vegetation and structural stage (Table 2-1) and analyzing each survey station's photographs. Deciduous and coniferous (i.e., primarily black spruce) vegetation were distinguished based on their relative densities at ecosites previously classified as mixed wood. Patterns of bird occupation were then analyzed to determine whether deciduous and mixed vegetation warranted separate ecosite codes. Shrub-stage and mature-stage spruce stands were differentiated based on tree height and the degree of canopy closure. Separating these two structurally distinct stands yields two ecological communities with different bird assemblages, e.g., species requiring mature trees for nest cavities, such as owls and woodpeckers, are unlikely to be found in shrub-stage forests. These new ecosites were summarized along with their previous PEM codes

and descriptions of key vegetation characteristics. In total, 32 distinct ecosystem units were developed from the PEM model (Table 2-2).

Table 2-1. Structural and successional stages of vegetation associated with ecosystem units in the Eagle Plains Project Regional Study Area.[1]

Code	Structural Stage	Description
1	Non-vegetated	Very recent disturbance and no vegetation (or <5% vegetation).
2a	Sparse	Initial stages of primary and secondary succession with 5–10% vegetation cover maintained by environmental conditions.
2b	Cryptogram (Bryoid-dominated)	Bryophyte-dominated community maintained by environmental conditions.
3a	Herb (Forb-dominated)	Early successional stage of herbaceous communities maintained by environmental conditions or disturbance. Includes non-graminoid herbs and ferns.
3b	Herb (Graminoid-dominated)	Early successional stage of herbaceous communities maintained by environmental conditions or disturbance. Includes grasses, sedges, reeds, and rushes.
3c	Herb (Aquatic)	Early successional stage of herbaceous communities maintained by environmental conditions or disturbance. Dominated by floating or submerged plants.
4a	Tall Shrub	Early successional stage of forest or shrub communities dominated by shrub layer vegetation > 2 m tall.
4b	Low Shrub	Early successional stage of forest or shrub communities dominated by shrub layer vegetation <2 m tall.
5	Pole/Sapling	Trees >2 m tall and typically densely stocked. Vertical structure and layering not yet evident.
6	Young Forest	Forest canopy with distinct layers and somewhat open stand.
7	Mature Forest	Mature trees and well-developed understories at canopy openings.
8	Old Forest	Old and structurally complex stands composed mainly of shade-tolerant and regenerating tree species.

Modified PEM	PEM	*N*[1]	Vegetation Description
211-D	211	7	Wet deciduous shrub; predominantly willow and scrub birch. Structural stage 4b.
211-SB	211, 213	3	Wet black spruce shrub (peat bog). Structural stages 4a–6.
211-SB-ML	211, 213	2	Wet black spruce shrub with moderate lichen cover. Structural stages 4a–6.
213-tp	213	2	Wet black spruce dominant forest; tall and productive stands. Structural stages 6 and 8.
221	221	1	Moist mixed shrub; black spruce and deciduous (scrub birch and willow). Structural stage 4b.

Modified PEM	PEM	*N*[1]	Vegetation Description
221-D	221	12	Moist deciduous shrub; predominantly scrub birch and willow. Structural stages 4a–b.
221-SB	221, 223	18	Moist black spruce shrub. Structural stages 4a-6.
221-SB-LL	221, 223	3	Moist black spruce shrub with low lichen cover. Structural stage 4a.
221-SB-ML	223	2	Moist black spruce shrub with moderate lichen cover. Structural stage 6.
221-SB-HL	221	1	Moist black spruce shrub with high lichen cover. Structural stage 4a.
222	222	6	Moist mixed forest; spruce and deciduous (birch and/or alder). Structural stages 5-8.
222-D	222	1	Moist deciduous forest; birch dominant. Structural stage 6.
223-tp	222, 223	4	Moist black spruce forest; sometimes mixed with white spruce. Structural stages 6-7.
223-LL-tp	223	2	Moist black spruce forest; sometimes mixed with white spruce; low lichen cover. Structural stages 6-7.
230	230	1	Mesic herb with <15% shrub cover. Structural stages 2b and 4b.
231-D	231	4	Mesic deciduous shrub; predominantly willow and scrub birch. Structural stages 4a–b.
231-D-ML	231	1	Mesic deciduous shrub; predominantly willow and scrub birch; moderate lichen cover. Structural stage 4a.
231-SB	231, 233	7	Mesic black spruce shrub. Structural stages 4a–6.
231-SB-HL	233	3	Mesic black spruce shrub with high lichen cover. Structural stages 4a–6.
232	232	3	Mesic mixed forest; black spruce and deciduous (paper birch and/or trembling aspen). Structural stages 5–6.
232-D	232	3	Mesic deciduous forest; predominantly paper birch and willow. Structural stages 5–6.
233-tp	233	5	Mesic black spruce forest sometimes mixed with white spruce; tall and productive stands. Structural stages 6-7.
233-LL-tp	233	1	Mesic black spruce forest with some black spruce shrubs; low lichen cover; tall and productive stands. Structural stages 4b, 6–7.
233-HL-tp	233	1	Mesic black spruce forest; high lichen cover; tall and productive stands. Structural stage 6.
310	310	4	Riparian herb with little to no shrub cover. Structural stages 3b–c.
311-D	311	22	Riparian deciduous shrub; predominantly scrub birch and willow. Structural stages 4a-b.
311-SB	311, 313	4	Riparian black spruce shrub. Structural stages 4a–6.
311-SB-T	311	4	Riparian black spruce and tamarack shrub. Structural stages 4a–6.
313	313	11	Riparian spruce forest; mix of black and white spruce, as well as hybrids. Structural stages 6–8.
400	400	4	Wetland herb. Structural stage 3b.
401-D	401	1	Wetland deciduous shrub; predominantly scrub birch and willow. Structural stage 4b.
500	500	17	Open water.

[1] Sample size, the number of survey stations (point count or pond) within each modified PEM ecosite.

2.3.2.2 Bird Habitat Types

Once ecosystem units were reclassified, they were grouped according to vegetation and structural stage similarities. Mixed and deciduous vegetation, while ecologically distinct, did not differ in their use by birds; therefore, they were grouped in a single category. Ultimately, 32 ecosystem units were consolidated into ten broad avian habitat types: Herb, Deciduous/Mixed Shrub, Tall Shrub – Black Spruce, Deciduous/Mixed Forest, Spruce Forest, Riparian/Wetland Deciduous Shrub, Riparian Coniferous Shrub, Riparian Spruce Forest, Open Water, and a classification ('Unknown') for distant (>100 m) or flyover observations that prevented associating birds with habitat (Table 2-3). As a post hoc exercise, ELC ecosite types were assigned to broad habitat types based on the spatial overlap with survey sites with the ELC map and verified using field-based habitat descriptions (Table 2-3). For a complete list of ELC codes, names, and descriptions, see Attachment Table 1 in Section 2.6.1 (Attachment 2-A).

Table 2-3. Avian habitat types developed by grouping modified Predictive Ecosystem Mapping ecosites, based on their similarities in vegetation and structural stages, in the Eagle Plains Project Regional Study Area. *A posteriori* classified ELC ecosites are provided for each habitat type.

Avian Habitat Type	Modified PEM Ecosite	ELC Ecosite[1]	Structural Stages	*N*[2]	Vegetation Description
Herb	230, 310, 400	31, 33, 42, B2	2b, 3b, 3c, 4b	9	Herb dominant sites found along crests and upper slopes, riparian zones, and wetlands; <20% shrub cover.
Deciduous and Mixed Shrub	211-D, 221, 221-D, 231-D, 231-D-ML	06, 22, 23, 31, 33, 34, 35, 42, B2	4a-b	24	Predominantly scrub birch and/or willow vegetation, sometimes with a mix of black spruce; lichen cover possible.
Tall Shrub – Black Spruce	211-SB, 211-SB-ML, 221-SB, 221-SB-LL, 221-SB-ML, 221-SB-HL, 231-SB, 231-SB-HL	05, 06, 14, 20, 23, 33, 34, 42	2b, 4a-b, 6	35	Tall shrub/dwarfed black spruce dominated area often with low to high lichen cover.
Deciduous and Mixed Forest	222, 222-D, 232, 232-D	04, 05, 06, 33, 34	5, 6, 7, 8	13	Birch dominant forest or mix of spruce and deciduous (e.g., birch, aspen, and alder) stands.
Spruce Forest	213-tp, 223-tp, 223-LL-tp, 233-tp, 233-LL-tp, 233-HL-tp	05, 33, 42, B1	6, 7, 8	14	Black spruce dominant forest, sometimes mixed with white spruce, and often with low to high lichen cover. Ranges from intermediate height stands with open canopy to tall and closed canopy forest.
Riparian/Wetland Deciduous Shrub	311-D, 401-D	20, 23, 31, 33, 35, 42, 43, 44	2b, 3b, 4a-b	23	Predominantly scrub birch and willow shrub along riparian zones and wetlands.
Riparian Coniferous Shrub	311-SB, 311-SB-T	22, 33, 35, 42, 43, B1	2b, 4a-b, 6	8	Black spruce and tamarack dominant riparian shrub.
Riparian Spruce Forest	313	22, 23, 31, 35, 42, 43, B2	6, 7, 8	11	Dominated by mix of black and white spruce, as well as spruce hybrids.
Open Water	500	LA, PD	1	17	Non-vegetated open water.
Unknown	UNK	UNK	UNK	74	Unknown habitat due to distant observations (>100 m) or flyovers.

[1] Broad ELC polygons within which survey stations were located.

[2] Sample size, the number of survey stations (point count or pond) within each habitat group.

2.3.3 OCCURRENCE AND DISTRIBUTION SURVEYS

Two experienced bird biologists conducted field surveys in the Project RSA between June 25 to 30, 2019. Each biologist had more than 15 years of experience conducting point count surveys and could reliably identify all bird species by sight and vocalizations that had the potential to occur. All surveys employed a targeted, stratified habitat design to provide sampling across all broad avian habitat types.

2.3.3.1 Breeding Bird Point Count Surveys

'Point count' surveys were conducted in terrestrial habitats following standardized survey methods (Ralph et al. 1995, Resources Inventory Committee 1999a, Matsuoka et al. 2014). Point count stations were visited along walking transects to facilitate efficient survey productivity (i.e., versus individual point counts spaced more widely, which would have resulted in longer travel time and a lower number of survey stations). Point count survey stations were established within a Geographic Information System (GIS) using guided site selection to provide coverage across all avian habitat types and broad spatial coverage across the RSA (Map 2-1). Random site selection approaches were explored but ultimately not used because of challenges associated with safety (steep terrain), logistics (access), and reduced sample sizes (i.e., randomization resulted in much smaller sample sizes due to greater travel times to transect starting stations and between stations). Site selection targeted a minimum of four stations in each habitat type. The location of existing and proposed development features was also considered to ensure the surveys covered those areas. Stations were spaced approximately 500 m apart, with a minimum spacing of 400 m, to avoid counting the same birds from multiple stations. Point count locations were chosen in two ways to associate bird occurrences with habitat types: (1) locating stations within one PEM polygon, at least 100 m from the polygon edge; and (2) locating the station on the boundary between two PEM polygons where the location of birds in different habitat types could be reliably determined (e.g., on the transition between shrubland and forest type). Each point count station was surveyed once to maximize the number of sampled sites.

Survey methods followed standard point count survey methodologies (Ralph et al. 1995, Resources Inventory Committee 1999a, Matsuoka et al. 2014). Surveys used a 10-minute detection period and an unlimited recording distance. Biologists conducted surveys during the dawn chorus (i.e., a half-hour before dawn to ~8:30) when territorial singing rates are highest. Upon arriving at the predetermined survey station location, surveyors evaluated the station location and, where appropriate, revised the location by up to 50 m to aid in accurately plotting bird locations in their associated habitat types. Once on station, surveyors waited two minutes to allow any birds disturbed by the surveyor's arrival to settle and resume their activities. Once the official observation period began, surveyors recorded all birds detected (visual or auditory) during the 10-minute detection period by plotting their locations on a point count map form and recording the standardized four-letter species name abbreviation, time of detection, sex, age, number, behaviour, and the habitat type in which they occurred (i.e., ecosystem unit and structural stage). Surveyors assigned birds estimated to be >100 m distant at a distance of 101 m due to the high uncertainty of estimates at those distances. Following the surveys, a bearing and distance were measured on the point count map from the

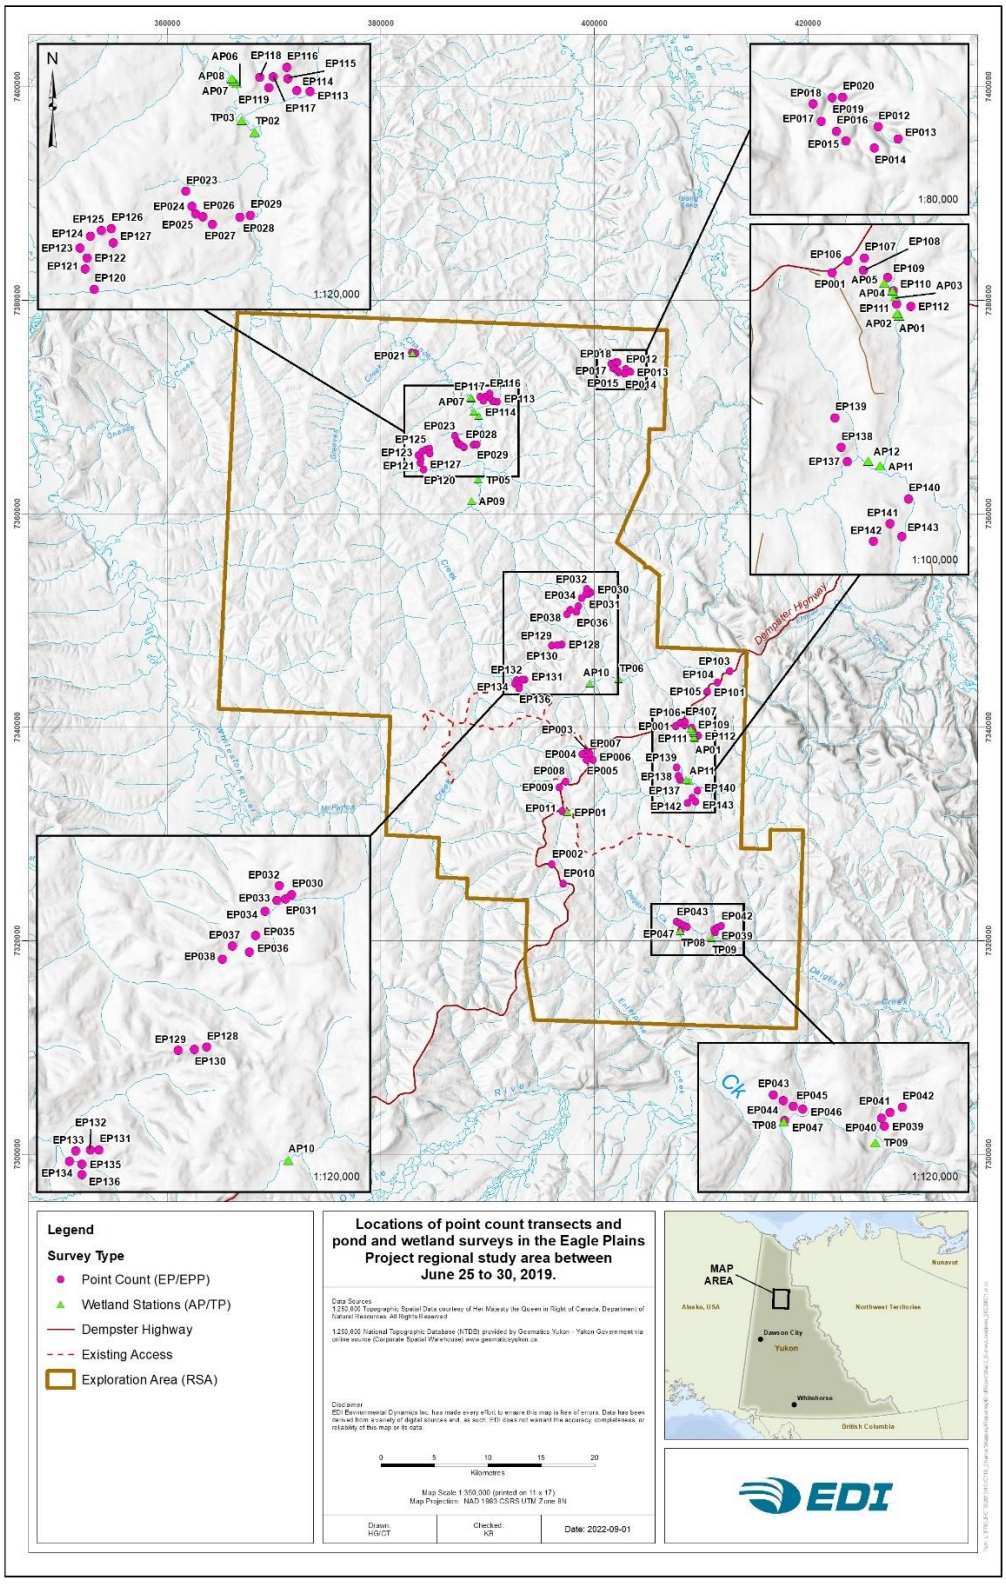
station location for each bird observation (<100 m) used to calculate coordinates for each observation. A total of 91 point count stations were surveyed over six days.

2.3.3.2 Pond and Wetland Surveys

For wetland surveys, protocols were adapted from the BC RISC Standards *Inventory Methods for Waterfowl and Allied Species* (Resources Inventory Committee 1999b). Before surveys, ponds and open water wetlands within 3 km of existing or proposed project development were identified using the PEM map. Shoreline surveys were conducted at 19 unique ponds, and observations were made from stations along the shoreline using binoculars and scopes. The number of stations varied from one to five, depending on the size and shape of the ponds. Approximately half of a pond's total perimeter was traversed along a section of shoreline parallel to the longest axis of the feature to provide complete visual coverage of the waterbody. Surveyors approached waterbodies covertly and began surveys behind screening vegetation to avoid flushing birds from the ponds before they were tallied. Ground-based surveys were thought to provide a census of birds present at each pond. However, a few birds obscured by shoreline vegetation may not have been counted. Biologists recorded the following information for each pond for all detected birds: species, sex, age, number, and habitat associations.

2.3.3.3 Cliff-nesting Raptors Habitat Assessment

Cliff-nesting raptors, including Peregrine Falcon, Gyrfalcon, and Golden Eagle, are relatively common in parts of North Yukon with suitable cliffs, such as the Ogilvie Mountains, south of Eagle Plains. Nesting occurrences of these species are not known in the Eagle Plains area. Due to the subdued topography of the Eagle Plains area, suitable nesting cliffs are likely to be uncommon or non-existent. We systematically assessed the potential for suitable nesting cliffs across the study area by mapping areas with a slope >30 degrees (the lowest gradient in which EDI Environmental Dynamics Inc. (EDI) staff have found cliff nests in other parts of the Yukon). This mapping exercise did not identify any suitable cliffs in the area. Therefore, targeted field surveys for this species group were not conducted.



Map 2-1. Locations of point count transects and pond and wetland surveys in the Eagle Plains Project Regional Study Area between June 25 to 30, 2019.

2.4 RESULTS AND DISCUSSION

2.4.1 DESKTOP ASSESSMENT

Based on range and habitat requirements, 128 species can occur in the Eagle Plains Project RSA. This includes 99 'Likely' species (52 confirmed by surveys and incidental observations presented in this report) and 29 'Possible' species. These 'Possible' species included Common Nighthawk (*Chordeiles minor*) observed once in the RSA during these surveys. Despite the confirmed occurrence, the species is still considered 'Possible' because it is outside its regular range, and none were observed during NABBS between 2014 and 2018 (i.e., the single observation during these surveys could have been an extralimital record). A summary of these potential species and conservation statuses, ordered by species groups, is provided in Table 2-4. A more detailed discussion of the species identified within the Project RSA is provided in Section 2.4.2. For an exhaustive list of all potential bird species, see Attachment Table 2 in Section 2.6.2 (Attachment 2-B).

The NABBS database is a valuable information source for the occurrence and distribution of bird species in the region because they are a recent and systematic survey. Of the two survey routes near the Project area (i.e., routes 78 and 79), route 79 was surveyed annually between 2014 and 2018, and route 78 was surveyed in each of those years except 2016. In total, observers who participated in these surveys identified 1,945 birds from 48 species (Table 2-4). Though these data are useful in identifying species common to the region, road-side surveys introduce bias in estimating species occurrences and relative abundances, especially when extrapolating to off-road areas (Sólymos et al. 2020). This may explain why 'Possible' species (e.g., Harlequin Duck [*Histrionicus histrionicus*], Surfbird [*Calidris virgata*], and Golden-crowned Sparrow [*Zonotrichia atricapilla*]) were recorded on the NABBS routes but not within the RSA, and why 18 species confirmed during surveys within the RSA (e.g., Red-necked Phalarope [*Phalaropus lobatus*], Great Gray Owl [*Strix nebulosa*], and American Three-toed Woodpecker), were not detected over five years of road-side surveys.

Overall, species occurrence and relative abundance patterns differed among years in both NABBS routes. The total number of detections decreased from 2014 to 2018, and this pattern was consistent for most bird species. This may partly correspond to the survey effort. The number of species identified and the number of birds detected were similar between route 78 (920 counts from 34 species) and route 79 (1,025 counts from 39 species) during the five-year period. No species-specific trends were evident in the data.

The NABBS data also included three species (six detections) federally designated as Special Concern: Short-eared Owl (*Asio flammeus*; one occurrence in both 2015 and 2016, and two occurrences in 2018), Rusty Blackbird (*Euphagus carolinus*; one occurrence in 2015), and Olive-sided Flycatcher (*Contopus cooperi*; one occurrence in 2018).

Table 2-4. Total number of potential (likely and possible) bird species in the Eagle Plains Project Regional Study Area, June 2019, grouped by higher-order classification. North American Breeding Bird Survey (2014–2018) confirmed species and counts are provided.

Order	Likely	Possible	Likely + Possible (Total)	NABBS Confirmed (2014–2018)[1]

[1] Count of individual bird observations for each group in brackets.

2.4.2 OCCURRENCE AND RELATIVE ABUNDANCE

A total of 974 birds from 52 species were detected during the breeding bird surveys (i.e., point count transects and wetland/pond surveys). One raptor species not included in these counts—Swainson's Hawk—was identified, incidentally, on four separate occasions between June and August 2019, totalling five individuals. These additional observations bring the number of total detections to 979 birds from 53 species.

Songbirds (*Passeriformes*) were the most diverse and abundant group of birds, while falcons (*Falconiformes*), owls (*Strigiformes*), and nightjars (*Caprimulgiformes*) were the least diverse and abundant (Table 2-5). Proportionally, more waterfowl and shorebirds were identified during wetland/pond surveys, and more songbirds and raptors were identified during point count transects. More birds were counted during point count transects (743 versus 231), but a similar number of species were identified during point counts transects and wetland/pond surveys (42 in point counts and 37 in wetlands; Table 2-5).

Table 2-5. Total counts and species of birds observed during point count transects and wetland/pond surveys in the Eagle Plains Project Regional Study Area, June 2019, grouped by higher-order classification.

Order	Point Count Transects		Wetland/Pond Surveys		Combined	
	Count	No. Species	Count	No. Species	Count	No. Species
Waterfowl – Anseriformes	3	2	99	7*	102	7
Shorebirds – Charadriiformes	18	4	38	7*	56	7

2.4.3 SPECIES AND HABITAT ASSOCIATIONS

Analyses of the association between bird species and habitat type controlled for survey effort (i.e., average counts per point count station). The average number of birds (i.e., relative abundance) and the average number of species varied considerably among survey stations and the different avian habitat types (Figure 2-1; Table 2-6). The average relative abundance was greatest in Open Water, Deciduous and Mixed Shrub, Riparian/Wetland Deciduous Shrub, and Spruce Forest habitats; it was lowest in Riparian Spruce Forest, Herb, and Tall Shrub – Black Spruce habitats. Among habitat types, the proportion of (average) detections to the (average) number of species was consistent, with a higher relative abundance being associated with a greater number of species. In general, this pattern was related to the structural complexity and productivity of the various habitat types. For example, Herb habitat is less structurally complex and consists exclusively of graminoid ground cover; it had the fewest species (but had a relatively high number of unique species; see Figure 2-2). In contrast, Spruce Forest habitat can be structurally complex due to variations in canopy cover, understory, and ground cover, and older stands may contain a variety of forest structures that provide habitat for a variety of bird species and life requisites including nesting (e.g., Yellow-rumped Warbler), perching (e.g., Olive-sided Flycatcher), and insect foraging (either on the ground [e.g., Gray-cheeked Thrush] or on live/dead trees [e.g., American Three-toed Woodpecker]). Consequently, Spruce Forest had the greatest species richness of all avian habitat types. The exception to the general association between relative abundance and species richness was Open Water habitat, which had the highest relative abundance but one of the lowest average number of species.

The number of species (i.e., species richness) and the number of unique species (i.e., species exclusive to a habitat type) were summarized for each avian habitat type. Unequal survey effort across habitat types could bias such comparisons of species totals across habitat types; however, it does provide a useful approach to examine general patterns of bird occurrence and assemblages within and across habitat types. Spruce Forest, Riparian/Wetland Deciduous Shrub, and Deciduous and Mixed Shrub habitat types had the greatest species richness, while Herb and Open Water habitat types had the least species richness (Figure 2-2). Patterns of species richness may, in part, be due to the distribution of survey stations in each habitat type, especially in Herb habitat (only nine stations). The Open Water habitat also had low species richness despite surveys at 17 survey stations. This may reflect the limited availability of waterbodies and wetlands in the broader region (i.e., relatively few water-associated bird species occur because the habitat is so limited and dispersed).

No clear association was found between species richness and the number of unique species. For example, Open Water was one of the least species-rich habitat types but had the most unique species. This is not surprising because Open Water is a unique habitat compared to the other terrestrial habitats, and a different complement of bird species occurs there. Other habitat types with many species (e.g., 21 species in Deciduous and Mixed Shrub) had no species unique to those habitats. Likely, riparian habitat types did not have unique species because species that occupy riparian habitat often have broad, rather than specific, requirements. For example, Rusty Blackbird and Lesser Yellowlegs were found in Riparian Coniferous Shrub, Riparian/Wetland Deciduous Shrub, and Herb habitat types.

Patterns of bird occurrences were analyzed in terms of species-specific detection rates (Table 2-6). Songbird species had the highest detection rates overall because these species consistently occupied several different habitat types. Only 15 species occupied a single habitat, and the remaining 47 species occupied multiple habitats (most frequently two or three habitats; Figure 2-3). Species that occupied four or more habitat types were exclusively songbirds and had the highest detection rates. This included species groups such as thrushes, sparrows, and their respective allies. Only 10 species occurred in six or more habitats: Canada Jay, American Robin, Gray-cheeked Thrush, Swainson's Thrush, Common Redpoll, Fox Sparrow (*Passerella iliaca*), White-crowned Sparrow (*Zonotrichia leucophrys*), American Tree Sparrow, Lincoln's Sparrow, and Yellow Warbler. Overall, species with high detection rates included a combination of habitat specialists and habitat generalists. Waterfowl and obligatory wetland species (e.g., Red-necked Phalarope), which were restricted to Open Water habitat, had high detection rates in that habitat (Table 2-6).

In contrast, thrushes (e.g., Gray-cheeked Thrush) and warblers (e.g., Yellow Warbler), which occupied several different habitat types, had high detection rates in many of the habitats they occupied (Table 2-6). The five species with the highest overall (average) detection rates (i.e., across all 110 survey stations in the RSA) were Canada Jay, Swainson's Thrush, Lincoln's Sparrow, White-crowned Sparrow and Yellow-rumped Warbler. For a general overview of bird species assemblages within each habitat type, ordered by highest to lowest detection rates, see Table 2-7. General patterns of frequency and use of habitat types by species in the RSA are consistent with expectations and correspond to patterns reported in other studies (Schieck and Song 2006, Mahon et al. 2016).

[1] Birds listed in descending order of average detection rate (values after the bird names) in each avian habitat type.

[2] Values in the column headings indicate the number of samples per habitat type.

2.4.4 SPECIES OF CONSERVATION CONCERN

Four species observed in the Project RSA (Red-necked Phalarope, Common Nighthawk, Olive-sided Flycatcher, and Rusty Blackbird) were federally listed as either Special Concern or Threatened (Table 2-8). These species are either of regional, national, or continental concern, and two are designated with regional stewardship in BCR 4. The conservation statuses of all potential bird species in the Project area are listed in Attachment Table 2 in Section 2.6.2 (Attachment 2-B). Of those species, three additional species of Conservation Concern are likely to occur in the Project RSA, including Horned Grebe (*Podiceps auritus)*, Short-eared Owl, and Bank Swallow (Table 2-8). Two cliff-nesting raptors listed as 'specially protected' species under the Yukon *Wildlife Act*, Peregrine Falcon and Gyrfalcon, can occur in the broader region but are unlikely to occur in the Project RSA because of a lack of appropriate cliffs. Another 'specially protected' species, Trumpeter Swan (*Cygnus buccinator*; not listed below), is exclusive to southern Yukon and Alaska during the breeding season and, thus, is unlikely to occur in the Project RSA.

Table 2-8. The conservation status and counts of bird species in the Eagle Plains Project RSA.

Species Common Name	COSEWIC[4]	SARA[5]	BCR 4 Priority[6]	Yukon *Wildlife Act*	RSA Count	NABBS Count (2014–2018)
Horned Grebe[1]	SC (Apr 2009)	1 – SC	R – stewardship N/C – concern	No	0	0
Red-necked Phalarope	SC (Nov 2014)	1 – SC	N/C – concern	No	15	0
Peregrine Falcon[2]	NAR (Nov 2017)	–	R – stewardship N/C – concern	Yes	0	0
Gyrfalcon[2]	NAR (Apr 1987)	–	–	Yes	0	0
Short-eared Owl[1]	T (May 2021)	1 – SC	N/C – concern	No	0	4
Common Nighthawk[3]	SC (Apr 2018)	1 – T	N/C – concern	No	1	0
Olive-sided Flycatcher	SC (Apr 2018)	1 – T	R – stewardship R/N/C – concern	No	6	1
Bank Swallow[1]	T (May 2013)	1 – T	–	No	0	0
Rusty Blackbird	SC (Apr 2017)	1 – SC	R – stewardship R/N/C – concern	No	19	1
			Totals		**41**	**6**

[1] Species that are 'Likely' to occur in the Eagle Plains Project RSA.

[2] Cliff-nesting raptors that are 'Likely' to occur in the broader region, but do not have suitable habitat in the Eagle Plains Project RSA.

[3] A species that is 'Possible' in the Eagle Plains Project RSA because of its range limits. One occurrence was observed but status remains uncertain.

[4] Most recent COSEWIC assessments; E = Endangered, NAR = Not at Risk, SC = Special Concern, T = Threatened.

[5] SARA statuses from the latest amended list in May 2023 (Legislative Services Branch 2023); Schedule 1 codes equivalent to COSEWIC.

[6] Priorities, concerns, and stewardships from BCR 4 2013 report; C = Continental, N = National, R = Regional.

2.4.5 ADEQUACY OF ONE YEAR OF SURVEYS

The official guidance provided by the Canadian Wildlife Service for avian baseline studies usually is to conduct at least two years of field surveys (Hanson et al. 2009), and the DRAFT 2022 guidelines emphasize a statistical review of the power to detect changes (ECCC-CWS 2022). Repeat surveys account for annual variation in patterns of bird occurrences and distribution and imperfect detectability associated with bird survey methods. During our initial consultation with CWS we proposed conducting a single year of surveys, dependent on the outcome of the surveys. CWS indicated that they always prefer to see multiple years of data collected. However, they may not raise objections to the Project Proposal if significant avian conservation concerns or information uncertainties do not occur. In our opinion, the one year of multi-species field surveys that we conducted, in combination with the desktop assessment, provides sufficient baseline information about bird species to proceed with the Project Proposal.

2.5 SUMMARY

The purpose of this study was to document the potential occurrence, relative abundance, and habitat associations of birds across the Project's RSA. This study consisted of a combination of a desktop assessment and field surveys. The information presented in this report was collected by Professional Biologists and qualified environmental practitioners, following generally accepted scientific survey designs and methods. The field survey design used a targeted, stratified habitat design to provide a representative sample across the RSA.

Based on range and habitat, 128 species potentially occur in or adjacent to the RSA. Forty-eight (48) were recorded from the North American Breeding Bird Survey data in adjacent areas. Possible species include eight listed under the SARA or identified in the Yukon *Wildlife Act*, and 67 are considered a priority and management concern under the federal Bird Conservation Region 4 Plan. Birds listed under the SARA observed during surveys included Red-necked Phalarope, Common Nighthawk, Olive-sided Flycatcher, and Rusty Blackbird.

Field surveys observed 53 species in the RSA. Point counts identified 42 species, and wetland surveys identified 37 species. Swainson's Hawk was identified via incidental sightings and is an interesting species. It has a disjunct breeding range in North Yukon separated by several hundred kilometres from their primary range to the south. Patterns of species relative abundance and richness (number of species) varied among the different habitat types. Average relative abundance and species richness were the greatest in Spruce Forest, Deciduous and Mixed Shrub, Riparian/Wetland Deciduous Shrub habitats, and lowest in Herb and Tall Shrub – Black Spruce habitats. These patterns were generally related to the structural complexity and productivity of these different habitat types. However, the number of unique species in each habitat did not depend on structural complexity. Many unique species were found in the Herb and Open Water habitats. General patterns of bird occurrence and habitat associations in the RSA are consistent with expectations and correspond with the limited existing information about birds in the area.

2.6 BIRD SECTION ATTACHMENTS

2.6.1 ATTACHMENT 2–A — ECOLOGICAL AND LANDSCAPE CLASSIFICATION ECOSYSTEM UNITS

Ecological and Landscape Classification (ELC) Ecosystem Units (Ecosites)

Codes, names, and descriptions of ecosites assigned *a posteriori* to habitat groups in the Project RSA are listed below.

Attachment Table 1. Ecological Landscape Classification ecosystem units developed for the Eagle Plains Project Regional Study Area.

Code	Name	Description and typical situation
10	Sparsely Vegetated	Vegetative cover <10%.
11	Dry Herb	Area dominated with herbaceous vegetation with very low shrub cover (<5%).
12	Dry Lichen	*Cladonia* sp. (i.e., caribou forage species) dominated areas with very low shrub cover (<5%) typically on south facing slopes.
13	Dry Mix Shrub	Dry shrub dominated areas with very low *Cladonia* sp. (i.e., caribou forage species) cover (<10%); disclimax community.
14	Dry Shrub/ Spruce – Lichen	Dry areas with spruce cover >5% and *Cladonia* sp. (i.e., caribou forage species) cover >10%.
15	Dry Shrub/ Aspen – Lichen	Dry areas with aspen cover >5% and *Cladonia* sp. (i.e., caribou forage species) cover >10%.
16	Dry Spruce – Birch – Lichen	Dry areas with either white spruce, black spruce, and/or Alaskan paper birch cover; spruce, scrub birch, and *Cladonia* sp. (i.e., caribou forage species) cover >10%.
17	Dry Aspen	Dry areas with aspen dominant canopy and very low *Cladonia* (i.e., caribou forage species) cover (<5%).
01	Mesic Herb	Area dominated by herbaceous vegetation with very low shrub cover (<5%); neither disclimax nor successional pathway known. No distinct mottles or seepage present; some sites may have permafrost (frozen layer contains no ice crystals or ice layers).
02	Mesic Birch – Willow	Area has a history of anthropogenic disturbance; regeneration is dominated by either Alaskan paper birch and/or willow species. No distinct mottles or seepage present, some sites may have permafrost (frozen layer contains no ice crystals or ice layers).
03	Mesic White Spruce – Alaskan Paper Birch – Alder	Area dominated by Alaskan paper birch with mixed-wood understory (i.e., white spruce and alder). Usually found along upper slope to crest positions on gentle to moderate slopes. No distinct mottles or seepage present, some sites may have permafrost (frozen layer contains no ice crystals or ice layers).
04	Mesic Black Spruce – Alaskan Paper Birch	Area dominated by black spruce and Alaskan paper birch with >30% shrub cover; mid-slope position. No distinct mottles or seepage present, some sites may have permafrost (frozen layer contains no ice crystals or ice layers).
05	Mesic Alaskan Paper Birch	Area dominated by Alaskan paper birch stands with > 30% shrub cover; mid- to upper-slope position. No distinct mottles or seepage present, some sites may have permafrost (frozen layer contains no ice crystals or ice layers).
06	Mesic Black Spruce – Labrador Tea	Area dominated by black spruce with Labrador tea shrub layer; level or mid- to upper-slope position on gentle slopes. No distinct mottles or seepage present, some sites may have permafrost (frozen layer contains no ice crystals or ice layers).

Code	Name	Description and typical situation
20	Shrubby Riparian Birch – Willow	Shrubby riparian area dominated by scrub birch, tea-leaved willow, or diamond leaved willow and bog cranberry; disclimax community.
21	Riparian White Spruce – Prickly Rose	Treed riparian zone dominated by white spruce with a mixture of shrub species; rose usually present.
22	Riparian Spruce – Birch – Willow	Treed riparian zone dominated by white and black spruce, possibly some Alaskan paper birch, and a mixture of shrub species such as scrub birch and willow.
30	Moist Herb	Area dominated with herbaceous vegetation with very low shrub cover (<5%) on gentle to moderate slopes. Faint to distinct mottles can be observed; no seepage or slight seepage present. Permafrost is present but at variable depths; some ice crystals can be observed in frozen layer.
31	Moist Shrub/ Scrub Birch – Labrador Tea – Willow	Area dominated by scrub birch and Labrador tea with <10% spruce cover; shrub layer has tea-leaved willow. Typically found at level or mid- to upper-slope position on gentle slopes. Successional pathway unknown but considered a shrub disclimax site. Faint to distinct mottles can be observed; no seepage or slight seepage present. Permafrost is present; some ice crystals can be observed in frozen layer.
32	Moist Shrub/ Spruce – Scrub Birch – Labrador Tea	Area dominated by >10% spruce cover, <5% willow cover, and >15% lowbush cranberry. Typically found at mid to upper slope position on gentle slopes; disclimax community. Faint to distinct mottles can be observed; no seepage or slight seepage present. Permafrost is present but at variable depths; some ice crystals can be observed in frozen layer.
33	Moist Spruce – Labrador Tea	Area dominated by >15% spruce tree cover. Presence of *Cladonia* sp. (i.e., caribou forage species). Typically found at level or upper-slope position on gentle slopes. Faint to distinct mottles can be observed; no seepage or slight seepage present. Permafrost is present but at variable depths due to frost boils; some ice crystals can be observed in frozen layer.
34	Moist Spruce – Alder – Labrador Tea	Area dominated by >15% spruce tree cover; alder and *Cladonia* sp. (i.e., caribou forage species) present. Typically found at mid-slope position on gentle slopes. Faint to distinct mottles can be observed; no seepage or slight seepage present. Permafrost is present but at variable depths due to frost boils; some ice crystals can be observed in frozen layer.
35	Moist Spruce – Scrub Birch – Labrador Tea	Area dominated by <15% spruce tree cover with *Cladonia* sp. (i.e., caribou forage species) present. Typically found at level or gentle slopes. Faint to distinct mottles can be observed; no seepage or slight seepage present. Permafrost is present but at variable depths due to frost boils; some ice crystals can be observed in frozen layer.
36	Moist Birch – Willow	Area dominated by willow and birch trees, often associated with old anthropogenic disturbances; successional pathway unknown. Faint to distinct mottles can be observed; no seepage or slight seepage present. Permafrost is present but at variable depths due to frost boils; some ice crystals can be observed in frozen layer.
40	Wet Herb	Area dominated with herbaceous vegetation with very low shrub cover (<5%) on level to lower-slope positions. Distinct to prominent mottles; seepage present; permafrost near surface. Ice layer present within or above frozen soil or frozen organic layer.
41	Wet Shrub – Tamarack	Area with >5% tamarack; low presence of *Cladonia* sp. (i.e., caribou forage species) and high presence of *Sphagnum* sp. or glow moss. Scrub birch and Labrador tea present. Distinct to prominent mottles; seepage present; permafrost near surface. Ice layer present within or above frozen soil or frozen organic layer.
42	Wet Shrub – Black Spruce – Tussock Cottongrass	Area dominated by >5% black spruce and >10% tussock cottongrass. Labrador tea, scrub birch, *Sphagnum* sp. and *Cladonia* sp. (i.e., caribou forage species) present. Typically found on level ground but also from toe to mid-slope positions; disclimax community. Distinct to prominent mottles; seepage present; permafrost near surface. Ice layer present within or above frozen soil or frozen organic layer.

Code	Name	Description and typical situation
43	Wet Shrub – Black Spruce – Sphagnum	Area dominated by >5% black spruce, <10% tussock cottongrass, and >25% *Sphagnum* sp.; disclimax community. Distinct to prominent mottles; seepage present; permafrost near surface. Ice layer present within or above frozen soil or frozen organic layer.
44	Wet Shrub – Scrub Birch – Tussock Cottongrass	Area dominated by <5% black spruce, >10% scrub birch, and >30% tussock cottongrass; disclimax community. Distinct to prominent mottles; seepage present; permafrost near surface. Ice layer present within or above frozen soil or frozen organic layer.
45	Wet Shrub – Scrub Birch – Graminoid	Burned area composed of <5% black spruce; dominant shrub is scrub birch, while dominant graminoid is either spruce muskeg sedge or bluejoint reedgrass; disclimax community. Distinct to prominent mottles; seepage present; permafrost near surface. Ice layer present within or above frozen soil or frozen organic layer.
46	Wet Black Spruce – Labrador Tea – Cladonia	Area with >15% black spruce, >20% *Cladonia* sp. (i.e., caribou forage species), and <5% tussock cottongrass. Distinct to prominent mottles; seepage present; permafrost near surface. Ice layer present within or above frozen soil or frozen organic layer.
47	Wet Black Spruce – Tussock Cottongrass – Sphagnum	Area with >15% Labrador tea and <10% *Cladonia* sp. (i.e., caribou forage species). Distinct to prominent mottles; seepage present; permafrost near surface. Ice layer present within or above frozen soil or frozen organic layer.
48	Wet Black Spruce – Carex	Area dominated by either a spruce muskeg sedge or bluejoint reedgrass herbaceous layer; shrub layer is a mixture of Labrador tea, scrub birch, and willow species with >30% cover. Distinct to prominent mottles; seepage present; permafrost near surface. Ice layer present within or above frozen soil or frozen organic layer.
B1	Bog – Black Spruce – Lichen	Treed or shrubby peatland ecosystem unit with poor nutrient regime within the rooting zone. Stunted black spruce with <50% *Sphagnum* sp. and >10% *Cladonia* sp. (i.e., caribou forage species) ground cover.
B2	Bog – Black Spruce – Sphagnum	Treed or shrubby peatland ecosystem unit with poor nutrient regime within the rooting zone. Stunted black spruce with >50% *Sphagnum* sp. ground cover.
F	Fen	Treed, shrubby, or graminoid peatland ecosystem unit where groundwater inflow maintains relatively high mineral content within the rooting zone. Graminoid fen has >20% *Sphagnum* sp. or moss cover.
M	Marsh	Shallowly flooded mineral wetland ecosystem dominated by emergent vegetation. Area dominated by graminoids and has less than 10% Sphagnum or moss cover.
S	Swamp	Treed or shrubby mineral wetland ecosystem unit with a flowing or fluctuating, semi-permanent, near-surface water table.
W	Shallow Water	Shallow water ecological communities dominated by rooted, water submerged, and floating aquatic plants.
AN	Anthropogenic	An area of anthropogenic disturbance not included in other definitions (e.g., areas cleared for camps).
ES	Exposed Soil	Any area of exposed soil not included in other definitions. Includes areas of recent disturbance (e.g., terrain slides) and human-made disturbances where vegetation cover is <5%.
Fa	Flood Active Channel	Ecological communities scoured by river floodwaters for prolonged periods. Usually dominated by annuals or herbs that can re-sprout from underground structures.
LA	Lake	A body of water >2 m deep or large enough to be classified as a lake (>8 ha).
PD	Pond	A small body of water greater than 2 m deep, but not large enough to be classified as a lake (<8 ha).

Code	Name	Description and typical situation
Rc	Rock Cliff	Ecological communities of vertical rocky sites commonly with some bryophyte cover (rock crusts); small pockets of soils may support vascular vegetation. Also used to map non-vegetated cliffs.
RI	River	A watercourse formed when water flows between continuous, definable banks. The flow may be intermittent or perennial.
Ro	Rock Outcrop	Bluffs and knobs of solid rock with limited soil development and high cover of exposed rock; drought tolerant cryptogams often prominent.
Rt	Rock Talus	Active and inactive talus (i.e., large rocks) and scree (i.e., smaller rocks and more soil); small pockets of soils may support some vascular plants.
RZ	Road	An area cleared and compacted for the purpose of transporting goods and services by vehicle.

2.6.2 ATTACHMENT 2–B — LIST OF ALL POTENTIAL BIRD SPECIES AND THEIR CONSERVATION STATUSES

All bird species with the potential to occur in the Project area:

Names, federal conservation statuses (SARA, COSEWIC), BCR 4 priority, territorial status (i.e., species highlighted by Environment Yukon and those considered of conservation concern in the Yukon Conservation Data Centre track list), and indication of occurrence in the Project RSA for all 128 bird species, are listed below:

Attachment Table 2. List of species with the potential to occur in the Eagle Plains Project Regional Study Area.

Species Common Name[1]	Documented in RSA[2]	COSEWIC[3]	SARA[4]	Environment Yukon (YCDC Track List)[5]	BCR 4 Priority Species[6]
Horned Grebe [L]		SC (Apr 2009)	1 – SC	*	R – stewardship N/C – concern

3 MARTEN

3.1 PURPOSE AND OBJECTIVES

American marten (*Martes americana*; hereafter marten) were selected as a Valued Component (VC) for the Project due to their value as a furbearer, as well as their relevance as an indicator species for mature and old forest values (Buskirk and Ruggiero 1994, Suffice et al. 2017). The VGFN have a community trapline within the RSA and value marten as a furbearer for its economic value, social values associated with trapping, and environmental values as a component of the regional wildlife community.

This section provides a summary of marten ecology in the subarctic taiga. That information is used to develop a habitat model to quantify the quality, amount, and distribution of potential marten habitat across the RSA. A Habitat Suitability Index (HSI) model was developed using relevant environmental data in a GIS to quantify the amount of marten habitat into relative quality categories (i.e., High, Moderate, Low, and Nil/Very Low).

3.2 TRAPPING

According to trapping records, marten were the most heavily trapped species in the two group trapping concessions that overlap the RSA between 2012 and 2018 (Figure 3-1,). Between 2012 and 2018, 715 marten were reported from the two concessions (i.e., 401, 402) overlapping the RSA. The number of marten reported varied widely among the trapping seasons: the greatest harvest was 240 marten reported in 2015 compared to the lowest harvest of 0 marten the following year. Unfortunately, trapping records from 2019 onwards were unavailable for those concessions.

Trapping mortality in marten is biased towards males and juveniles, and harvests that include a high proportion of adult females indicate potential overharvesting (Strickland and Douglas 1987, Hodgman et al. 1994, Fortin and Cantin 2005). Exhaustive trapping removes resident adult marten from the population and allows juveniles to establish home ranges in vacant areas, thus lowering the overall age of the population. Juveniles have lower reproductive output relative to adults; therefore, this change in age structure can lower population fecundity and growth rates (Archibald and Jessup 1984, Fortin and Cantin 2005). Without knowledge of the age and sex structure of harvested marten, it is not possible to assess the sustainability of trapping in the RSA.

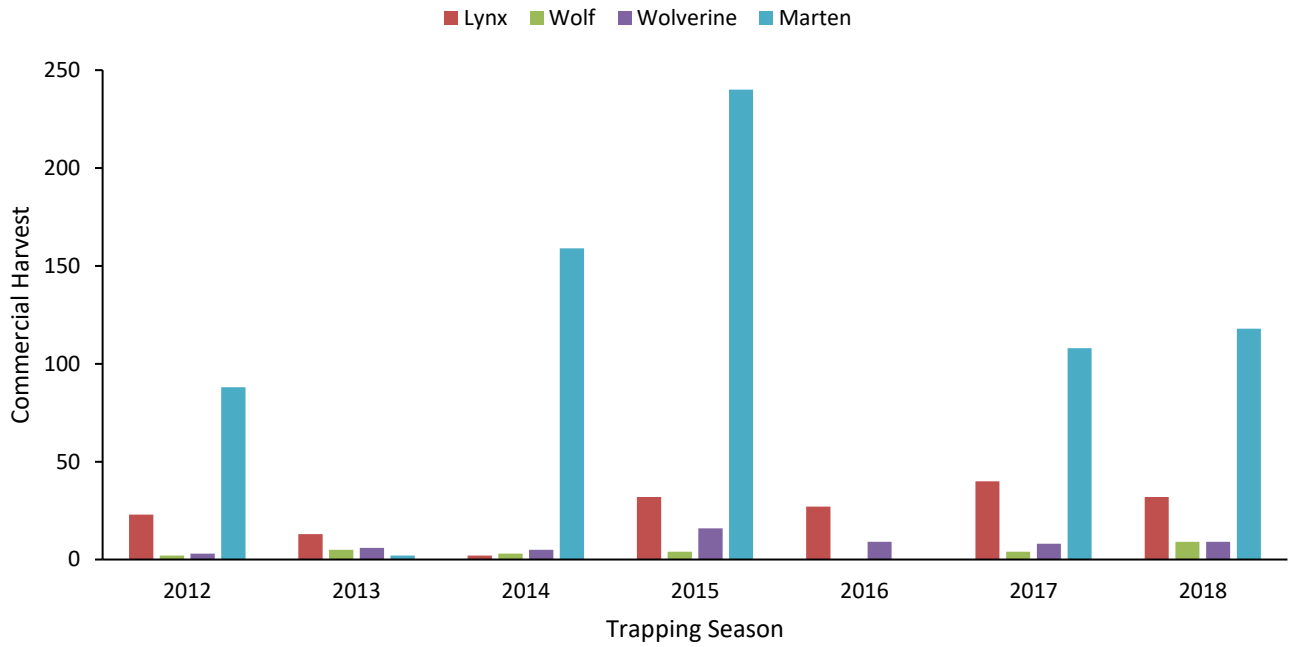

Figure 3-1. Commercial harvest returns for group trapping concessions overlapping the RSA for which records were available.

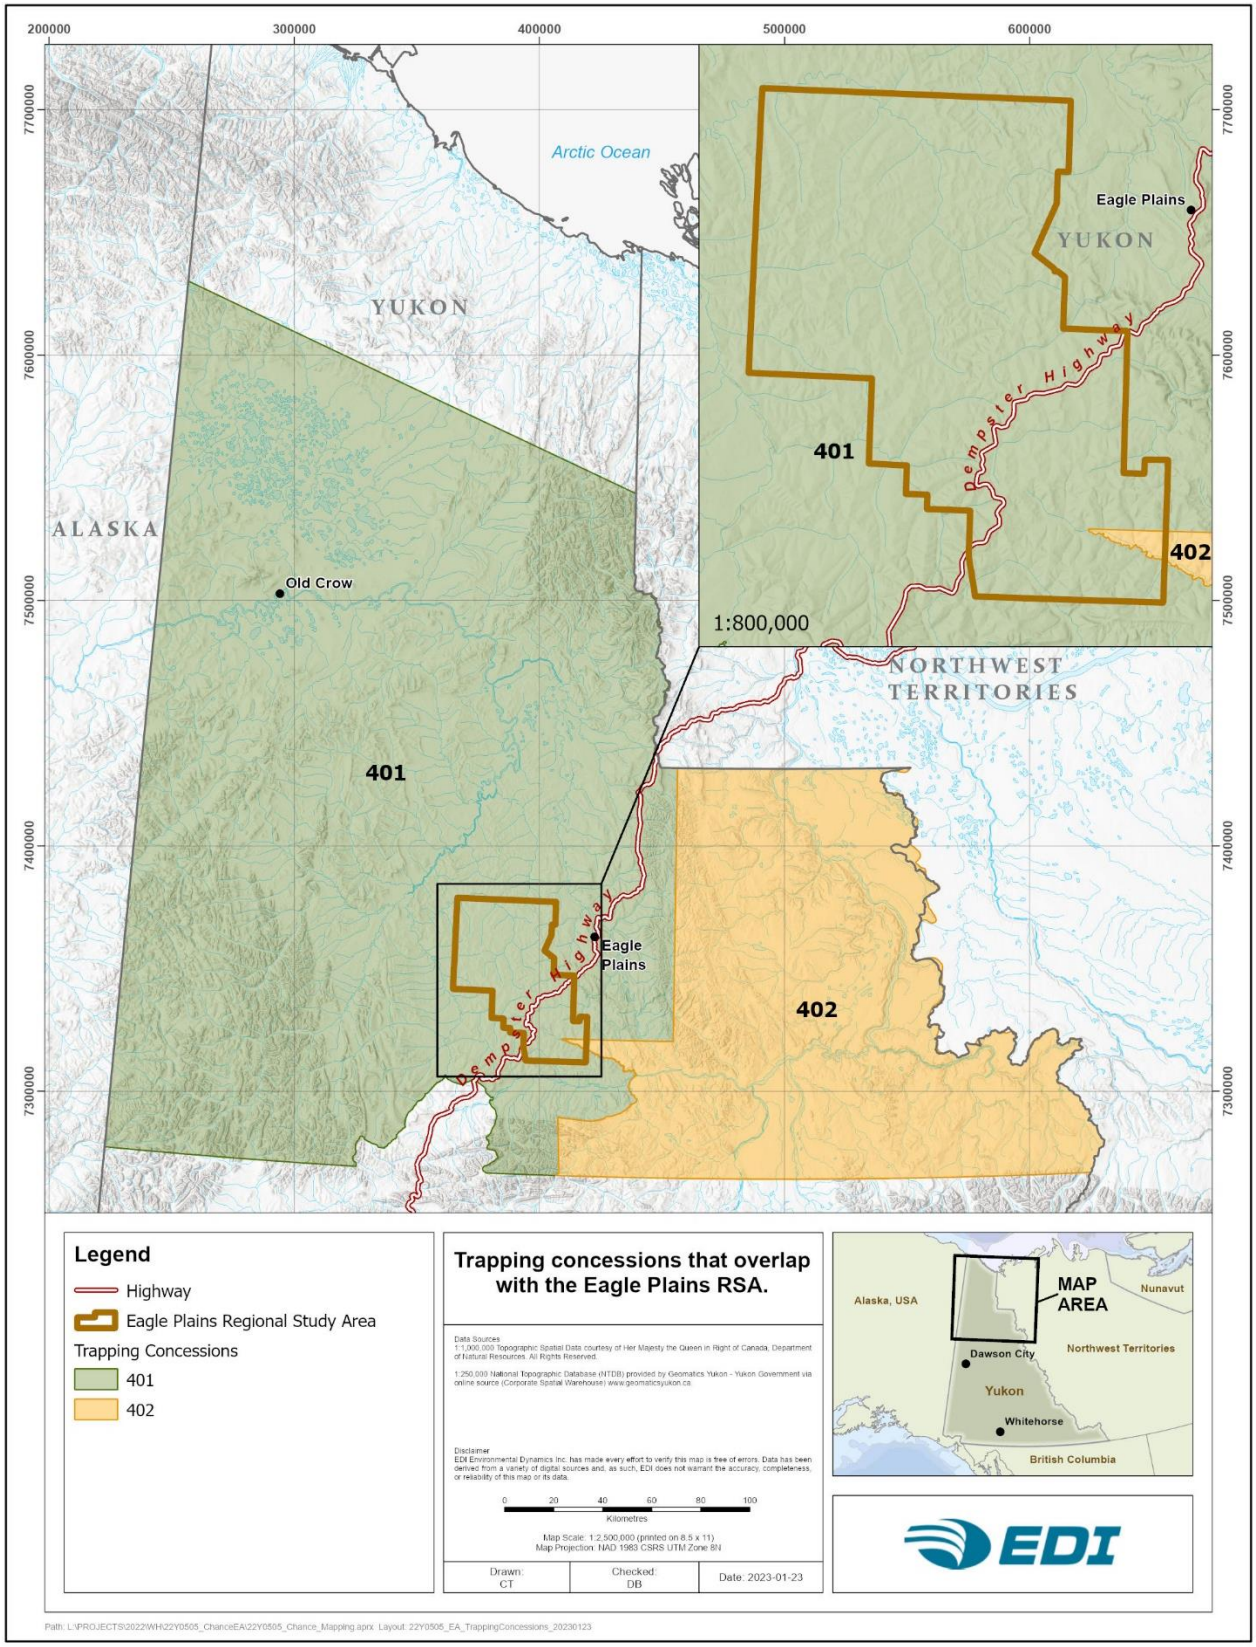

Map 3-1. Trapping concessions that overlap with the Eagle Plains RSA.

3.3 GENERAL HABITAT ECOLOGY OF MARTEN

The RSA occurs in the boreal taiga, at the northern limit of marten range (Buskirk and Ruggiero 1994, Yukon Ecoregions Working Group 2004a). While marten occur over a contiguous range across northern North America from Labrador to Alaska (Snyder and Bissonette 1987, Buskirk and Ruggiero 1994, Drew 1995, Paragi et al. 1996), little is known about their basic ecology in northern boreal forest and taiga ecosystems (Latour et al. 1994). In more productive forests to the south, marten are often associated with mature forest structures, such as large trees, snags, and coarse woody debris (CWD; Buskirk and Ruggiero 1994, Thompson et al. 2012). However, there is some evidence that in northern boreal forests, marten exploit structural stages with short, stunted trees that are sparsely distributed (Latour et al. 1994, Paragi et al. 1996). Marten in the Alaskan taiga selected habitat types with the greatest amount of CWD and the greatest abundance of vole, rather than canopy cover (Paragi et al. 1996). Across the Yukon forest-to-tundra ecotone, marten preferred open taiga areas rather than boreal forest, and were positively associated with small mammal (i.e., taiga vole [*Microtus xanthognatus*], and red-backed vole [*Myodes* spp.]) biomass (Pretzlaw 2006). Therefore, occurrence and habitat selection patterns for marten in northern boreal and taiga ecosystems can differ from those described elsewhere in North America (Pretzlaw 2006).

During 2015 and 2016, EDI performed snow tracking surveys to quantify the presence and distribution of furbearers and ungulates south of Dawson, Yukon (EDI Environmental Dynamics Inc. 2017). Snow tracking transects covered various habitat types, including 49% shrub, 13% coniferous, 10% herbs, 8% exposed land, 7% frozen rivers, and 13% other classes (i.e., broadleaf, mixedwood, rock/rubble, wetland). Marten tracks occurred in shrubland 51% of the time, coniferous forest 15% of the time, and herb sites 10% of the time. These results indicate that marten occurred across all major vegetated habitat types approximately in proportion to their availability on the landscape (EDI Environmental Dynamics Inc. 2017).

Home ranges of marten in the taiga are larger than in other regions of North America (Latour et al. 1994). In the Mackenzie Valley, NWT, mean home range sizes of adult males were 1,420 ha, and those of adult females were 680 ha. Overall, mean home range size of adult marten was 1,110 ha (Latour et al. 1994). In contrast, the average size of a marten home range in British Columbia (BC) is 525 ha for males and 316 ha for females, and in Ontario, the size of a typical marten home range is between 390 and 660 ha (Lofroth 1993, Manlick et al. 2017a). Marten density in the taiga (the carrying capacity) is likely limited by the availability of arboreal cavities for natal denning, subnivean CWD sites and underground shelters, small mammal abundance, predation, and intraguild competition (Brainerd et al. 1995). The estimated minimum density of marten was 0.0016/ha in the Mackenzie Valley, NWT (Latour et al. 1994), and 0.0025/ha in the Alaskan taiga (Paragi et al. 1996). The estimated fall density of resident adults in the northern boreal region of the Yukon was 0.006/ha (Archibald and Jessup 1984).

3.3.1 FORAGING

Marten habitat selection in the Eagle Plains Ecoregion may depend largely on prey distribution and availability (Paragi et al. 1996). Taiga vole are the prey most selected by marten in the Alaskan taiga, likely due to their larger size (mean weight = 54 g) relative to red-backed vole (mean weight = 20 g; Paragi et al. 1996). Potential

and confirmed mammalian prey in the taiga includes snowshoe hare (*Lepus americanus*), red squirrel (*Tamiasciurus hudsonicus*), red-backed vole, taiga vole, lemmings (*Lemmus* spp., *Dicrostonyx* spp.), and to a lesser extent, deer mice (*Peromyscus maniculatus*) (Paragi et al. 1996). Non-migratory grouse, including willow ptarmigan and spruce grouse, are available year-round and are likely prey for marten in the taiga (Paragi et al. 1996). However, marten are dietary generalists and their diet fluctuates seasonally with the breeding cycles of small mammal prey, bird migration and nesting periods, and fruiting periods of understory plants (Ben-David et al. 1997, Carlson et al. 2014, Twining et al. 2019).

In northern latitudes, marten foraging and population dynamics are influenced by fluctuations in the abundance of small mammal prey (Zielinski 2000). Multiple scat analyses in the NWT and Alaska found that small rodents, including vole and lemming, were the most important diet item for marten (Buskirk and Ruggiero 1994). Small rodents in northern regions undergo relatively large periodic fluctuations in population size (Krebs 1996). Marten populations are likely tightly coupled with these small mammal population cycles due to the relatively low diversity of mammalian prey species in the Eagle Plains Ecoregion (Yukon Ecoregions Working Group 2004a, Roth et al. 2007). Marten abundance and fecundity are correlated with temporal variability in the abundance of preferred prey, likely due to nutritionally demanding processes associated with reproduction and juvenile recruitment (Carlson et al. 2014, Flynn and Schumacher 2016).

Previous research has shown berries to be most important for marten diet during the summer and fall (July–November) when fruit availability is greatest (Baker 1992, Schaumann and Heinken 2002, Twining et al. 2019). Further, there is recent evidence that *Vaccinium* fruit are also an important winter food item for marten in coastal areas where they remain accessible year-round (Banner et al. 2014, Eriksson et al. 2019). Similarly, common juniper (*Juniperus communis*) berries are an important winter food item for marten in other regions (Hargis and McCullough 1984). Therefore, marten in the RSA likely consume fruit from several species of shrub depending on habitat and season, including blueberry and lowbush cranberry in upland woodlands, and crowberry (*Empetrum nigrum*), lingonberry, cloudberry (*Rubus chamaemorus*), and bog cranberry (*Vaccinium oxycoccos*) in lowland black spruce-shrub sites (Yukon Ecoregions Working Group 2004a).

The diet of marten in interior regions of North America is typically dominated by species of voles associated with structurally complex forests (Thompson and Colgan 1994, Poole et al. 2004, Eriksson et al. 2019). Habitat structures normally associated with old forests, including stumps, snags, and large pieces of downed wood, provide subnivean access to small mammal prey in areas with deep snow (Zielinski et al. 1983, Baker 1992, Delheimer et al. 2019). However, within the Yukon, red-backed voles are present across all vegetation types and appear to be more abundant in subalpine shrub habitats than lower elevation boreal forests (Pretzlaw 2006, EDI Environmental Dynamics Inc. 2017). Taiga vole are restricted to the taiga and avoid forest cover (Pretzlaw 2006). Taiga vole in Alaska appear to select post-fire structural stages and are found in black spruce forests, birch forests, forest-grassland edge, and grasslands (Wolff and Lidicker Jr. 1980). Provided there is sufficient understory shrub cover, habitat used for foraging is probably directly associated with increased prey availability regardless of forest age or structural stage (Keim et al. 2011, Vigeant-Langlois and Desrochers 2011).

3.3.2 COVER

Across much of their distribution, marten select home ranges with old or late-mature forests and avoid recently cut forests (Chapin et al. 1998, Bridger et al. 2017, Suffice et al. 2017). Older forests contain complex woody structures, including mature trees, stumps, snags, and large pieces of CWD that marten require to meet many life history requirements, including thermal cover and escape cover from predators (Zielinski et al. 1983, Mowat 2006a, Andruskiw et al. 2008). Shrub cover can also be an important factor influencing marten habitat quality, as marten use understory shrubs as cover from aerial predators such as Northern Goshawk (*Accipiter gentilis*; Poole et al. 2004, Zielinski et al. 2005, Slauson et al. 2007).

Important habitat features typically associated with old forests, including stumps, snags, and large pieces of downed wood, provide subnivean access to winter denning in areas with deep snow (Zielinski et al. 1983, Baker 1992, Delheimer et al. 2019). A winter den is a structure that may be used repeatedly for resting for prolonged periods (Birks et al. 2005). Natal dens are used for parturition and kit rearing during the breeding season, and may be used as resting sites in other seasons (Birks et al. 2005). A scarcity of tree cavities leads marten to use denning sites that provide suboptimal thermal cover and escape from predators (Birks et al. 2005). Marten dens may be found in tree branches, bird nests, rock crevices, underground burrows, occupied houses, nest boxes, or barns (Birks et al. 2005). Therefore, marten may use a range of below or above-ground structures for winter denning in the RSA, regardless of forest age or structural stage.

3.3.2.1 Thermal Cover

In winter, marten possess limited energy reserves and must reduce energetic costs by seeking insulated resting sites (Spencer 1987, Buskirk et al. 1989, Brainerd et al. 1995). Marten are shown to be more dependent on subnivean resting sites at more northern latitudes (Brainerd et al. 1995). Marten's choice of resting above or below snow cover depends on the ambient air temperature relative to the temperature in a microenvironment; in other words, marten are more likely to rest wherever is warmest (Buskirk et al. 1989). In Scandinavia, marten seek underground or subnivean resting sites instead of arboreal sites when the ambient air temperature is very low (Brainerd et al. 1995). Any subnivean spaces not entirely surrounded by snow are suitable; however, CWD is best in terms of thermal properties (Buskirk et al. 1989). Therefore, thermal cover generally increases with increased coniferous cover and associated CWD. Rock provides some protection from digging predators; however, rock provides poor insulation than wood, and rock dens may contain organic bedding for insulation (Buskirk et al. 1989, Birks et al. 2005).

3.3.2.2 Escape Cover

As a mesocarnivore, pressure from competition and predation can play an important role in the population dynamics of marten populations (Kiseleva 2012, Manlick et al. 2017b). Aside from marten, wolf (*Canis lupus*), red fox (*Vulpes vulpes*), lynx (*Lynx canadensis*), and wolverine (*Gulo gulo*) are the primary mammalian predators in the Eagle Plains Ecoregion. Marten likely select habitat with sufficient escape cover (e.g., medium-sized coniferous trees and CWD) to avoid risk of intraguild predation by these species (Slauson et al. 2007, Eriksson

et al. 2019). Furthermore, marten within the Eagle Plains Ecoregion compete with least weasel (*Mustela nivalis*), lynx, and red fox for shared small mammal prey (Slough and Jung 2007).

Marten in North America select home ranges that contain vertical forest or understory shrub cover where they perceive lower risk of predation from aerial predators as well as larger carnivores that, depending on the system they occupy, includes mustelid, canid, and felid species (Slauson et al., 2007; Eriksson et al., 2019). Red fox are the most generalist and widespread carnivore in the northern boreal-tundra ecotone, and may limit marten populations through intraguild predation (Lindström et al. 1995, Birks et al. 2005, Pretzlaw 2006). Therefore, fox predation may force marten to remain arboreal and den above ground (Birks et al. 2005). Aerial predators include Northern Goshawk and Great Horned Owl (*Bubo virginianus*), both of which are predators of marten in other regions and occur year-round in forests in the Yukon (Bull and Heater 2001, Doyle and Smith 2001, Sinclair et al. 2003). Golden Eagle also occur in northern Yukon during the breeding season and may be predators of marten. However, marten may perceive a lower risk of predation in open woodlands and shrublands of the Eagle Plains due to the absence of several predators of marten in more southern biomes, including bobcat (*Lynx rufus*) and coyote (*Canis latrans*; Thompson and Colgan 1994, Bull and Heater 2000, Moriarty et al. 2016).

3.3.3 REPRODUCTION

Natal dens are used for the parturition and rearing of neonates and are critical for recruitment and population viability (Buskirk and Ruggiero 1994). Across North America, most natal dens are found in structurally complex sites (Buskirk and Ruggiero 1994). Marten prefer arboreal cavities for parturition and rearing neonates due to the shelter they provide from terrestrial predators, including red fox (Spencer 1987, Brainerd et al. 1995). Marten kits are very vulnerable to fox predation when kits move out of arboreal dens (Brainerd et al. 1995). However, scarcity of arboreal cavities may force marten to use alternative structures for natal denning (Birks et al. 2005). For example, arboreal cavities are rarely used as resting sites in Finland and northern Russia (Brainerd et al. 1995). In the NWT, an adult female marten denned and produced young within a 21-year-old burn (Latour et al. 1994). Therefore, a better understanding of habitat selection by adult female marten in the taiga is needed (Paragi et al. 1996).

3.3.4 DISPERSAL

North American marten are sensitive to forest fragmentation and are found across landscapes with greater amounts of contiguous forest (Thompson et al. 2012). Previous studies show that 5 km of nonforested habitat between forest patches is an effective barrier to dispersal for marten (Buskirk and Ruggiero 1994). Timber harvesting and extensive road networks increase the density of forest edges and generally reduce habitat connectivity for species such as marten adapted to forest interiors (Robitaille and Aubry 2000, Mowat 2006b). However, marten use narrow strips of forest and abandoned roads as movement corridors between more suitable patches of mature forest (Potvin and Bertrand 2004, Breault et al. 2021).

Furthermore, there is evidence that in regions with sparse forest cover, marten may be adapted to meet certain resource requirements in nonforested habitats. For example, in Scotland, forest habitat is limited and pine

marten (*Martes martes*) consistently use matrix habitats, including scrub and tussock grassland, to meet life history requirements (Caryl et al. 2012). Intensively managed forests in Scotland lack resources such as den sites and important prey (e.g., short-tailed field vole [*Microtus agrestis*]), abundant in grasslands long thought to be impermeable to marten movement or at best suboptimal marten habitat (Caryl et al. 2012).

Cold temperatures and high seasonality result in different patterns of habitat use among marten in North America (Zielinski et al. 1983). Marten habitat selection was investigated in the Alaskan taiga in a landscape composed of mature coniferous forests of black spruce and larch (*Larix laricina*) from 5–20 cm diameter at breast height (DBH) 100–115 years post-fire, as well as dense, young forests 30 years post-fire, and tall shrub and pole sapling forests with some moss and herb structural stages 10 years post-fire (Paragi et al. 1996). Marten abundance, hunting intensity (based on snow-tracking), and CWD density were the greatest in 10-year burns relative to 30-year burns and mature forests (Paragi et al. 1996).

However, this study found that juveniles were more common in recent burns than in mature stands, and recent burns were likely used only by nonbreeding marten (Paragi et al. 1996). Non-transient marten used coniferous forest more often than transient adult and juvenile marten, which were more likely to use scrub habitat (Paragi et al. 1996). For natal denning, resources are limited in herb and shrub structural stages and prey populations are unpredictable relative to mature forests (Paragi et al. 1996). Therefore, post-fire clearings may be only suitable for dispersing juveniles and transient adult marten (Paragi et al. 1996). Herb and shrub structural stages may function as population sinks for immature and transient marten dispersing from contiguous mature forest (Paragi et al. 1996). Previous HSI models for marten in the taiga have ranked nonforested habitats, including post-fire clearing and shrubland as low-suitability habitat (EDI Environmental Dynamics Inc. 2018). However, habitat requirements of breeding marten in the taiga are not well-understood (Paragi et al. 1996).

3.3.5 DISTURBANCE

3.3.5.1 Fire

Marten are dietary generalists and are not limited to prey associated with mature/old forest structural stages (Baker 1992, Paragi et al. 1996, Poole et al. 2004). Marten in the Alaskan taiga use snags and windthrown trees as winter cover in recent burns before coniferous regeneration occurs (Paragi et al. 1996). Trappers in Alaska view fire as beneficial to furbearer populations. Rodent prey, including red-backed vole, tundra vole (*Microtus oeconomus*), meadow vole (*Microtus drummondii*), and taiga vole, are abundant in dense herbaceous vegetation growth following recent fires (Stephenson 1984). Extensive use of post-fire clearings occurred by marten 1– 3 years post-fire. High population abundance occurs within 3–10 years post-burn, with activity centred in unburned inclusions and burn edges (Stephenson 1984).

In the Alaskan taiga, marten abundance, frequency of investigations, hunting intensity, and CWD density were greatest in 10-year burns relative to older burns and mature forest (Paragi et al. 1996). Subnivean access based on tracks was greatest in 10-year burns relative to mature forests and 30-year burns (Paragi et al. 1996). Small mammal biomass and diversity were greatest in the 10-year burn. This structural stage provided a more stable

prey base due to greater diversity of rodents and more stable populations of red-backed vole (Paragi et al. 1996). Young forests 30 years post-fire had the least stable small mammal populations and lacked taiga voles, the prey most selected by marten in this study (Paragi et al. 1996). The suitability of post-fire clearings for marten may be low at first and increase 6–10 years post-fire as ground cover recovers and small mammals occupy the habitat (Paragi et al. 1996). Suitability begins to decrease 15–20 years post-fire and reaches minimum suitability 25–30 years post-fire when CWD has fully decayed and young forests establish. These forests lack near-ground structures for subnivean foraging, escape cover, denning, and resting sites (Paragi et al. 1996).

Adult marten in the NWT were more likely to have home ranges in unburned stands than burned stands (Latour et al. 1994). Unburned forests were open, 90-year-old black spruce-herb, or black spruce-bog forests with average tree height from 5–10 m, and average DBH from 4–14 cm (Latour et al. 1994). Burned stands were characterized by regeneration of open to sparse deciduous vegetation (40% bare ground), a primarily willow shrub layer, and a birch/balsam fir canopy (Latour et al. 1994). Wet areas were characterized by moss, lichen, and Labrador-tea in the understory with sparse, stunted black spruce in the tree layer (Latour et al. 1994). Long-term use by adult marten within home ranges indicated greater use of unburned forests relative to burned forests (Latour et al. 1994). In burns, most snags remained standing and deadfall lay directly on the ground; therefore, burns did not provide access to subnivean spaces, and hunting was mostly on the surface of snow with little protection from predation (Latour et al. 1994). However, an adult female marten with a home range partially within a burn, denned and produced young within the 21-year-old burn (Latour et al. 1994). Furthermore, home ranges of 1 adult and 1 juvenile tracked for 14 and 15 months were entirely within the burns (Latour et al. 1994). Using post-fire structural stages by breeding marten in the taiga is not well understood and should be explored in future studies (Paragi et al. 1996).

3.3.5.2 Roads

The Dempster Highway runs roughly southwest to northeast through the southern half of the RSA. The RSA includes numerous winter roads (15 m average width) from previous exploration activities dating back to the 1960s. Project activities will be accessed via existing and new winter roads. Generally, marten avoid open areas and areas of high human disturbance, including roads (Hargis et al. 1999, Potvin et al. 2000). Marten in North America generally avoid roads due to increased predation risk and lower availability of preferred prey; however, predation risk is assumed to be low in the RSA because primary predators of adult marten are absent or at low density in the Eagle Plains Ecoregion (Yukon Ecoregions Working Group 2004a, Moriarty et al. 2011, 2015, Joyce 2018). Therefore, marten may perceive a lower risk of predation along roads within the RSA due to the absence of several predators of marten in more southern biomes (Bull and Heater 2001, Mowat 2006a, Thompson et al. 2012). Further, abandoned roads (5 m average width) may provide easier pathways for marten movement than undisturbed forest and greater cover from aerial predators than openings (Breault et al. 2021). However, extensive road networks may fragment woodland and shrubland, reducing habitat connectivity and limiting marten dispersal (Caryl et al. 2012).

3.3.5.3 Seismic Lines

The RSA contains numerous 2D seismic lines (range = 5–8 m wide, mean = 5.4 m wide) from previous exploration activities dating back to the 1960s. Most 2D exploration occurred between 1961 and 1984, with new 2D exploration in 2001 incorporating Low Impact Seismic (LIS) techniques(Access Consulting Group and EBA Engineering Consultants Ltd. 2001, GEOTIR 2014). Approximately 2,200 km of new 3D LIS exploration (1.5–3 m wide) was conducted in a 32,500 ha area between November 2013 and April 2014 (GEOTIR 2014). This new 3D exploration is located near the RSA's centre, north and south of the Dempster Highway. The entire RSA, including legacy and contemporary seismic lines, was assessed as a linear feature study. There were signs of normal and magnified succession on 2D and 3D seismic lines. Among 2D lines, 89% had growth >1.5 m height and were considered fully recovered, and 22% of 2D lines made in the 1950s and 1960s showed magnified succession. All 3D lines were made in 2014 and showed normal succession.

In the northern boreal forest (i.e., southwest NWT, northeast BC, and northwest Alberta), marten use of seismic lines is strongly influenced by line width and state of regeneration (Tigner et al. 2015). In this study, forests were open black spruce bogs in lowlands, and upland white spruce-aspen with dense shrubs. Remote wildlife cameras were used to quantify marten use of seismic lines relative to adjacent interior forests. Marten were detected in open lines >3 m wide up to 90% less than forest interiors, but were detected in open lines <2 m wide or lines >6 m with at least partially recovery roughly equally to forest interiors (Tigner et al. 2015). Use of seismic lines is thought to be driven by the perceived risk of predation; marten avoid open habitats but use disturbed habitats following sufficient recovery of overhead and lateral cover (Tigner et al. 2015).

3.3.6 HABITAT SUMMARY

In more productive forests to the south, marten are often associated with mature forest structures, such as large trees, snags, and CWD (Buskirk and Ruggiero 1994, Thompson et al. 2012). Marten select habitats with structural complexity which provides subnivean access to small mammal prey, thermal cover, escape cover from predators, as well as natal denning sites (Spencer et al. 1983, Buskirk and Ruggiero 1994, Latour et al. 1994, Paragi et al. 1996). Within the Subarctic Bioclimate Region, characterized by stunted, open canopy spruce-dominated habitats, tree growth is often limited by the presence of permafrost resulting in disclimax vegetation communities with tall and low shrub structural stages. Therefore, patterns of habitat selection of marten in the RSA may differ from those in southern biomes (Pretzlaw 2006).

Habitat quality in the RSA should be evaluated within the context of reduced availability of old forest structures and lack of contiguous, coniferous forests in the Eagle Plains Ecoregion. Marten select habitat types with the most large pieces of downed wood and the largest standing live and dead trees available at the landscape scale (Zielinski et al. 1983, Baker 1992, Delheimer et al. 2019). Trees, snags, and CWD >30 cm in diameter are associated with older structural stages within the RSA. These structures would be considered too small to provide thermal cover and support natal denning requirements for marten elsewhere in North America (Buskirk et al. 1989, Delheimer et al. 2019). However, these structures are likely large enough to provide thermal cover and support natal denning requirements for marten in the northern context of the RSA (Spencer 1987, Brainerd et al. 1995).

3.4 METHODS

An HSI model was used to estimate habitat quality across the RSA (U.S. Fish and Wildlife Service 1980). An HSI model, also referred to as a knowledge-based habitat suitability model (Clarke 2012), is a common method for assessing habitat quality for wildlife species, and a method adapted for use in environmental impact assessments (U.S. Fish and Wildlife Service 1980). Habitat is defined as the particular place occupied by a specific population within a community and usually characterized by the dominant plant form or physical characteristics (U.S. Fish and Wildlife Service 1980). Each species requires habitat to supply space, food, cover, water, and other requirements for survival (U.S. Fish and Wildlife Service 1980). Suitability is defined as the habitat's ability, in its current structural stage, to provide the life requisites of the species (Resources Inventory Committee 1999c).

3.4.1 HABITAT SUITABILITY MODELLING

HSI modelling uses spatial datasets such as land cover, disturbance history, and topography. It ranks available habitats according to their ability to support a selected species. The habitat rankings can be based on various sources, including ecological survey data, local knowledge, expert knowledge, and traditional knowledge. HSI models can be based on suitability ratings for one habitat variable or the combination of ratings for multiple variables to quantify the quality, amount and distribution of potential habitat for the species (Dijak and Rittenhouse 2009).

3.4.1.1 Rating Scheme

Habitat ranking schemes reflect knowledge of the species' habitat use and ecology (Resources Inventory Committee 1999). A 4-class system was chosen to rank habitat suitability in this study because there is an intermediate level of knowledge of habitat quality for marten in the taiga (Resources Inventory Committee 1999, EDI Environmental Dynamics Inc. 2018). Thus, habitat was assigned a suitability ranking of High (H), Moderate (M), Low (L), or Nil/Very Low (N/VL) relative to the range of habitat quality across the RSA. Using a mathematical equation, the HSI score was produced by combining suitability ratings for several specific habitat variables (e.g., vegetation community type) into one final HSI score.

The developed habitat model produced HSI scores ranging from 0 to 1. Scores were used rather than classes to combine scores and adjustments from multiple variables into a final HSI score. Scores were categorized into four qualitative categories: High (>0.75 to 1.0), Moderate (>0.50 to 0.75), Low (>0.25 to 0.50), Nil/Very Low (>0.0 to 0.25; Resources Inventory Committee 1999). The rating categories correspond to qualitative predictions of the relative suitability of the habitat for supporting five life requisites of marten: reproduction, thermal cover, escape cover, foraging, and dispersal. High-quality habitat supports all five life requisites. Moderate-quality habitat supports escape cover, foraging, and dispersal. Low-quality habitat only supports limited foraging and dispersal. Nil/Very Low-quality habitat does not contribute significantly to any life requisites; however, herb and shrub structural stages and stunted disclimax forest areas likely function as permeable barriers and allow intra-territorial movements within marten home ranges (Caryl et al. 2012). Habitat conditions and suitability interpretations for each rating class are provided in Table 3-1.

Table 3-1. Description of habitat rating classes used in the marten HSI model.

HSI Score	Habitat Rating	Description
>0.75 to 1.0	High	Suitable (optimal). Provides conditions for natal denning (large live conifer trees, large snags, large CWD), thermal cover (medium/large-sized elevated CWD subnivean), escape cover, foraging, and dispersal.
>0.50 to 0.75	Moderate	Suitable (suboptimal). Provides conditions for escape cover (small/medium-sized live or dead conifer trees, and/or small CWD, and/or dense shrub cover), foraging, and dispersal.
>0.25 to 0.50	Low	Limited Suitability. Provides conditions for foraging (i.e., any size or species of tree that would support prey species and CWD large enough for subnivean access; grass and/or horsetails for hare, voles, birds, and/or berries for prey or marten), and dispersal (i.e., some herb or sparse deciduous/shrub cover).
>0.0 to 0.25	Nil/Very Low	Unsuitable. Non-vegetated areas, such as alpine, water, or highways, that do not provide conditions to support any life requisites for marten. Non-vegetated areas may be used for intra-territorial movements.

3.4.1.2 Habitat Variables

Habitat variables were identified as potentially important for describing marten habitat (Table 3-2). Variables were evaluated for inclusion based on the strength of relationships found in other studies, the ecological relevance to marten in the Eagle Plains Ecoregion, and the availability of the variable in GIS databases for the RSA. Based on these criteria, ELC and Linear Feature (LF) data were included in marten habitat modelling.

Distance to riparian areas was considered for inclusion in the model. Riparian areas are important foraging habitat for marten in North America (Spencer et al. 1983, Ben-David et al. 1997), and elder members of the VGFN observed good marten habitat in the area where the Blackstone and Peel rivers meet (Sherry and Vuntut Gwitchin First Nation 1999, p. 140). Riparian areas generally have greater prey availability relative to the surrounding landscape due to higher densities of prey and greater volumes of CWD, which increase access to subnivean spaces (Buskirk et al. 1989). ELC data accurately represent increased habitat quality in mature/old riparian forests found as narrow strips along most major watercourses in the RSA, including Chance Creek in the northwest and Dalglish Creek in the southeast. Therefore, a variable for distance to riparian was redundant with the ELC mapping and was not included in the model.

The history of fire disturbance has influenced marten distribution and was considered for inclusion in the model. However, the nature of the relationship between fire history and patterns of use by marten is unclear for the taiga biome. Recent burns and post-fire clearings are generally considered suboptimal habitat. They are used mainly by nonbreeding and dispersing juvenile marten (Paragi et al. 1996). In the NWT, adult martens were likelier to locate home ranges in unburned stands than burned ones (Latour et al. 1994). However, recent burns may provide foraging opportunities not present in older burns or mature forests (Paragi et al. 1996). Furthermore, fire history was explicitly accounted for in the structural stage of the ELC mapping. Therefore,

a separate variable for fire history was determined to be redundant with ELC mapping and was not included in the model.

Elevation was considered as a variable for inclusion in the model. Marten generally occur at higher elevations than similarly-sized mesocarnivores, due to adaptations for travelling over snowpack and hunting in subnivean spaces (Grinnell et al. 1937, Zielinski et al. 2005, 2017). However, elevation within the rolling topography of the RSA does not vary substantially (range = 343–752 m asl) and was likely not a significant driver of marten distribution. Therefore, elevation was not included as a variable in the model.

Table 3-2. Summary of habitat variables commonly associated with marten habitat quality from published literature relevant to the Regional Study Area.

Variable	Included in model?	Rationale
Ecosite (ELC)	Yes	Marten select conifer-dominated stands with dense shrub cover.
Structural Stage (ELC)	Yes	Marten select mature/old forests with complex structure.
Distance to Riparian	No	Most ecosites defined by permafrost rather than riparian. ELC data more accurately represent increased habitat quality in mature/old riparian forests than distance to riparian.
Linear Features	Yes	Generally, marten avoid linear features due to increased predation risk. It is included as a habitat modifier/downgrade to adjacent habitat.
Fire History	No	Different patterns of use by marten depending on study. Fire may affect habitat quality positively or negatively, dependent on ecosite and time since disturbance. Fire history was explicitly accounted for in the structural stage of the ELC mapping. Therefore, it would be redundant to include it in the model.
Elevation	No	Range in elevation within RSA (343–752 m asl) is not enough to affect marten distribution.

Ecological and Landscape Classification

ELC mapping refers to an integrated approach to mapping and classifying land units according to their ecological similarity (Environment Yukon 2016a). As part of another study in the RSA (EDI Environmental Dynamics Inc 2021), field plots were used to establish preliminary classification units and site/soil conditions across various ecological communities. The vegetation association organization and ecosite and coding system follows the Yukon ELC Mapping Guidelines (Environment Yukon 2016a). Non-forested and sparsely/non-vegetated ecosystem were assigned to group/realm following *Biogeoclimatic Ecosystem Classification of Non-forested Ecosystems in British Columbia* (BC MFLNRORD and BC MOE 2010, Mackenzie 2012), and anthropogenic units were classified following *Standards for Terrestrial Ecosystem Mapping in British Columbia* (Resources Inventory Committee 1998a). Wetland sites were classified according to the Canadian Wetland Classification System for class, form, subform, type and subtype.

The remaining ecosites were coded with a two-digit number that indicates, by its number series, a certain range of soil moisture conditions: 10s are dry sites, 00s are mesic sites, 20s are riparian sites, 30s are moist

sites, and 40s are wet sites. Ecosite names reflect plant species that are important indicators of the vegetation found within the ecosite (e.g., 33 – Moist Spruce – Labrador Tea).

Biologists delineated ELC polygons in a GIS based on discernible differences among vegetation, topography, terrain, soils, gradients, and patterns (relationship patterns between ecosystem units, polygon shape and orientation). Three or fewer ecosystem units (i.e., ecosites) were entered per polygon. Each ecosite had an associated structural stage modifier (e.g., pole sapling) and decile, representing the percent area of the polygon in each ecosite (i.e., all deciles sum to 100%).

A subsample (n = 97) of ELC field plots were used to describe habitat suitability rankings for marten within the context of the Eagle Plains Ecoregion. Field plots were identified as High (n = 10), Moderate/high (n = 21), Moderate (n = 20), Moderate/low (n = 44), and Low (n = 2). No field plots were in Nil/Very Low habitat suitability. ELC ecosites and structural stages were used to generalize habitat rankings from field plots to ELC GIS data (Table 3-3).

Every combination of ecosite and structural stage was assigned an initial HSI score of High (HSI >0.67 to 1.0), Moderate (HSI >0.33 to 0.67), Low (HSI >0 to 0.33), or Nil/Very Low (HSI = 0). Only ecosites and structural stages represented in the RSA were included in habitat modelling. All non-vegetated ecosites (AN, ES, Fa, LA, PD, RI, RZ) were ranked as Nil/Very Low (0.0). Vegetated ecosites in the non-vegetated structural stage (1) were ranked as Nil/Very Low (0.0). Ecosite 10 (sparsely vegetated) was ranked as Nil/Very Low (0.0) regardless of structural stage. All other vegetated ecosites with Sparse/cryptogram (2/2a) or Herb/graminoid-dominated (3/3b) structural stage were all ranked as Low quality (0.1). Vegetated ecosites in Low shrub (4b) structural stage were ranked as Low quality (0.33) and ranks increased with structural stage to a maximum of 1.0 (High quality) for conifer/mixedwood ecosites, and a maximum of 0.67 (Moderate quality) for deciduous/shrub ecosites, and 0.33 (Low quality) for wetland (bog, marsh, fen) ecosites.

Linear Features

Linear features (LF) were surveyed in the RSA as a companion study for the exploration project proposal (EDI Environmental Dynamics Inc., unpublished study). LFs were classified as 2D, 3D, winter roads (any trails or limited use roads with an obviously curving path), and the Dempster Highway. A subsample (n = 64) of field plots from the LF surveys were used to investigate habitat suitability for marten on-line and off-line. Determining the relative level of impact of various types of LFs established empirical evidence for modelling.

No linear features contained high suitability habitat; the average difference between off-line and on-line habitat suitability rankings across all types of LFs was 0.81 (SD = 0.79, range = 0–3, n = 64). All 2D lines (average width = 5.4 m, n = 27) were moderate-low habitat suitability on-line, and when compared to off-line habitat, the average difference in suitability ranking was 0.85 (off – on), (SD = 0.82, range = 0–2). 3D lines (width range = 1.75–5 m, n = 27) were mostly moderate-low habitat suitability (n = 24), and the average difference between off-line and on-line suitability was 0.63 (SD = 0.69, range = 0–2). The average difference among winter roads (average width = 5 m, n = 8) was 0.88 (SD = 0.64, range = 0–2). Along the Dempster Highway (average width = 15 m, n = 2), the average difference was 2.5 (SD = 0.71, range = 2–3). The average difference in HSI between off-line and on-line field plots was scaled to a score from 0–1 for downgrading:

- Dempster Hwy (30.0 m wide) = (2.5*0.25) = 0.625
- Winter Roads and 2D lines (10.0 m wide) = (0.87*0.25) = 0.218
- 3D lines (10.0 m wide) = (0.63*0.25) = 0.158

2D and 3D lines were mapped using a 10 m width due to limitations of the spatial scale of modelling (10 m raster). The 2D lines are wider than 3D lines and thus have a greater local effect on marten habitat suitability. The difference in effect between 2D and 3D lines on marten habitat was accounted for by applying a greater value for downgrading 2D lines (–0.218) compared to 3D lines (–0.158).

Table 3-3. HSI ratings for marten habitat quality in the Eagle Plains RSA based on an assessment of ELC field plots.

3.4.1.3 Model Structure

Each ELC polygon contains up to three ecosites with deciles indicating percent cover relative to the total area of the polygon. A weighted average HSI score was calculated for each polygon using the following equation:

$$ELC_r = \frac{\sum_{i=1}^{n} d_i h_i}{\sum_{i=1}^{n} d_i}$$

where ELC_r is the initial weighted average, d_i is the decile value, and h_i is the HSI score for each ecosite. HSI polygons were converted to a 10x10 m resolution raster, and linear feature adjustments were applied to the initial HSI scores for each cell:

$$HSI = ELC_r - LF_r$$

where LF_r is the LF adjustment.

3.5 RESULTS AND DISCUSSION

The model indicated a patchwork of High, Moderate, and Low-quality marten habitat, across the RSA (Table 3-4; Map 3-1). High-quality marten habitat is associated with mesic, spruce-dominant ecosites in mature to late structural stages. It includes some of the most common ecosystem units in the RSA, including Moist Spruce – Labrador Tea (33), Moist Spruce – Alder – Labrador Tea (34), and Mesic Black Spruce – Alaska Paper Birch (04; Figure 3-1). Concentrations of High-quality habitat include Enterprise and Dalglish Creeks watersheds in the south, a band running east-west north of the Dempster Highway, and the western part of the northern half of the RSA. Moderate-quality habitat is associated with wetter or younger ecosystem units than High-quality habitat and is widespread across the RSA. High and Moderate-quality habitat is also concentrated in narrow strips of mature/old riparian forests along some of the major watercourses in the RSA, including Chance and Greaves Creeks in the northwest and McParlon Creek west of the Dempster Highway.

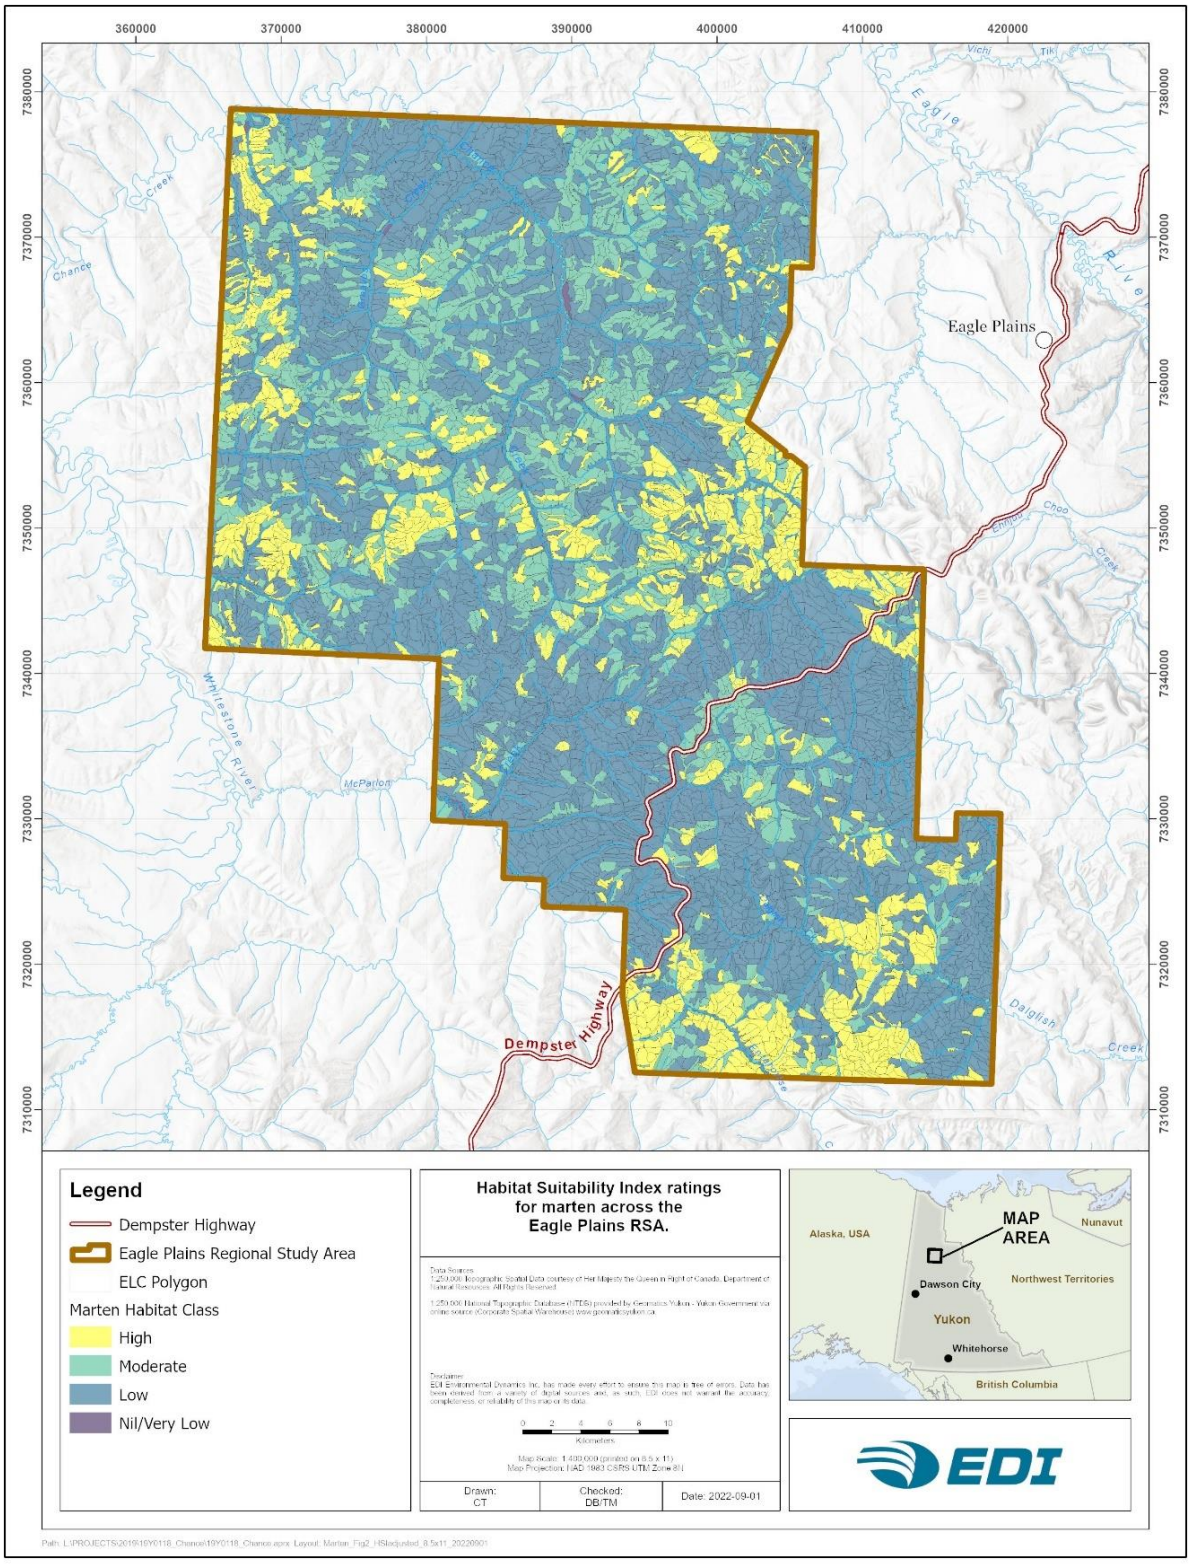
There is extensive Low-quality habitat, represented by vegetation communities in tall and low shrub structural stages found throughout the RSA (Figure 3-1). These habitats generally lack mature forest structures, such as large trees, snags, and CWD, which marten require for subnivean foraging, escape/thermal cover, and denning (Buskirk and Ruggiero 1994, Thompson et al. 2012). Low-quality habitat was associated with shrubby wetlands and stunted black spruce sites in low valley bottoms in the Chance watershed in the northwestern portion of the RSA and regenerating fire-disturbed areas on both sides of the Dempster Highway in the southern part. Completely non-vegetated areas are rare in the RSA; thus, there is almost no Nil/Very Low-quality habitat (Table 3-4; Map 3-1).

Linear features had a relatively minor effect on the overall quality, amount, and distribution of potential habitat for marten. The effect of linear features on habitat suitability for marten is mainly limited to site-level effects (Map 3-2). This effect was due to the narrow width of linear features (Moriarty et al. 2016, 2017) and their small extent relative to the overall RSA. Though existing linear features reduce habitat quality at the site level,

their effects are negligible to habitat supply at the home range scale for marten (Table 3-4). The Dempster Highway was likely the only linear feature in the RSA that could limit the movement of marten. Marten avoid crossing open areas due to increased predation risk relative to areas that provide escape cover (Slauson et al. 2017). However, the highway likely functions as a barrier, not an obstacle or constraint to their movement (Beyer et al. 2016). Therefore, it is likely that marten can and will cross the highway, so the potential barrier limits to their movement likely do not affect habitat availability at the home range scale.

Table 3-4. Relative availability of marten habitat in the Eagle Plains RSA.

Habitat Rating	HSI Scores	Area (ha)	Area (%)
High	>0.75 to 1.0	38,049.63	15.94
Moderate	>0.50 to 0.75	55,202.05	23.12
Low	>0.25 to 0.50	142,484.78	59.68
Nil/Very Low	>0.0 to 0.25	3,015.79	1.26
Total		238,752.25	100



Map 3-2. Habitat Suitability Index model ratings for marten across the Eagle Plains RSA.

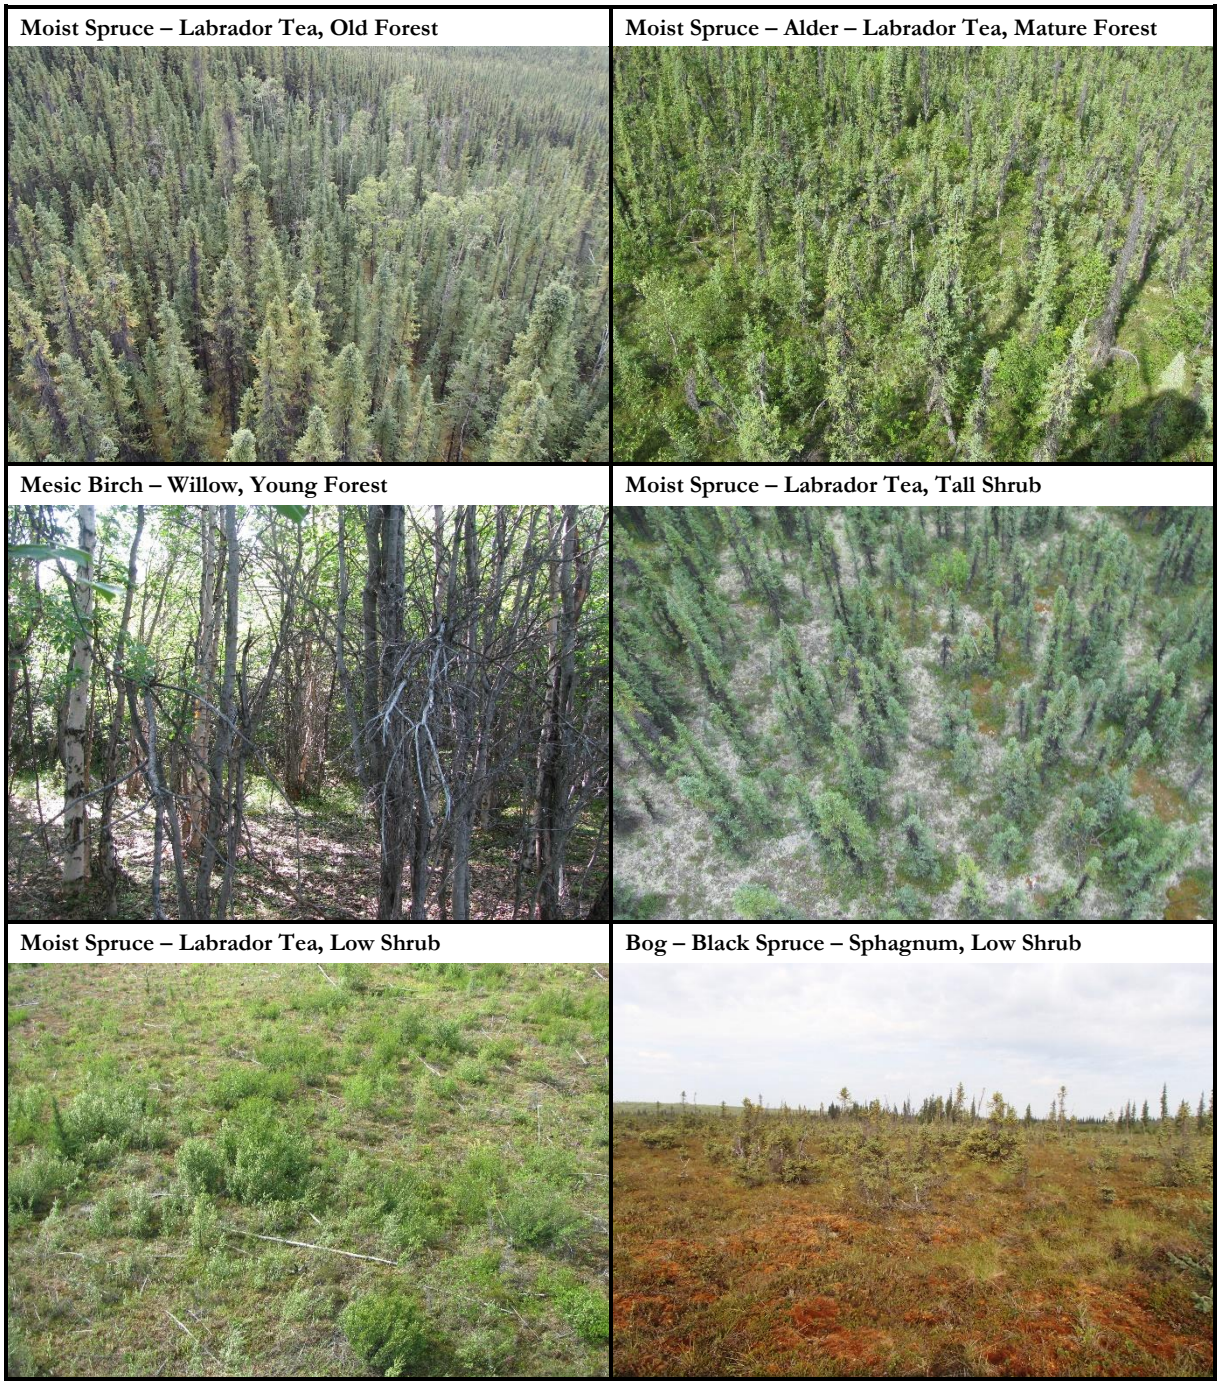


Figure 3-2. Examples of High (top row), Moderate (middle row), and Low (bottom row) quality marten habitat in the Eagle Plains RSA.

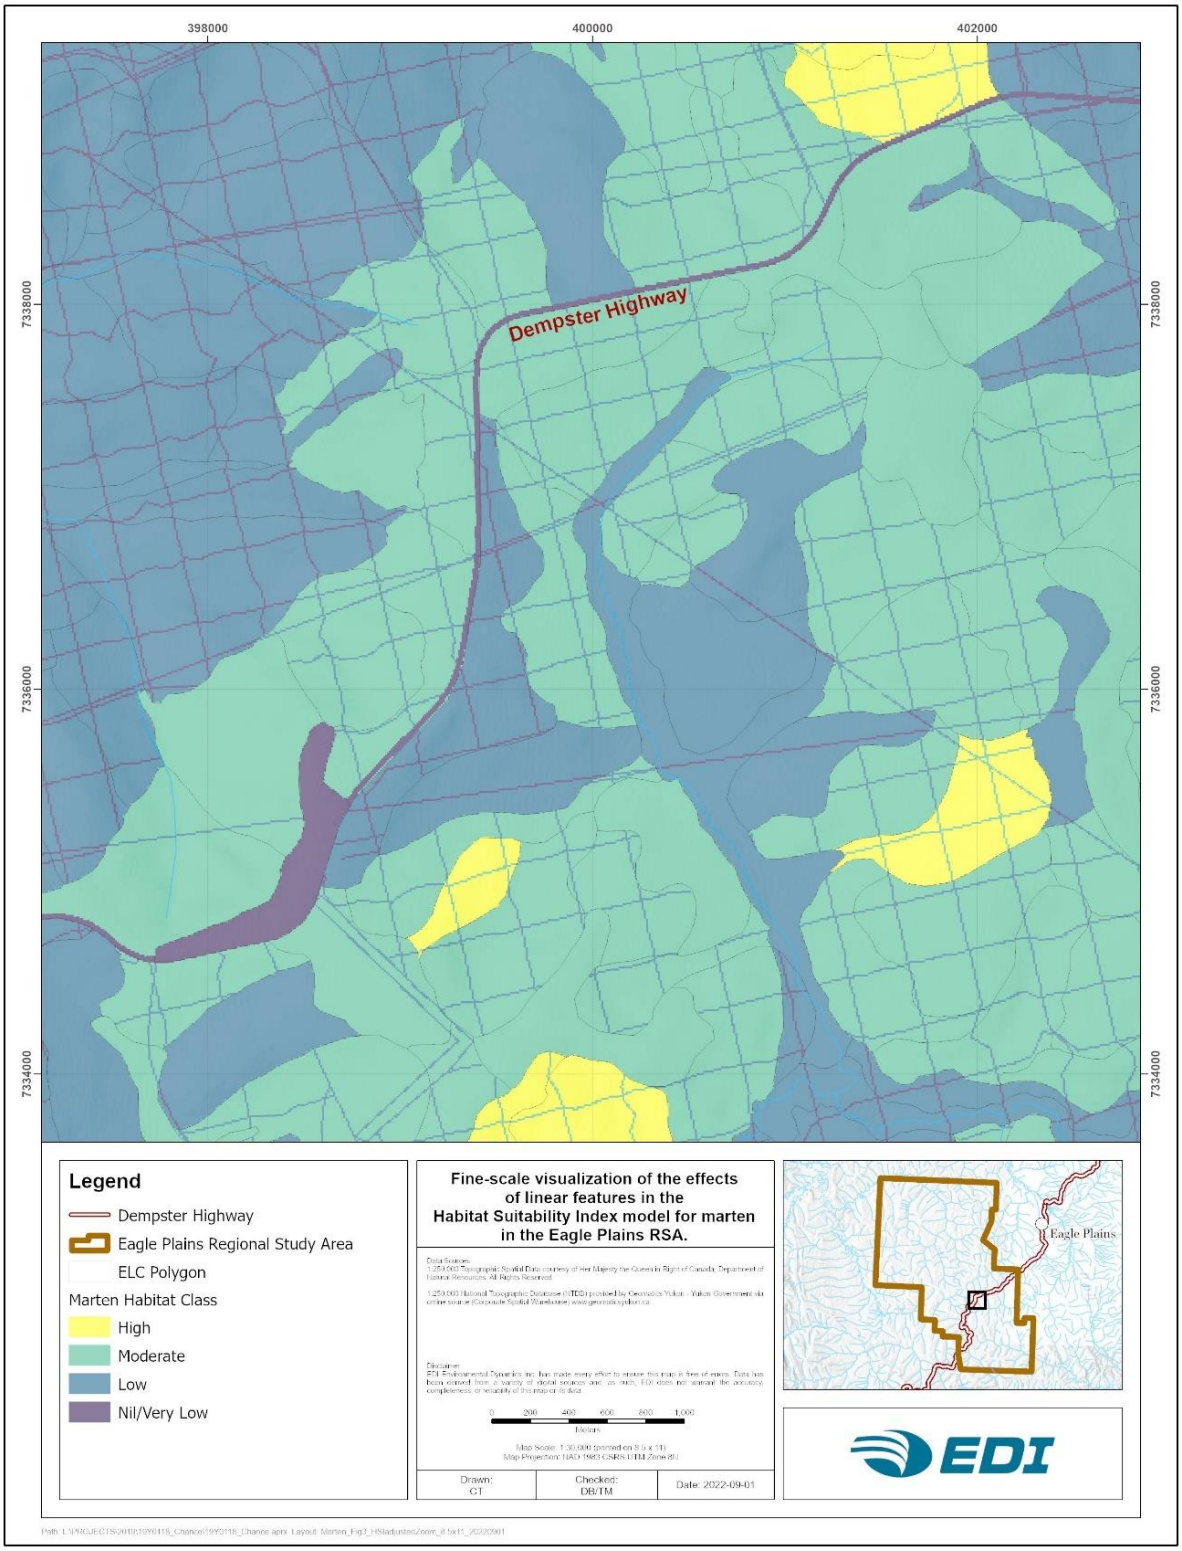


Map 3-3. Fine-scale visualization of the effects of linear features in the Habitat Suitability Index model for marten in the Eagle Plains RSA.

3.5.1 MODEL VERIFICATION AND CONFIDENCE

The frequency of use of habitat by marten in the RSA is expected to correlate to the ordinal habitat classes used in the model. However, independent marten occurrence data were not available to test that expectation. The overall confidence in the model is moderate based on moderate knowledge of marten in northern ecosystems and the lack of local field verification.

3.6 SUMMARY

The quality, amount, and distribution of potential habitat for marten were quantified across the RSA using a Habitat Suitability Index model. Ecosite and vegetation structural stages were used to assign areas an initial HSI score, which was then modified based on the presumed adverse effects of linear features on marten habitat. The HSI model indicates a patchwork of High (16%), Moderate (23%), and Low (60%) quality marten habitat across the RSA. High-quality marten habitat occurred in relatively large areas of contiguous mature/old spruce forests and narrow strips of mature/old riparian forests along major watercourses. The RSA contains extensive Low-quality habitat, associated with vegetation communities in tall and low shrub structural stages, including regenerating burns and open, stunted black spruce forest. Non-vegetated areas that constitute Nil/Very Low habitat are a minor component of the RSA. Linear features reduce habitat quality at the site level, but their effects on habitat supply at the scale of a marten's home range are limited.

4 GRIZZLY BEAR

4.1 PURPOSE AND OBJECTIVES

Grizzly bears (*Ursus arctos horribilis*) were selected as a VC for the Project due to their conservation status and social, cultural, and economic value. Grizzly bear have been assessed as a species of Special Concern in Canada, indicating their populations are at risk of becoming threatened if not adequately managed (COSEWIC 2007). Grizzly bears have cultural significance for Indigenous people of Yukon, some of which have traditional uses for their fur, fat, and meat (Benson 2014, Yukon Grizzly Bear Conservation and Management Plan Working Group 2019a). In addition, grizzly bears are managed as a Big Game species in Yukon (Government of Yukon 2002) and harvested by Yukon residents and non-residents (i.e., outfitting operations) throughout much of the territory. Grizzly bear are considered an iconic Yukon species and the opportunity to view grizzly bears attracts tourists from around the world (Yukon Grizzly Bear Conservation and Management Plan Working Group 2019a).

This section summarizes the current state of knowledge about grizzly bear ecology in the Project and broader areas, including population trends, distribution, habitat selection, diet, and sources of mortality. This report emphasizes grizzly bear ecology specific to the Taiga Cordillera Ecozone where the Project is located. The behavioural ecology and population characteristics of grizzly bears in the taiga are likely distinct from bears inhabiting coastal, boreal, and arctic barren-ground ecosystems, given substantial variation in habitat and food availability across these regions (Mowat and Heard 2006, Mowat et al. 2013). This report draws from multiple sources, including published and unpublished literature, personal communications with biologists, and traditional knowledge where available. Few studies on grizzly bears have been conducted in the region and the broader Taiga Cordillera. Thus, literature from surrounding regions was consulted when local information was unavailable.

4.2 POPULATION STATUS AND DISTRIBUTION

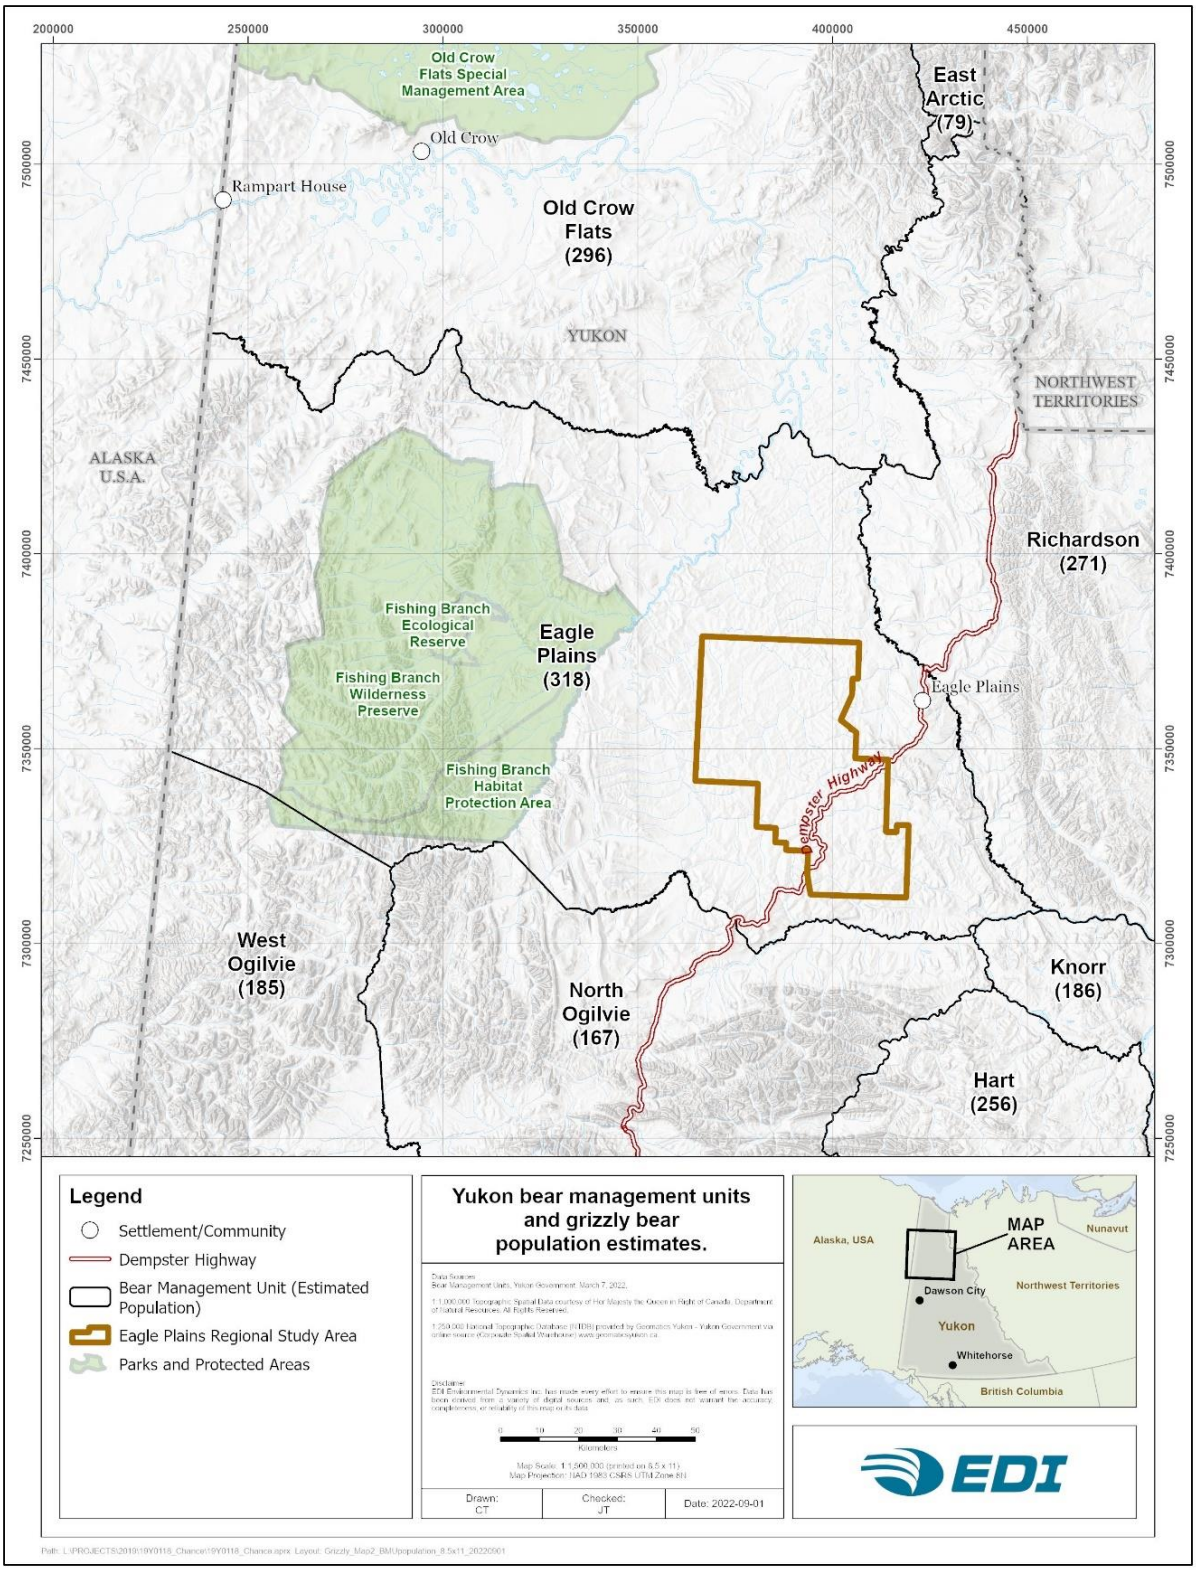
4.2.1 POPULATION

Yukon's grizzly bear population is estimated at 6,000 to 7,000 individuals, comprising approximately 25% of Canada's total grizzly bear population (COSEWIC 2007). The Yukon population estimate was derived from expert-opinion-based estimates of grizzly bear densities in each Yukon Ecoregion, using habitat information and local knowledge collected in the 1980s (Smith and Osmond-Jones 1990, Yukon Grizzly Bear Conservation and Management Plan Working Group 2019b). The exceptions are the Southern Lakes Region and Yukon North Slope, where more recent estimates are available from population assessments using genetic mark-recapture methods (Yukon Fish and Wildlife Branch 2016, 2017). The RSA is located within the Eagle Plains Ecoregion, which has a grizzly bear population estimate of 184 individuals (Yukon Grizzly Bear Conservation and Management Plan Working Group 2019b).

Yukon's grizzly bear populations are managed within bear management units (BMU), generally delineated by outfitting concession boundaries. The Inuvialuit Settlement Region is an exception, where grizzly bears are managed under a separate co-management agreement (WMAC [NS] and WMAC [NWT] 1998). Population estimates for each BMU were derived from the original expert-based Ecoregion estimates (except the Southern Lakes Region and North Slope). Population estimates for BMUs range from 43 to 503 bears; with variation attributed to differences in habitat quality and the sizes of BMUs.

The Eagle Plains BMU, which encompasses the RSA, has a population estimate of 318 bears (Map 4-1). However, the population estimate for the Eagle Plains BMU includes Ni'iinli Njik (Fishing Branch) Territorial Park, which likely has much higher grizzly bear densities than the RSA due to abundant salmon and winter denning habitat (Vuntut Gwitchin Government and Environment Yukon 2010). Grizzly bear densities are considered low throughout the RSA, although limited information is available (Pongracz and Suitor, pers. comm., 2022). Population densities for the adjacent Richardson Mountains are estimated at approximately 23 bears per 1,000 km^2 (Clarkson et al. 1993), but grizzly bears are more abundant in the mountains than the taiga plains that characterize the RSA (Benson 2014).

Grizzly bear population trends in Yukon are primarily tracked through harvest monitoring. The Yukon population is stable (Yukon Grizzly Bear Conservation and Management Plan Working Group 2019a). There is minimal data on population trends within the Eagle Plains BMU, given low grizzly bear harvest rates (refer to Section 3.1), but traditional knowledge provides some insight. Gwich'in knowledge holders suggest that grizzly bears in the Gwitch'in Settlement Area have a generally stable population (Benson 2014). However, elders noted that grizzly bears have declined in some areas from 1940 to the early 2000s due to increased hunting pressure, the opening of the Dempster Highway, increased use of snow machines, and a general northward range shift towards the Inuvialuit Settlement Region.



Map 4-1. Yukon bear management units and grizzly bear population estimates.

4.2.2 DISTRIBUTION

Grizzly bears occur throughout the Yukon, ranging from the BC/Yukon border to the Arctic coast. They are generalist omnivores that may live in various habitat types (Mowat et al. 2013), and they occur in all Ecoregions within Yukon.

In northern Yukon, seasonal grizzly bear distribution generally tracks the availability of key food resources such as berries, fish, ungulate calves, and ground squirrels (MacHutchon and Wellwood 2003). Very little information exists about grizzly bear distribution within the RSA. The Whitestone River adjacent to the RSA (Map 1-1) is an area of higher grizzly bear concentration in the region (Pongracz and Suitor, pers. comm., 2022). During the fall, grizzly bears congregate in Ni'iinli Njik (Fishing Branch) Territorial Park, approximately 20 km west of the RSA, to feed on spawning salmon in the Fishing Branch River (Vuntut Gwitchin Government and Environment Yukon 2010).

In and adjacent to the Gwitch'in Settlement Region, grizzly bears are more common in the Richardson Mountains, the Ogilvie Mountains, and the barren arctic coast than in the flat, low-elevation taiga that overlaps the RSA (Benson 2014). These distributional patterns are attributed to a lack of ground squirrels and other key food sources in the moist, hummocky spruce forest that characterizes much of the RSA.

4.2.3 CONSERVATION STATUS AND THREATS

COSEWIC has assessed grizzly bears as a species of Special Concern (COSEWIC 2007). The Western Canadian grizzly bear population is listed under Schedule 1 of the SARA, which requires measures to prevent grizzly bears from becoming Threatened or Endangered. Within Yukon, grizzly bears are not currently considered a species of conservation concern (Yukon Conservation Data Centre 2019), although a conservation plan was developed for grizzly bears in 2019 to promote healthy and viable grizzly bear populations into the future (Yukon Grizzly Bear Conservation and Management Plan Working Group 2019a).

The greatest threats to the Canadian grizzly bear population are considered to be 1) human-caused mortality, including illegal and legal hunting, conflict kills, and railway or road mortalities, and 2) habitat loss and fragmentation (COSEWIC 2007). Members of the VGFN had observed in the late 1990s that Grizzly bears did not come near to the Dempster highway but were concerned with the old garbage dump areas along the highway possibly attracting bears (Sherry and Vuntut Gwitchin First Nation 1999, p. 286, 289). Key threats to grizzly bear populations in the Yukon are human-wildlife conflict and harvest mortality, although habitat loss and climate-related changes to food availability may also be significant (Yukon Grizzly Bear Conservation and Management Plan Working Group 2019a). Northern grizzly bear populations cannot sustain high mortality rates due to their low reproductive rates and low densities (Nagy et al. 1983). Sources of mortality in the RSA and surrounding region are discussed in detail in Section 4.4.

4.3 MORTALITY AND HARVEST

Grizzly bears are managed as a big game species in Yukon (Government of Yukon 2002), and harvest is permitted in most parts of the territory outside of National Parks, including resident, non-resident, and subsistence harvest. The overall mortality management system is based on estimated total sustainable mortality rates of ≤ 2% of the female population, ≤ 6% of the male population, and ≤ 4% of the total population (Yukon Grizzly Bear Conservation and Management Plan Working Group 2019a). Total allowable mortality rates account for mortality from harvest, and other sources, including vehicle collisions and defence of life and property (DLP) kills (i.e., conflict kills).

Yukon grizzly bear harvest is managed within BMUs, although harvest rates are often reported at the scale of Game Management Subzones (GMS) or broader Game Management Zones (GMZ). The bag limit is one grizzly bear every three years in open subzones, and hunters must report all bear kills (Government of Yukon 2021). The RSA is located within GMZ 1, with the lowest licenced grizzly bear harvest rates in the Yukon. Between 1980 and 2014, the annual grizzly bear harvest in GMZ 1 varied from zero to three bears (Milligan 2018). More specifically, within the Eagle Plains BMU (Map 4-1), only two grizzly bears were harvested from 1995 to the present (Pongracz and Suitor, pers. comm., 2022). The Eagle Plains BMU does not overlap any outfitter concessions (i.e., no non-resident harvest), so reported harvest rates are attributed to licenced resident harvest.

Other sources of grizzly bear mortality include DLP kills, collisions with vehicles, and predation from other bears or large carnivores. Grizzly bear mortality rates in the Eagle Plains BMU are low relative to other BMUs in the territory, with an annual average mortality density of < 0.1 bears per 1,000 km², based on records from 2005 to 2016 (Yukon Grizzly Bear Conservation and Management Plan Working Group 2019b). Mortality rates tend to be higher in southern Yukon, where both the human population and road densities are comparatively high, with mortality densities up to 0.6 bears per 1,000 km² in some BMUs (Yukon Grizzly Bear Conservation and Management Plan Working Group 2019b). However, these rates do not account for unreported human-caused mortality (e.g., unreported DLP kills) or natural sources of mortality. Reported DLP kills accounted for an average of 11 grizzly bear mortalities per year in Yukon from 1980 to 2016. DLP mortality rates are very low within the Eagle Plains BMU; from 1995 to 2021, only one grizzly bear DLP kill was reported (Pongracz and Suitor, pers. comm., 2022).

The correlation between road density and grizzly bear mortality has been well documented in other parts of western North America (McLellan 1990, Mace et al. 1996, Boulanger and Stenhouse 2014, Proctor et al. 2019). Most historical grizzly bear mortalities in central BC and Alberta were related to human activity and occurred within 500 m of a road (Ciarniello et al. 2004, Boulanger and Stenhouse 2014). In BC, grizzly bear mortality rates are known to increase in areas where road densities exceed 0.6 km/km² (Lamb et al. 2018). Mortalities were caused by higher rates of legal harvest, poaching, and conflict kills near roads, in addition to direct mortalities from road collisions. Roadside hunting of grizzly bears is currently permitted in Yukon, although this is under review in some local areas (Yukon Grizzly Bear Conservation and Management Plan Working Group 2019a).

Grizzly bear mortalities from vehicle collisions are rare in Yukon. Fifteen grizzly bear mortalities resulted from collisions with vehicles from 2003 to 2014 on all Yukon Highways (EDI Environmental Dynamics Inc. 2015). Collisions tended to occur in spring and summer when grizzly bears were foraging on roadside vegetation. Most collisions occurred on the Alaska Highway (60%), which has higher traffic volumes than other roads in the territory. The only major road in the RSA is the Dempster Highway, which has comparatively low traffic volumes and is unpaved. From 2003 to 2014, only one bear collision was reported on the Dempster Highway near Dawson City. The bear species was unidentified.

Predation is a source of mortality for grizzly bears, but predation rates are generally unknown in the Yukon. Male grizzly bears occasionally prey on females and cubs on the North Slope (Clarkson and Liepins 1994). Wolves in packs have also been known to kill grizzly bears in northern Yukon (Benson 2014).

4.4 REGIONAL HABITAT ECOLOGY AND DIET

The distribution of available forage strongly influences habitat selection by grizzly bears during spring, summer, and fall seasons (Nielsen et al. 2010, Milakovic et al. 2012) and the supply of suitable den sites in winter (Smereka et al. 2017). Security and thermal cover are also important (McLellan 1990). However, they are generally selected with nearby foraging habitats (Milakovic et al. 2012).

Much of the available information on seasonal grizzly bear habitat selection and diet comes from the interior mountains and coastal regions of western North America (e.g., Hamilton 1978, McCormick 1999, McLellan and Hovey 2001, Ciarniello et al. 2007, Maraj 2007, Nielsen et al. 2010, Milakovic et al. 2012, McClelland et al. 2020). However, the ecological characteristics of these populations may differ substantially from that of grizzly bears in northern Yukon. At a finer spatial scale, grizzly bear ecology within the RSA differs from grizzly bears elsewhere in northern Yukon, such as the Yukon North Slope or the nearby Ogilvie and Richardson Mountains (Pongracz and Suitor, pers. comm., 2022), but very little information exists about grizzly bears within the RSA. Literature and traditional knowledge from similar ecosystems in northern Yukon have been summarized to the extent possible, including the Taiga Cordillera and adjacent Taiga Plains Ecozones. When information specific to the region was unavailable, literature from other parts of the Yukon or western North America was consulted.

4.4.1 SEASONAL DIET

Grizzly bears have broad omnivorous diets, including plants, fish, terrestrial wildlife, and insects (MacHutchon and Wellwood 2003, Ciarniello and River 2018). Grizzly bear diets differ among regions due to variations in food availability across local climates (Mowat and Heard 2006, McLellan 2011, Coogan et al. 2014). Individual grizzly bear diets are also highly variable and dependent on seasonal and annual availability of food items within their home ranges (MacHutchon and Wellwood 2003, McClelland et al. 2020).

Seasonal grizzly bear diets generally reflect the phenological progression of key food resources such as herbaceous plants, ungulate calves, berries, and fish (Hamer and Herrero 1987, MacHutchon and Wellwood 2003, McClelland et al. 2020). Vegetation is a major component of grizzly bear diet in northern Yukon; for

example, vegetation comprised more than 30% of grizzly bear diet in the Richardson Mountains (Koizumi 2012). During spring, important plant foods for grizzly bears in the Taiga Cordillera include the roots of alpine hedysarum (*Hedysarum alpinum*), sedges (*Carex* spp.), grasses, horsetail (*Equisetum spp.),* and berries leftover from winter such as kinnikinnik (*Arctostaphalos uva-ursi*), bearberry (*Arctostaphalos rubra* or *A. alpina*), and crowberry (MacHutchon 2000, MacHutchon and Wellwood 2003). In summer and early fall, grizzly bear diet in northern Yukon includes a variety of berries such as blueberry (*Vaccinium uliginosum*), soapberry (*Shepherdia canadensis*), crowberry, bearberry, kinnikinnik, cranberry (*Vaccinium vitis-idaea*), and cloudberry (MacHutchon 2000, MacHutchon and Wellwood 2003). When berries are unavailable, grizzly bears may forage on herbaceous vegetation such as sedges, grasses, and horsetails. As berry availability declines in late fall, grizzly bears may dig for alpine hedysarum more frequently (MacHutchon and Wellwood 2003).

In northern Yukon, grizzly bear diets incorporate a relatively high proportion of terrestrial wildlife, comprising up to 70% of their diet (Mowat and Heard 2006, Koizumi 2012). Mammals are likely an important food source throughout the spring, summer, and fall whenever they are available, including caribou (*Rangifer tarandus*), moose (*Alces alces*), arctic ground squirrels (*Spermophilus parryii*), and small rodents (MacHutchon 2000, MacHutchon and Wellwood 2003, Koizumi 2012). Arctic ground squirrels are an important food source, and grizzly bears may spend increasing effort pursuing them as berry availability declines in late fall (MacHutchon and Wellwood 2003). Arctic ground squirrels tend to select slopes with well-drained soils and avoid wet, flat, or hummocky terrain (Barker and Derocher 2010), which characterizes much of the RSA. Thus, grizzly bears with home ranges that overlap the RSA may rely heavily on other food sources (e.g., alpine hedysarum or ungulates). Traditional knowledge suggests that bears may travel to the nearby Richardson Mountains to forage on ground squirrels in fall (Benson 2014).

Ungulates may be a particularly important food source in spring, when grizzly bears in northern Yukon and Alaska prey on caribou and moose calves (Boertje et al. 1988, MacHutchon 2000, MacHutchon and Wellwood 2003). Barren-ground caribou (*Rangifer tarandus groenlandicus*) are a focal food source for grizzly bears in northern Yukon during caribou calving and seasonal migration periods (MacHutchon and Wellwood 2003). Grizzly bears may follow caribou as they migrate to and from their calving grounds (Reynolds and Garner 1987, Benson 2014), targeting calves or opportunistically preying on adults (MacHutchon and Wellwood 2003). Northern grizzly bear populations that prey on caribou during calving or migration have higher reproductive rates and population densities than those that do not overlap caribou range (Reynolds and Garner 1987). Grizzly bear diet has not been studied within the RSA, and there is no scientific data on the relative importance of caribou as a food source. However, the Porcupine caribou herd migrates through the RSA en route to calving grounds on the arctic coastal plain and again during their return to winter range in the Richardson and Ogilvie mountains (Russell et al. 1993, Ryder et al. 2007). Grizzly bears within the RSA likely use caribou during spring and fall migration.

Salmon, trout, and char are important seasonal foods for grizzly bears (Mowat and Heard 2006, Adams et al. 2017). During fall, grizzly bears congregate at the Fishing Branch River in Ni'iinlii Njik Territorial Park to feed on chum salmon (*Oncorhynchus keta*) (Vuntut Gwitchin Government and Environment Yukon 2010). Grizzly bears on the north slope are also known to feed on Dolly Varden trout (*Salvelinus malma*) (MacHutchon and Wellwood 2003). Baseline fish inventories for the Project found that salmon and trout were absent within the

RSA (EDI Environmental Dynamics Inc. 2022a). Arctic grayling (*Thymallus arcticus*) were the most common fish species, although longnose sucker (*Catostomus catostomus*) and round whitefish (*Prosopium cylindraceum*) were also present. Grizzly bear in the Richardson Mountains have been observed feeding on arctic grayling (Benson 2014), and whitefish and sucker are known food sources in the central Canadian arctic (Gau et al. 2002, Barker 2011).

4.4.2 FORAGING HABITAT

The availability, abundance, and distribution of important grizzly bear forage directly influence grizzly bear abundance and distribution during the growing season (McLoughlin et al. 2002a, Nielsen et al. 2017, McClelland et al. 2020). Grizzly bear populations in the subarctic and arctic are generally considered limited by food (McLoughlin et al. 2002a). Grizzly bears may balance the selection of high-quality food patches with avoidance of landscape features associated with high mortality risk, such as areas with dense human developments and roads (Nielsen et al. 2010, Proctor et al. 2017). However, given the relatively low harvest rates and low levels of human development in the RSA, it is likely that grizzly bear habitat selection is driven by food availability.

The literature on grizzly bear foraging habitat selection in the mountains, boreal forest, and coastal regions of western North America is extensive (e.g., Hamilton 1978, McCormick 1999, McLellan and Hovey 2001, Ciarniello et al. 2007, Maraj 2007, Nielsen et al. 2010, Milakovic et al. 2012, McClelland et al. 2020), but far less is known about habitat use in northern ecosystems. Studies in northern Yukon, Alaska, and NWT have focused mainly on arctic barren-ground grizzly bears (Phillips 1987, MacHutchon 1996, Gau 1998, McLoughlin et al. 2002a, Barker 2011), leaving a substantial knowledge gap about grizzly bear ecology in the Taiga Cordillera (particularly non-mountainous areas such as the Eagle Plains Ecoregion).

Grizzly bear distribution was clumped in the Richardson Mountains rather than uniform; bear densities were comparatively high in habitats with abundant food such as riparian valleys and low in flat tundra plains (Clarkson et al. 1993). Local traditional knowledge suggests that mountains are better grizzly bear habitat than taiga or barren-ground plains due to the abundance of berries and ground squirrels, and the earlier snowmelt on windblown and south-facing slopes in spring (Benson 2014). Grizzly bears in northern Yukon have large home range sizes (up to 1,250 km^2) and travel long distances to reach suitable foraging habitat (MacHutchon 2000). Thus, grizzly bears in the RSA may travel to the Richardson or Ogilvie Mountains for seasonal forage. This is consistent with the knowledge that grizzly bears have low densities in the RSA, and their behaviour is characterized by seasonal movements through the area (Pongracz and Suitor, pers. comm., 2022).

In the central Canadian arctic, barren-ground grizzly bears selected eskers, shrubby riparian zones, and tussock tundra throughout the spring, summer, and fall, corresponding with the spatial and temporal availability of food (Phillips 1987, McLoughlin et al. 2002a). Esker slopes support a relatively high abundance of berry-producing shrubs and arctic ground squirrels (Gau 1998, Barker and Derocher 2010, Barker 2011), whereas riparian zones and tussock tundra may provide herbaceous forage such as horsetails, sedges, and cotton grasses (*Eriophorum* spp.) (Gau 1998, Gau et al. 2002). Barren-ground grizzly bears also selected habitat with abundant lichen, which may attract caribou (McLoughlin et al. 2002a). During the Porcupine caribou

migration on the Yukon north slope, grizzly bears travelled along river channels or selected hillsides with long sight-lines, presumably to increase their chances of detecting caribou (MacHutchon 2001).

4.4.3 COVER (SECURITY AND THERMAL HABITAT)

Security habitat includes areas of dense vegetation that provide visual screening from other grizzly bears or humans (Mace and Waller 1997). Security cover may be particularly important for sub-adult male bears and sows with cubs to avoid adult males defending their territories or killing cubs to bring females into estrus (LeFranc et al. 1987, McLellan 2005). Female grizzly bears may select lower-quality foraging habitat if it provides high security values or spatial separation from potentially aggressive male bears (Pearson 1975, McLellan and Shackleton 1988). For example, female grizzly bears in the arctic are thought to occupy the Mackenzie Delta to avoid male bears in adjacent mountain ranges (Benson 2014).

Thermal cover includes habitat that provides relief from the elements, such as solar exposure or extreme weather. Cover from heat and solar exposure is provided by various habitats such as open water (e.g., rivers, streams, lakes), permanent snow patches, steep north aspects, and mature forest patches with high canopy closure (Pearson 1975, LeFranc et al. 1987). Grizzly bears may also select forests with high canopy closure for day beds to seek shelter from heavy rains (Pearson 1975, Munro et al. 2006). The importance of thermal cover for grizzly bears in the Taiga Cordillera has not been studied.

4.4.4 WINTER DENNING HABITAT

Grizzly bears in northern Yukon hibernate in winter from approximately October to May (Nagy et al. 1983, MacHutchon 2000), although the timing for den entry and emergence depends on annual weather patterns. Grizzly bears will enter their dens as late as mid-November and emerge as early as March if the weather is warm (Benson 2014).

No records exist of grizzly bears dens within the RSA, although grizzly bears are known to den in the mountains of Ni'iinli Njik (Fishing Branch) Territorial Park, approximately 20 km west of the RSA (Pongracz and Suitor, pers. comm., 2022). Grizzly bears in the arctic and subarctic typically excavate their dens in locations with suitable soil, such as sand, gravel, or glacier-deposited rock (MacHutchon 2000, Smereka et al. 2017). Grizzly bears in Vuntut National Park in northern Yukon preferentially select den sites in the mountainous regions of the park and avoid denning in Old Crow Flats, which is characterized by flat topography, large wetland complexes, and spruce forests (MacHutchon 2000). Denning within Old Crow Flats is likely limited to dry, steep riverbank slopes (MacHutchon 2000). Grizzly bears throughout the Gwitch'in Settlement Area are known to prefer denning in the mountains; however, in areas with flat topography (such as the RSA), grizzly bears will select small topographical features such as hills, steep riparian banks, or lakesides to excavate their dens (Benson 2014). Grizzly bears in northern Yukon have large home ranges (Section 4.5.5) and may travel long distances to reach winter den sites (up to 65 km; Craighead 1976). Thus, some grizzly bears with home ranges overlapping the RSA may travel to nearby mountain ranges (Richardson Mountains, Ogilvie Mountains, or Ni'iinli Njik Territorial Park) to hibernate.

In arctic barren-ground ecosystems, grizzly bears select river banks, lakesides, or eskers with silty or sandy soil for denning (Harding 1976, Mueller 1995) and avoid open spruce forest (Smereka et al. 2017). Grizzly bears prefer to excavate their dens on steep south-facing slopes with abundant shrub cover in the arctic (Mueller 1995, McLoughlin et al. 2002b) and the boreal forest of southern Yukon (Libal et al. 2012). The root structures of tall shrubs such as willow (*Salix* spp) and dwarf birch (*Betula glandulosa*) may provide support to the ceilings of excavated grizzly bear dens (McLoughlin et al. 2002b).

4.4.5 HOME RANGE AND SEASONAL MOVEMENTS

Grizzly bear home range sizes are variable and have an inverse relationship with food availability (Nagy and Haroldson 1990, McLoughlin et al. 2000). Thus, grizzly bear home ranges in productive coastal or interior mountain habitats of BC are typically smaller and have greater overlap than those in less productive boreal, taiga, or arctic barren-ground ecosystems (McLoughlin et al. 2000, Edwards et al. 2009, Hamilton et al. 2018). Additionally, the size of individual home ranges may vary annually in response to fluctuations in the quality and abundance of food (McLoughlin et al. 2000). The largest recorded grizzly bear home range sizes in North America were in the central Canadian Arctic, where mean home range sizes for female and male bears were 2,100 km² and 7,245 km², respectively (McLoughlin et al. 2003).

No data on grizzly bear home range sizes within the RSA are available, but studies conducted in other parts of the Taiga Cordillera provide some insight. Grizzly bear home range sizes in the Old Crow flats of Vuntut National Park were estimated at 650 – 750 km² for females and 1,150 – 1,250 km² for males (MacHutchon 2000). In the Richardson Mountains north of the RSA, female grizzly bears had mean annual home ranges of 442 km² and males had home ranges of 760 km² (Koizumi 2012). The smaller home ranges in the Richardson Mountains may be attributed to more food resources, such as berries and ground squirrels relative to the taiga plains (Benson 2014).

Grizzly bears have low fidelity to home ranges in unproductive arctic ecosystems, where food distribution is spatially and temporally heterogenous, and grizzly bear population densities are low (Edwards et al. 2009). Under these conditions, it is beneficial for grizzly bears to adjust the size and location of their home ranges to maximize forage availability. For example, in northern Yukon and Alaska, grizzly bears may travel long distances to follow the seasonal migration of barren-ground caribou (Reynolds and Garner 1987, MacHutchon 2001). Grizzly bears in northern Yukon are also thought to travel long distances to find suitable winter denning habitat in the mountains (Benson 2014).

4.5 SUMMARY

Available data suggest that a low density of grizzly bears are distributed throughout the RSA. Rates of recorded harvest mortality are low within the Eagle Plains BMU, but other sources of mortality are largely unknown and unrecorded. Grizzly bear diet in the RSA and surrounding region predominantly consists of vegetation (berries, roots, and herbaceous plants) and terrestrial wildlife, including caribou, moose, and arctic ground squirrels. Grizzly bears may rely heavily on caribou (particularly calves) during the seasonal migration of the Porcupine caribou herd through the region. Habitat quality in the RSA is generally poor compared to the adjacent mountain ranges, where berries and ground squirrels are more abundant. Lastly, grizzly bears in the RSA may excavate their winter dens in riverbanks, lakesides, and hills where suitable soil can be found, or they may travel to nearby mountain ranges to den on steep south-facing slopes. Most of the information presented in this review was based on scientific studies.

5 MOOSE

5.1 PURPOSE AND OBJECTIVES

Moose (*Alces alces*) were selected as a VC for the Project due to their importance as a managed game species, and their cultural values to First Nations living in the Yukon. Winter, and especially the late winter season, is often a difficult time for moose due to the limited availability of forage and increased energetic demands to move through crusted or deep snow. A winter habitat suitability map was developed for moose in the RSA to identify high-suitability winter forage habitat areas. The map quantifies the winter forage habitat in each habitat class (high, moderate, low/nil/very low) within the RSA.

This section summarizes information and data on moose use and ecology in the subarctic taiga that was used to develop habitat suitability mapping to quantify the suitability, amount, and distribution of potential habitat for moose in the RSA.

5.2 GENERAL HABITAT ECOLOGY OF MOOSE

5.2.1 EXISTING INFORMATION

There is limited knowledge of moose within the RSA. In 2001, Anderson Resources Ltd submitted a project application and a mitigation plan for an Eagle Plains 2001–2003 Seismic Survey Program (Access Consulting Group and EBA Engineering Consultants Ltd. 2001). This report describes moose knowledge of the area as being limited and incidental. The authors reviewed the existing data and had discussions with local wildlife biologists and other resource users about winter usage patterns by moose in the general vicinity of the Eagle Plains project area. At that time, moose were only superficially studied in the Eagle Plains Area (Access Consulting Group and EBA Engineering Consultants Ltd. 2001).

The 2001 project application report stated that an approximate moose density of about 0.05 moose/km² was estimated for the project area based on general habitat assessment. The application also provided the following information:

> "*Within the project area, moose are not commercially exploited and there are no outfitting concessions. There is limited off-road access and the moose population density within the project area is known to be low, hence the subsistence harvest is minor. YTG Renewable Resources harvest data show that, in the last twenty years, only 13 moose have been harvested in the Dempster Corridor subzones (Game Management Zone 1-55 and 1-56).*
>
> *Anderson conducted a post-rut moose survey in early November of 2000, to augment the currently very limited knowledge regarding moose populations in the project area. The survey was conducted to provide baseline information on the level of range usage by moose within the project area. During the course of the 2-day survey, 30 moose were observed and an additional 64 sets of tracks were encountered. In general, moose were more frequently associated with the higher elevations (between 400 m and 700 m above sea level), but were widely dispersed throughout all of project*

area's drainages. From the survey results, an overall population of approximately 60-90 moose was estimated (Access Consulting Group and EBA Engineering Consultants Ltd. 2001)."

These observations of greater moose abundance at higher elevations are consistent with observations from VGFN elders around the same time (Sherry and Vuntut Gwitchin First Nation 1999, p. 7). They discussed that Eagle Plains was an important moose range, but that some animal populations had changed their land use after the Dempster highway was built and there was low density near the highway (Sherry and Vuntut Gwitchin First Nation 1999, p. 287, 299).

In 2001, an aerial survey was completed from June 18–22 within the 2001 project area. During that survey, 19 moose were incidentally observed, with most observations noted in the South Eagle River and Dalglish Creek area. A general point of interest was that moose calving was expected in several drainages, but was particularly noteworthy in the South Eagle River (Access Consulting Group and EBA Engineering Consultants Ltd. 2001).

In 2013 Environment Yukon conducted an 'Eagle Plains Mammal Occupancy Aerial Survey' from March 19 to March 24, 2013 (Environment Yukon, unpublished data). The survey aimed to assess the occurrence and distribution of large mammals within the broader Eagle Plains Ecoregion. Over the 6 survey days, 64 moose were observed, including cow and calf observations. The data indicated that moose were widely distributed within the Eagle Plains area, but the area was not comprehensively surveyed, and formal analyses/reporting were not included with the data.

From October 2014 through August 2016, Yukon Environment deployed 37 (2014) to 48 (2015) pairs of remote cameras in the Eagle Plains area (Burden 2016). The objective was to assess the use of linear features by medium to large mammals (wolves, caribou, and moose) by comparing the use of wildlife on and off seismic lines by placing cameras at random locations on seismic lines, and camera locations off seismic lines. The report is a data summary with no statistical analysis, and the results are non-standardized (e.g., lacking a catch per unit effort reporting metric). Regardless, there was some information collected for moose relevant to this study. Over the two years of study, moose encounters were infrequent and varied slightly among years (0.33 moose/100 camera days in 2014–2015, 0.43 moose/100 camera days in 2015–2016). Moose were found in the study area throughout the year but were observed more often from May through November (spring through fall). No statistical analyses or apparent trends were used to determine moose associations with linear disturbances.

EDI did not complete other population or distribution surveys for moose as part of the current baseline studies. Efforts focused on developing a winter habitat model to quantify habitat suitability, amount, and distribution across the RSA.

5.2.2 HABITAT ECOLOGY OF MOOSE

Moose are one of the most widely distributed ungulates and range from the Arctic coasts of North America, Europe, and Asia down to the southern limits of the boreal forest and farther south where suitable montane biomes are located exist. In the Yukon, moose densities generally range between 100 and 250 moose for every 1,000 km^2 of suitable moose habitat (Environment Yukon 2016b). The Regional Biologist has indicated that,

based on his observations, moose densities in Eagle Plains are relatively low compared to some parts of the southern Yukon, but that moose densities in Eagle Plains are high compared to other parts of North Yukon (Mike Suitor, pers comm).

Moose make seasonal movements to various habitats such as calving, summer, rutting, and winter habitats. These seasonal movements may range from a few to many kilometres (Clarke et al. 2017, Government of Yukon 2022). Changing environmental conditions can affect the quality, quantity, distribution, and accessibility of cover and forage over a landscape. Key habitat requirements are rarely distributed evenly over space or time, so moose move to access various resources as availability changes. Periodic disturbances, such as wildfire and vegetation clearing change the abundance and availability of moose cover and forage. Moose are generally not evenly distributed across the landscape; they concentrate in particular habitats offering higher forage opportunities(Government of Yukon 2022). Moose with access to large quantities of forage are known to travel less than those in areas where forage is less abundant (McCulley et al. 2017). There is a wide variation in home range sizes for moose across the boreal forest and between seasons (Phillips et al. 1973, Addison et al. 1980, Clarke et al. 2017, McCulley et al. 2017). Moose that frequent the Old Crow Flats wetland complexes in northern Yukon are known to spend summer months within this area and then migrate 250 km to spend the winter within the Alaska Arctic National Wildlife Refuge (McCulley et al. 2017).

Moose habitat selection patterns vary among populations, individuals, seasons, and sexes (Clarke et al. 2017, McLeod and Clarke 2017). Furthermore, habitat use by moose can differ depending on the type of land cover and the availability of resources in a particular area. In northern Yukon, moose appear to frequent narrow strips of forest along the rivers (Photo 5-1), and VGFN elders have observed good moose habitat just south of the RSA along the Blackstone and Ogilvie rivers and the wetlands of the Blackstone Uplands (Sherry and Vuntut Gwitchin First Nation 1999, p. 303). In the south, moose frequent the treeline in the subalpine shrub zone. Moose in the Yukon also tend to concentrate in recent burns and along waterways with interconnecting ponds, marshes and meandering streams (Government of Yukon 2022).

Moose inhabit numerous stand-cover types and structural stages. Conifer stands are generally used primarily as cover to moderate extremes of cold, wind, heat, deep snow, and security from predators (Timmermann and McNicol 1988, McCulley et al. 2017). Early seral areas are usually shrub-dominated and used by moose because shrub species comprise more than 60% of a moose's annual diet (Renecker and Schwartz 2007). During the spring and summer, moose forage primarily on the leaves of woody plants, aquatic plants, and forbs. During winter, the diet shifts to highly lignified woody stems, resulting in higher ruminating times (Renecker and Hudson 1986). Plant form and twig diameter have also been shown to affect digestion rates, influencing moose winter foraging (Vivas et al. 1991). Some preferred moose forage species include:

- Willows (*Salix* spp.)
- Red-osier dogwood (*Cornus sericea*)
- Saskatoon serviceberry (*Amelanchier alnifolia*)
- Highbush cranberry (*Viburnum edule*)
- Mountain ash (*Sorbus sitchensis*)
- Scrub birch (*Betula glandulosa / nana*)

- Trembling aspen (*Populus tremuloides*)
- Lodgepole pine (*Pinus contorta*)
- Paper birch (*Betula papyrifera*)

These browse species may be used preferentially due to their height and growth form (Baker 1990, Van Ballenberghe et al. 1989). The palatability of shrub species can also vary from region to region. Soopolallie (*Shepherdia canadensis*) was recorded as an important forage species for moose on the Kenai Peninsula, Alaska (Edwards 1940) but appears to be unpalatable in other parts of the boreal forest (Rolley and Keith 1980). In northeast Alberta, the preferred browse species was Saskatoon serviceberry; even in areas where it was uncommon, the species was still heavily used when it was present (Nowlin 1978). In the Peace-Athabasca Delta, moose feed primarily on willow, red-osier dogwood, paper birch and balsam poplar. In one study done in the taiga region ranging from northwestern Manitoba to Great Slave Lake NWT, winter moose diet was mainly composed of *Betula papyrifera* bark (Thomas 1990). Risenhoover (1989) found that willows accounted for more than 94% of the winter moose diet in Denali National Park and Preserve.

Within the RSA, willows and scrub birch are the dominant browse species available for moose. Willows often form the predominant diet in other northern areas. Willows are well adapted to wetter soils and are commonly found in wetland and riparian habitats (Photo 5-2). Willows are also an early successional species and are often abundant in early seral habitats resulting from forest fires and human-disturbed areas (e.g., seismic lines, cutblocks, and road rights-of-way). Moose have been reported selecting previously burned habitats and areas within 100 m of streams and waterbodies, presumably due to the abundant forage (Wasser et al. 2011). In habitats with low availability of twigs and leaves, moose sometimes use a foraging technique called 'bark-stripping' where long, linear strips of bark are peeled from certain trees, such as aspen (LeResche and Davis 1973, Miquelle and Van Ballenberghe 1989). However, the bark is usually a relatively small component of moose diets (Miquelle and Van Ballenberghe 1989). It is unlikely to be a significant food source in Eagle Plains due to the dominance of spruce, whose bark is non-palatable.

Across Canada, heavily used areas by moose include wetlands, floodplains of major rivers, riparian areas, regenerating cut blocks and burns, and avalanche chutes. Their preferred habitat types include recent burns, logged areas, lake and river shores, willow and alder swamps and other wetland areas MacCracken et al. 1997). Food (including forage quality) and climate are considered important aspects of habitat for moose (Franzmann 1981). Analyses of moose range commonly stress the abundance, production, and use of woody shrubs as important characteristics when describing moose habitat requirements (LeResche and Davis 1973; Jung et al. 2009).

In Labrador, moose can be observed more often in riparian areas and hardwood stands and less often in string bogs, open conifer-lichen stands, barren hilltops than expected based on the availability of those habitat types during the winter (Jung et al. 2009). Riparian areas are often high suitability habitats for moose in winter due to the availability of high-quality forage species such as willows. Willows and birch found within the riparian shrub communities are often adjacent to a strip of closed-canopy conifer-dominated forest that provides thermal cover and snow interception. The combination of shrub communities and closed-canopy mature riparian forests offer a highly suitable habitat mosaic for moose (Jung et al. 2009).

During the winter, moose are influenced by snow depth, snow density and hardness. Moose movements begin to be impeded at snow depths of 70 cm, and moose strongly avoid areas with >100 cm of snow. Moose generally winter in areas where snow depths are less than 70 cm (Coady 1974, Franzmann 1981). In mountainous areas, where snow accumulation can vary substantially, this can result in strong patterns of seasonal range use, with moose avoiding mid an upper elevation where snow accumulation is higher. For example, in the Pelly-Macmillan River area (Central Yukon), moose concentrated along the major river valleys during late winter, where the combination of shallower snow under mature forest canopies and dense willows in wetland areas provided moose with optimal habitat (O'Donoghue 2005). However, snow is not expected to strongly influence the distribution or habitat selection in the RSA in most years. This is due to the relatively modest elevation range within the RSA. The average maximum snow depths of approximately 80 cm are just on the edge of the range that moose avoid (EDI Environmental Dynamics Inc. 2021). Over much of the winter, snow depths are less than 70 cm.

Predation is recognized as a major factor affecting the dynamic of moose populations (Gasaway et al. 1992, Ballard and Van Ballenberghe 2007). In general, prey species select security habitats at multiple scales based on various factors that can affect their perceived predation risk. Perceived security is also a dynamic factor that varies over time and is dependent on the density and behaviour of predators, including humans. Moose population growth and density in Yukon are thought to be limited by wolves (Hayes et al. 2003). Consequently, moose may avoid habitats that increase the potential for wolf encounters. However, predator avoidance may be a more prominent factor in habitat selection at the landscape scale than within a home range (Dussault et al. 2005). Habitat types with taller and denser vegetation likely provide some protection from wolves during winter. Habitat types that provide cover from predators may also contain taller trees that intercept snow, reducing snow depth and reducing the energy required to move.

At a minimum, security habitat should conceal a moose from predators. It can be assumed the security habitat for moose can be provided by any forest stand of adequate density with trees and shrubs taller than 2 m. Security cover for moose is most critical during spring calving when cow moose seek out islands and gravel bars on river floodplains for calving. At calving time, cow moose and calves can find secure habitat in dense deciduous or mixedwood stands, or tall shrubs with canopy cover >50% (MacCracken et al. 1997). During winter, deep, and persistent snow has been shown to have a greater impact on the physical condition of moose and thus increasing its risk of predation. Within one study (Dickie et al. 2020), moose seem to select riparian areas to facilitate movement instead of selecting them only for foraging opportunities. In the RSA, most wildlife trails were observed adjacent to riparian areas.

Photo 5-1. A moose observed adjacent to a narrow treed riparian area in the RSA (Photo provided by Palmer Environmental 2019).

Photo 5-2. Shrubby riparian area, on the edge of a burn, where willows have been browsed by moose.

5.2.3 DISTURBANCE

5.2.3.1 Fire

Burns are often a major factor affecting the distribution and abundance of moose across the boreal forest, with densities peaking 20 to 25 years after fire (LeResche 1974). Studies have shown that moose populations are often denser in burned areas where browse is of higher quality and greater abundance than adjacent, unburned areas (Gasaway et al. 1989). Moose have been reported selecting previously burned habitats that are 10–30 years old (Maier et al. 2005) and less than 40 years old (Wasser et al. 2011). Overall, fire creates favourable forage conditions for moose when regenerating shrubs are available for browse.

Several large wildfires have affected the RSA, occurring between 1959 and 2018. Areas that were affected by fire, and are still regenerating, were labelled with a fire disturbance code in the ELC vegetation maps. For older burn areas, the adjacent non-burned area was compared to the burn area to see if there was a noticeable difference in vegetation. Areas that did not have a noticeable difference were not characterized as fire disturbed as they were considered regenerated. The appropriate structural stage was assigned to reflect the stage of regeneration.

The post-fire successional pathways for many of the ecosystem units in the RSA were the same or very similar, making the differentiation of ecosystem units based on revegetation difficult. For example, almost all ecosystem units regenerate initially with deciduous shrubs (willow and scrub birch) and a mix of spruce and deciduous trees (primarily paper birch), and, as succession progresses, the prominence of spruce increases and deciduous shrubs and trees decreases. Often the post-fire succession also varied within an ecosystem unit depending on several factors, including the number and frequency of fires, the intensity of the fire, and the amount of permafrost present before and after the fire. Field observations suggest that hot fires likely melted a larger portion of the permafrost, permanently altering the moisture regime of the affected area; therefore, site moisture regimes are altered, and some sites do not return to the same ecosystem unit that had been established before the fire. From a moose habitat perspective, the result is that, except for some ecosystem units in riparian areas, the abundance of browse species is affected more by regeneration status and structural stage than ecosystem unit type.

The current structural stage for some of the more recent fire-disturbed areas was difficult to determine due to the range in age and variety of the imagery. To be consistent, the mappers assigned a shrub structural stage to all fire disturbed areas unless there was strong evidence suggestion another structural stage (i.e., a plot stating it was graminoid dominant, Photo 5-3).

Photo 5-3. Recent burn in a graminoid structural stage. Generally, regenerating shrubs become available as browse to moose about 10 years after fire disturbance.

5.2.3.2 Linear Features

Linear features are the primary type of anthropogenic disturbance in the Project area. However, there are many uncertainties regarding the extent, impacts, and recovery status of linear features in the area. Linear features include narrow, linear clearings on the landscape, typically used for transportation and seismic exploration activities. The Project area has numerous 2D seismic lines (e.g., Photo 5-4) and winter roads from previous exploration activities dating back to the 1960s. The majority of 2D exploration occurred between 1961 and 1984. Some 2D exploration occurred in 2001 that incorporated LIS techniques (Access Consulting Group and EBA Engineering Consultants Ltd. 2001, GEOTIR 2014). More recently, approximately 2,200 km of 3D low-impact seismic (LIS) exploration was conducted in a 325 km² area between November 2013 and April 2014 (GEOTIR 2014). This 3D exploration grid is near the centre of the Project area, spanning north and south of the Dempster Highway.

Linear features can affect predation risk on moose. Facilitated predation operates by increasing the spatiotemporal overlap and interactions between wolves and prey species (Serrouya et al. 2016, Dickie et al. 2020). The magnitude and extent of such overlap are dependent on the extent and use of linear features across the contiguous woodland habitat. Linear features may enhance predation rates by increasing predator abundance via travel corridors and, ultimately, by optimizing hunting efficiency (Serrouya et al. 2016, Dickie et al. 2017, DeMars and Boutin 2018). The degree to which facilitated predation operates and affects prey species is context dependent. The primary features possibly associated with facilitated predation in the Project area are winter roads/trails, 2D and 3D seismic lines, and the Dempster Highway. In winter, clearing and compaction of snow on linear features by plowing or snowmobiles can elevate predator movements (Keim et al. 2019b), further exacerbating predation risk.

The Dempster Highway runs roughly southwest to northeast through the southern half of the RSA. The RSA includes numerous winter roads (15 m average width) from previous exploration activities dating back to the 1960s. The Project will be accessed via existing and new winter roads. Moose have been shown to avoid human development and activity, but response varies by season, sex, and population. Reduced use by moose has been documented near roads (Rolley and Keith 1980).

Moose use of seismic lines is variable. In a study completed in northern Alberta by Dickie et al. (2020), moose selected to be closer to riparian areas and avoided being closer to linear features. Another study demonstrated that seismic lines could increase encounter rates between prey and predator by facilitating predator movement (McKenzie et al. 2012). Moose, wolves and even people tend to move faster on linear features since these features create a path with less visual and physical resistance to movement but in some cases the ease of movement can increase the risk of prey species encountering a predator. Dickie et al. (2020) noted that moose had tendency to move faster while on linear features which could support the theory that moose perceive LFs as a risk to wolf encounters.

Many uncertainties surrounding the ecological impacts and recovery potentials for linear features, particularly of 2D and 3D seismic lines, in the taiga ecosystem that characterizes Eagle Plains. EDI completed a linear feature study. The purpose of that study was to systematically describe and quantify the current conditions of linear features across the RSA by providing a baseline inventory and assessing the successional and functional status of linear features. Six types of successional pathways were defined on linear features in the Eagle Plains area (Table 5-1; after Simpson 2008).

Most sites surveyed (79%) were undergoing normal succession, and that vegetation was either in a low shrub (56.1%) or tall shrub (29.0%) structural stage along the linear features sampled. Almost all 3D plots were at a low shrub structural stage (67% less than 1 m), while 2D plots and winter roads were distributed more evenly through low shrub, tall shrub, and forested structural stages (21% greater than 4 m and 5% greater than 8 m). The analyses suggested that 2D seismic lines regenerate to a more shrub-dominated community relative to pre-disturbance conditions, 3D seismic lines had lower woody cover than off-line plots after five years of regeneration, and fire has the potential to increase shrub and tree growth on linear disturbances. Sightlines along linear features decreased substantially as the height of vegetation increased, and ease of travel along linear features decreased with the amount of woody cover. Fire played an important role in shaping functional recovery by increasing the amount of woody cover and the structural stage of vegetation.

Under normal succession, 2D seismic lines had 12% to 19% greater mean shrub cover than the corresponding off-line sites in burnt and unburnt conditions, respectively. In unburnt conditions, 2D seismic lines had considerably shorter and sparser trees than paired off-line plots, but in burnt conditions, the 2D lines showed denser trees. Burn status appeared to influence some successional classes. Magnified succession was more common at burnt sites (19 burnt versus 5 unburnt), while stagnated succession was more common at unburnt sites (3 burnt versus 7 unburnt). Sites on a normal successional trajectory did not appear to have any relationship to burnt status, while other successional classes were too uncommon to draw any conclusions.

Studies focusing on the use of linear features by moose are limited. However, Keim et al. (2019a) found that moose used 3D seismic lines the least and used well-defined 2D seismic lines and pipelines the most.

Photo 5-4. Example of a low shrub 2D seismic line within the RSA.

Table 5-1. Descriptions of successional classes documented in the RSA (Simpson 2008).

Successional Class	Description
Normal succession	Similar to adjacent forest, but at an earlier seral stage. E.g., young trees that may be surrounded by early successional shrub and forb or graminoid species. Disturbance is likely only the removal of trees and shrubs, with little to no disturbance to soil or permafrost.
Magnified succession	Increased moisture and nutrient availability due to soil disturbance. Often new seral species due to removal of original trees and shrubs. Resulting vegetation is likely shrub or deciduous tree dominant, typically with more productive growth than adjacent sites. Disturbance is likely the removal of trees and shrubs, with significant disturbance to soil or permafrost.
Retrogressive succession	Removal of insulating peat layer causes a change in the soil thermal regime. Active permafrost layer depth increases, releasing water content. Resulting habitat is likely moss, graminoid, forb, or low shrub dominated, with high moisture content. Disturbance includes the complete removal of trees and shrubs, and soil or active permafrost layer.
Successional stagnation	Suspension of succession at herb or low shrub stage. Likely dominated by graminoids; area may have been seeded. Check line age to differentiate from normal succession. Disturbance to soil or permafrost is likely. Ground may have been compacted.
No succession	No ecological differences except that the forest opening is linear instead of random. Disturbance is likely only the removal of trees and shrubs, with little to no disturbance to soil or permafrost.
Recent disturbance	Newer seismic line where successional patterns cannot yet be determined. Line age was checked to differentiate from other successional patterns.

5.2.4 HABITAT SUMMARY

The late winter season is often a difficult time for moose due to the limited availability of forage and increased energetic demands to move through crusted or deep snow. A winter habitat suitability map was developed for moose in the RSA to identify high-suitability winter forage habitat areas. Moose select winter habitat based on three criteria: food availability, snow conditions, and predator avoidance (Dussault et al. 2005). Within the RSA, moose primarily select winter habitat based on browse availability.

The development of the moose habitat model will focus on the following key points:

- Habitat use is believed to be driven by forage availability.
- Winter is the most limiting season for forage availability.
- Winter forage in the RSA is primarily willow species.
- Areas with high willow cover in the RSA are riparian areas, burn areas and some mesic and moist ecosystem units with moderate willow understory.
- Elevation and snow are not likely a significant factor given the limited topography within the RSA; and
- Linear features like seismic lines and trails may provide small patches with elevated willow cover, but their extent are too small to affect habitat selection.

Willows are the primary winter food for moose and signs of moose browsing were commonly observed in the areas that contain abundant willow during the Project baseline surveys. As willow is an early succession species, the shrub is most abundant in disturbed areas such as burns. Anthropogenic disturbances in the RSA, such as 2D seismic lines, may also have a high willow cover, but the extent of these areas is too small to provide significant forage opportunities to moose. Outside of regenerating areas, the high cover of willows is mainly associated with riparian shrublands along streams and disclimax shrublands within the RSA.

5.2.5 HABITAT SUITABILITY MAPPING

Habitat suitability mapping identifies the current ability of an ecosystem unit to provide certain life requisites for a given wildlife species or provide the environmental conditions needed for cover, food and space. A habitat suitability rating is a value given to each structural stage of each ecosystem unit in a project area. The rating is the suitability value assigned to a habitat for its potential to support a particular species for a specified season and activity. It is often expressed as a percentage of the best habitat. It also reflects the species' expected use of a habitat (Resources Inventory Committee 1999c). Habitat ratings are a product of knowledge and assumptions.

The important role of vegetation is incorporated into any wildlife habitat evaluation. Biophysical factors which are considered to influence wildlife habitats can include vegetation type, slope, aspect, and other geographic features. Since vegetation cover type is an expression of various biophysical conditions such as soil moisture, aspect, and relief, it generally offers a current and valid prediction of habitat for many terrestrial wildlife species, at least at broad scales.

The wildlife habitat evaluation is essentially a modelling process that has two primary requirements:

1. Good knowledge of the habitat needs of a species, and how these habitat needs relate to the described ecosystem units; and
2. A standard approach to establishing wildlife species-habitat relationships and ratings for ecosystem units consistently.

The suitability maps use ecosystem attributes for assigning suitability values to a polygon. Wildlife habitat suitability ratings are a widely applicable method of wildlife habitat assessments. While there are recognized limitations to any habitat evaluation and assessment procedure, suitability ratings using ecosystem unit classification have the following advantages (Resources Inventory Committee 1999c):

1. It is predictive.
2. The methodology is consistent.
3. Large areas can be covered.
4. It is flexible and can be applied to a range of map scales, wildlife species, and general to detailed habitat assessments.
5. It provides strategic planning for habitat management.
6. It ties the wildlife resource to other resource uses (e.g., forestry, recreation, and corridor analyses).

The results of this type of model can provide information on the suitability, amount and distribution of potential moose foraging habitat within the RSA.

5.3 METHODS

The moose habitat suitability model was based on habitat suitability mapping standards and methodology (Resources Inventory Committee 1999c). This methodology is commonly used in habitat assessment. The habitat suitability methodology involves three key steps:

1. Selection of relevant habitat variables to include in the model.
2. Development of rating scores for each habitat variable.
3. Building a relationship among the variables to produce overall habitat suitability scores.

A moose winter forage habitat suitability model was developed based on professional opinion and the availability of suitable datasets. Land cover datasets (vegetation, linear disturbances, and fire history) were considered for the suitability modelling. Other variables were considered but not included in the model. They were assumed to correlate with the vegetation cover types and associated structural stages.

5.3.1 RATING SCHEME

This model uses a categorical rating scheme where each category represents an ordinal measure of habitat suitability. The number of categories used in a rating scheme reflects knowledge of the species' ecology and habitat use (Resources Inventory Committee 1999c). For species like moose, where our understanding of the

species and the availability of relevant base environmental data to support habitat modelling is relatively good, 4- and 6-class schemes are typically used. A 6-class system was initially chosen to rank the base habitat units because the 6-class system facilitated finer differentiation of ratings across the numerous habitat types that occur in the RSA (Table 5-2). However, for interpretive purposes, the ratings were generalized into a 4-class system for most model outputs. In the 4-class system, High and Moderately-High were combined into one category (High) and Nil and Very Low were combined into one category (Nil/Very Low).

High and Moderately High suitability habitat provides some of the best winter foraging opportunities for moose within the RSA. Moderate suitability habitat provides some winter foraging opportunities. Low and very low-quality habitat has limited winter foraging opportunities for moose in the RSA. Nil suitability habitat provides no winter foraging opportunities. It is often associated with features without vegetation (e.g., rivers, streams, roads) or with very sparse vegetation cover.

Within the RSA, the highest rated areas included natural shrublands and regenerating burns in riparian areas, as well as small extents of deciduous and mixed-wood ecosystems on mesic and moist sites. Moderate rated areas were predominantly regenerating burns on mesic to wet sites. Low rated sites were mostly undisturbed stands of open, stunted spruce on mesic to wet sites, ranging from tall shrub to old forest structural stages. Differentiating ratings between Moderate and Low areas was often difficult. Many sites, both burned and unburned, had average willow cover less than 15%, with high variation in cover among sites in the same ecosystem units. Generally, 7% willow cover was used as the threshold to differentiate between Moderate and Low sites. This is a relatively low value of willow cover but using a higher threshold would have resulted in large areas of regenerating burn being classified the same (Low) as undisturbed areas. In Eagle Plains, a substantial amount of total winter forage appears to occur within large areas with relatively low willow cover (i.e., the Moderate suitability areas).

Although the vegetation field data confirmed that the amount of shrubby browse (i.e., willow cover) was greater in fire disturbed areas than undisturbed areas, the amount of browse in regenerating burns was not as high as reported in some other studies. For example, the percent cover of willow in burns in the most common ecosystem unit, EU33-Moist Spruce Labrador Tea, was 11% compared to 7% in unburned areas. As a result of this pattern, areas with fire disturbance attributes in the ecosystem mapping database were generally rated one class higher than the same ecosystem unit that was not burned (mostly Moderate for burns and Low for unburned areas).

Table 5-2. Rating scheme used to rate moose habitat suitability.

Rating	Code	HS Score	Description
High	1	95	Suitable. Conditions at optimal. The best foraging opportunities for moose are expected to be found in these areas of the RSA. Willow percent cover is greater than 15%. Includes both disclimax and seral shrublands areas.
Moderately High	2	75	Suitable. Conditions near optimal. Above average foraging opportunities for moose is expected to be found in these areas. Willow percent cover also typically greater than 15% but, on average, less than High.
Moderate	3	50	Suitable. Suitability is lower than optimal conditions but meet minimum requirements from an energy balance perspective. Willow percent cover generally ranges between 7% to 15%.

Rating	Code	HS Score	Description
			Although willow cover is moderate to low in absolute terms, the large extent in this rating category contributes a substantial amount of the total available forage across the RSA.
Low	4	30	Suitability Unknown. Areas in this rating class offer some forage but the amount is so low and dispersed that the energetic return of using these areas are, on average, mostly negative. Willow species present but typically less than 7% cover.
Very Low	5	10	Unsuitable. Willow species presence and cover is usually less than 2%. Moose are expected to strongly avoid these areas.
Nil	6	0	Unsuitable. Willow presence not expected.

5.3.2 SELECTION OF RELEVANT HABITAT VARIABLES

Potentially relevant foraging habitat variables were identified from published literature, other habitat models, and personal experience. A suite of different habitat variables was identified as candidates in this habitat model, based on their known importance to winter foraging ecology (Table 5-3). The variables were evaluated for inclusion based on availability in GIS database, the ecological relevance to moose in the RSA, and relationships found in other studies. Based on these criteria, ecosystem unit, structural stage data and fire disturbance, all from the ELC mapping database, were included in the moose habitat modelling. Other variables were not included in the model as they were not expected to play a major role in winter habitat use by moose or because they were correlated with one of the three selected variables.

Distance to riparian areas was considered for inclusion in the model. Riparian areas are important foraging habitats for moose (Clarke et al. 2017, McCulley et al. 2017). Within the RSA, riparian areas generally contain abundant browse species relative to the adjacent ecological units. The ELC developed ecosystem units specific to riparian habitats. The ecosystem unit data accurately represent increased habitat suitability in riparian areas found as narrow strips along most watercourse and drainages in the RSA. Therefore, a variable for distance to riparian was redundant and was not included in the model.

Elevation was considered as a variable for inclusion in the model. In winter, moose generally occur at lower elevations to minimize the energetic costs of travelling through deep snow. Moose generally start avoiding areas with >70 cm of snow and rarely occur in areas with >100 cm. However, elevation within the rolling topography of the RSA does not vary substantially (range = 343–752 masl) and was likely not a significant driver of moose distribution. Therefore, elevation was not included as a variable in the model.

Slope was considered as a variable for inclusion in the model. Moose avoid very steep slopes (i.e., generally >35 degrees). In more southerly locations, moose will select moderately steep, south aspect slopes in winter where the combination of slope and aspect reduces snow depth and favours shrubby browse cover. However, steep slopes >35 degrees do not occur in the area, and south aspect slopes do not play a significant role in snow depths at this northern latitude. Therefore, slope was not included as a variable in the model.

Linear features were considered for inclusion in the model. LFs were surveyed in the RSA as a companion study for exploration project proposal (EDI Environmental Dynamics, unpublished study). LFs that were classified as 2D had an average width of 5.4 m and, under normal succession, had greater mean shrub cover than the corresponding off-line sites. The 3D lines had narrower widths and were not as shrubby, or shrubs

were not consistent in shrub cover and species present. The few winter roads also were not consistent in available browse species. The greater shrub cover does not signify the presence of higher quality browse species such as willows. The combination of shrub species cover found within LFs, and the small extent of LF did not warrant including them as a variable in the model because these two factors would not substantially affect habitat use by moose.

Table 5-3. Summary of habitat variables commonly associated with moose habitat suitability from published literature relevant to the Regional Study Area.

Habitat Variable	Ecological Rational	Included in Model (Yes or No)
Ecosystem Unit (ELC)	Ecosystems units have specific vegetation communities associated with them and are the best predictor of winter browse species occurrence.	Yes
Structural Stage (ELC)	Moose typically select shrub structural stages or open mature forest habitats as forage habitat.	Yes
Distance to Riparian	Any shrubby feature influenced by a creek or stream was given a riparian code in the ELC. ELC data more accurately represent increased habitat quality in riparian forests than the distance to riparian	No
Elevation	Elevation can strongly affect snowpack depth, with depths >70 cm limiting winter movements by moose. The limited range in elevation within RSA (343 – 752 m), combined with average winter snowpacks just reaching critical depths for moose, is assumed to be insufficient to affect moose distribution in winter.	No
Slope	Moose avoid steep slopes (>35%) and prefer south-facing slopes. A combination of slope and aspect reduces snow depth and favors shrubby browse cover. However, steep slopes >35 degrees do not occur in the area, and south aspect slopes do not play a significant roll in snow depths at this northern latitude.	No
Fire History (ELC)	Fire may increase forage habitat quality for moose, but it is dependent on time since the disturbance and ecosystem unit. The ELC mapping accounts for the fire history by using the structural stage and a disturbance code.	Yes
Linear features	Moose may avoid linear features due to increased predation risk depending on the region. Linear features may provide foraging opportunities. Linear features within the RSA may affect habitat quality positively or negatively, dependent on ecosystem unit and time since disturbance.	No

5.3.2.1 Ecological and Landscape Classification Based Variables

Ecosystems units have specific vegetation communities associated with them and are the best predictor available of winter browse species occurrence. Moose typically select shrub structural stages or open mature forest habitats as forage habitats. The ecosystem unit and structural stage variables are based on the recently completed ELC mapping of the RSA. A summary of ELC methods and results are presented here. Refer to

the separate baseline report for more detailed information about the ELC mapping (EDI Environmental Dynamics Inc 2021).

Ecosystem Unit Variable

ELC mapping refers to an integrated approach to mapping and classifying units of land according to their ecological similarity (Environment Yukon 2016a). ELC mapping aims to provide information on the biological and physical characteristics of various landscape components to facilitate a range of interpretations and assist in sustainable management (Rowe and Sheard 1981, Environment Yukon 2016a). For example, defining ecosystem units (i.e., ecosites, ecological communities) with similar vegetation, site and soil characteristics can provide information on the current condition of vegetation, can facilitate the development of vegetation mitigation measures during infrastructure development and aid in assessing habitat suitability for wildlife across a landscape.

To best meet the needs of the Project, a manual ELC mapping approach was completed, where mappers examine and interpret digital ortho-imagery to delineate and attribute polygons with ecological information manually. Using existing GIS datasets, this method typically provides a higher level of detail and accuracy than predictive modelling approaches. The mapping and classification methodology conforms to the Yukon Ecological and Landscape Classification and Mapping Guidelines, Version 1.0 (Environment Yukon 2016a), and the Standard for Terrestrial Ecosystem Mapping in British Columbia (Resources Inventory Committee 1998b) were used as guidelines.

To complete the ELC mapping of the RSA, new broad-ecosystem classification units were developed that had similar floristic composition and clearly interpretable ecological context in terms of site-scale climate, landscape position, substrate, hydrology conditions, and moisture and nutrient regimes. The goal was to develop Project-specific ecosystem units representing the range of ecological communities within the RSA while being reliably and repeatedly identifiable from a mapping perspective. The final ELC system used for the Project merged the methodology outlined by the YBEC system with aspects of the BEC system used in BC and referenced some of the existing units.

The most common ecosystem unit mapped in the RSA is Moist Spruce – Labrador Tea (Code 33) (44%) followed by Moist Spruce – Alder – Labrador Tea (Code 34) (12%) and Mesic Black Spruce – Alaska Paper Birch (Code 04) (9%) (Table 5-4). The least common (0%) ecosystem units mapped in the RSA are Dry Sparsely Vegetation (Code 10) and Mesic Birch – Willow (Code 02), and Moist Birch – Willow (Code 36). Both Birch – Willow ecosystem units are influenced by anthropogenic disturbances. Other less common ecosystem units that occur more naturally are Dry Aspen (Code 17), Mesic White Spruce – Alaska Paper Birch – Alder (Code 03), and Wet Shrub Scrub Birch – Graminoid (Code 45).

Table 5-4. Ecosystem units mapped in the Eagle Plains RSA.

Code	Name	Total Area (ha)	% of RSA	Average percent cover of *Salix* sp.
10	Sparsely Vegetated	2.6	0.0	No data
14	Dry Spruce-Lichen (Conifer)	1,826.5	0.8	5.3%
15	Dry Aspen-Lichen (Deciduous)	280.8	0.1	No data
16	Dry Spruce-Birch-Lichen (Mixedwood)	2,103.6	0.9	4.5%
17	Dry Aspen (Deciduous)	80.1	0.0	No data
02	Mesic Birch - Willow	90.5	0.0	22.0%
03	Mesic White Spruce – Alaska Paper Birch – Alder	98.3	0.0	No data
04	Mesic Black Spruce – Alaska Paper Birch (Mixedwood)	21,150.0	8.9	4.6%
05	Mesic Alaska Paper Birch (Deciduous)	11,496.0	4.8	12.5%
06	Mesic Black Spruce – Labrador Tea (Conifer)	7,463.5	3.1	12.2%
20	Shrubby Riparian Birch – Willow	860.2	0.4	27.6%
21	Riparian White Spruce – Prickly Rose	192.1	0.1	12.0%

Structural Stage Variable

Within the ELC database, the structural stage attribute (Table 5-5) describes the appearance of a stand or vegetation community and defined by the codes and criteria listed in the Field Manual for Describing Yukon Ecosystems (Environment Yukon 2017).

Most of the RSA is mapped in a Shrub structural stage (74%), with 45% of the RSA in a Low Shrub structural stage (Table 5-5). Approximately 1% of the RSA is in an Old Forest structural stage, and 21% is in a Mature Forest structural stage.

Table 5-5. Structural stages mapped in the Eagle Plains RSA.

Code	Structural Stage	Criteria	Area (ha)	% of RSA
1	Non-vegetated	No vegetation or less than 5% established vegetation, often due to recent disturbance (e.g., placer mining) or unvegetated rock.	8.0	0
2	Sparse / cryptogram	Either the initial stages of primary and secondary succession or a cryptogram community maintained by environmental conditions; sparsely vegetated or dominated by bryophytes and lichens; may be prolonged where there is little or no soil development (e.g., bedrock).	76.9	0.03
2a	Sparse (5–10% vegetation cover)	5–10% vegetation cover.	2.6	0
2b	Bryoid	Bryophyte-dominated	0	0
2c	Lichen	Lichen-dominated	0	0

Code	Structural Stage	Criteria	Area (ha)	% of RSA
3	Herb	Early successional stage or herbaceous communities maintained by environmental conditions or disturbance (e.g., wetlands, post-fire forest succession); herb dominated, including forbs, graminoids and ferns; some invading or residual shrubs and trees may be present but are usually sparse or absent; many herbaceous communities are continually maintained in this stage.	7.8	0
3a	Forb - dominated	Herbaceous communities dominated (greater than 1/2 of the total herb cover) by non-graminoid herbs, including ferns.	0	0
3b	Graminoid – dominated	Herbaceous communities dominated (greater than 1/2 of the total herb cover) by grasses, sedges, reeds and rushes.	161.1	0.07
3c	Aquatic	Herbaceous communities dominated (greater than 1/2 of the total herb cover) by floating or submerged aquatic plants; does not include sedges growing in marshes with standing water.	0	0
3d	Dwarf shrub	Communities dominated (greater than 1/2 of the total herb cover) by dwarf woody species, such as kinnikinnick or dwarf willows.	0	0
4	Shrub	Early successional stage or shrub communities maintained by environmental conditions or disturbance (e.g., wetlands, flooding, post-fire forest succession); dominated by shrubby vegetation; either dominated by shrubby vegetation, including tree seedlings/saplings, or if sparsely vegetated overall, the dominance of shrubs characterizes the community as a shrubland. This may include sites where trees are stunted due to the presence of permafrost, preventing the stand from reaching a higher structural stage.	10,196.7	4.3
4a	Tall shrub	Communities dominated by tall shrub layer vegetation - woody plants > 2m tall and ≤ 7 cm dbh; may be a successional stage or may be in this stage perpetually due to environmental conditions or disturbance.	57,934.3	24.3
4b	Low shrub	Communities dominated by low shrub layer vegetation - woody plants < 2m tall; may be a successional stage or may be in this stage perpetually due to environmental conditions or disturbance.	107,861.2	45.2
5	Pole sapling	Trees > 5m tall and > 7 cm dbh, typically densely stocked. Self-thinning and vertical structure are not yet evident in the canopy. Younger stands are vigorous (usually > 15–20 years old); older stagnated stands (up to 100 years old) are also included; time since disturbance usually < 40 years; up to 100+ years for dense (5000 – 15000+ stems per ha) stagnant stands.	554.8	0.2
6	Young Forest	Self-thinning has become evident, and the forest canopy has begun to differentiate into distinct layers. A more open stand than the pole/sapling stage.	8,322.6	3.5

Code	Structural Stage	Criteria	Area (ha)	% of RSA
7	Mature Forest	Trees established after the last stand-replacing disturbance have matured; a second cycle of shade tolerant trees may have become established; shrub and herb understories become well developed as the canopy opens up.	50,518.9	21.2
8	Old Forest	Stands of old age with complex structure; patchy shrub and herb understories are typical; regeneration is usually of shade-tolerant species with composition similar to the overstory. Fire maintained stands may have a 'single-storied' appearance. Very old stands having complex structure with abundant large-sized trees, snags and CWD; snags and CWD occurring in all stages of decomposition; stands are comprised entirely of shade-tolerant overstory species with well-established canopy gaps.	2,302.7	1.0
n/a	Not Applicable (River, etc.)		692.4	0.3
	Total RSA		**238,640**	

5.3.2.2 Fire History

Fire disturbance was considered as a variable in the model. Numerous studies in boreal and sub-boreal regions have found that moose select areas regenerating from fires. Recent burns and post-fire clearings are generally considered optimal foraging habitat for moose. Forest fires are a significant component of the landscape ecology of the Eagle Plains Ecoregion. Typically, regenerating burns contain higher cover of shrubby browse species than undisturbed areas. This includes both deciduous shrubs like willow, as well as sapling deciduous trees like aspen and paper birch. Although burns are classified as Low and Tall Shrub in the ELC, structural stage alone does not uniquely identify them. Large extents of disclimax, stunted black and white spruce ecosystem unit types were also classified as Tall Shrub.

Numerous studies and data from the ELC mapping, indicate that fire disturbance results in increased shrubby browse cover during the Low and Tall Shrub structural stages of regeneration, and that regenerating burns are selected by moose in winter. Therefore, fire disturbance was included in the model.

5.3.3 WILDLIFE HABITAT RATINGS

Qualitative, categorical habitat suitability ratings were developed for each combination of ecosystem unit and structural stage in a lookup table format. For the Shrub structural stages separate ratings were provided depending on whether the area was recently burned or not. The difference in the amount of browse cover was minimal in other structural stages according to burn status and burned and unburned areas were rated equivalently. The development of ratings was based on expert opinion and primarily by the following assumptions:

- Winter habitat suitability is primarily driven by the amount of shrubby browse species that are predicted to occur and especially the percent cover of willow species. The average percent cover

of willow species by ecosystem unit per structural stage was calculated using vegetation data collected during baseline surveys (Section 5.6.1).

- Low shrub structural stages, including disclimax shrublands (wetlands and shrubby drainages) and regenerating burns, generally offer the highest value forage and are generally rated High.
- The suitability of tall shrub areas depends on disturbance status. Tall shrub areas regenerating from fire disturbance are also rated Moderate (mostly) to High, depending on the ecosystem unit. However, Tall shrub stages also include extensive areas of disclimax stunted spruce (including multiple EUs) that generally offer low to moderate browse species, which are rated accordingly.
- Older structural stages (5–8) can have similar browse and are mostly rated depending on the EU (Table 5-4). On average stage 7 and 8 tend to have slightly more browse than stages 5 and 6.

Every combination of ecosystem unit and structural stage was assigned in initial habitat suitability score based on a 6-class rating scheme (Table 5-6). If there was no structural stage listed for an ecosystem unit, it received a rating of 6 (Nil) for moose winter forage.

The extent of areas with high cover of preferred browse species (mostly willow) is limited in the RSA. The ecosystem unit by structural stage combinations with >15% willow cover was generally rated High (1) and Moderately High (2) and account for only 12% of the extent in the RSA (Photo 5-5 to Photo 5-9). Large extents of the RSA have relatively low willow cover of 5–15% and were rated as Moderate (3) and Low (4) (Photo 5-10 to Photo 5-14). Differentiating the classifications between Low and Moderate was difficult because the differences in willow presence among different sites were not consistent, and variation in willow cover within the same site type was large (i.e., resulting in overlapping confidence intervals across sites). The basis for classifying sites as Low or Moderate considered (i) average cover of willow from field plots (>7% favouring classification to Moderate), (ii) fire history (fire disturbance within 40 years favouring classification to Moderate), and (iii) a qualitative assessment of the potential for each EU and structural stage combination to support willow and other browse species.

Although Moderate and Low rated habitats have relatively low cover of willow in an absolute sense, they likely provide a substantial proportion of total winter forage for moose in the RSA due to the large extents that Moderate and Low suitability habitats cover. That is, in Eagle Plains the overall, total availability of winter forage for moose appears to be distributed in relatively low levels across large portions of the RSA, versus being concentrated in relatively small portions of the landscape, which is typical in more mountainous portions of Yukon.

Overall, EUs in sparsely vegetated or herbaceous structural stages, non-vegetated EUs and certain wetland EUs were assigned Very Low (5) or Nil (6) ratings unless the presence of willow cover was observed (Photo 5-15 and Photo 5-16).

The effect of fire disturbance in boreal ecosystems in enhancing moose browse as the stand regenerates through the low shrub and tall shrub structural stages are well documented. Although evidence of this was observed in Eagle Plains, the degree to which regenerating burns resulted in an elevated cover of browse

species was somewhat muted compared to values reported in other studies. For example, for the most extensive EU, Moist Spruce-Labrador Tea (code 33) (comprising 43% of the RSA), the average percent cover of willow was 11% in burns compared to 6% in unburned areas (Photo 5-11 and Photo 5-12). Similar patterns were evident for most other moist and wet EUs. On average, fire disturbance resulted in a modest increase in willow cover. As a result, areas with fire disturbance within the last 40 years were generally rated one class higher than unburned areas. Most frequently, this resulted in a rating change from Low to Moderate.

Photo 5-16. Low shrub – bog – black spruce – lichen habitat (code B1) rated as very low moose winter forage.

5.3.4 MODEL STRUCTURE

In the ELC map, each polygon contains up to three components. For example, a polygon could contain 80% EU34-Moist Spruce – Alder – Labrador Tea and 20% EU22-Shrubby Riparian Birch – Willow. These composite polygons occur because the pattern of ecosystem distribution occurs as a set of small patches that are too small to map as separate individual polygons. To account for this issue of composite polygons, habitat ratings were applied in two ways (1) an area weighted average of the habitat suitability scores for the components within each polygon, and (2) the proportion of High suitability habitat in each polygon.

The area-weighted average score was calculated using the habitat suitability scores from Table 5-2 and the decile proportion for each polygon component, following equation:

$$ELC_r = \frac{\sum_{i=1}^{n} w_i X_i}{\sum_{i=1}^{n} w_i}$$

Where ELC_r is the weighted average score, w_i is the decile proportion for each polygon component, and X_i is the habitat rating for each polygon component from Table 5-2. An example is provided in Table 5-7 for a polygon with two components:

Although this weighted average approach is a good approach for summarizing average habitat suitability across the study area, it has the disadvantage that, with the averaging process, you lose track of the occurrence of small extents of High suitability areas. This issue is addressed in the second version of model outputs, mapping the proportion of High suitability habitats within each polygon.

The two types of outputs compliment each other for assessment and management at different scales. The weighted average output is intended to be used for strategic assessments and planning, such as assessing the overall effects of the Project on moose habitat, or to compare the relative suitability of moose habitat in one sub-watershed to another. The proportion of High suitability habitat can be used to support finer-scale operational measures, such as locating roads and well sites to avoid high suitability winter moose habitat.

Although the initial habitat ratings for each ecosystem unit/structural stage/fire disturbance combination used a 6-class rating scheme, the composite ratings of the ELC polygon scores were generalized to a 4-class system for simpler interpretation, essentially combining Moderately High and High, and Nil and Very Low.

Due to the small size of many of the High and Moderately High habitats areas, they were frequently formed the second or third component of composite ELC polygons. Consequently, these areas of High were often 'lost' when calculating the weighted average rating for the polygon (i.e., the polygon they were in ended up being rated Moderate or even Low overall). To account for this issue, the amount and location of High and Moderately High areas were examined separately from the polygon weighted average score. This was done by mapping the amount of High and Moderately High areas in each polygon. For example, a polygon with a weighted average habitat score of Low, might contain 20% High+Moderately High.

Table 5-7. An example of a multiple component polygon habitat scoring.

Component	Proportion	Ecosystem Unit	Structural stage	Burn Status	Habitat Score
1	0.8	Moist Spruce – Alder – Labrador Tea	Tall Shrub	Not Burnt	30
2	0.2	Shrubby Riparian Birch – Willow	Low Shrub	Not Burnt	95

ELCr = 0.8*30 + 0.2*95 = 43, which corresponds to an overall categorical rating of Low

5.4 RESULTS AND DISCUSSION

The amounts of predicted moose winter habitat in the RSA are presented for the finer-scale 6-class rating scheme before averaging scores within ELC polygons in Table 5-8, and the consolidated 4-class rating scheme after averaging scores within ELC polygons, in Table 5-9. As mentioned in the Methods, the 4-class scheme essentially combines the High and Moderately High classes and the Nil and Very Low from the 6-class scheme. The 6-class scheme was originally used because it was assumed that there would be greater amounts of areas in the high and low ends of the habitat suitability gradient. However, since the amounts of highest and lowest suitability habitat are so low (i.e., 2.5% High and 0.4% Nil) it makes sense to use the 4-class scheme from this point forward.

The model results indicate that High-suitability winter moose habitat (12%) is limited, and that the remaining area is approximately split between Moderate and Low, with Nil/Very Low areas only accounting for approximately 1% of the RSA. The distribution of winter moose habitat shows clear spatial patterns across the RSA, when examining the average habitat suitability scores across ELC polygons (Map 5-1) and the percent of High-suitability habitats occurring in each polygon (Map 5-2 and Map 5-3). In the map of the average suitability scores (Map 5-1), areas of Moderate suitability are concentrated in the southern half and along the western and northern boundary in the northern portion of the RSA. These areas often correspond to regenerating burns. In the northern half of the RSA, much of the Chance Creek watershed is rated Low, corresponding to a lack of fire disturbance and dominance of open canopy, stunted spruce ecosystems, which offer limited browse for moose. High-suitability winter habitat is found scattered across the RSA, generally in much smaller patches than areas of Moderate and Low. High suitability areas are often in narrow riparian strips along streams and non-confined drainage areas (Map 5-2), but also includes certain deciduous and mixed-wood ecosystem units, like the Mesic Alaska Paper Birch (code 05), which accounts for the concentration of High suitability habitats in the northwest portion of Map 5-3.

This pattern of having a relatively large portion of the landscape in Moderate suitability winter habitat is different than occurs in other parts of Yukon, especially in more mountainous areas, where suitable winter habitat (i.e., High and Moderate suitability) are often constrained by elevation, snow depths and greater distribution of diverse vegetation communities (McCulley et al. 2017). In Eagle Plains, a substantial amount (74%) of the RSA is in a shrub structural stage mostly dominated by scrub birch and Labrador tea and almost half (44%) of the RSA is described as the Moist Spruce – Labrador tea ecological unit which are large areas with relatively low willow cover (i.e., the Moderate suitability areas).

The pattern of winter habitat across the RSA is likely to affect the broad distribution of moose. Due to the scattered occurrence of High suitability habitat across the RSA, some moose are expected to occur across the RSA. However, local densities are likely to be vary in relation to the portions of Low and Moderate that form the matrix of habitat at a larger scale. Where most of the habitat matrix is Low, such as across most of the Chance watershed, moose densities are expected to be relatively low and habitat use is expected to be largely constrained to the scattered patches of High. Where most of the habitat matrix is Moderate, such as the southern half of the RSA, moose densities are expected to be substantially higher; and, although moose use is

expected to still be relatively higher in the High habitats, considerable use of the Moderate suitability matrix is also expected.

Table 5-8. Estimated amounts of moose winter forage habitat across the Eagle Plains RSA using a 6-class rating scheme.

Habitat Rating	Area (ha)	Area (% of RSA)
High	5,961.9	2.5%
Moderately High	23,736.7	9.9%
Moderate	111,561.7	46.7%
Low	94,068.2	39.4%
Very Low	2,492.4	1.0%
Nil	842.6	0.4%
Total Area	238,663.5	100%

Table 5-9. Estimated amounts of moose winter forage habitat across Eagle Plains RSA averaging suitability scores within ELC polygons and generalizing to a 4-class rating scheme.

Average Habitat Suitability	Area (ha)	Area (% of RSA)
High	16,944.4	7.10%
Moderate	145,394.1	60.92%
Low	74,514.5	31.22%
Nil/Very Low	1,810.5	0.76%
Total	238,663.5	100%

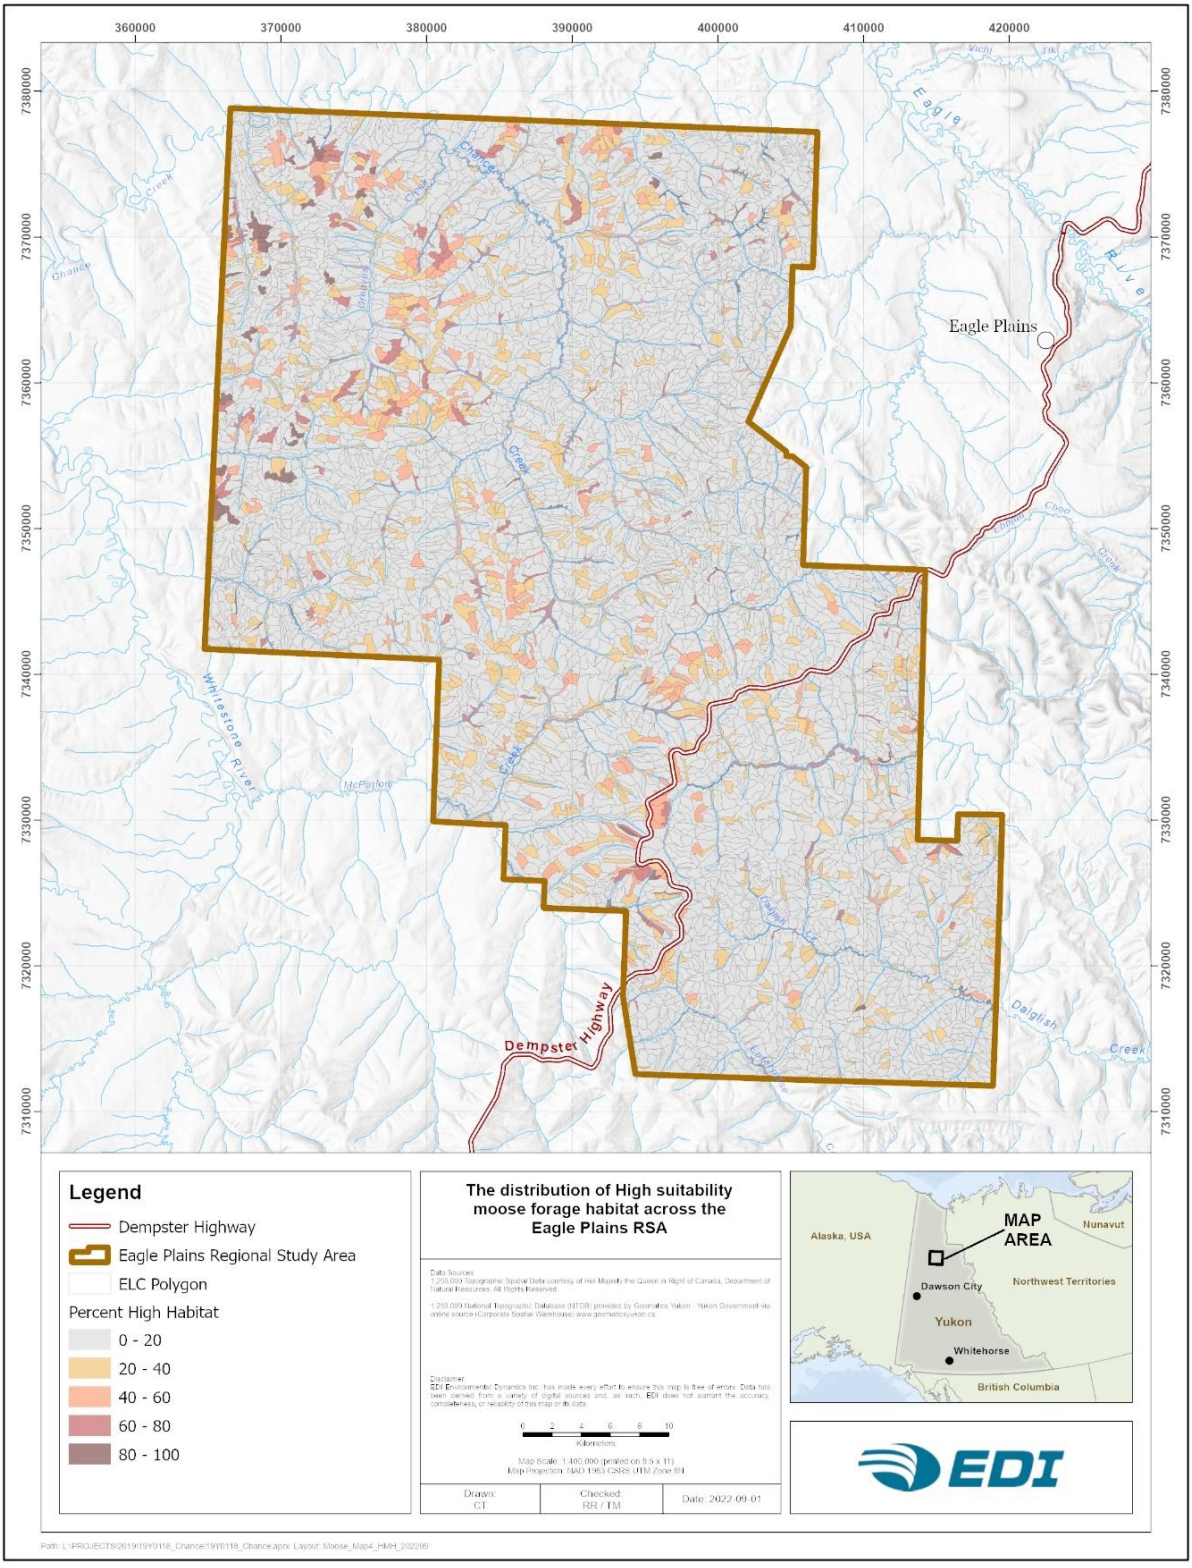

Map 5-3. The distribution of High suitability moose forage habitat across the Eagle Plains RSA.

5.5 SUMMARY

The suitability, amount, and distribution of potential habitat for moose were quantified across the RSA using a habitat suitability model. The habitat model was for foraging habitat during winter because this life requisite and season are believed to be the most limiting to moose in the RSA. The model consisted of qualitative ratings applied to combinations of three variables from the ELC mapping: ecosystem unit, structural stage and fire disturbance. High suitability habitats consisted of disclimax shrublands, most commonly associated with riparian areas. Moderate suitability habitats were dominated by regenerating burns but also included small areas of mixed and deciduous forests with shrubby understories. Low suitability habitats were mostly open canopy, stunted spruce forests. High-suitability moose winter foraging habitat is limited across the RSA (12%), but Moderate habitat is extensive (43%). Although moose are expected to select the High-suitability areas preferentially, a substantial amount of total winter forage appears to occur within large areas with relatively low willow cover (i.e., the Moderate suitability areas). Due to the scattered occurrence of High-suitability habitat across the RSA, some moose are expected to occur across the RSA in winter. However, local densities are likely to vary with the portions of Low and Moderate habitats that form the habitat matrix at a larger scale.

6 CARIBOU

The Porcupine Caribou Technical Committee (PCTC) provided telemetry data and seasonal range polygons for the Porcupine Caribou Herd (PCH). Technical discussions and feedback provided by the PCTC also helped align subsequent analyses conducted in this section. This section and much of the technical content reflect responses to their detailed technical review.

6.1 PURPOSE AND OBJECTIVES

Caribou were selected as a VC for the Project due to their importance to the Gwich'in people for subsistence hunting and their cultural and ecological values. The Project occurs exclusively within the range of the PCH, which is a subpopulation of the barren-ground subspecies of caribou (*Rangifer tarandus groenlandicus*). Within the North Yukon Land Use Plan, the PCH is considered "the most significant and culturally important wildlife resource in the planning region" (Vuntut Gwitchin Government and Yukon Government 2009). The herd has been the mainstay of Gwich'in culture for centuries. It is considered a keystone species whose presence or absence influences the composition and dynamics of the wildlife communities and ecosystems in North Yukon. The PCH is a migratory herd with an extensive annual range that spans most of North Yukon and a large area in north-eastern Alaska. The PCH overlaps the Project area primarily during the rut/late fall and winter seasons.

This section summarizes existing information about the ecology of the PCH, and, using telemetry data and analysis outputs to: i) Quantify the degree of seasonal range overlap by the PCH with the RSA during fall and winter, when seasonal range use overlaps the RSA; ii) Quantify habitat use patterns and selection by the PCH during fall and winter; iii) Quantify movement rates and residency periods of the PCH during fall and winter; and, iv) Quantify the potential effects of linear features on the occurrence and movements of the PCH.

6.1.1 SPATIAL BOUNDARIES

Three spatial extents were considered as part of this study:

- The Eagle Plains Project RSA (2,386 km²)
- The Eagle Plains Ecoregion (20,400 km²), and
- The Yukon portion of the PCH's rut and late fall and winter seasonal ranges (65,000 km² and 58,000 km², respectively).

The Eagle Plains Project RSA includes all proposed exploration areas. The RSA has relatively similar patterns of vegetation communities and historical exploration disturbances across it. The Eagle Plains Ecoregion (see Section 1.3) encompasses the Project RSA and provides an ecologically similar area, beyond the proposed exploration areas, that allows certain comparisons between the RSA and adjacent undisturbed areas (e.g., habitat distribution and within-season movement patterns).

The Yukon portion of the PCH's fall and winter seasonal ranges is the largest extent and covers much of North Yukon. This area occurs predominantly within the Taiga Cordillera Ecozone. This Ecozone covers most of the northern Yukon and the southwest corner of the NWT. The Taiga Cordillera includes mountainous areas (e.g., British Mountains, Richardson Mountains, and North Ogilvie Mountains) separated by subdued basins (e.g., Eagle Plains, Old Crow Flats, and Old Crow Basin). The area consists of glaciated and unglaciated terrain and continuous permafrost. The climate in the Taiga Cordillera is variable from its northern to southern extent, with summers ranging from cool to warm with extended periods of daylight, while winters are generally long, cold, and dark. The vegetation in the taiga is dominated by stunted, open spruce forests, which result from short, cool growing seasons, and poor soils over permafrost (Ecological Stratification Working Group 1995). This extent was used to reference spatially broad questions, such as the PCH's seasonal distribution and movement patterns.

6.2 GENERAL ECOLOGY OF THE PORCUPINE CARIBOU HERD

6.2.1 CONSERVATION STATUS

The PCH is a subpopulation of barren-ground caribou in Canada, known for large aggregations of individuals, dramatic population fluctuations, lengthy migrations, and significant cultural and social value to northern Indigenous peoples and other Canadians (COSEWIC 2016). All caribou belong to one species, *Rangifer tarandus*. Within Canada, caribou populations are classified within 12 "Designatable Units" based on a suite of biological, genetic, and evolutionary traits (COSEWIC 2011). All 14–15 subpopulations of barren-ground caribou are considered part of one Designatable Unit (DU 3). Barren-ground caribou were assessed as Threatened by COSEWIC (COSEWIC 2016). The subspecies is not listed on Schedule 1 of the federal SARA. Within Yukon, barren-ground caribou are considered Vulnerable/Apparently Secure (Yukon Government 2020).

6.2.2 SEASONAL RANGES AND MOVEMENTS

Like most barren-ground caribou subpopulations, the PCH has a large annual range and makes long-distance migrations, hundreds or thousands of kilometres, among different seasonal ranges. Often, seasonal ranges vary across and within years in response to variation in forage availability, snow cover, and predation or parasite risk (Russell et al. 1993). The PCH's annual range extends approximately 250,000 km² from Alaska, through Yukon, and into the western edge of NWT. The herd undertakes long-distance migrations across seasonal ranges necessary for key aspects of their life cycle. Eight (8) primary life cycle periods occur for the PCH (Porcupine Caribou Technical Committee 1993). Key information for the eight periods are summarized in Table 6-1 (using information from Russell et al. 1993, Porcupine Caribou Technical Committee 1993, Ryder et al. 2007). The Porcupine Caribou Technical Committee (1993) assessed the relative importance of seasonal ranges using six criteria: energy balance, reproductive contribution, tolerance to disturbance, escape requirements, the intensity of use, and whether alternative habitats are available. Although all seasons are important to meeting the annual life requisites of the PCH, the calving and post-calving seasons are considered

of highest importance and fall and winter are considered of lowest importance (Porcupine Caribou Technical Committee 1993).

Key information associated with each of the eight seasons is provided below, elaborating on summary information in Table 6-1, and including a combination of scientific knowledge (Russell et al. 1993, Porcupine Caribou Technical Committee 1993, Ryder et al. 2007) and traditional ecological knowledge (Sherry and Vuntut Gwitchin First Nation 1999, Ryder et al. 2007). Typical patterns of seasonal range use are shown in Map 6-1. After calving on the north slope and Arctic coastal plains, the PCH typically splits in two, with portions of the herd moving southwest in Alaska and southeast in Yukon. Animals in the Yukon typically follow a clockwise movement through the seasonal ranges from the calving grounds on the north slope, to the British Mountains in summer, to the Richardson Mountains in late summer, dispersing widely and variably across northern Yukon (as far south as the Ogilvie Mountains) in fall and winter, before returning north to the coastal plains in spring. The PCH can potentially overlap the RSA primarily in the rut/late fall and winter periods.

During the Calving and Post-Calving periods cows and bulls tend to occupy different habitats and exhibit different movement patterns, so their ranges are described separately for these periods. During the relatively short calving period (June 1–10), cows occur in the Arctic coastal plains and adjacent uplands and foothills in Alaska and Yukon. Concentrated use often occurs in the Jago Uplands between the Hulahula and Aichilik rivers in Alaska. The calving season is one of the seasons of greatest importance (rank 1) (Porcupine Caribou Technical Committee 1993). Adult females are generally in their poorest body condition and have the largest energy deficits. The calving period is critical to the survival and development of calves (i.e., the source of initial annual population recruitment). The herd occurs in a relatively concentrated range, which appears to offer reduced predation risk and abundant forage that coincides with the timing of calving, and no alternative areas of similar value are available.

During the Post-Calving and Movement period (June 11–30) cows (and new calves) travel away from the calving areas. Cows that calved in the Yukon tend to move west into Alaska. Often, movements are higher into the foothills and uplands, following melting snow and newly emerging vegetation. However, the herd can occur anywhere from the coastline well into the foothills during this period. Selection of local habitats to avoid insect harassment is often a factor by the end of June. The Post-Calving period is also considered a period of highest importance (rank 1) (Porcupine Caribou Technical Committee 1993). Lactating females have their highest energy demands. Movement rates and group sizes increase through June, and cow/calf groups are believed to be relatively intolerant to disturbance.

During the calving to post-calving movement period (June 1–30) most bulls, juveniles, and non-productive cows occur in north Yukon between the Babbage and Firth rivers across a range of habitats within the coastal plains and the British Mountains. Animals tend to be quite mobile and follow plant emergence across habitats and elevations as spring progresses. This period is considered to have relatively low importance (rank 3) for bulls and non-productive cows (Porcupine Caribou Technical Committee 1993) because they are not tending young-of-the-year, high-quality forage is becoming abundant, and insect harassment is limited.

During Early Summer (July 1–15), both cows and bulls remain concentrated in the general north slope area, but the overall range continues to expand. Group sizes increase to the tens of thousands, and movement rates can average 25 km per day. Early summer often marks the beginning of the split of the herd between Alaska and Canada. In Alaska, distribution is widespread into the Brooks Range, and, in Canada, animals typically move into the southern British Mountains by mid-July. Local habitat use is driven by both selection for high-quality forage and insect avoidance. Insect avoidance strategies include using coastal areas adjacent to the Beaufort Sea (often primarily females) and higher elevation snow patches and barren ground in the Brooks Ranges and British Mountains (mostly males). Early summer is considered to have an importance rank of 2. Though food is generally abundant, the energy balance is limited by insect avoidance, resulting in reduced feeding times and selection of areas with less forage. Animals are still susceptible to disturbance, but tolerance is higher than during the calving and post-calving periods (e.g., calves have greater mobility, and more range is available due to snow melt).

By mid-summer (July 16–August 7), the majority of the PCH has left the coastal plains. Animals in Alaska have moved into the southern portion of the Brooks Range, and animals in Yukon have moved southeast into, or are en route to, the northern Richardson Mountains. Daily movement rates remain high through the mid-summer period, and though group sizes are often still large, groups are often breaking up and more dispersed than the aggregations that occur during post-calving and early summer. Mid-summer has an importance rating of 2 for the same reasons identified for early summer. Mid-summer is the period of potentially highest insect harassment, and, similar to early summer, habitat selection may favour insect avoidance over areas with the highest forage. Lactating females suffering insect harassment may be in an energy deficit.

During late summer and fall migration (August 8–October 7), insect harassment declines dramatically. Forage quality and abundance also begin to decline but are generally still abundant. Caribou exhibit high feeding rates during this period and gain fat reserves for the winter. During this period, the herd breaks up into smaller groups and disperses widely across North Yukon, mostly staying north of the treeline for most of the period. Fall migration often follows terrain features like ridges and valleys, but movement routes are unpredictable from year to year. Late-summer and fall migration is considered to have less importance (rank 3) due to the abatement of insect harassment, the relative abundance of forage across a variety of habitat types, the dispersed distribution of the herd, and relatively high tolerance to disturbance (Porcupine Caribou Technical Committee 1993).

The rut and late fall (October 8–November 30) continue to be a period of broad distribution and movement by the PCH, including widespread movement south of the treeline. In Yukon, the rut can occur from the Richardson Mountains to the southern Ogilvie Mountains. The areas where the rut occurs do not appear to have affinity from year to year. Rather, the rut appears to occur wherever the herd happens to be at that time along the fall migration. The rut and late fall period has the lowest level of importance(rank 4), due to the lack of insects, large range extent, ample food, the dispersed distribution of the herd, and relatively high tolerance to disturbance (Porcupine Caribou Technical Committee 1993).

During early, mid, and late winter (December 1–March 31), the PCH is at its most dispersed stage, both in terms of the extent of the range it uses and group aggregations. Average daily movement distances (2 km per

day [km/day] to 5 km/day) (Russell and Gunn 2017) are lower than in other seasons, except for cows during calving (Russell and Gunn 2017). Winter range use varies from year to year, depending on snow depth and condition. In Yukon, during deep snow years, use is concentrated in the Richardson Mountains and the Ogilvie-Hart basins. The Whitestone River and Eagle Plains areas are used more in low snow years. Forage during winter consists primarily of lichens. Unlike reports for some other caribou herds, winter habitat is generally not considered limiting for the PCH (Russell et al. 1993). In shallow to average snow years, the caribou maintain neutral to surplus energy balances (Russell et al. 1993). The PCH is relatively tolerant to human activity during the winter (Porcupine Caribou Technical Committee 1993). Similar to the rut and late fall period, winter has the lowest level of importance (rank 4) due to the lack of insects, large range extent, ample food, the dispersed distribution of the herd, and relatively high tolerance to disturbance (Porcupine Caribou Technical Committee 1993).

During the spring, spring migration, and pre-calving season, (April 1–May 31) caribou begin moving north toward the calving grounds. Average daily movement rates increase from approximately 6 km/day at the start of the season to approximately 24 km/day through May. Similar to the fall migration, no well-defined migration corridors are used consistently from year-to-year during spring migration, but certain terrain feature types like ridges and valleys are regularly used. During spring migration, local snow conditions often affect movement patterns and routes. In years or locations with low snow levels, migration tends to be more dispersed. In years or locations with high snow levels, movements tend to be more concentrated along trail networks on ridges (Porcupine Caribou Technical Committee 1993). Caribou, especially pregnant cows, typically enter an energy deficit during spring due to reduced forage availability as they leave the lichen-rich taiga and before forbs have emerged; in addition, higher energy expenditure is associated with migration. Spring is rated as higher in importance than winter, but still relatively low overall (rank 3), due to lack of association with specific habitats, relatively low threats from predators, and lack of insect harassment (Porcupine Caribou Technical Committee 1993).

Table 6-1. Key life cycle periods for the Porcupine Caribou Herd (after Porcupine Caribou Technical Committee 1993). The Porcupine Caribou Herd overlaps the Project Regional Study Area during Rut and Late Fall and Early, Mid, and Late Winter.

Season	Dates	Characteristics	Importance*
Early, Mid, and Late Winter	Dec. 1 – Mar. 31	The herd is at its most dispersed at this time across 2 winter ranges: in Yukon, mostly south of the Porcupine River in boreal taiga and in Alaska, centred in the Chandalar River/Arctic Village area. Winter range use varies from year to year, depending on snow depth and condition. Caribou at this time of year are relatively tolerant to human activity. In shallow to normal snow years, animals can gain weight.	4
Spring, Spring Migration, and Pre-Calving	Apr. 1 – May 31	Herd distribution varies depending on snowmelt; migration routes vary yearly. Pregnant females are typically in an energy deficit due to reduced forage once they leave the lichen-rich taiga.	3
Calving (cows)	June 1 – 10	Calving occurs on the coastal plain of NE Alaska and, to a lesser degree, NW Yukon. This area offers reduced predators and abundant spring forage; no alternative range is available. Cows are at the lowest point of physical condition and are least tolerant to human disturbance.	1
Post-Calving and Movement (cows)	June 11 – 30	As calves develop over the first two weeks of life, the cows and calves tend to aggregate into larger groups and increase movement rates to track plant green-up. The post-calving period imposes high energetic demands on lactating females, and cow/calf groups are relatively intolerant of disturbance. The post-calving range is primarily in Alaska, and cows that calved in Yukon tend to move west along the foothills into Arctic National Wildlife Refuge. Insect avoidance can affect distribution by the end of June.	1
Calving to Movement (bulls)	June 1 – 30	Bulls, non-pregnant cows, and subadults tend to concentrate east of the calving grounds in northern Yukon. Animals track the progression of green-up from the coastal plains to the northern foothills and into intermountain regions.	3
Early Summer	July 1 – 15	Cows continue to require a high-energy intake for milk production, but insect avoidance also drives distribution. Key areas selected for insect avoidance are the coastal plain adjacent to the Beaufort Sea (mostly cows/calves) and mountains in the Brooks and British Mountains (mostly bulls and cows without calves). Long-distance movements during this period are also an insect avoidance behaviour.	2
Mid Summer	July 16 – Aug. 7	Mid-summer continues to be a period of high insect harassment. Two areas are consistently used – the northern Richardson Mountains in Yukon and the southern portion of the Brooks Range in Alaska. Females with cows may be in energy deficit.	2
Late Summer and Fall Migration	Aug. 8 – Oct. 7	As insect activity declines, the herd disperses widely but mostly stays north of the tree line until the latter part of the period – in Alaska south of the Brooks Range and in Yukon north of the Porcupine River. Animals exhibit high feeding rates and gain fat for the winter.	3
Rut and Late Fall	Oct 8 – Nov. 30	The region where rut occurs has no affinity from year to year; rut occurs wherever the herd happens to be along fall migration. In Yukon, distribution can occur from the southern Ogilvie Mountains to the Richardson Mountains.	4

* 1 = highest importance, 4 = lowest.

6.2.3 DIET AND HABITAT

Barren-ground caribou are generalist foragers who feed on grasses, sedges, forbs, lichens, and shrubs during the growing season. During winter lichens constitute the primary forage of most barren-ground caribou populations (Photo 6-1 and Photo 6-2). Over three winters, the composition of PCH fecal samples was similar, consisting of, on average, 64% fruticose lichens, 11% evergreen shrubs, 8% moss, 6% horsetails, and 5% foliose lichens (Russell et al. 1993).

Russell et al. (1993) surveyed lichen distribution across the Yukon portion of the PCH range. Fruiticose lichens were widespread across survey plots and overall biomass estimates were similar to values reported in other western barren-ground caribou ranges (Joly and Cameron 2018). Within the PCH's Yukon range, lichen biomass varied across regions, habitat (range) types and stand ages. Average lichen biomass varied substantially among regions, with the highest biomass occurring in Eagle Plains (78.3 g/m^2), followed by North Fork Pass (45.0 g/m^2), Chapman Lake (33.6 g/m^2), Ogilvie Valley (32.5 g/m^2), and Richardson Mountains (29.9 g/m^2). In terms of habitat type, lichen biomass varied over three-fold across the seven habitats (range) that Russell et al. (1993) surveyed. Open conifer forest types had the greatest lichen biomass, and the forb herbaceous type had the lowest.

In terms of stand age, the generally accepted theory is that lichen biomass is greatly reduced following a fire, increases in abundance up to 125–175 years, and decreases as lichens are overtaken by mosses and shrubs (Klein 1982). Field surveys by Russell et al. (1993) found that lichen biomass in the PCH range was actually highest in stands <50 years since fire, and that lichen biomass decreased across all subsequent older age classes, to a nearly 50% reduction in the oldest age class (>270 years) (Photo 6-3). This local data suggests that younger stands may make a greater contribution to lichen forage than previously believed. Russell et al. (1993) emphasizes the importance of a mosaic of stand age classes, resulting primarily from wildlife, to maintaining lichen biomass at the regional level over time.

Although habitat selection is often driven by forge availability, especially in winter, reducing predation risk (Latham et al. 2011) and minimizing exposure to insect harassment during summer (Russell and Nixon 1990) also factor into habitat selection by caribou.

6.2.3.1 Effects of Snow

The regional patterns of PCH distribution in winter vary among years, often related to snow accumulation, which can limit forage availability (Russell et al. 1993). During the 1970s and 1980s, the distribution of the PCH in winter varied in a regular pattern across four regions with different snow regimes: Yukon/Alaska border, Richardson Mountains, Ogilvie/Hart region, and the Whitestone/Eagle region (Russell et al. 1993).

On average, the Ogilvie/Hart region had the lowest mean snow accumulation. During winters when most animals occupied this region snow depths were normal to high across the overall winter range. Heavy snows in the north early in the season seemed to emphasize concentrated use in this region, pushing animals to the south during the fall migration and rut. Once animals moved into the Ogilvie/Hart basin they typically remained in the region, taking advantage of the comparatively shallow snows, until spring migration.

During the winters when most Yukon wintering animals occupied the Richardson Mountains, snow depths tended to be normal to above normal. Strong winds in the Richardson Mountains resulted in uneven snow distribution, with many areas having reduced snowpacks, including some areas being blown completely bare. During the winters when most Yukon wintering animals occupied the Whitestone/Eagle area, snowpacks were invariably below normal. This area generally had the highest lichen biomass, but snow depths appeared prohibitive during years with normal to deep snow. In the two years when most of the Yukon wintering animals occupied the Yukon/Alaska border area (overlapping with the Fortymile Herd), snows were deeper than average in all other wintering areas.

Photo 6-1. Mesic, mature forest, with mat-forming terrestrial lichens in the Eagle Plains RSA.

Photo 6-2. Lichen communities are often diverse in Eagle Plains. This lichen mat includes *Cladonia spp.* (lighter green) that are preferred forage for caribou, as well as *Stereocaulon spp.* (darker grey) and *Flavocetraria spp.*, which are both also eaten by caribou but less preferred.

Photo 6-3. Lichen cover is generally reduced in regenerating burns. However, EDI observed high lichen abundance in some regenerating burns, consistent with previous work by other researchers (Russell et al. 1993).

6.2.4 POPULATION LEVELS AND TREND

Although most barren-ground caribou subpopulations are declining (COSEWIC 2016), the PCH numbers have increased over the last two decades. The last successful population survey in 2017 estimated the population at 218,457 (95% CI = 202,106 – 234,808) caribou (Porcupine Caribou Technical Committee 2019). Population surveys of the PCH began in the 1970s. The objective is to survey the herd every two to three years, but that period is sometimes extended depending on herd behaviour (aggregation patterns), funding, and logistical issues. Since the first survey in 1972, the PCH has had two periods of population growth, with an interceding decline (Figure 6-1). From 1972 to 1979 the population was relatively stable at just over 100,000 animals. By 1989 the herd had increased to approximately 178,000. Over the next 12 years, the herd declined by 55,000 to 123,000 in 2001. By 2010, the herd had recovered to 169,000 and increased to 218,000 in the last survey in 2017. During the latest growth phase, 2010 to 2017, the estimated population growth rate of 3.7% is almost identical to the growth rate during the 1972 to 1989 growth phase (Porcupine Caribou Technical Committee 2019).

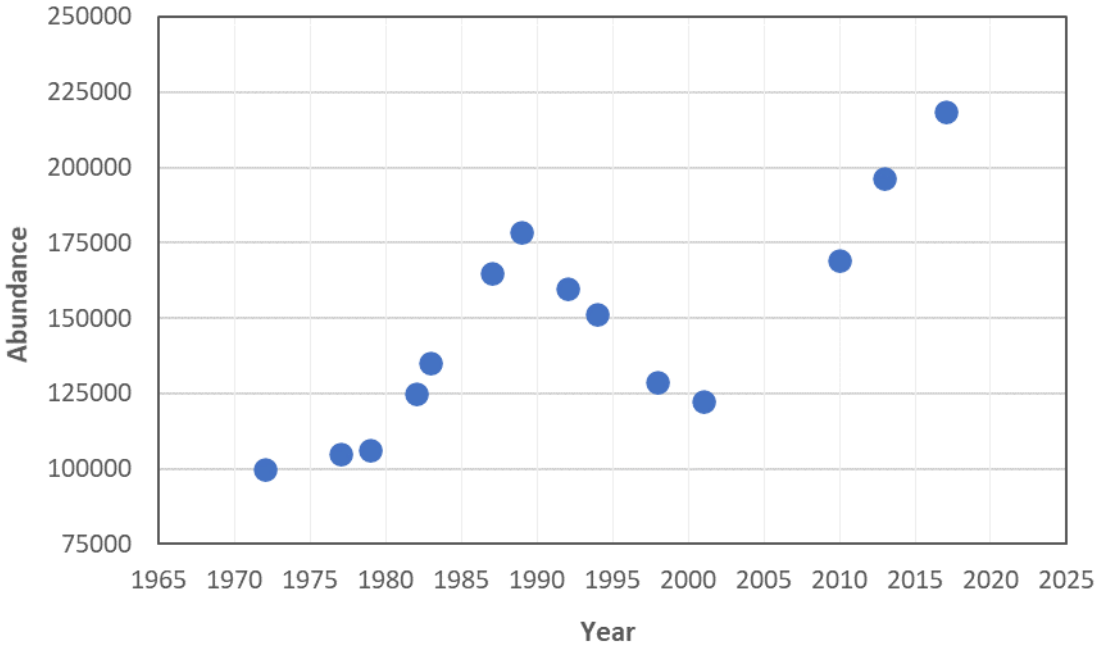

Figure 6-1. The population size of the Porcupine Caribou Herd from 1972 to 2017 (Porcupine Caribou Technical Committee 2019).

6.2.5 POPULATION DYNAMICS

Large magnitude population fluctuations are a key ecological trait of barren-ground caribou. Subpopulations (herds) often experience declines of >80% and increases >500%, which occur over several decades and caribou generations (COSEWIC 2016). Based on scientific studies and Indigenous Traditional Knowledge, the interval between population highs varies from approximately 30–80 years among subpopulations (Ferguson et al. 1998, Gunn 2003, COSEWIC 2016). There has long been debate about whether the intervals

between population highs and lows, and the population levels that occur at highs and lows, are regular enough to be considered cycles (Gunn 2003, COSEWIC 2016, Bongelli et al. 2020). A recent analytical study found that historical population fluctuations of the barren-ground caribou population overall and 9 of 11 sub-populations fit a sine-cyclic model with periods ranging from 26–55 years (Bongelli et al. 2020). However, COSEWIC (2016) points out that cumulative changes in the environment, habitat, climate, and harvest regimes for many caribou subpopulations are without historical precedent, and therefore it is uncertain whether future populations patterns will follow historical patterns.

Despite large magnitude changes in the abundance of barren-ground caribou, there is still a poor understanding of how limiting factors regulate population change. Predation, human harvest[1], parasites and disease, and food supply are all considered limiting factors of barren-ground caribou (COSEWIC 2016); however, no single factor has been conclusively demonstrated as a primary limiting factor across subpopulations and over time. Despite strong advocacy for certain factors by certain researchers (e.g., for predation by Bergerud (1996)), the weight of evidence is that population dynamics involve complex interactions among limiting factors that vary over time and among subpopulations (Klein 1991, Whitten 1996). Over the 50 years that the PCH has been monitored, the population has not exhibited population fluctuations as large as other barren-ground caribou populations (COSEWIC 2016). This may be due to the large annual and seasonal ranges and diversity of habitats across ranges (Russell et al. 1993, Whitten 1996). Whitten (1996) suggests that periods of decline are caused by nutritional stress and predation exacerbated by adverse weather. Population growth during periods of favourable weather is dampened by a combination of poor nutrition, predation, and human harvest and disease. No true density dependent regulation or equilibrium was observed for the PCH from the 1970s to early 1990s (Whitten 1996).

6.2.6 LIMITING FACTORS

6.2.6.1 Food Supply and Overgrazing

The amount and distribution of forage have implications for population distribution and demography of barren-ground caribou (COSEWIC 2016). In general, food limitation is most prevalent during winter, when caribou diet consists primarily of lichen, and does not pose a constraint to caribou from late-spring through fall when graminoids, forbs, and deciduous shrubs are bountiful and predominate their diet (Thompson and McCourt 1981, Russell et al. 1993). Lichen availability depends on both density-dependent and density-independent factors, but the degree to which either is a limiting factor depends on ecological context. For example, density-dependent competition for forage, when local densities are high, and competition is intense, can cause overgrazing of lichen and reduce its abundance (Ferguson et al. 2001, Joly 2009). Recovery of lichen communities following overgrazing can take more than 20 years (Klein 1987).

[1]Human harvest is considered a natural population factor for barren-ground caribou because hunting has occurred for centuries (Sherry and Vuntut Gwitchin First Nation 1999, COSEWIC 2016). However, it is recognized that the nature of hunting has dramatically changed over the last century with the advent of high-powered rifles and snowmobiles.

The potential for lichen supply to regulate caribou herd size and demography is most likely for herds with small ranges on low productivity tundra islands (e.g., Klein 1987). For large, widely-distributed herds, it is more likely that density-independent factors, such as climate and natural disturbance, contribute to limitations in lichen supply that affect caribou distribution (Gunn et al. 2011). Lichen is a slow-growing food source; its distribution is affected by fire (see Joly 2009) and its accessibility depends on regional snow conditions, such as snow hardness and depth (Collins and Smith 1991, COSEWIC 2016). Therefore, caribou tend to shift winter ranges and foraging locations based on burn and snow conditions so that they may access areas with higher lichen abundance (Jandt et al. 2008, Pedersen et al. 2021). In the PCH, annual variation in the distribution of caribou during winter is thought to be a result of caribou tracking available and accessible lichen patches (Russell et al. 1993, WMAC 2009).

The potential for food supply, especially lichen, to regulate the PCH is limited because of their large annual and seasonal ranges and the diversity of habitats (e.g., several broad ecoregions) found within those ranges. Variation in distribution and range use may counteract any limitations on food supply at local scales (Hinkes et al. 2005). PCH migration from the tundra, at the northern extent of their range, to the taiga cordillera, at the southern extent of their range, may serve as a strategy to maximize the available food supply. Overall, the PCH winter range is relatively rich in lichen resources and is comparable to, or better than, those of other herds that winter in taiga regions (Russell et al. 1993).

Forest Fires

Forest fires are a significant natural disturbance agent in taiga forests and play a substantial role in the availability of caribou forage, especially lichen. Occasional fires are important to maintaining lichen biomass at a landscape level. Peak lichen biomass is generally associated with forests 125-1750 years old before lichen volumes decrease due to competition from other species like moss and shrubs (Klein 1982). However, frequent fires can reduce the extent of mature and old forests where productive lichen biomass occurs. For example, forest fires in the winter range of the Bathurst Herd reduced the area of forest by 30% between 1990 and 2000 (Chen et al. 2013). More broadly, the average area burned by large fires in Canada's taiga has increased since the 1960s (Krezek-Hanes et al. 2010). Climate change modelling suggests a further increase in fire extent of 25% by 2030 and 75% by the end of the century (Wotton et al. 2010). Generally, caribou avoid burned areas in winter for several decades until lichen biomass increases to the point where it is favourable for caribou to forage. Changes in landscape vegetation patterns due to fire are believed to affect regional seasonal use areas and migration routes of caribou (Gunn et al. 2011).

The PCTC monitors the extent of burn areas across the forested portion of the PCH annual range; since 1960, 18% of the area has burned (Porcupine Caribou Technical Committee 2021a). The five-year average of the area burned in the Yukon portion of the PCH annual range is 1,552 km² (Porcupine Caribou Technical Committee 2021a).

6.2.6.2 Predation

Wolves are the primary predators of barren-ground caribou (COSEWIC 2016). However, grizzly bears can also be significant predators of caribou, especially calves (Gau et al. 2002). Predation is an important factor

affecting many facets of caribou ecology, as caribou movements and habitat choices are often made to minimize exposure to predators (Bergerud 1996). One of the hypotheses about why barren-ground caribou migrate is that it reduces predation risk. The idea is that moving throughout the year limits the numerical response of wolves (Hayes and Russell 2000). In the NWT, wolf densities in the arctic tundra calving grounds were only 22% compared to wolf densities in the taiga, where the herd wintered. However, as caribou numbers increase, their range expands, causing some caribou to return earlier to the ranges of taiga denning wolves, which results allows wolf numbers to increase (Heard et al. 1996).

A study of wolf predation on the PCH estimated that wolves killed about 7,600 adult caribou each year, regardless of herd size (Hayes and Russell 2000). In 1992 this corresponded to a predation rate of 5.8%, or about one-third of adult mortality. As the PCH declined through the 1990s, the predation rate by wolves increased from 5.8% to 7.4%. Migratory movements effectively reduced wolf predation during the calving through summer seasons due to the combination of smaller ranges and lower densities of wolves in the arctic tundra. Only 16% of the mortality occurred during the calving/summer seasons compared to 84% during the fall and winter seasons, when wolves were predominantly in the taiga zone.

Generally, wolf predation does not appear to regulate barren-ground caribou subpopulations (Crête and Huot 1993, Messier 1995, Hayes and Russell 2000). Hayes and Russell (2000) estimated that the predation rate would have had to be near twice the observed level to cause the PCH to decline during their study. However, the limiting effect of predation increases as population size decreases, which can result in a cumulative effect with other limiting factors as the population declines (COSEWIC 2016).

6.2.6.3 Hunting

Human hunting of barren-ground caribou has occurred for centuries over much of the species range in North America (Sherry and Vuntut Gwitchin First Nation 1999, COSEWIC 2016). Although humans and caribou have co-existed for centuries, technological changes (e.g., high-powered rifles, snowmobiles, and aircraft) and social changes (e.g., commercial hunting) have changed the potential effects human hunting can have on some barren-ground caribou populations (COSEWIC 2016). Over the last half-century, there has been clear evidence of population-level impacts from harvesting. From 2008 to 2011 the estimated harvest rate on north Baffin Island was 41%. During the mid-2010s harvest rates of the Southampton population were considered well beyond sustainable limits (COSEWIC 2016). Harvest is more likely to pose a threat when population monitoring data is poor and/or harvest management decisions lag population declines. For example, in the Bathurst subpopulation, a constant harvesting level during a period of population decline resulted in an increase in the harvest rate (i.e., as a percent of population size) from 2–4% to 10–16% of abundance (Boulanger et al. 2011).

There is no simple, sustainable harvest level applicable to all barren-ground caribou populations. Effects of harvesting depend on herd size, population trend, and the proportion of females that are harvested (Boulanger and Adamczewski 2016). Harvesting may also interact with other limiting factors, such as predation and weather (Klein 1991). Most harvest plans target a total harvest rate of 0–5%, depending on herd status, and with restrictions on harvesting females (e.g., Environment and Natural Resources 2013).

Recognizing the importance of effective harvest management for both the conservation and continued long-term harvest of the Porcupine Caribou, the Porcupine Caribou Management Board led the development of a comprehensive *Harvest Management Plan for the Porcupine Caribou Herd in Canada* (HMP) in 2010 (Porcupine Caribou Management Board et al. 2010)[2]. Key components of the plan include the determination of specific management actions related to the estimated herd size and a set of general best hunting practices. Management actions are determined each year using a set of six population indicators: 1) estimated herd size, 2) harvest information, 3) adult cow survival, 4) calf birth rate, 5) calf survival to nine months, and 6) body condition. In addition, descriptive indicators from people on the land include caribou health, hunting success, and weather conditions that affect caribou. The results from the indicators are rolled up into a 4-class colour chart, and management actions are specified for each colour zone. Management actions become more restrictive across each zone once the herd falls below 115,000 animals, including ceremonial harvests only below 45,000 animals (Porcupine Caribou Management Board et al. 2010).

Implementation of the HMP is guided by a formal Implementation Plan (Porcupine Caribou Management Board 2016). Key components of the Implementation Plan are to 1) guide annual monitoring of the population indictors and harvest levels, 2) provide a forum for all the HMP Parties to review and discuss the population indicators and harvest levels and 3) provide an annual recommended harvest management colour zone plus any additional management actions that are deemed appropriate. Population indictors are monitored each year by the PCTC and summarized in an annual report (e.g., Porcupine Caribou Technical Committee 2021). Annual harvest levels are monitored by each Party or user group and are compiled by the PCTC into an annual report (e.g., Porcupine Caribou Technical Committee 2021b). Each year, the HMP Parties hold an annual meeting to discuss the results of the population and harvest monitoring and determine the harvest management zone for the following year and any additional management actions the Parties feel may be required.

Over the eight-year period, 2013–2014 to 2020–2021, the annual reported harvest rates of Porcupine Caribou have ranged from 749 to 3,367 caribou. The reported annual harvest rates are considered the minimum estimated harvest (Porcupine Caribou Management Board 2022). Due to reporting challenges faced by some Parties, significant harvest may be missed in some regions in some years. Notwithstanding the reporting challenges, the reported Canadian harvest is estimated to be between 1% and 2% of the 2017 population estimate of 218,000 caribou and is not considered a threat to population decline (Porcupine Caribou Management Board 2022). The comprehensive measures within the HMP to monitor and respond to declines in the PCH (i.e., by reducing harvest) provide a solid system to minimize the potential effects that harvesting could have on the herd.

[2] The HMP was agreed to by eight Parties with authorities and responsibilities managing the PCH within Canada, including Gwich'in Tribal Council, Inuvialuit Game Council, Vuntut Gwitch'in Government, Trʻondëk Hwëchʻin Government, First Nation of Na-Cho Nyäk Dun, Government of the Northwest Territories, Government of Yukon, and Government of Canada.

6.2.6.4 Parasites and Disease

Biting and parasitic insects, pathogens (i.e., viruses and bacteria) and internal parasites are important factors in caribou ecology and population dynamics (Gunn and Irvine 2003, Kutz et al. 2012, COSEWIC 2016).

Harassment by parasitic insects can be a key driver of behaviour, movement, and body condition of caribou during summer (Downes et al. 1986, Russell and Nixon 1990). Warble flies (*Hypoderma tarandi*) and nose botflies (*Cephenemyia trompe*), both of the family Oestridae, are the primary source of harassment for Arctic caribou, though mosquitoes (Culicidae), blackflies (Simuliidae), and horseflies (Tabanidae) also are known to cause harassment (Downes et al. 1986, Toupin et al. 1996, Witter et al. 2012a). There are two primary harmful effects of insects. The direct effects of the parasitic burden can result in decreased body condition and reproduction (Albon et al. 2002, Cuyler et al. 2012). Indirect effects include the behavioural response to avoid insects, which includes a reduction in time spent foraging, increased energy expenditure, and selection of low-quality habitats such as ridge tops, coastal regions, snow patches, and unvegetated areas (Downes et al. 1986, Russell and Nixon 1990, Walsh et al. 1992, Toupin et al. 1996, Witter et al. 2012a). These behavioural responses can result in reduced body condition going into the winter with negative implications for survival and fecundity (Russell et al. 1993, Cuyler et al. 2012).

The responses of caribou to disease and other parasites are less evident and less studied than responses to insects. Most occurrences of disease and internal parasites in caribou are at subclinical levels (not severe enough to produce observable symptoms) but can still result in reduced body condition and fitness (Gunn and Irvine 2003). A range of pathogens and parasites observed in caribou includes viruses, bacteria (e.g. brucellosis), helminths (e.g., roundworms, tapeworms, and flukes) and protozoa (Tessaro and Forbes 1986, Gunn and Irvine 2003, Kutz et al. 2012, COSEWIC 2016). Gunn and Irvine (2003) suggest that caribou may have evolved foraging strategies to minimize exposure to parasites. Similar to parasitic insects, internal parasites can reduce caribou body condition and pregnancy rates resulting in population-level impacts (Albon et al. 2002, Kutz et al. 2012).

6.2.6.5 Climate Change

Climate change can potentially affect barren-ground caribou populations negatively and positively through various mechanisms. A recent literature review on this topic identified five primary factors that affect caribou population dynamics that could be affected by climate change: (i) summer range conditions, (ii) parasites and disease, (iii) movement, migration, and distribution, (iv) extreme weather and icing events, and (v) winter range conditions (Mallory and Boyce 2018). The effects of these factors are likely to be complex and interact with climate and non-climate-related factors that will result in substantial local variation and uncertainty in potential outcomes to caribou (Cebrian et al. 2008, COSEWIC 2016).

On balance, climate change is predicted to have mostly positive effects on the summer range condition of barren-ground caribou. Increasing temperatures will likely lead to longer growing seasons, increases in plant productivity, and an earlier onset of spring. Pearson et al. (2013) predict dramatic increases of 29-68% in above-ground plant biomass in the arctic by 2050. These effects could increase caribou body condition and reproductive success by lengthening the summer period of food availability, by increasing the amount of

forage and providing earlier access to forage (i.e., relative to the energetically demanding periods of birthing and lactation) (Tews et al. 2007, Cebrian et al. 2008, Mallory and Boyce 2018). This prediction is supported by a 20-year study in Norway, 1994–2015, where reindeer body mass resulted from greater plant productivity associated with warmer summer temperatures (Albon et al. 2017). In the PCH, earlier and warmer springs over the last thirty years have resulted in more food available for nursing cows, correlated with higher early calf survival (Griffith et al. 2002). However, positive effects on caribou summer range may not occur uniformly across all ranges. Some researchers have suggested the potential for a trophic mismatch between the timing of caribou and vegetation phenologies (Vors and Boyce 2009). Also, a predicted shift to greater cover of woody shrubs may be negative to caribou because shrubs tend to have greater chemical and structural defenses against herbivory and lower available protein than other forage such as grasses, forbs and sedges (Thompson and Barboza 2014).

Most studies suggest that climate change is predicted to increase the potential effects of parasitic insects and disease on barren-ground caribou (Mallory and Boyce 2018). Warmer and longer summers are likely to increase the length and severity of insect harassment, leading to lower body condition of caribou, including lactating cows and calves (Witter et al. 2012b). Climate change is also predicted to increase parasitism by other taxa, such as protozoans and helminths, and the northern expansion of some parasitic species has already been observed (Kutz et al. 2013). Certain ungulate diseases are also expanding northward as the climate warms (Arifin et al. 2020). Arctic ecosystems and species may be more susceptible to the spread of parasites and diseases than southern populations because they have had less exposure and opportunity to develop resistance from an evolutionary perspective.

Extreme weather, such as icing events, large changes in snowfall patterns, and summer heat episodes, is predicted to increase with climate change and negatively affect caribou (Mallory and Boyce 2018). Restricted or total loss of access to forage due to icing in the winter range can significantly affect survival and body condition for barren-ground caribou (Tyler 2010, Hansen et al. 2014). These events tend to be more catastrophic in the high Arctic but have been reported broadly across caribou ranges; including within the VGFN territory where the refreezing of wet snow one winter restricted access to food and greatly affected the health of a caribou herd (Sherry and Vuntut Gwitchin First Nation 1999, p. 186). Ice crusts on snow can also negatively affect travel abilities, body condition, and predation risk of caribou (Griffith et al. 2002). Deep snowpacks can reduce the availability of terrestrial lichen forage in winter. The Porcupine Caribou are known to vary winter range use in response to regional weather patterns (Russell et al. 1993). Changes to regional snow patterns may make areas, such as Eagle Plains, less available to the herd (Russell and Gunn 2017).

Several studies have predicted that climate change could affect the movements, migration and distribution of barren-ground caribou (Mallory and Boyce 2018). Effects are predicted to be most dramatic for subpopulations that travel over ice during the winter and where warming temperatures are already reducing the extent and duration of ice (Poole et al. 2010). Changes in regional snow conditions predicted due to climate change can also affect the migration patterns and seasonal distributions of barren-ground caribou. Russell et al. (1993) observed that the PCH adjusted the concentration of winter range use in relation to winter snowpacks. Areas such as Eagle Plains, which receive the greatest use during low snow years may become less available if regional snowpacks increase. Other studies have indicated that snow depths and snow conditions

(e.g., crusting) affect the migration routes, behaviours, and energetic costs of Porcupine Caribou during spring migrations (Whitten 1996, Griffith et al. 2002).

During winter, many barren-ground caribou subpopulations forage primarily on terrestrial lichen. Climate change is predicted to reduce terrestrial lichen biomass due to increased productivity from other plants (notably shrubs) and, in the boreal/taiga forest, due to increased forest fires (Mallory and Boyce 2018). Some studies indicate the area burned each year in northern Canada could double by the end of the century (Wotton et al. 2010). The potential adverse effects of climate change on caribou winter range depend mainly on the assumption that caribou require lichen-rich diets in winter. Some researchers have long questioned the need for lichens during the winter (Bergerud 1974), and more recent studies suggest that winter diets dominated by graminoids rather than lichens were not detrimental to caribou populations (Heggberget et al. 2002, van der Wal 2006). However, in the Western Arctic Herd a decline in recruitment and abundance in the herd occurred when the winter diet showed increased graminoids and decreased lichens being consumed (Joly 2009). In the past, the conditions of winter range and winter weather were not considered to be limiting to the PCH (Russell et al. 1993, Porcupine Caribou Technical Committee 1993). However, the combination of reduced lichen forage, deeper snow in some areas, and extreme weather events that are predicted to occur with climate change has the potential to increase the limiting effect of the winter range on the PCH.

6.3 PORCUPINE CARIBOU HERD MANAGEMENT

There is a long history of co-management of the PCH among indigenous, state, territorial and federal governments, with international and national management boards formalizing in the mid-1980s. Canada and the United States of America co-manage the herd under the *Agreement Between the Government of Canada and the Government of the United States of America on the Conservation of the Porcupine Caribou Herd (1987)*. The International Porcupine Caribou Board (IPCB) is comprised of Canadian and American representatives. The Porcupine Caribou Management Board (PCMB) is a co-management board for the Canadian portion of the herd's range, formed under the *Porcupine Caribou Management Agreement (1985)*. The *Porcupine Caribou Management Agreement (1985)* was established to coordinate management efforts toward conserving the herd and maintaining and protecting special harvesting rights in the Porcupine Caribou for indigenous users while providing for other users to share in the harvest. The PCMB and IPCB have led or contributed to the development of several plans for the PCH, including:

- *Plan for the International Conservation of the Porcupine Caribou Herd (1987),*
- *Wildlife Conservation and Management Plan for Yukon North Slope (2002),*
- *Porcupine Caribou Harvest Management Plan (2010)* and an associated *Implementation Plan (2010, revised 2016),*
- *Porcupine Caribou Herd Strategic Framework 2015-16 to 2019-20.*

The international agreement also provided for a joint technical committee to coordinate research and monitoring activities and advise the IPCB on scientific matters surrounding the herd. This committee, known

as the "Porcupine Caribou Technical Committee" (PCTC), has been functioning since the 1970s. Over time, the PCTC has taken on the role of advising the Canadian PCMB and the IPCB. The PCTC comprises biologists and scientists from Yukon, Alaskan, Canadian and American government agencies, university researchers, and other caribou experts.

The PCTC leads most of the monitoring and research initiatives associated with the PCH on behalf of the PCMB and the IPCB. Core monitoring work that the PCTC does includes population abundance surveys (normally every two to five years depending on herd behaviour, funding, and logistics), population demographic monitoring (e.g., calf birth and survival rates and important age and sex ratios), seasonal movement monitoring (via GPS telemetry tracking), caribou body condition monitoring, habitat and human disturbance assessments, and annual snow surveys. Monitoring results are normally provided to the PCMB and the IPCB via annual reports (e.g., Porcupine Caribou Technical Committee 2019) and via presentations at the annual harvest meetings. The PCTC also intermittently conducts specific data analyses, such as habitat selection studies and seasonal range mapping, to support land use planning and other management initiatives.

6.3.1 PROTECTED AREAS AND MANAGEMENT AREAS AND PLANS

A network of parks protects the portion of the PCH annual range that occurs within Yukon, special management areas, conservation areas, wilderness areas, protected areas, ecological preserves, habitat protection areas, and IMA zones within the North Yukon Regional Land Use Plan and the Peel Watershed Regional Land Use Plan (Map 6-2). In total, 54% of the annual range of the PCH within Yukon falls within some type of protected area where industrial activity is prohibited, 36% of the annual range occurs within regional LUP IMA zones, and 9% of the annual range is not covered by any type of land management zonation. A summary of the overlap of different types of protected areas and management areas with the seasonal ranges of the PCH is provided in Table 6-2.

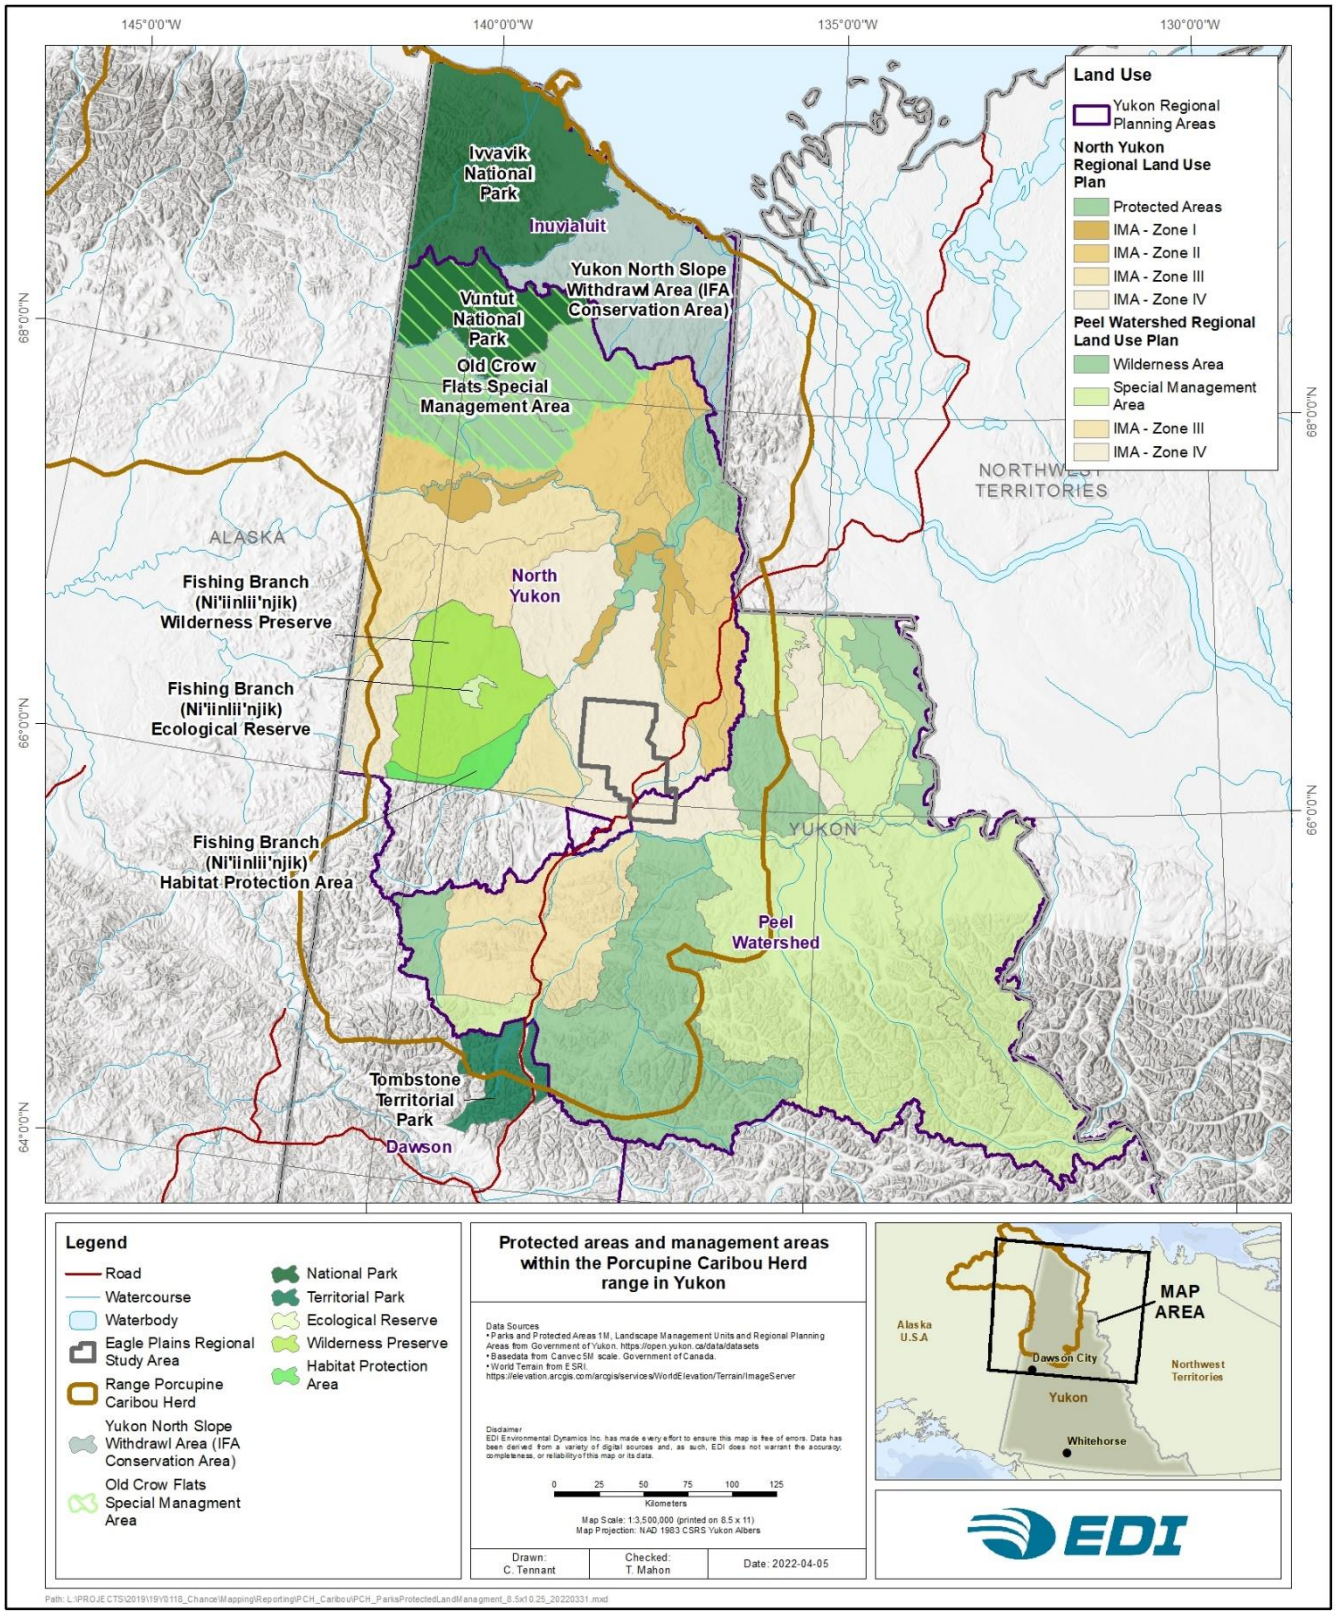
The Project is within the North Yukon Planning Region and Peel Watershed Planning Region and is subject to the NYLUP (Vuntut Gwitchin Government and Yukon Government 2009) and PWLUP (Peel Watershed Planning Commission 2019). The project falls within IMA Zone IV of both plans, a zone with lower ecological and cultural values and the highest permissible development of the four IMA zones. The NYLUP and PWLUP include management objectives and strategies to minimize the effects of human development activities on wildlife and wildlife habitat, generally, and specific objectives and strategies for caribou.

In addition to the Regional Land Use Plans, the Habitat Programs Section of the Yukon Department of Environment, Yukon Government maintains an inventory of important habitat areas for focal management species, including caribou, within the Wildlife Key Area Inventory (Environment Yukon 2014b). Wildlife Key Areas are specific geographic locations used by wildlife for critical, seasonal life functions, such as calving areas and mineral licks. No Wildlife Key Areas for caribou occur within the Project RSA (Government of Yukon 2015).

Table 6-2. Summary of the overlap of different types of protected areas and management areas with the seasonal ranges of the Porcupine Caribou Herd.

Season	Area (km²)	% of Seasonal Range					
		Protected Areas [1]	IMA I	IMA II	IMA III	IMA IV	Not Zoned
Early, Mid, Late Winter	58,090	37	2	8	19	18	15
Spring, Migration and Pre-calving	68,463	55	1	7	21	7	9
Calving	14,636	100	0	0	0	0	0
Post-Calving and Movement	7,622	100	0	0	0	0	0
Early Summer	5,901	100	0	0	0	0	0
Mid Summer	24,417	86	0	14	0	0	0
Late Summer and Fall Migration	57,928	60	4	15	13	8	0
Rut and Late Fall	65,249	31	3	10	23	13	20

[1] including parks, special management areas, conservation areas, wilderness areas, protected areas, ecological preserves, and habitat protection areas.



Map 6-2. Protected areas and management areas within the Porcupine Caribou Herd range in Yukon.

6.4 SEASONAL DISTRIBUTION

Considerable effort has been placed towards quantifying and mapping space use of PCH caribou in Yukon. Satellite-telemetry collaring programs have allowed for the tracking of individuals within the herd to delineate the herd's seasonal distributions. The PCTC supplied EDI with spatial polygons of PCH seasonal ranges spanning 37 years (1970–2016), which provided an opportunity to determine the amount of overlap between seasonal ranges and the RSA. Simple measures of overlap (%) can yield useful insight into the historical frequency of occupation and how PCH caribou are likely to interact with the Project.

The Project RSA overlaps a relatively small proportion of late fall (October 8 to November 30) and winter (December 1 to March 31) ranges. Most of the overlap occurs in portions of the ranges that are less frequently used on an annual basis. No overlap occurs with frequently used portions of late fall and winter ranges.

6.4.1 METHODS

The seasonal ranges used for this analysis consisted of mapped 'sensitive habitat' polygons provided by the PCTC that correspond to eight seasonal life cycle periods for the PCH (Porcupine Caribou Technical Committee 1993). Within each season, the PCTC identified four levels of use based on the frequency of overlap among annual estimates of seasonal home ranges computed for collared caribou, 1970–2016. The four use levels correspond to the proportion of years that home range estimates overlapped any given area: >40 %, 30–40 %, 20–30 %, and <20 %. The lowest category (<20 %) corresponds to very low use and is not considered part of the regular seasonal ranges of the PCH. The degree of overlap of the Project RSA with the PCH seasonal ranges was calculated in a GIS by measuring the overlap of the RSA with each 'frequency of use' category for each seasonal range. All eight life cycle periods were considered for the analysis, but only late fall (including rut, October 8 to November 30) and winter (December 1 to March 31) ranges overlapped the RSA. The overlap analysis was constrained to Yukon because fall and winter ranges in Yukon and Alaska are functionally discrete. Including the Alaskan ranges would dilute the degree of overlap of the RSA with the Yukon ranges.

6.4.2 RESULTS

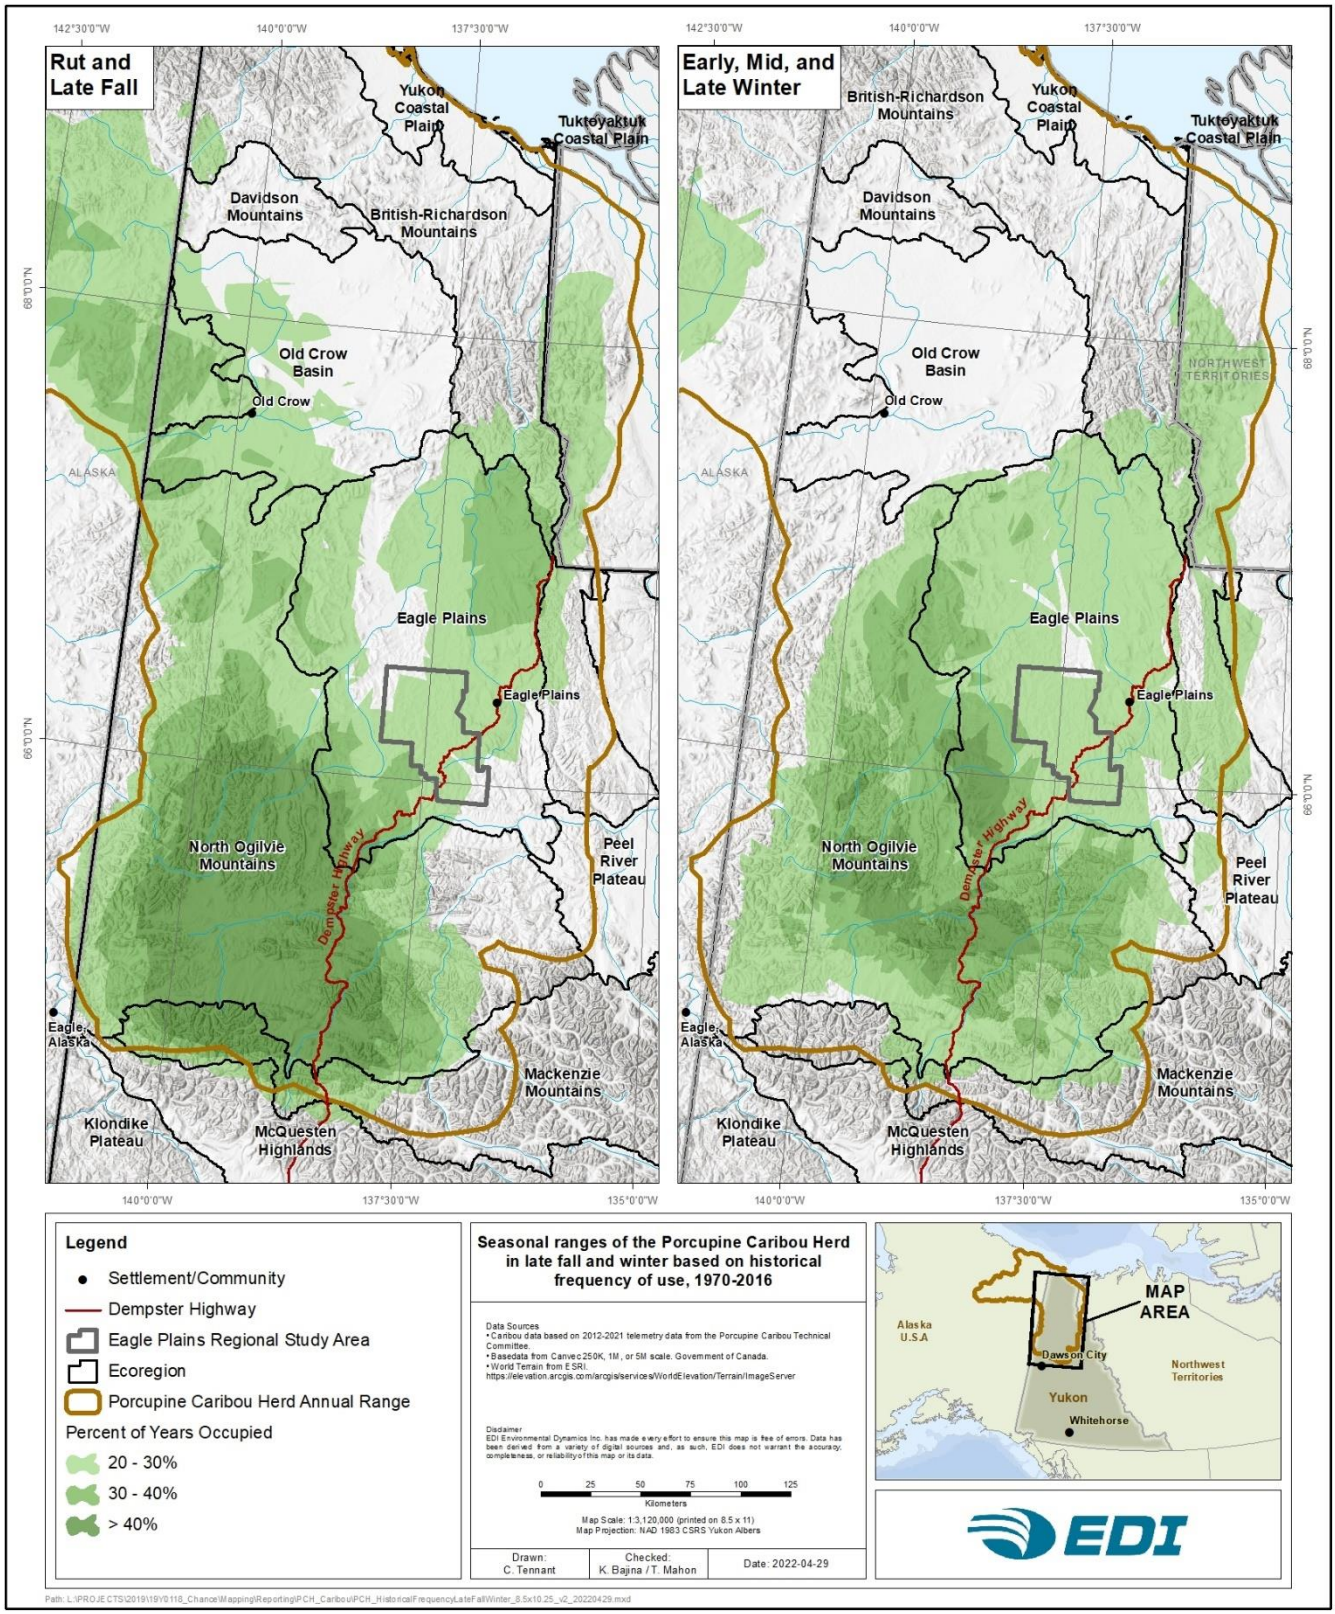
Only two seasonal life cycle periods had relatively frequent overlap (i.e., >20 % across years) with the RSA: (1) rut and late fall, and (2) early, mid, and late winter. For simplicity in this and subsequent analyses, these two periods are referred to as 'late fall' and 'winter' seasons. The RSA overlaps a relatively small portion of the seasonal ranges for both late fall and winter seasons: 5.97% in late fall and 6.54% in winter (Map 6-3). The greatest overlap occurred with the 20–30 % frequency of use areas; 5.90% and 6.12% of late fall and winter ranges, respectively (Table 6-3). No overlap occurred between the Project RSA and the most frequently used areas (>40 %) for either season.

PCH caribou have a wide-ranging distribution in late fall and winter and occupy a large portion of northern and central Yukon. Though some use occurs in the Project RSA and the broader Eagle Plains ecoregion, more frequent use occurs further southwest in the taiga cordillera of the North Ogilvie Mountains in late fall and

winter, and in the Richardson Mountains in late fall (Map 6-3). As discussed in the background sections, Section 6.2.2 *Seasonal Ranges and Movements* and Section 6.2.3.1 *Effects of Snow*, the distribution of the PCH in winter varies across four regions with different snow regimes: Yukon/Alaska border, Richardson Mountains, Ogilvie/Hart region, and the Whitestone/Eagle region (Russell et al. 1993). Use of the Whitestone/Eagle region is highest in years with lower than average snowpacks.

Table 6-3. Percent overlap of the Porcupine Caribou Herd late fall and winter ranges with the Project RSA based on the annual frequency of use by caribou, 1970–2016.

Seasonal Range	Annual Use by Caribou (%)	Percent Overlap with RSA (%)
Late Fall	< 20%	0.55
	20–30%	5.90
	30–40%	0.07
	> 40%	0.00
Winter	< 20%	0.07
	20–30%	6.12
	30–40%	0.42
	> 40%	0.00



Map 6-3. Annual frequency of use by the Porcupine Caribou Herd in late fall and winter ranges relative to the RSA, 1970–2016.

6.5 HABITAT USE

The general distribution of PCH caribou across seasons provides some context for their potential interaction with, and overlap of, the Project RSA. However, to caribou, all space on the landscape is not equivalent. Habitat needs to be considered to predict how often caribou might occur in the area based on the amount and distribution of necessary resources, such as forage. To better understand how PCH caribou use habitat across their late fall (including rut) and winter (i.e., early, mid, and late season) ranges, statistical models were developed to describe the relationship between caribou locations and relevant habitat components. These models considered habitat available to caribou broadly across their seasonal range. Habitat models were developed for late fall and winter using GPS location data (2012–2021) of satellite-collared caribou provided by the PCTC. Habitat model outputs were used to estimate the amount and distribution of habitat within the Project RSA and across the PCH's late fall and winter ranges.

The chosen models for late fall and winter performed reasonably well in predicting PCH caribou habitat selection based on several measures of model performance. Light macrolichen cover was the key driver of caribou habitat use in both seasons, though preference for lichen was strongest during winter. During late fall, caribou tended to select flat, mid-elevation regions near large waterbodies. During winter, caribou tended to select flat areas at low and high elevations while remaining distant from waterbodies. Caribou also avoided areas with dense conifer trees, shrub (deciduous and evergreen), forb, and graminoid cover. Base habitat models predicted the distribution and proportion of selected habitat in the Project RSA to be approximately equivalent during late fall and less during winter relative to the full extent of those seasonal ranges.

6.5.1 METHODS

6.5.1.1 Spatial Extent

Habitat modelling was conducted across the Yukon portion of the late fall and winter seasonal ranges defined in Section 6.5, *Seasonal Distribution* (i.e., areas with >20% frequency of annual use). Analyses were limited to the Yukon portion of late fall and winter ranges because of the potential differences in the ecology of caribou occupying Alaska versus Yukon. Using the full Yukon range yields the benefit of identifying broad patterns of habitat selection that affect the territory-wide distribution of the PCH. However, use of a broader scale may dilute patterns of habitat selection at local scales, e.g., only within Eagle Plains ecoregion. Whether such dilution leads to a loss of information depends on caribou habitat preferences in different ecoregions.

6.5.1.2 Data Preparation

The PCTC provided EDI with GPS location data (2012–2021) of satellite-collared PCH caribou. These data covered the entire annual range of the PCH and were reduced to include locations only within the late fall and winter range extents, as described above. The reduced data set consisted of 164 caribou in late fall and 172 caribou in winter. Most of these data (39.02% in late fall and 42.74% in winter) were attributed to locations collected in 2020–2021.

Spatial habitat data were acquired to relate caribou locations to environmental conditions within fall and winter seasonal ranges (as defined above) and, where appropriate, account for variation in conditions across time. For example, temporal changes (from 2010 to 2020) in the distribution of plant functional types (PFTs) due to grazing, fire, and climate-driven vegetation dynamics were captured using predicted top cover percentage (%) raster layers developed by Macander et al. (2022). Based on initial data exploration exercises, the PFTs that were considered ecologically relevant to habitat use of the PCH included light macrolichens (also see Macander et al. 2020), graminoids, forbs, evergreen shrubs, deciduous shrubs, and conifer trees. Data for topography on the landscape were acquired from a Digital Elevation Model (DEM; 1:250,000) for Yukon and were used to develop measures of absolute elevation (metres), slope percent (slope tool in the Spatial Analyst extension, ArcGIS 10.7; ESRI 2019), aspect (degrees), and a terrain ruggedness index (TRI; Sappington et al. 2007). A measure of relative elevation was created by combining absolute elevation and a simplified stream network (CanVec; nearest main watercourse from a 1:1,000,000 scale watercourse layer) and then employing the HAR tool from the Riparian Topography Toolbox in ArcGIS (Dilts 2015). A CanVec (1:1,000,000) waterbody layer was also used to map distances to waterbodies >1 ha. Caribou may use frozen waterbodies as an antipredator tactic to increase sightlines. They may also be mineral licks (Ferguson and Elkie 2005).

6.5.1.3 Statistical Models

Determining which resources (habitat features) are selected most often by animal populations is important because it provides information about how those animals meet fundamental requirements for survival and reproduction (Manly et al. 2002). Resource selection functions (RSF) are a statistical method that quantifies how resources are chosen by relating animal observations to resources available across the landscape. RSFs predict the probability of an animal occurring at specific locations (e.g., within a study extent) based on the combination of resources available at those locations. Results of a RSF can be mapped to identify important areas of resource selection for caribou and, therefore, can inform the conservation and management of the species.

Caribou observations were first overlayed with environmental spatial data layers to develop RSFs for PCH late fall and winter ranges. Environmental values were extracted for each known location of caribou plus ten times as many randomly sampled locations (spaced a minimum distance of 50 m apart). Availability was deemed global, so available locations were randomly selected within the late fall and winter study areas. Independence among observations of caribou was assumed by resampling caribou locations to a maximum of one per day. Available locations were compared to locations known to be occupied or 'used' by caribou to identify the combination of resource units preferred by caribou. Logistic regression was used to develop RSFs within a generalized linear mixed model framework. The general formula for logistic regression is as follows:

$$logit(P) = \beta_0 + \beta_1 x_1 \ldots \beta_n x_n + Y$$

where the predicted value P is dependent on the linear predictor ($\beta_0 + \beta_1 x_1 \ldots \beta_n x_n$) through a logit-link function, and x is the *i*-th environmental covariate and β is its associated coefficient. An interaction was included between Ecoregion and macrolichen cover to account for the varied distribution, and possibly selection, of lichen among ecoregions. An additional random effect term, Y, was added to account for (a) the

variation in habitat selection associated with each caribou year and (b) the unequal sample sizes among years. Large weights were applied to all available locations ($weight_{avail}$ = 1,000) relative to used locations ($weight_{used}$ = 1) to ensure that parameter estimates were not biased by the sampling ratio of used and available points (Muff et al. 2020). The linear predictor was used to calculate the probability of selection P:

$$P = \frac{e^{(\beta_0+\beta_1 x_1 \ldots \beta_n x_n+Y+E)}}{1+e^{(\beta_0+\beta_1 x_1 \ldots \beta_n x_n+Y+E)}}$$

where e is the natural exponential function and P is bounded by $0 < P < 1$.

6.5.1.4 Exploring Covariate Relationships

Before analyses, all continuous covariates, such as PFT top covers, elevation, slope, TRI, HAR, and distance to waterbodies, were standardized to have a mean of zero and a standard deviation of one. Standardizing the values across covariates ensures model convergence and improves the ability to rank the relative importance of each covariate in a model. The aspect was converted from continuous (degrees) to categorical (cardinal directions) based on 90° intervals. To prevent biased estimates of coefficients and inflated errors, multicollinearity among covariates was assessed using a correlation matrix (dropping variables with Pearson's product moment correlation $|r| > 0.7$ [see Dormann et al. 2013]) and variance inflation factor scores (dropping variables with VIF scores > 3 [Zuur et al. 2009]). For example, absolute and relative (HAR) elevation in winter were highly correlated (r = 0.69). The decision to choose one over the other was based on univariate response curves assessed using generalized additive modelling (GAM; see below). In other words, of the highly correlated covariates, the one with the greatest selection response (slope) was chosen. In this case, absolute elevation was retained over HAR.

Data exploration consisted of (1) univariate analyses with the response variable (i.e., used versus available), and (2) univariate and multivariate GAMs to assess the potential marginal effect of each covariate on the (non-linear) shape of the response curve (i.e., probability of use). These exercises informed model development. For example, rather than assuming a linear increase for percent light macrolichen cover, the variable was logarithmically transformed to fit the expectation that the probability of selection increased at incrementally smaller values as the quantity of lichen in a patch increased (Figure 6-2). Additionally, different patch sizes were considered for PFT covers by estimating the mean percent cover within 100 m, 500 m, and 1,000 m buffers around used and available points.

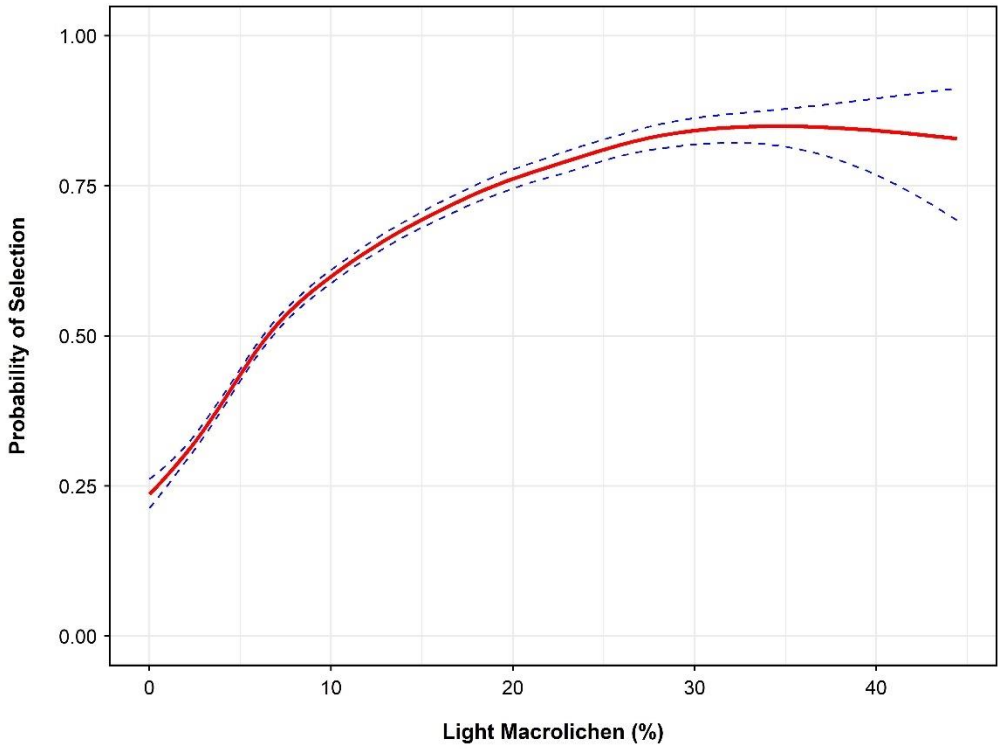


Figure 6-2. Generalized additive model assessing the probability of selection of light macrolichens by PCH during winter.

6.5.1.5 Model Selection and Validation

Habitat models were selected for late fall and winter by implementing 'full' models (with all relevant covariate terms) and assessing the variation explained by the inclusion of each covariate. The best models were chosen based on (1) statistical considerations using Akaike's information criterion (AIC; Burnham and Anderson 2002), which balances the trade-off in the amount of variance explained (i.e., model likelihood) with the number of parameters considered, and (2) ecological significance to caribou in the late fall and winter seasons. Since the goal of the model was prediction, as many covariates as necessary were retained. Thus, alternative candidate models were considered not by testing competing hypotheses but rather by dropping covariates with low magnitude (scaled) coefficients $< |0.1|$. Model diagnostics were run on simulated residuals to assess (a) goodness-of-fit (i.e., Kolmogorov-Smirnov test), (b) issues related to dispersion, (c) the frequency of outliers, (d) variance among categorical predictors, and (e) quantile regressions of observed versus expected residuals.

The predictive performance of late fall and winter models were assessed using a 5-fold cross-validation approach as per the steps outlined in Johnson et al. (2006). (1) The original data were partitioned into 5-fold groups. For each iteration of the evaluation procedures, four groups were combined into the training dataset. The remaining group was used as the testing dataset. (2) The RSF was estimated for each training dataset. (3) RSF values from the training dataset were predicted in a GIS and reclassified into 10 quantile rank bins. (4) Midpoint (median) values of raw RSF scores were calculated for each quantile bin. (5) Percent utilization was

calculated for each quantile bin using equation 4 in Johnson et al. (2006). (6) The number of used observations from the testing dataset that fell in each quantile bin were counted. (7) The number of expected observations from the testing dataset was calculated for each quantile bin using equation 5 in Johnson et al. (2006). (8) Observed versus expected counts and proportions from the testing dataset were compared and tested formally using linear regression, spearman's rank correlation, chi-square goodness-of-fit (i.e., observed versus expected counts), and tests of proportions for each quantile bin (i.e., chi-square observed versus expected proportions). These steps were repeated until each fold was used as the testing dataset. The 5-fold cross-validation procedure was implemented for several candidate models for both late fall and winter to determine whether simpler models yielded more accurate predictions.

6.5.1.6 Habitat Quality, Amount, and Distribution

Models selected for late fall and winter were used to generate predictive habitat maps across those seasonal ranges. These mapped predictions aimed to identify the amount and distribution of habitat available to PCH caribou. To facilitate the comparison of relative habitat quality across the study area, the RSF predictions were classified into four ordinal ratings: Very Low, Low, Moderate, and High. To help objectively define ecologically relevant classification of the RSF values we conducted a post-hoc selection-ratio test of the caribou locations against the RSF predictions. This approach identified the point within the RSF value range where values switch from avoided to being selected. The portion of the 'selected' RSF value range was divided at the midpoint into the Moderate and High ratings and the portion of the 'avoided' range was divided at the midpoint into the Very Low and Low ratings. For example, for RSF output with a range from 0 to 1, if the selection-ratio calculation determined the breakpoint between avoidance and selection occurred at 0.6, the habitat quality ratings would be Very Low = 0.0-0.3, Low = 0.3-0.6, Moderate = 0.6-0.8, and High = 0.8-1.0.

To determine the breakpoint within the RSF value range that switched from avoided to selected, the frequency distributions of mapped RSF predictions were partitioned into 50 quantile bins with each bin consisting of two-percentile intervals. Selection ratios were calculated for each quantile bin by associating mapped RSF predictions to used and available collar locations and then assigning each location to a quantile bin. The selection ratio for each bin was calculated as follows:

$$SR_{bin} = \frac{Used_{prop} - Avail_{prop}}{Avail_{prop}}$$

where $Used_{prop}$ and $Avail_{prop}$ are the proportion of used and available locations in each quantile bin. Selection ratios were used to categorize habitat quality into the discrete ratings discussed above (i.e., Very Low, Low, Moderate, and High). The bin at which selection ratios switched from negative to positive identified the threshold between Low and Moderate quality habitat. Very Low quality habitat was identified based on the midpoint between the smallest quantile bin and the Low/Moderate quality habitat threshold. Similarly, the midpoint between the Low/Moderate quality habitat threshold and the largest quantile bin differentiated Moderate and High quality habitat. For certain management questions or purposes, it may be adequate to just use two habitat classes—avoided or selected. Subdividing those into the four ratings provides further resolution for certain management questions or objectives. For example, when comparing different

road route options that must traverse an area of 'selected' habitat, potential impacts are expected to be minimized by locating the road in Moderate versus High habitat areas.

RSF frequency distributions were extremely right skewed so that very high RSF values were low in frequency. This issue arises when dealing with RSFs with 'infinitely weighted' available locations, which has become standard practice in recent years (e.g., Muff et al. 2020). In late fall and winter RSFs, the ratio of used to available locations was 1:10 with an additional large weight (i.e., 1,000) assigned to each available location. These large weights effectively reduce RSF predictions to very small decimal numbers and skews their distribution. To ensure that this skew did not underestimate the amount of High versus Moderate quality habitat, all RSF values equal to or greater than the 98th percentile were fixed at that value. Thus, there were effectively 49 quantile bins, in total, because all predictions in the 50th bin were assigned to the 49th bin.

To compare the amount and distribution of selected habitat within the Project RSA (~2,386 km^2) to the broader landscape, the amount of selected habitat was assessed within similar sized polygons across the seasonal ranges. A grid composed of 50 km x 50 km (2,500 km^2) cells was placed over the Yukon extent of the PCH ranges, and the proportion of selected habitat was assessed for each cell.

6.5.1.7 Statistical and Geospatial Software

All statistical analyses were completed in R software for Statistical Computing, version 4.1.0 (R Development Core Team 2020). Package 'mgcv' (Wood 2011) was used to develop and assess non-linearity in response-covariate relationships using generalized additive modelling. Package 'glmmTMB' (Brooks et al. 2017) was used to fit generalized mixed-effects models. In addition to visual assessment of covariate-response relationships, package 'DHARMa' (Hartig 2021) was used to assess simulated model residuals (e.g., goodness of fit, dispersion, outliers, heteroscedasticity). Package 'groupdata2' was used to partition data into training and testing datasets; it was especially useful for partitioning a consistent number of used and available locations among the data folds. All geospatial analyses were completed in R, version 4.1.0 (R Development Core Team 2020), QGIS (QGIS Development Team 2020), and ArcGIS, version 10.7 (ESRI 2020).

6.5.2 RESULTS AND DISCUSSION

6.5.2.1 Habitat Models

The selection of late fall and winter habitat models required an iterative model fitting, testing, and cross-validation process. The appropriate patch size (i.e., 100 m, 500 m, or 1,000 m) of each PFT was selected based on GAM plots to identify which patch size corresponded with the greatest change (slope) in selection. Initial model selection procedures determined that 'full' models, with all possible covariates, were the most parsimonious for late fall (No. 1 in Table 6-4) and winter (No. 1 in Table 6-5) RSFs. However, the 'full' model for late fall did not yield the best predictive performance based on the 5-fold cross-validation procedure. The best performing model for late fall excluded the effects of all PFTs except lichen (No. 3 in Table 6-4; Table 6-6), which yielded a better fit between observed and expected proportions across 10 quantile bins based on regression (i.e., higher R^2; intercepts closer to zero and slopes closer to one), tests of proportions

(i.e., greater number of equivalent observed/expected bins), and spearman rank correlations (i.e., larger correlation coefficients). See Section 5.6.1 for plots and summaries of 5-fold cross-validation results for the selected late fall RSF model. Regressions for each fold had very strong fits (all $R^2 > 0.93$) but did have intercepts that differed from zero and slopes that differed from one. The primary reason for this deviation was a greater number of observed proportions in the largest (10th) quantile bin, whereas all other bins were close to the line of unity (1:1 ratio). Spearman rank correlations were consistently very high (all $r > 0.98$ and $p < 0.001$). The mean number of bins in which observed proportions were no different than expected proportions, across all five folds, equalled 5.2 (low = 4, high = 8).

The best performing model for winter consisted of the full parameterization (No. 1 in Table 6-5; Table 6-7), which yielded a better fit between observed and expected proportions across 10 quantile bins based on regression (i.e., higher R^2; more intercepts closer to zero and slopes closer to one), tests of proportions (i.e., greater number of equivalent observed/expected bins), and spearman rank correlations (i.e., larger correlation coefficients) than any alternative candidate model. See Section 5.6.1 for plots and summaries of 5-fold cross-validation results for the selected winter RSF model. Regressions for each fold had strong fits (all $R^2 > 0.79$) and had intercepts that were no different than zero and slopes that were no different than one. Spearman rank correlations were consistently very high (all $r > 0.98$ and $p < 0.001$). The mean number of bins in which observed proportions were no different than expected proportions, across all five folds, equalled 5 (low = 3, high = 6). In conclusion, both late fall and winter model had a fair agreement between observed and expected proportions and had very high spearman rank correlations, which suggests that these models perform adequately for prediction (e.g., see Johnson and Russell 2014, White and Gregovich 2017, Johnson et al. 2020).

Habitat use varied moderately between late fall and winter. Although selection coefficients were highest for macrolichen cover and elevation in both seasons, the relationships varied somewhat, and the extent of Moderate and High rated habitat was reduced in winter compared to late fall. Selection (positive coefficient) for macrolichen cover, the most relevant plant functional type in either season, was greater in magnitude during winter (Table 6-7) than during late fall (Table 6-6). Though the magnitude of selection for macrolichen varied by ecoregion (i.e., interaction), the best-fitting patch size for the selection of macrolichen was consistently 100 m. However, patch size varied for other plant functional types considered during winter (Table 6-7; e.g., conifer tree cover versus forbs). During late fall, caribou selection (positive coefficients) of vegetation was solely driven by lichen cover. Meanwhile, during winter, caribou tended to avoid (negative coefficients) other PFTs such as conifer trees, forbs, graminoids, deciduous shrubs, and evergreen shrubs. The lack of selection/avoidance of other PFTs during late fall is likely the result of more diverse forage use in late fall than in winter and individual variation in habitat choice. Such variation is consistent with a broad habitat selection pattern at the population-level, which led to the poorer predictive performance of late fall models that included other PFT covers.

Preference of absolute elevation also varied between the seasons. Caribou occupied primarily mid elevations (approximately 750 m) during late fall (Table 6-6) but selected low and high elevations during winter (Table 6-7). Caribou also varied in their proximity to waterbodies >1 ha between seasons. Caribou tended to be closer to such waterbodies (negative coefficient) during late fall but remained farther (positive coefficient)

during winter. The ecological basis for these relationships to waterbodies is unclear, but the covariates were retained in the models because they improved predictive performance.

Coefficients associated with lichen cover were of the greatest magnitude, which suggests that the selection of lichen is the primary driver of habitat selection in late fall and winter. This pattern in vegetation use across both seasons is consistent with what is expected of PCH caribou diet and ecology (Thompson and McCourt 1981, Russell et al. 1993). Late fall and winter diets are mostly composed of lichens (and mosses). Though there is some evidence that caribou may forage on evergreen shrubs and deciduous shrubs during late fall (Russell et al. 1993), this pattern was weak, and these covariates were not included in the final model. Another similarity in selection among seasons was in terms of slope and aspect. Caribou avoided steep slopes (negative coefficients, logarithmic) and selected south- and west-facing aspects, which receive greater solar radiation than east- and north-facing aspects. This pattern could be attributed to productive lichen patches during both seasons and to decreased snow depth due to melt and wind during winter.i

Selection gradients (i.e., the degree of preference/avoidance) were greater during winter than late fall. This is likely because forage was more broadly available across different habitats due to lower snowpacks in late fall and because more locations in the late fall were likely associated with travelling than foraging. Though caribou distribution is broader in winter, there was clearly a stronger preference (positive coefficient) for light macrolichens and a stronger avoidance (negative coefficient) of areas with high cover of conifer trees. Stronger preference and avoidance in winter may result in more concentrated forage on lichen and from snow constraints on caribou distribution.

Temporal patterns of habitat selection also varied between late fall and winter. Habitat selection seemed to be fairly consistent across years in late fall but varied from winter to winter. A very small portion of the overall variance ($\sigma^2 = 0.00021$) in habitat selection could be explained by year effects during late fall. This model contributed little to the overall model likelihood and was penalized for an additional parameter ($AIC_\Delta = 2$); thus, year effects were not included for the late fall model. However, during winter, a year effect explained a sufficient amount of variation ($\sigma^2 = 0.013$) in habitat selection to warrant inclusion in the final model (i.e., $AIC_\Delta = -90.9$ with year effect). Variation among years was likely greater in winter due to the effects of snow across the landscape, which can broadly affect the distribution of PCH caribou and their foraging habits.

Snow accumulation and distribution is invariably an important factor affecting habitat selection by PCH caribou at multiple scales. At fine spatial scales, snow depth, density, and hardness can limit access to terrestrial lichens (Johnson et al. 2001). Although snow depth data were not available, elevation was considered as a suitable surrogate. In the winter RSF, caribou exhibited selection for low and high elevations and avoidance of mid elevations, where snowpacks are often deepest. Indeed, Pedersen et al. (2021) identified a significant correlation ($r > 0.6$) between elevation and snow depth in 33% of winters during their study of another barren-ground caribou herd, the Central Arctic Herd. The amount of snowfall and snowpack at broad spatial scales can cause the PCH to occupy different core wintering regions. For example, PCH caribou occupy the Ogilvie/Hart and Richardson Mountains regions on a rotational basis because these regions receive less snow than adjacent areas (Russell et al. 1993). This pattern is consistent with the current data, whereby GPS-collared PCH caribou occupied different ecoregions at different intensities (i.e., number of individuals and locations) across time.

Though snow depth could not be considered explicitly in habitat models, the variation estimated among years and differences in the use of ecoregions and elevations were considered to partially account for the influence of snow. These variables are considered coarse correlates of snowpack patterns across the landscape (Russell et al. 1993), yet, the exclusion of an explicit snowpack covariate does limit fine-scale predictions of how snow affects caribou resource selection. Ultimately, snow depth is probably the primary, ecologically relevant metric that would supplement the current covariate suite and provide greater insight on winter selection patterns. Available snow covariates were examined and deemed not to be useful. For example, information on snow prevalence, date of the first snow, or snow cover are not inherently useful because caribou (and other ungulates) are not constrained in their movements and foraging by shallow snow. Given these considerations, it was deemed more appropriate to account for the coarser effects of snow depth using ecoregion and elevation rather than using a snow cover that may be misleading both ecologically and mechanistically, resulting in a spurious correlation.

6.5.2.2 Predicted Habitat Distribution

Predicted habitat quality, amount, and distribution depended on the magnitude of resource selection and the distribution of habitat covariates across the landscape (i.e., primarily light macrolichen cover). Predictions from habitat models for late fall and winter were classified into four ordinal habitat quality ratings (i.e., Very Low, Low, Moderate, or High quality). See Section 6.9.2 for plots that demonstrate the switch from negative to positive selection ratios across quantile (two-percentile) bins for late fall (31st quantile bin [60th–62nd percentile]; Attachment Figure 11 and Attachment Figure 12) and winter (30th quantile bin [58th–60th percentile]; Attachment Figure 15 and Attachment Figure 16). Furthermore, Section 6.9.2 provides plots of (a) selection ratios associated with each habitat rating and (b) the proportion of the late fall and winter ranges composed of each habitat rating. In general, Very Low quality habitat had low, negative selection ratios while High quality habitat had high, positive selection ratios. Approximately 60% of the late fall and winter ranges consisted of avoided (Very Low and Low) habitat, and 40% consisted of selected (Moderate and High) habitat.

The distribution of habitat across the landscape differed between late fall (Map 6-4) and winter (Map 6-5) ranges. The proportion of selected late fall habitat in the Project RSA (0.404) was equivalent to the mean proportion in the broader late fall range when accounting for variance in that estimate (Table 6-8). In contrast, the proportion of selected winter habitat in the Project RSA (0.265) was substantially less than the mean proportion in the broader winter range (0.411) (Table 6-8). Though mean estimates of selected habitat in the broader late fall and winter ranges were approximately 0.40, there was considerable variation among the 50 km x 50 km cells used in the analyses. In the late fall range, the lowest and highest proportions of selected habitat were 0.140 and 0.881, respectively. Cells with the lowest proportions were located mostly along the western edge of the late fall range (i.e., high elevations in the North Ogilvie Mountains), and cells with the highest proportions were located mostly along the eastern edge of the late fall range (i.e., Eagle Plains ecoregion transitioning into Richardson Mountains). The lowest and highest proportions of selected habitat in the winter range were 0.106 and 0.764, respectively. Cells with the lowest proportions were located centrally in the winter range (i.e., Eagle Plains ecoregion) and cells with the highest proportions were located mostly along the eastern and southern edge of the winter range (i.e., Richardson mountains and North Ogilvie Mountains).

In the Project RSA, selected late fall habitat was concentrated at mid-elevation plateaus and depended on the amount of lichen cover. For example, a large patch of High quality habitat occurred adjacent (south side) to the Dempster Highway (inset in Map 6-4); this patch occurred on a large mid-elevation plateau, in proximity to waterbodies >1 ha in size, and relatively high amounts of lichen cover. In fact, several portions of the Dempster Highway intersected either Moderate or High quality habitat at mid-elevations and with moderate lichen cover. Across the broader landscape, the greatest amount of selected habitat occurred within the southern extent of the North Ogilvie Mountains ecoregion, the western extent of the British-Richardson Mountains ecoregion, and in large areas at the eastern extent of the Eagle Plains ecoregion (Map 6-4). Avoided habitat primarily occurred at low elevation valley bottoms or high elevations (> 750 m, e.g., at the peaks of British-Richardson Mountains) in areas with low lichen and vegetative cover.

Winter habitat occurred primarily at either valley bottoms with open stunted spruce or high elevations with sparse tree cover and high macrolichen cover. Selected habitat was also distant from large waterbodies and

wet environments containing forbs and graminoids, as well as areas with high cover of deciduous or evergreen shrub. In the RSA, selected habitat was localized in specific regions. For example, a large extent of High quality habitat occurred at the northern extent of the RSA, on the west side of Chance creek (Map 6-5). This area is low in elevation and has relatively high lichen cover. Two other large patches of High quality habitat occur at the southern extent of the RSA, both associated with low elevation and very high lichen cover. Although mid-elevations have relatively lower RSF predictions, in general, certain mid-elevation areas with high lichen cover, such as the areas along the Dempster Highway for late fall habitat are also predicted to offer Moderate or High quality winter habitat (inset in Map 6-4). Across the broader landscape, large extents of selected habitat occurred in the Richardson Mountains, the Ogilvie Mountains, and northern extents of Eagle Plains ecoregion. The greatest amount of avoided habitat (Very Low and Low) also occurred in Eagle Plains due to large areas of recent wildfire and its vast mid-elevation plateaus.

The use of multiple habitat ratings, as opposed to a binary classification (e.g., suitable versus unsuitable), was necessary to retain high resolution information on the distribution of habitat quality. For example, there were stark differences in the amount of lichen cover in areas of Moderate versus High quality habitat, and this can have implications for timing and extent of Project operations. Map 6-6 provides a comparison between winter habitat quality ratings and macrolichen cover in the Project RSA. There is a clear distinction between areas of high versus low macrolichen cover. There are several High quality ratings that occur along circular and N-S oriented ridges at the southwest corner of the RSA. Adjacent areas of similar elevation but with low macrolichen cover, transition from Moderate to Very Low in quality. Since macrolichen cover is the strongest driver of resource selection by PCH caribou during winter, it is important to be able to distinguish these high-value regions for management purposes.

Table 6-8. Proportion of selected (Moderate and High) caribou habitat in the Project RSA relative to the mean (and std. error) of 50 km x 50 km cells covering late fall and winter range extents.

Season	Scale	Proportion of Moderate and High Quality Habitat	Std. Error
Late Fall	Project RSA (2,387 km² total)	0.404	–
	Late Fall Range (88,149 km²) [1] (2,500 km² per cell) – 53 cells total	0.415	± 0.025
Winter	Project RSA (2,387 km² total)	0.265	–
	Winter Range (65,077 km²) [1] (2,500 km² per cell) – 40 cells total	0.411	± 0.026

[1] Late fall and winter ranges were subsampled using 2,500 km² cells (approximately the same size and the RSA) to facilitate estimation of mean and variance.

6.6 MOVEMENT

In addition to habitat selection, movement patterns across the seasonal ranges and within the vicinity of the Project RSA are important to understanding how the PCH may interact with the Project. Metrics such as daily travel rates and duration of residency (i.e., how long caribou spend in an area before moving on) help quantify how caribou use the landscape and how they may react to features, such as the Dempster Highway. In addition to movement metrics, the spatial locations of travel movements can define areas of concentrated movement during migration. To better understand factors affecting PCH caribou movement, two analyses were conducted: (1) calculation of daily movement rates and residency times of caribou in the Project RSA relative to the broader landscape, and (2) delineation of movement paths to assess broad-scale movement patterns and the potential for caribou to interact with the Project.

The PCH typically exhibit movements of several kilometres per day in both late fall and winter. Late fall daily movements (8.7 km/day in the RSA) were substantially greater than those during winter (4.4 km/day in the RSA), and caribou tended to occupy portions of the landscape for shorter periods during late fall than during winter. Caribou residency times in both seasons were two-fold greater in the broader landscape than within the Project RSA, suggesting that, on average, the RSA, is used as more of a transitory area than other portions of the seasonal ranges. The locations and patterns of movement during late fall (i.e., the end of the fall migration period) was variable within and across years and, overall, there was little evidence of dedicated migration corridors. However, in late fall of 2015, several caribou made directed movements along the height of land parallel to the Dempster Highway, from the northeast to the southwest. Although a small number of movements crossed the Dempster Highway, most movements stayed north of the Dempster Highway, potentially reflecting avoidance of the Dempster Highway. However, this series of movements did cross numerous 2D seismic lines, winter roads and a large 3D seismic grid in the RSA.

6.6.1 METHODS

6.6.1.1 Daily Movement Rates and Residency Times

Daily movement rates and residency times were calculated for each radio-collared caribou that occurred in late fall and winter range extents. The locations of each caribou were resampled to obtain one GPS fix per day. Movement rates were calculated as the speed (km/day) travelled between consecutive relocations and residency time was calculated as the number of days within a specified area. Movement rates and residency times were calculated for caribou occurring within the Project RSA (2,387 km^2) and, to compare to the broader landscape, metrics were also calculated within 50 km x 50 km (2,500 km^2) grid cells that covered fall and winter ranges. Means and standard errors of movement rates and residency times were calculated for all 50 km x 50 km cells and compared to mean values in the Project RSA.

6.6.1.2 Migration Movements

Travel routes were delineated by developing occurrence-use polygons that assessed the trajectory of each collared caribou during late fall, 2012-2021. These polygons were created using Brownian bridge movement models (BBMMs), which account for autocorrelated movements in animal relocations and assume that an animal's trajectory follows a diffusion-based (Brownian motion) process (Horne et al. 2007). BBMMs were developed, and kernel density estimation was used to predict 95% utilization distributions (UDs) for each animal, assuming a GPS location error of 100 m and implementing a grid-cell size of 500 m. Analysis was bounded to a 100 km buffer around the RSA to identify spatially relevant movement trajectories. BBMMs and UD polygons were created using the R package 'adehabitatHR' (Calenge 2006).

6.6.2 RESULTS AND DISCUSSION

6.6.2.1 Daily Movement Rates and Residency Times

Mean daily movement rates and residency times varied considerably between late fall and winter and between the Project RSA and the broader landscape. On average, caribou tended to move faster during late fall than during winter, and this was evident both in the Project RSA and across the full late fall range. The movement rates between the Project RSA and the broader landscape were greatest during late fall, i.e., at least a two-fold difference in movement rates outside versus inside the RSA. A similar outcome was evident for residency time inside versus outside the Project RSA. In both seasons, the residency time was at least twice as long outside the RSA than within it (Table 6-9).

Patterns in movement and residency were consistent with what is known about PCH caribou ecology. Caribou are at their most dispersed in both late fall and winter. Except for cows during the calving period, daily movements are lowest in winter and second lowest in late fall (Russell and Gunn 2017). Normally, faster movement rates are associated with shorter residency periods, but this was not the case for the PCH in late fall (Table 6-9). During late fall, caribou in the RSA had slower movement rates but also had shorter residency periods compared to the broader late fall range. A review of the movement trajectories indicates that although travel rates were slower inside the RSA, those paths had greater directional bias (i.e., movement in a single direction) than paths outside the RSA, which exhibited much more tortuosity. These more directed movement paths resulted in shorter residency periods, despite the slower movement rates.

During winter, caribou movement rates inside the RSA were similar to the broader landscape, but, similar to late fall, their residency time inside the RSA was significantly shorter than in the broader late fall range. This suggests that similar to the pattern in late fall, caribou tended to pass through the RSA in winter more quickly than other portions of the broader winter range. This pattern may be explained by the lower predicted habitat quality within the RSA relative to the broader landscape (see Section 6.5.2.2, *Predicted Habitat Distribution*, above). The faster movements and shorter residency times in late fall compared to winter likely reflect the tail end of fall migration movements. Notwithstanding the important differences in movement patterns between late fall and winter, the key results of these analyses are that, in both late fall and winter, PCH caribou (1) travel

several kilometres per day, on average, and (2) the RSA (or similar sized areas outside the RSA) are used for a relatively short portion of the overall season.

Table 6-9. Mean daily movement rates and residency times of the Porcupine Caribou Herd in the Project RSA relative to the mean (and standard error) of 50 km x 50 km cells covering late fall and winter range extents.

Season	Scale[1]	Daily Movement (km/day)		Residency Time (days) [2]	
		Mean	Std. Error	Mean	Std. Error
Late Fall	Project RSA (2,387 km² total)	8.95	± 0.64	4.50 (8.33 %)	± 0.83
	Late Fall Range (88,149 km²) [1] (2,500 km² per cell) – 53 cells total	15.03	± 2.06	7.65 (14.17 %)	± 0.66
Winter	Project RSA (2,387 km² total)	4.02	± 0.64	15.69 (12.86 %)	± 5.11
	Winter Range (65,077 km²) [1] (2,500 km² per cell) – 40 cells total	4.77	± 0.51	25.93 (21.25 %)	± 2.13

[1] Late fall and winter ranges were subsampled using 2,500 km² cells (approximately the same size and the RSA) to facilitate estimation of mean and variance. Estimates of mean and variance within the RSA are derived from differences in rates and residencies of individual caribou.

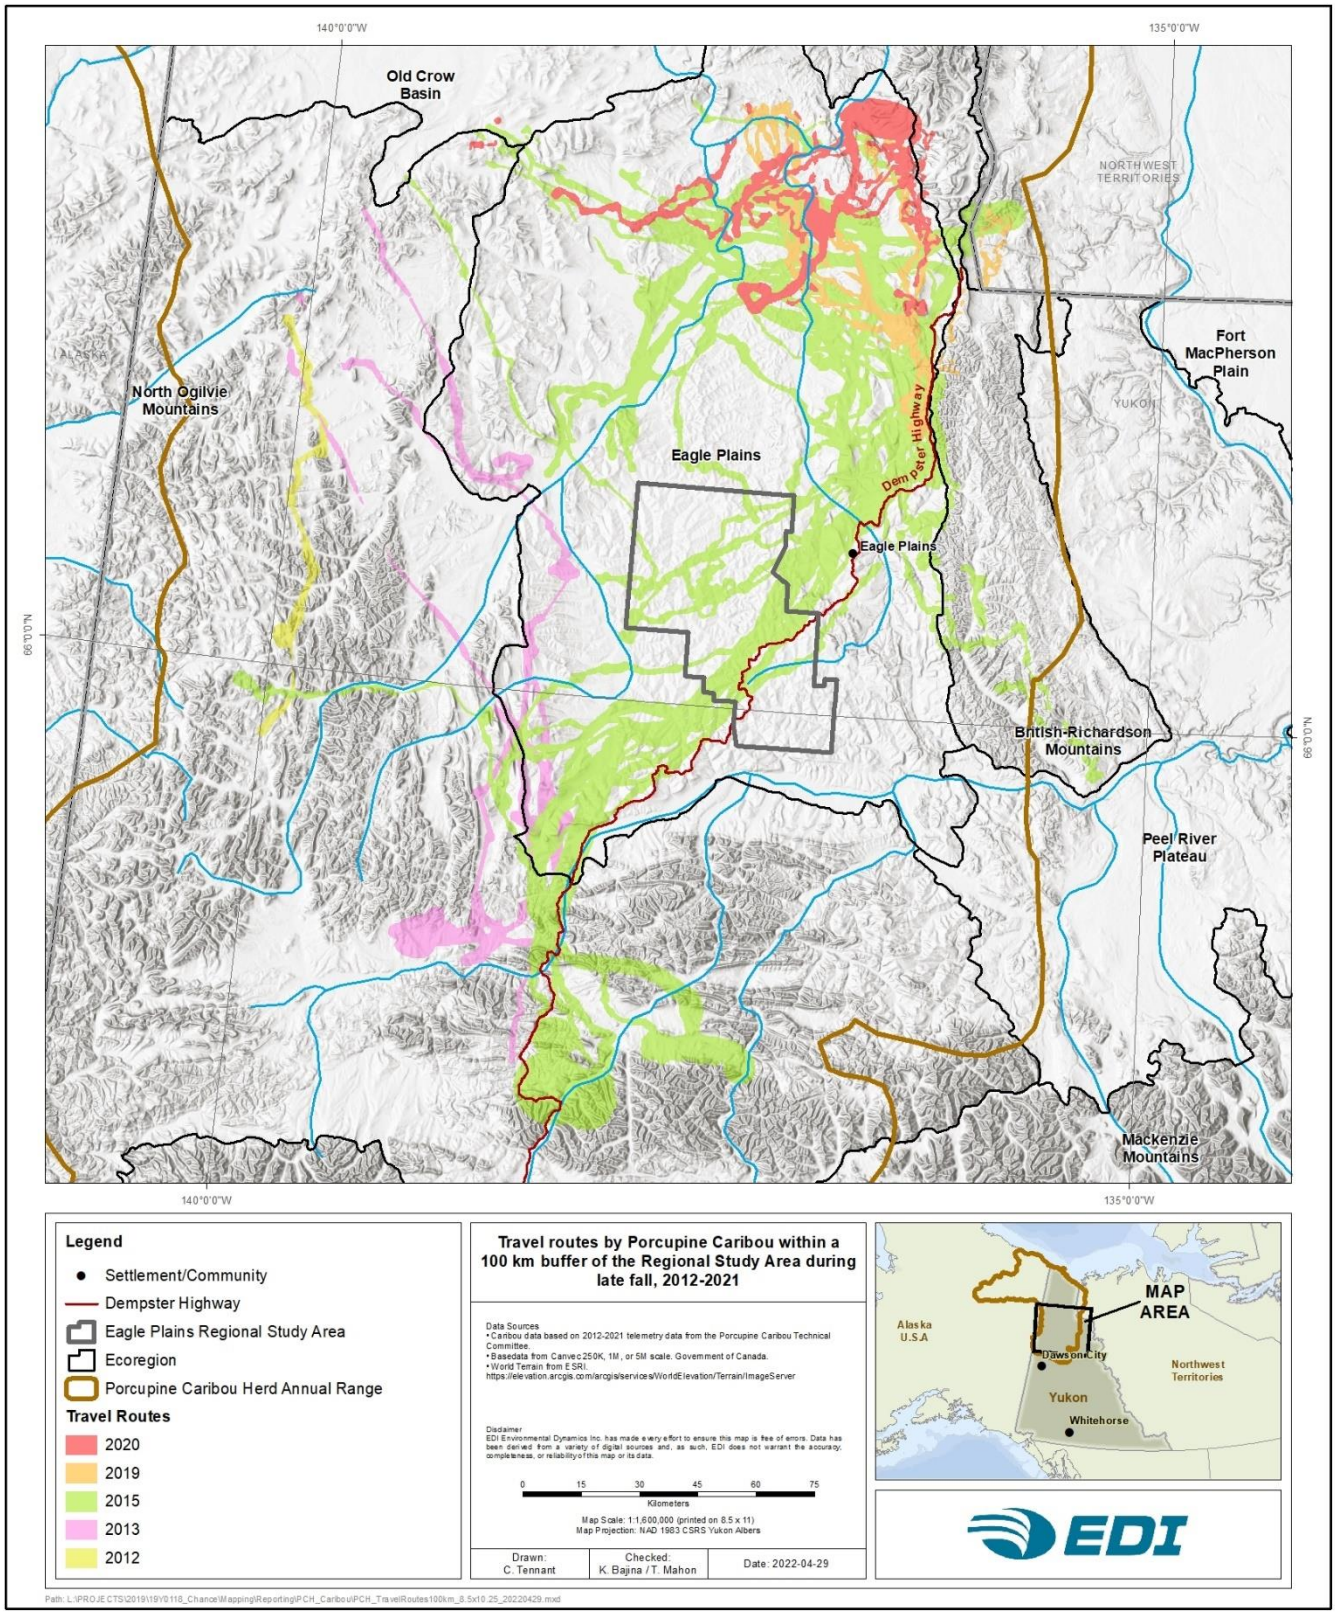
[2] Percent of the season indicated in brackets. Total days: late fall = 54 days, winter = 122 days.

6.6.2.2 Migration Movements

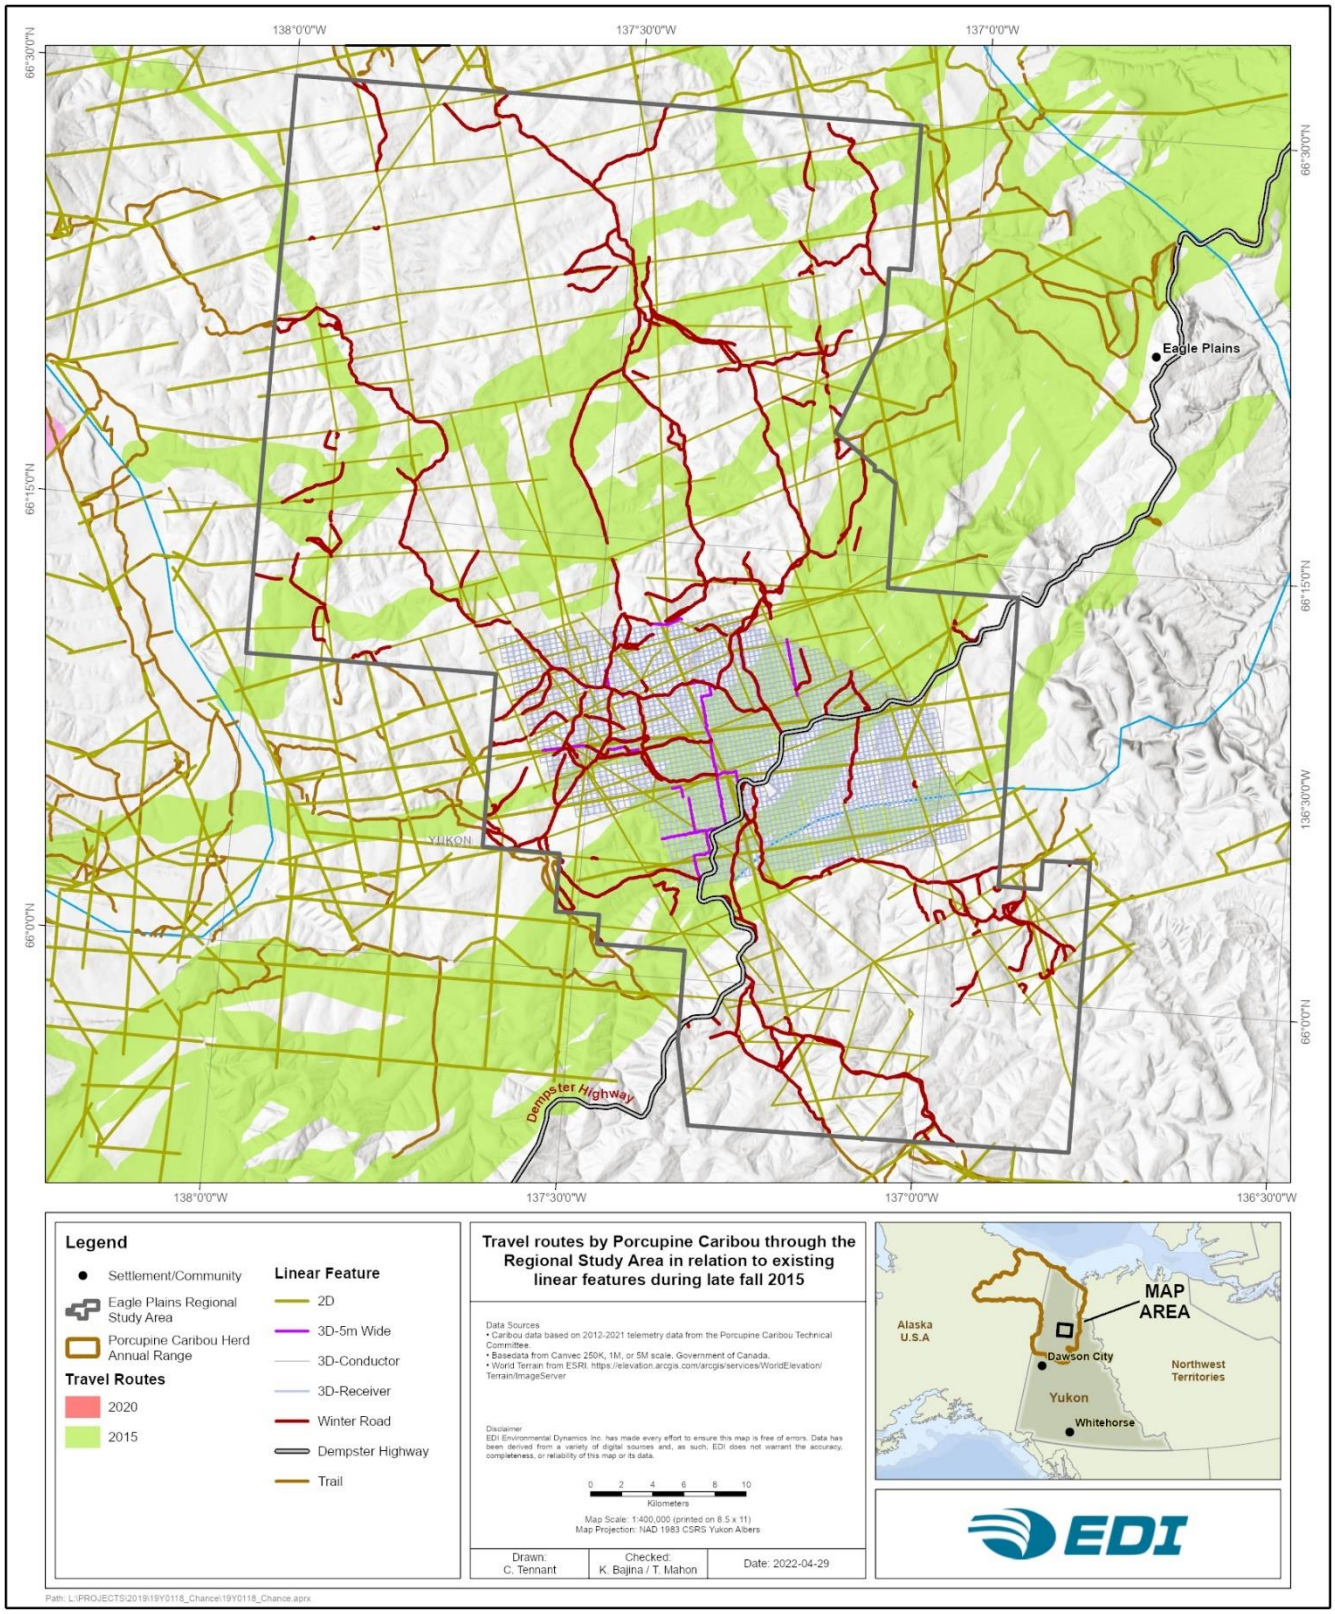
Travel routes through the Project RSA were only evident in late fall of 2015. At that time, 14 caribou travelled from the northeast quadrant of the Eagle Plains ecoregion to either the southwestern portions of that ecoregion or to the North Ogilvie Mountains, along the Dempster Highway (Map 6-7). Although two caribou did cross the highway in the vicinity of the RSA, most of the caribou (12) travelled parallel to the Dempster Highway, along its northwest side, before eventually crossing the highway south of the RSA in the Ogilvie Mountains (Map 6-7). The location of the movement routes in 2015 predominantly northwest of the Dempster Highway was previously noted by Russell and Gunn (2017), who suggested the caribou may have been avoiding crossing the highway. Although this is a valid hypothesis, supported by observations from VGFN elders (Sherry and Vuntut Gwitchin First Nation 1999, p. 288), it is important to note that the set of travel routes in 2015 did eventually cross the Dempster Highway south of the RSA in the Ogilvie Mountains. These crossings may be done at times of lower traffic such as nighttime, as elders had witnessed various unsuccessful attempts of herds to cross the Dempster as vehicles were passing during the day (Sherry and Vuntut Gwitchin First Nation 1999, p. 288). It is also important to note that travel routes in 2015 coincided with a broad, regional height of land (separating the Porcupine and Peel watersheds), which caribou sometimes travel on during migration movements (Russell et al. 1993). On an absolute scale, the height of land along the Dempster Highway, and proximate locations used by caribou as travel routes (~550–650 m), coincide with the mid elevations selected by caribou during fall (see Section 6.5.2.1, *Habitat Models*). The 12 caribou that

paralleled the Dempster Highway in the vicinity of the RSA did cross several inactive winter roads, numerous old 2D seismic lines, and a 350 km² area consisting of one-year-old 3D seismic exploration (Map 6-8).

Inferences about caribou movements are limited by the relatively small numbers of caribou that were collared (<0.1% of the herd annually) and the relatively small number of collared caribou that occurred within the RSA. Collared caribou only occurred in the Eagle Plains ecoregion in half of the years from 2012–2021; however, it is known from local knowledge that caribou occur in the ecoregion in most, if not all years. VGFN elders have discussed to importance of Eagle Plains for caribou winter habitat and noted that if caribou find a good feeding place with many trees, they will stay all winter (VGFN p185). During interviews in the late 1990's, they observed many caribou performing fighting, mating and rutting rituals around Blackstone Flats (Sherry and Vuntut Gwitchin First Nation 1999, p. 188). For the years when collared caribou were present in Eagle Plains, it is unknown how representative the collar locations are of the overall herd. For example, the concentration of travel routes through the RSA in 2015 suggests a potential movement corridor, but the proportion of caribou that is collared is too small to conclude this with confidence. The lack of movements in the same area in any other year does not support the idea that the cluster of movements in 2015 represent a regular travel corridor (but, again, this could reflect the small proportion of caribou collared).



Map 6-7. Travel routes identified for the Porcupine Caribou Herd within a 100 km buffer of the Project Regional Study Area during late fall, 2012–2021.



Map 6-8. Travel routes by Porcupine Caribou through the regional Study Area in relation to existing liner features during late fall 2015.

6.7 RELATIONSHIP TO LINEAR FEATURES

A key issue concerning the PCH is how anthropogenic development may alter caribou distribution, habitat use, and, ultimately, whether changes may influence population demography and access to the herd by First Nations and Inuvialuit harvesters. Linear features are the primary source of disturbance in the Project RSA and the broader Eagle Plains ecoregion. There is uncertainty about how caribou may respond to these features. To better understand the relationship between caribou and linear features, base habitat models were extended to assess the potential for habitat avoidance using a zone of influence (ZOI) framework. The ZOI delineates the area within which caribou behaviour is altered. ZOIs were estimated for three functionally distinct linear feature types (i.e., 2D seismic, winter roads and trails; 3D seismic; and the Dempster Highway). If ZOI estimates are statistically and ecologically significant (i.e., alter the selection of habitat and forage by caribou), they can be used to quantify effective habitat loss (i.e., perceived reduction in habitat quality by caribou due to avoidance) in the Project RSA and Eagle Plains ecoregion.

Statistical ZOIs were determined for 2D seismic lines (including winter roads and trails) in Eagle Plains in late fall and winter. However, confidence in those estimates is relatively low due to several factors. Statistical ZOIs were identified corresponding to 4 km avoidance of 2D seismic lines during late fall and 2 km avoidance of 2D seismic lines during winter. The analysis also identified that the PCH were attracted to the Dempster Highway and 3D seismic areas in both late fall and winter. Sufficient observations were associated with this pattern in relation to the Dempster Highway, but results for 3D seismic areas could be spurious due to a relatively low number of caribou locations in proximity to these features.

Although the analyses determined ZOIs associated with 2D seismic lines (and winter roads and trails), they should be interpreted with caution. (1) The magnitude of the ZOI effects was weak (i.e., including the ZOI effects in the habitat models had little effects on the habitat predictions). (2) Threshold distances estimated from ZOI analyses tend to be very sensitive to spatial and temporal contexts as well as the data and analytical methods used. Estimates of ZOIs can vary dramatically from year-to-year. This can include selecting to be closer to human features in some years and exhibiting dramatic difference in the threshold distances in years when human disturbances are thought to be avoided. The number of caribou locations in this study unevenly distributed with respect to the various linear features both spatially and across years. (3) The pattern of ZOI effects were not consistent with expectations and results from other studies. For example, having a 2 km ZOI for 2D lines and no ZOI for the Dempster Highway is counterintuitive. A previous study estimated a relatively large ZOIs for the Dempster (Johnson and Russell 2014). Based on these factors, it is recommended that these results not be used solely to estimate the effects of linear features on the PCH. Rather, it is recommended that the results be used in conjunction with results from other studies, adapted to the Eagle Plains setting and the ecology of the PCH, to develop a set of ZOIs for assessment and management purposes.

6.7.1 METHODS

A zone of influence framework evaluated the influence of linear features on PCH caribou distribution and habitat selection. Base habitat models developed for late fall and winter were extended by incorporating a 'distance to' covariate for each relevant linear feature and estimating the breakpoint beyond which the likelihood of observing caribou remained unchanged. If a ZOI was present, the likelihood of observing caribou would increase from linear feature footprint until the identified breakpoint. The primary method used to evaluate the presence and magnitude of a ZOI was a segmented regression approach (Boulanger et al. 2012, 2021).

Three functionally distinct types of linear features were considered based on their widths, densities, and extents in PCH fall and winter ranges: (1) 2D seismic, winter roads, and trails; (2) 3D seismic (grid); and (3) the Dempster Highway. The minimum distance between used/available locations and each feature was calculated and treated as a continuous covariate. To limit potential bias in ZOI estimates arising from broad-scale spatial patterns in distribution and habitat selection (see Boulanger et al. 2021, EDI Environmental Dynamics Inc. 2022b), GAMs were used to assess how the distribution of caribou changed at increasing distances from each linear feature type and to identify an 'iteration zone' to test for ZOIs. The iteration zone is defined as the boundary within which caribou distribution and habitat use are minimally affected by broad-scale patterns in climatic (e.g., snowfall) and biotic (e.g., caribou density and forage) processes. Practically, this refers to an initial range of distances (starting at 0 km) where selection is relatively flat (slope = 0) (see Boulanger et al. 2021). For example, during late fall, selection was fairly flat up to 100 km from the Dempster Highway, after which selection decreased sharply (see Attachment Figure 21 in Section 6.9.3). In other cases, such as the relationship to 2D lines during late fall, the slope was substantially greater than zero at very close distances (see Attachment Figure 19 in Section 6.9.3). Selection increased up until approximately 18 km, then sharply decreased until 25 km, and then, once again, sharply increased up until approximately 35 km. Given such non-linearity in the response, the iteration zone was identified within the first major bout of increase/decrease, i.e., within the first 25 km. This approach was taken in each case where a drastic, non-linear selection gradient occurred at very close distances to the linear feature.

Within the iteration zone, several distance thresholds were tested to identify a ZOI. The assumptions were that caribou presence would be reduced and resource selection altered within the threshold distance. We assigned all distances at or beyond the defined threshold the same distance value. For example, if a ZOI distance of 2 km was tested, then all distances up to 2 km retained their values (i.e., numbers ranging from 0 km to 1.99 km), but all distances at or greater than the ZOI were assigned a value of 2 km (e.g., 3 km or 4 km were assigned values of 2 km). A unique model was fit for each threshold tested, and the number of models corresponded to the outer boundary of the iteration zone identified for each linear feature type. In other words, if the iteration zone was deemed between 0 km and 25 km, then 25 models were tested — one for each kilometre interval. The best model, which corresponded with the most likely ZOI, was selected by evaluating the log-likelihoods of all models as a function of the distance thresholds. The highest log-likelihood corresponded with the model with the most statistical support (Boulanger et al. 2012). The magnitude of avoidance was estimated as the odds of caribou occurring at or beyond the ZOI relative to the odds of being on the linear feature (i.e., odds ratio = $e^{coefficient \times ZOI}$).

6.7.2 RESULTS AND DISCUSSION

The influence of linear features on PCH distribution and habitat selection varied between late fall and winter seasons and among functional linear feature types. ZOIs were detected for 2D seismic lines (including winter roads and trails) during late fall (4 km, Attachment Figure 25) and winter (2 km, Attachment Figure 28). These results were derived from analyses that considered only spatially relevant scales (i.e., iteration zones) (see GAM plots for 2D lines in Section 6.9.3). For example, relationships with 2D lines were evaluated only within the Eagle Plains ecoregion because most of these features occurred within this extent. The GAM plots in Section 6.9.3 also demonstrate that, though selection increased/decreased relative to 2D lines, these changes were low in magnitude. For example, within the iteration zones of 2D lines, there was an approximate 0.08 (or 8 %) increase in the probability of selection at far distances from these features. When estimated using a defined threshold, changes in the probability of selection necessarily increased (relative to GAMs) based on the imposed shape of the response (i.e., fitting a linear increase followed by a flat slope at distances equal to and beyond the ZOI). In practical terms, the odds of caribou occurring at distances equal to or beyond the ZOIs for 2D lines are 1.45 (odds ratio = $e^{0.000093 \times 4\ km}$) and 1.27 (odds ratio = $e^{0.00012 \times 2\ km}$) times greater, during late fall and winter, respectively, than the odds of caribou occurring on 2D lines. The ZOIs estimated for 2D lines in the current study were smaller than those previously estimated by Johnson and Russell (2014)—11 km from 1985–1998 and 6 km from 1999–2012 for wells, trails, winter roads, and seismic lines.

Although analysis of 2D seismic lines (including winter roads and trails) did identify statistically significant ZOIs, the results should be interpreted with caution. An important indicator to contextualize these results is whether estimated ZOIs influenced the selection of important habitat components. A comparison of coefficients between habitat models with and without ZOI terms provides a test of the ecological significance of estimated ZOIs (Boulanger et al. 2012). To accomplish this, predictions were made using the estimated ZOIs across the late fall and winter ranges to match the same spatial scale as base habitat models (see Table 6-10 and Table 6-11). During late fall, coefficients associated with macrolichen cover ($\beta_{lichen.base}$ = 0.694 ± 0.029 versus $\beta_{lichen.ZOI}$ = 0.689 ± 0.029) in Eagle Plains were invariant (Table 6-4 versus Table 6-10). Similarly, during winter, coefficients associated with lichen ($\beta_{lichen.base}$ = 1.119 ± 0.018 versus $\beta_{lichen.ZOI}$ = 1.114 ± 0.018) in Eagle Plains, and avoidance of other plant functional types, were consistent (Table 6-5 versus Table 6-11). So, even though ZOIs were determined for 2D lines, the magnitude of those effects was so small that it resulted in marginal changes to the habitat model predictions in both late fall and winter.

No ZOIs were detected for the Dempster Highway during either season. Instead, the segmented regression approach identified an attraction effect, rather than avoidance, for both late fall (9 km, Attachment Figure 27) and winter (11 km, Attachment Figure 30). Thus, caribou were more likely to occur within 9 km and 11 km of the Dempster Highway during late fall and winter, respectively, than beyond those distances. This result contradicts previous work by Johnson and Russell (2014), who identified ZOIs of major roads, including the Dempster Highway, to be as large as 30 km from 1985–1998 and 18.5 km during 1999–2012.

Similar to the results for the Dempster Highway, no ZOIs were determined for 3D seismic lines, but there is high uncertainty associated with those estimates due to the relatively small number of collared caribou that

interacted with the 3D seismic area. Attraction effects were found within 16 km and 4 km of 3D seismic lines during late fall (Attachment Figure 26) and winter (Attachment Figure 29), respectively. As with 2D lines, the magnitude of the attraction effect for Dempster Highway and 3D seismic lines was small relative to base habitat selection. Additionally, considering the potential mechanisms of effects that 3D lines could have on caribou, the apparent attraction of caribou to the 3D seismic lines is likely a spurious result. Based on other studies examining the effects of 3D lines on caribou and their primary predators, wolves, it was expected that the PCH would exhibit a neutral or weak avoidance response to 3D lines due to the potential for facilitated predation to occur.

In addition to the weak effects exhibited by ZOIs relative to base habitat selection, there are other factors that warrant cautious interpretation and use of these analytic results. (1) ZOI estimates and their magnitude of effect can be sensitive to (a) sample sizes and (b) spatial and temporal coverage of the data. Though numerous overall, the data used in this analysis had relatively modest sample sizes near linear features and were unevenly distributed in relation to linear features in Eagle Plains. (2) Caribou can exhibit dramatically different ZOIs from year to year. Collared caribou were only present in modest numbers in 2012/13, 2014/15, 2017/18, and 2018/19, so the data had to be lumped across years to estimate a single ZOI. (3) ZOIs estimated for the PCH in this analysis are substantially smaller than those estimated by Johnson and Russell (2014). The issues associated with these factors are discussed below.

The spatial and temporal context of ZOI studies can influence outcomes. Estimates of ZOIs are a consequence of broad- and fine-scaled space use, and these patterns of distribution can emerge from population demography, biotic interactions (e.g., density-dependent competition or predator-prey interactions), abiotic conditions (e.g., snowfall, forage availability), habitat selection, and potential sources of disturbance (e.g., dust fall, sensory disturbance) (Messier et al. 1988, Johnson et al. 2001, Mahoney and Schaefer 2002, Hinkes et al. 2005, Bowyer et al. 2014, Chen et al. 2017, Boulanger et al. 2021, Pedersen et al. 2021). These sources of variation in space use do not negate the importance of quantifying indirect effects of anthropogenic development, but they do point to underlying issues with the ZOI framework and its utility for management and mitigation. For example, Boulanger et al. (2021) documented ZOI responses by Bathurst caribou to the Ekati-Diavik mine complex (Northwest Territories) that have varied dramatically from year-to-year, which the authors attribute to changes in drought conditions. Similarly, Johnson et al. (2020) found that ZOIs around energy infrastructure (North Slope of Alaska, USA) reduced during periods of high mosquito activity for the Central Arctic Herd (CAH). In these examples, fine-scale changes in caribou space use was primarily driven by selection for areas adjacent to large, open bodies of water: Lac de Gras by Bathurst caribou and the Arctic Ocean by CAH caribou.

Another issue regarding the interpretation of ZOIs is their sensitivity to the data and analytical methods used. For example, Boulanger et al. (2021) found that GPS-collared caribou exhibited 'avoidance' (a ZOI) in only four out of nine years at the Ekati-Diavik mine complex (range = 6–13 km). In five of those nine years, caribou exhibited either no relationship or attraction to mine infrastructure. Additionally, when comparing an overlapping year (2012) between GPS data and aerial survey data for Bathurst caribou, a ZOI was identified using GPS collar data (ZOI = 7.09 km, odds ratio not overlapping zero; see Table 3 in publication) but was not identified using aerial survey data (ZOI = 11.4 km, odds ratio overlapping zero; see Table 4 in

publication). During the data exploration phase of the current study, ZOI results also varied considerably based on different subsets of the PCH data. For example, the estimates of a ZOI around 2D seismic lines (including winter roads and trails) changed by several kilometres when assessing not only different years but different spatial extents (e.g., ecoregions).

The ZOI analysis conducted by Johnson and Russell (2014) for the PCH used a similar approach to the current analysis and other studies, but yielded very different results for seismic lines and major roads. Johnson and Russell (2014) also caution against interpreting their results based on several factors, including a large change in the PCH's population size over their study duration, variation in animal behaviour across the range of development types, and relatively small effect sizes for caribou-disturbance responses. The potential reason for differences between the results in this study and those of Johnson and Russell (2014) are not apparent and may reflect the sensitivity of results to the differences in sample sizes and spatiotemporal patterns in the data used between the two studies. Landscape conditions and land use activities were similar between the two study periods and likely included some of the same data (e.g., winter 2012). Both Johnson and Russell (2014) and the current study dealt with trade-offs in spatial and temporal coverage. Though Johnson and Russell (2014) had data with longer temporal coverage (27 years), these data suffered from poorer spatial resolution associated with larger interval collar fixes (on average, once every seven days), smaller sample sizes (N = 2,127), and coarser habitat variables (i.e., landcover classification). In contrast, the current study used data with shorter temporal coverage (8 years) but had higher spatial resolution associated with collar fixes (on average, one per day), larger sample sizes (N_{fall} = 8,323 and N_{winter} = 13,014), and high resolution habitat variables (i.e., 30 m x 30 m plant functional type percent and digital elevation model). The current study had the advantage of higher spatial resolution, which is especially important for ZOIs, which are, by nature, a spatial phenomenon. A limitation to both this study and Johnson and Russell (2014) is the lack of sufficient interaction between caribou and linear features each year, which prevented the estimation of annual ZOIs.

ZOI analyses, including the analyses in this study, often do not explicitly test specific mechanisms that could be causing caribou to avoid anthropogenic features. It is assumed, correctly or incorrectly, that caribou avoid these areas because they perceive elevated predation risk (Frid and Dill 2002, Semeniuk et al. 2012). This can include avoidance due to direct sensory disturbances associated with the features and learned behaviours that could result in avoidance beyond sensory perception distances (Boulanger et al. 2021). Assuming the ZOIs detected in this study are 'real', potential mechanisms that cause caribou to avoid 2D seismic lines, winter roads, and trails are perceived mortality risk associated with human hunting (Wolfe et al. 2000, Plante et al. 2017) and facilitated predation by wolves (James and Stuart-Smith 2000, Dickie et al. 2017).

Ultimately, the purpose of measuring and testing caribou responses to linear features is to inform management and mitigation. Given the weak effects associated with the ZOIs generated here, and the analytical issues discussed above, it is recommended that these results not be used solely to estimate the effects of linear features on the PCH. Rather, it is recommended that the results be used in conjunction with results from other studies, adapted to the Eagle Plains setting and the ecology of the PCH, to develop a set of ZOIs for assessment and management purposes.

6.8 SUMMARY

The PCH is known for large population aggregations, dramatic population fluctuations, lengthy migrations, and significant cultural and social value to northern Indigenous peoples. Within the NYLUP, the PCH is considered "…*the most significant and culturally important wildlife resource in the planning region.*" Habitat, food supply, predation, hunting, disease and climate range likely play interactive roles as limiting factors to the PCH population. Factors have limited potential to regulate the PCH, individually.

- The potential for food supply, especially lichen, to regulate the PCH is more limited than other barren ground caribou herds because of the PCH's very large annual and seasonal ranges and the diversity of habitats found within those ranges (e.g., including several ecoregions). Overall, the PCH winter range is relatively rich in lichen resources and is comparable to, or better than, those of other herds that winter in taiga regions.
- Predation does not seem to play a role in limiting PCH growth while the herd is at high numbers. One study suggested that the predation rate had to be near twice the observed level to cause the PCH to decline.
- The comprehensive measures within the Harvest Management Plan to monitor and respond to declines in the PCH (i.e., by reducing harvest) provide a solid system to minimize the potential effects that harvesting could have on the herd.

The portion of the PCH annual range that occurs within Yukon is protected by a network of parks, special management areas, conservation areas, wilderness areas, protected areas, ecological preserves, habitat protection areas, and IMA zones within the North Yukon Regional Land Use Plan and the Peel Watershed Regional Land Use Plan. In total, 54% of the annual range of the PCH within Yukon falls within some type of protected area where industrial activity is prohibited, 36% of the annual range occurs within Integrated Management Area zones where development is limited, and 9% of the annual range is not covered by any land management zonation. The Eagle Plains RSA occurs within IMA Zone IV, which permits the highest level of development.

The PCH have historically overlapped the Eagle Plains RSA in the rut/late fall and winter periods. However, the RSA constitutes only a small portion of those ranges — 6.0% of the late fall range and 6.5% of the winter range. The RSA does not overlap with the most frequently used portions of the late fall and winter ranges.

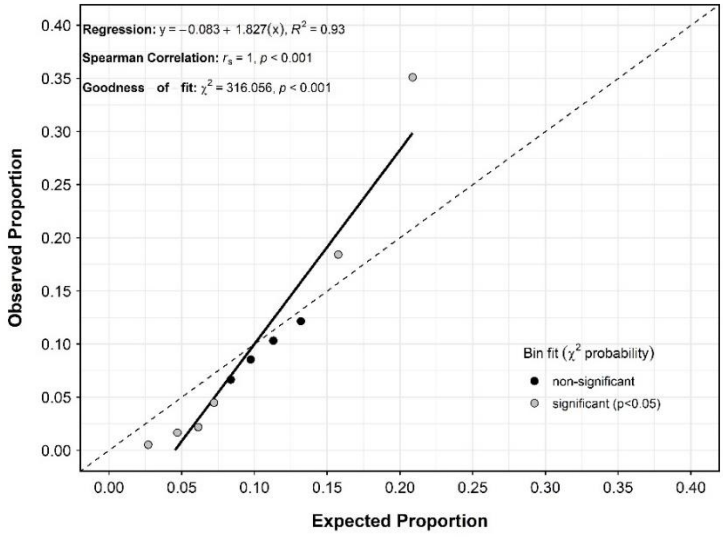
Habitat selection by the PCH in late fall and winter was estimated using resource selection functions. Selected habitats were dependent primarily on the distribution of macrolichen cover. Distance to linear features had a small effect on habitat model predictions. Overall, the strength of selection was greater in winter than late fall, which corresponds to broader movement patterns and use of more diverse habitats by the PCH in fall. In terms of regional habitat distribution, the RSA had similar proportions of selected habitat in fall as the full late fall range; however, the RSA had a much lower proportion of selected habitat in winter compared to the full winter range. Within the RSA, lichen distribution (and caribou use) was strongly affected by extensive recent burns, which had lower lichen cover than unburned areas.

The PCH typically exhibits movements of several kilometres per day in late fall and winter. Late fall daily movements (8.7 km/day in the RSA) were substantially greater than during winter (4.4 km/day). Caribou tended to occupy portions of the landscape for shorter periods during late fall than winter. Caribou residency times in both seasons were two-fold greater in the broader landscape than within the Project RSA, suggesting that, on average, the RSA is more of a transitory area than other portions of the seasonal ranges.

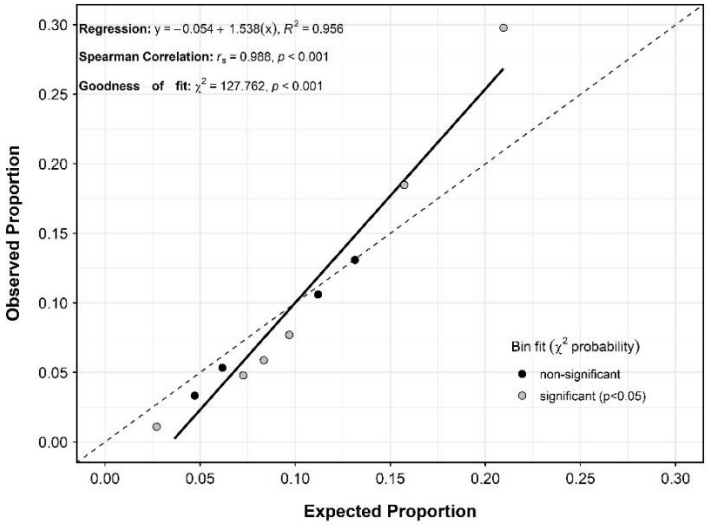
6.9 CARIBOU SECTION ATTACHMENTS

6.9.1 ATTACHMENT 6–A — 5-FOLD CROSS-VALIDATION

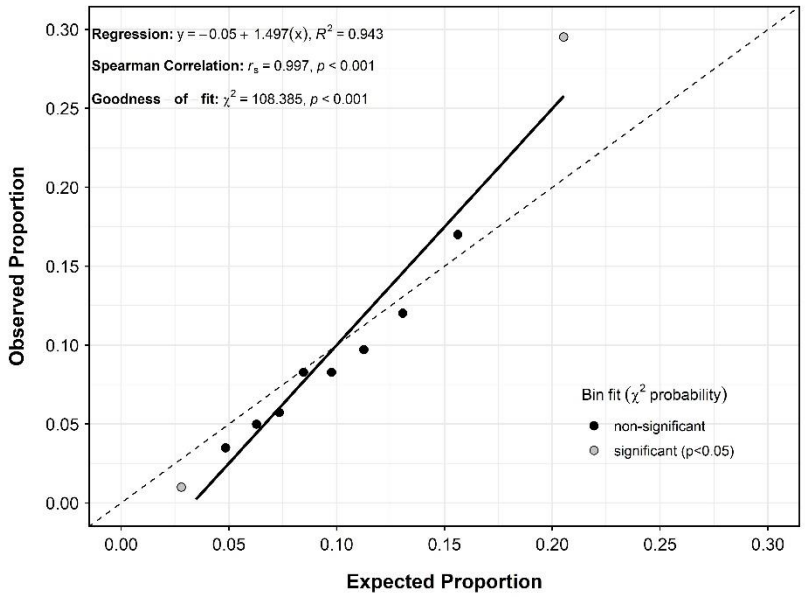
Late Fall



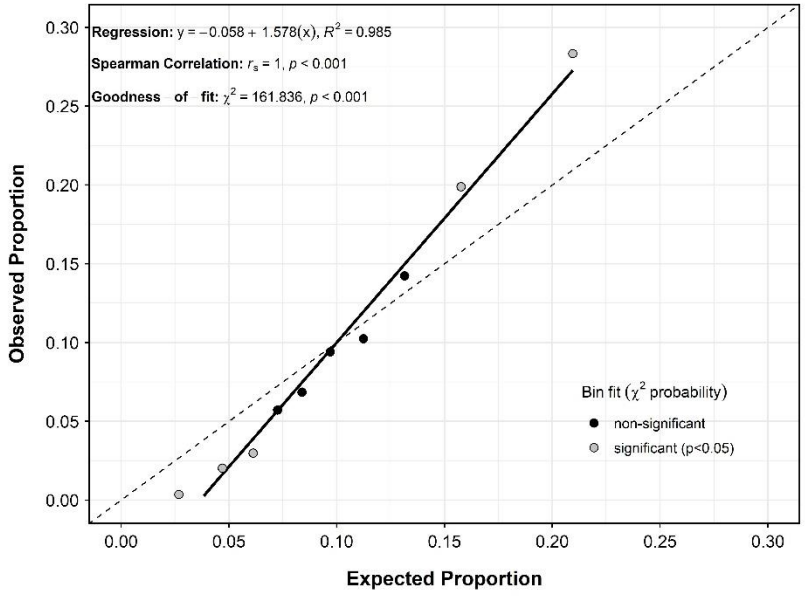
Attachment Figure 1. Cross-validation results comparing expected versus observed proportion of GPS telemetry observations (n = 18,310) of caribou during late fall across 10 quantile bins (Fold 1). Dashed line shows the line of unity (observed = expected). Black line shows the fitted regression; points are either black (not statistically different than expected) or grey (statistically different from expected) for each bin.



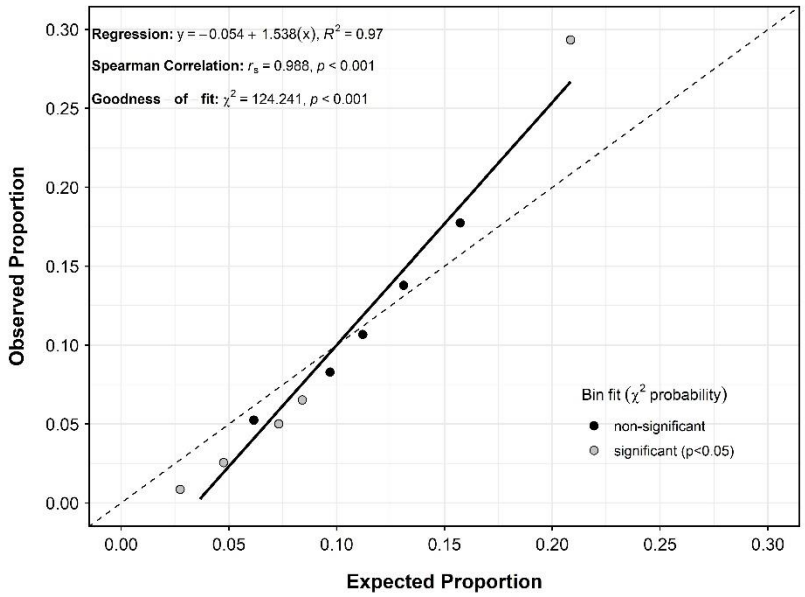
Attachment Figure 2. Cross-validation results comparing expected versus observed proportion of GPS telemetry observations (n = 18,310) of caribou during late fall across 10 quantile bins (Fold 2). Dashed line shows the line of unity (observed = expected). Black line shows the fitted regression; points are either black (not statistically different than expected) or grey (statistically different from expected) for each bin.



Attachment Figure 3. Cross-validation results comparing expected versus observed proportion of GPS telemetry observations (n = 18,310) of caribou during late fall across 10 quantile bins (Fold 3). Dashed line shows the line of unity (observed = expected). Black line shows the fitted regression; points are either black (not statistically different than expected) or grey (statistically different from expected) for each bin.

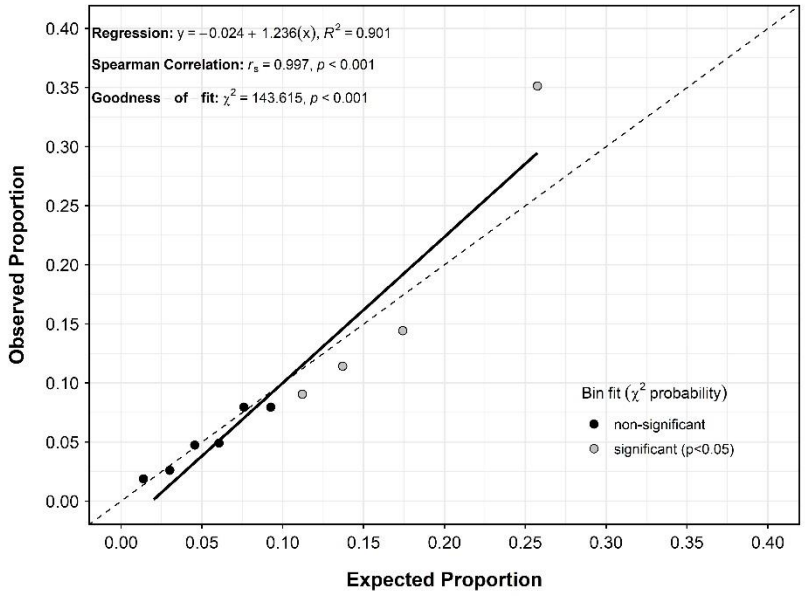


Attachment Figure 4. Cross-validation results comparing expected versus observed proportion of GPS telemetry observations (n = 18,310) of caribou during late fall across 10 quantile bins (Fold 4). Dashed line shows the line of unity (observed = expected). Black line shows the fitted regression; points are either black (not statistically different than expected) or grey (statistically different from expected) for each bin.

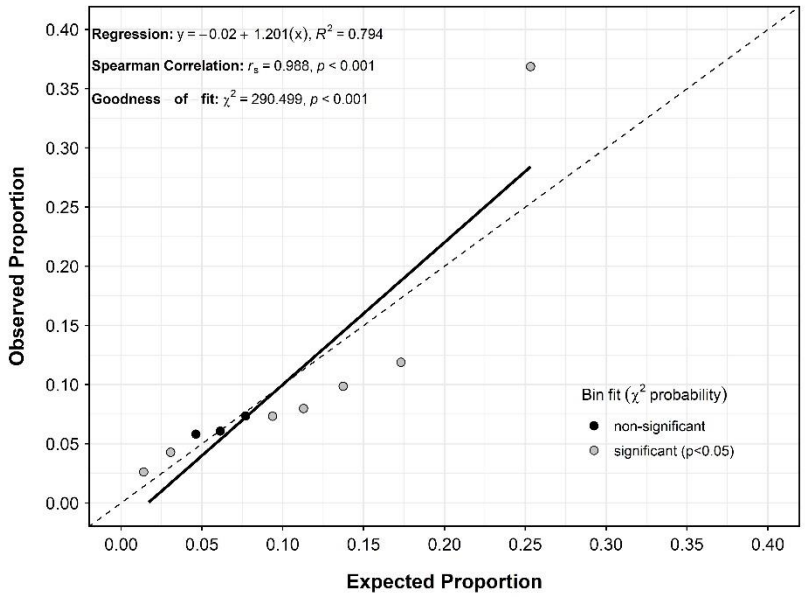


Attachment Figure 5. Cross-validation results comparing expected versus observed proportion of GPS telemetry observations (n = 18,310) of caribou during late fall across 10 quantile bins (Fold 5). Dashed line shows the line of unity (observed = expected). Black line shows the fitted regression; points are either black (not statistically different than expected) or grey (statistically different from expected) for each bin.

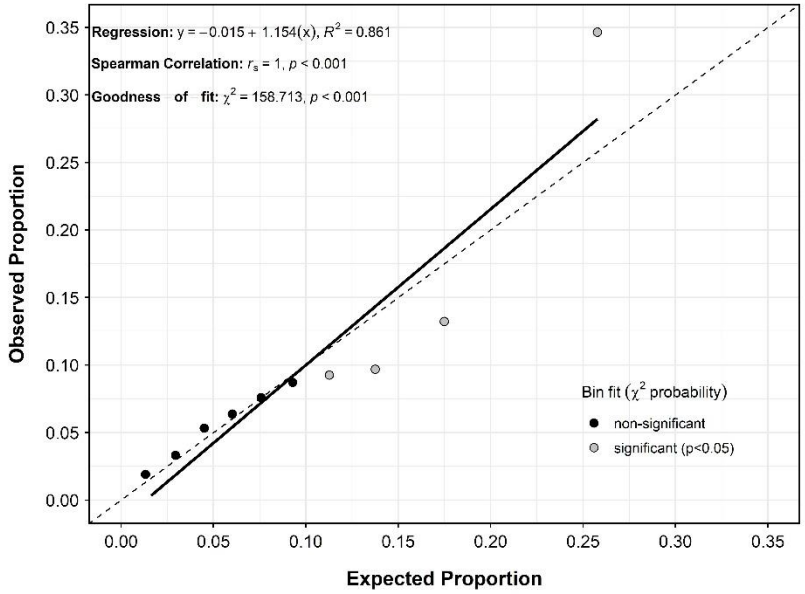
Winter



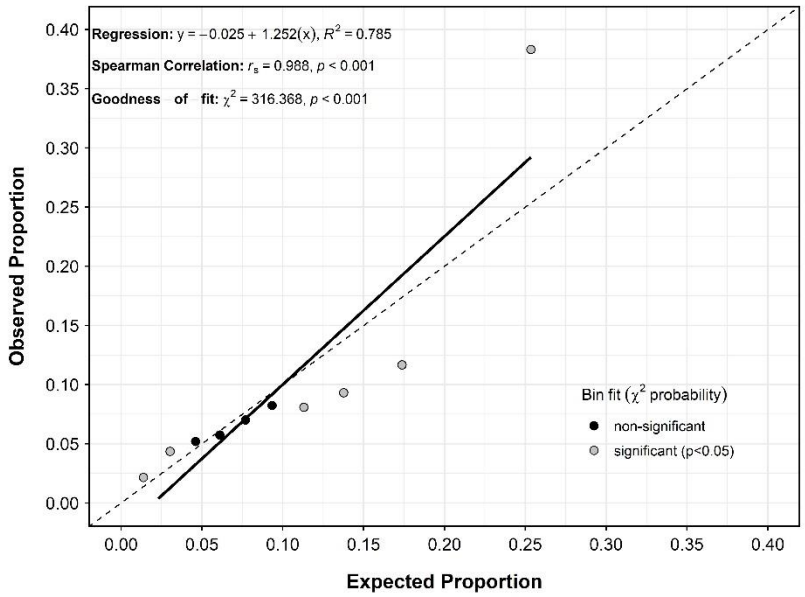
Attachment Figure 6. Cross-validation results comparing expected versus observed proportion of GPS telemetry observations (n = 28,630) of caribou during winter across 10 quantile bins (Fold 1). Dashed line shows the line of unity (observed = expected). Black line shows the fitted regression; points are either black (not statistically different than expected) or grey (statistically different from expected) for each bin.



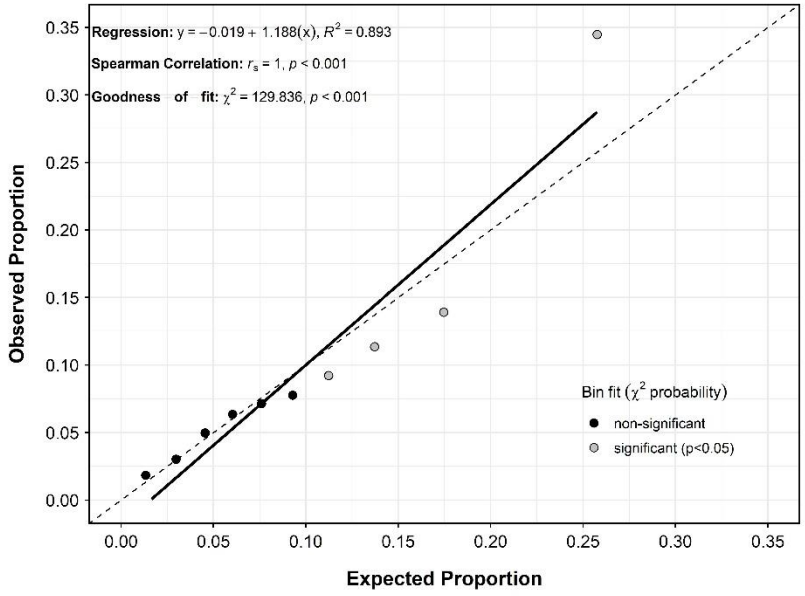
Attachment Figure 7. Cross-validation results comparing expected versus observed proportion of GPS telemetry observations (n = 28,630) of caribou during winter across 10 quantile bins (Fold 2). Dashed line shows the line of unity (observed = expected). Black line shows the fitted regression; points are either black (not statistically different than expected) or grey (statistically different from expected) for each bin.



Attachment Figure 8. Cross-validation results comparing expected versus observed proportion of GPS telemetry observations (n = 28,630) of caribou during winter across 10 quantile bins (Fold 3). Dashed line shows the line of unity (observed = expected). Black line shows the fitted regression; points are either black (not statistically different than expected) or grey (statistically different from expected) for each bin.



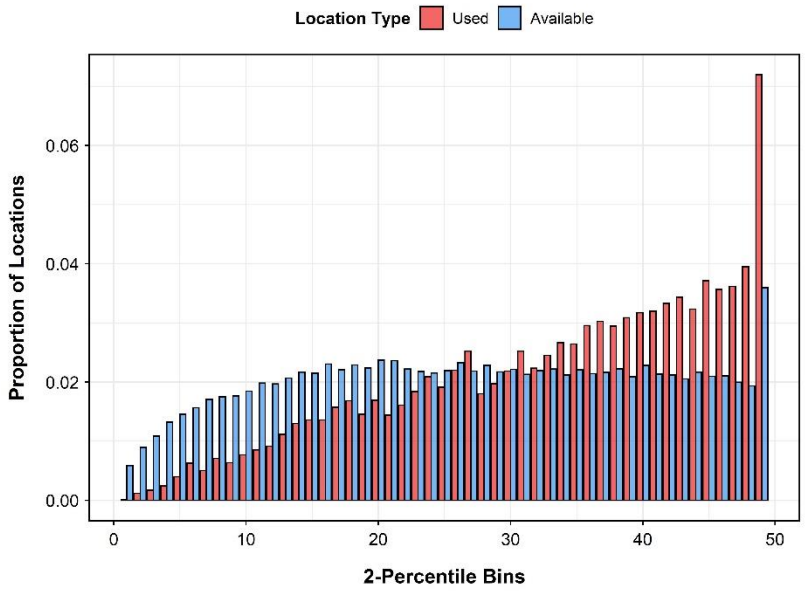
Attachment Figure 9. Cross-validation results comparing expected versus observed proportion of GPS telemetry observations (n = 28,630) of caribou during winter across 10 quantile bins (Fold 4). Dashed line shows the line of unity (observed = expected). Black line shows the fitted regression; points are either black (not statistically different than expected) or grey (statistically different from expected) for each bin.



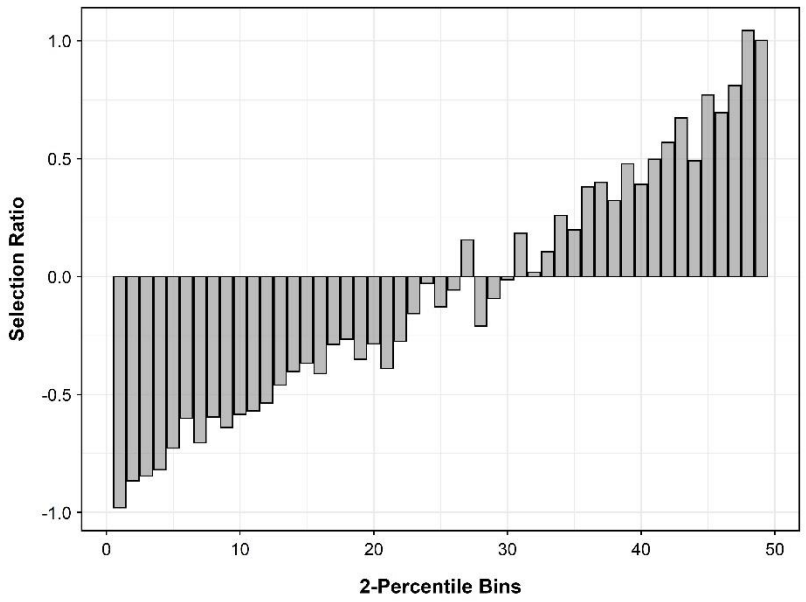
Attachment Figure 10. Cross-validation results comparing expected versus observed proportion of GPS telemetry observations (n = 28,630) of caribou during winter across 10 quantile bins (Fold 5). Dashed line shows the line of unity (observed = expected). Black line shows the fitted regression; points are either black (not statistically different than expected) or grey (statistically different from expected) for each bin.

6.9.2 ATTACHMENT 6–B — SELECTION RATIOS AND HABITAT RATINGS

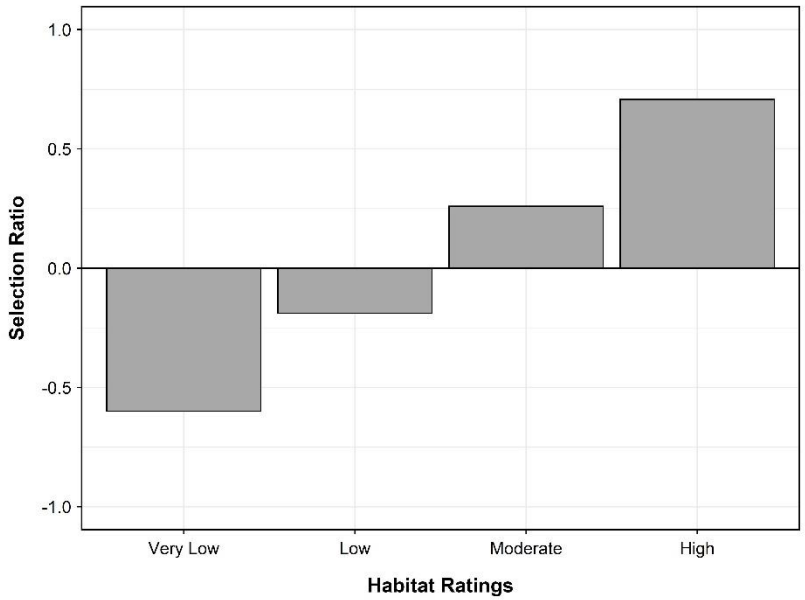
Late Fall



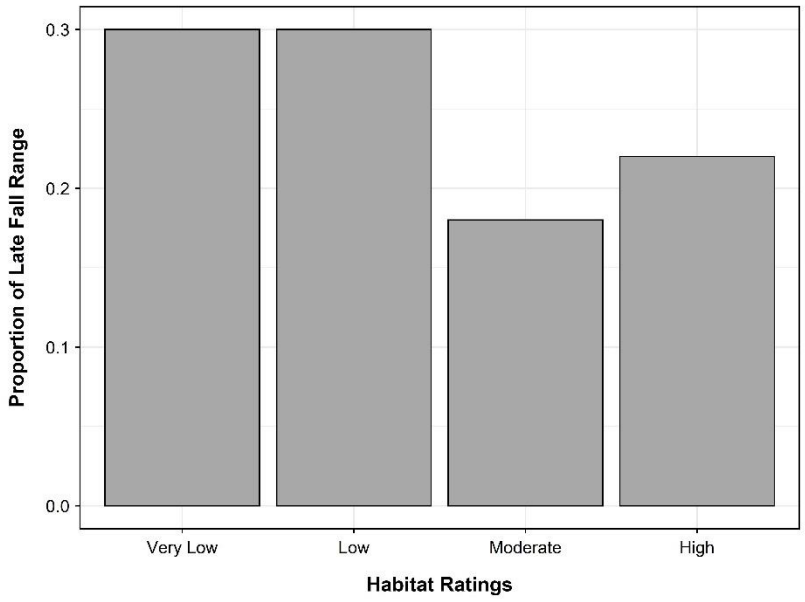
Attachment Figure 11. Proportions of used and available locations across 2-percentile (49 quantiles) interval bins of resource selection predictions during late fall, 2012–2021.



Attachment Figure 12. Selection ratios comparing the proportion of used to available locations across 2-percentile (49 quantiles) interval bins of resource selection predictions during late fall, 2012–2021.

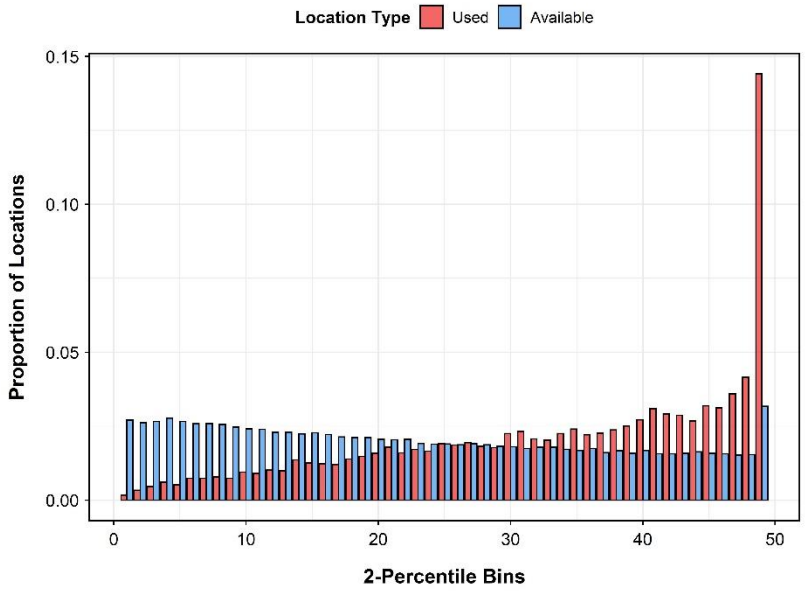


Attachment Figure 13. Selection ratios comparing the proportion of used to available locations across habitat rating classifications during late fall, 2012–2021.

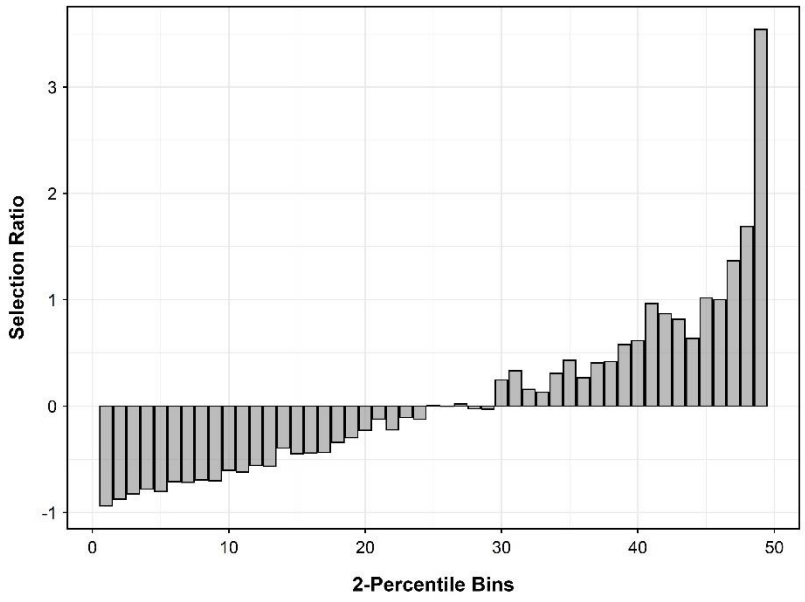


Attachment Figure 14. Proportion of the PCH late fall range composed by each habitat rating classification.

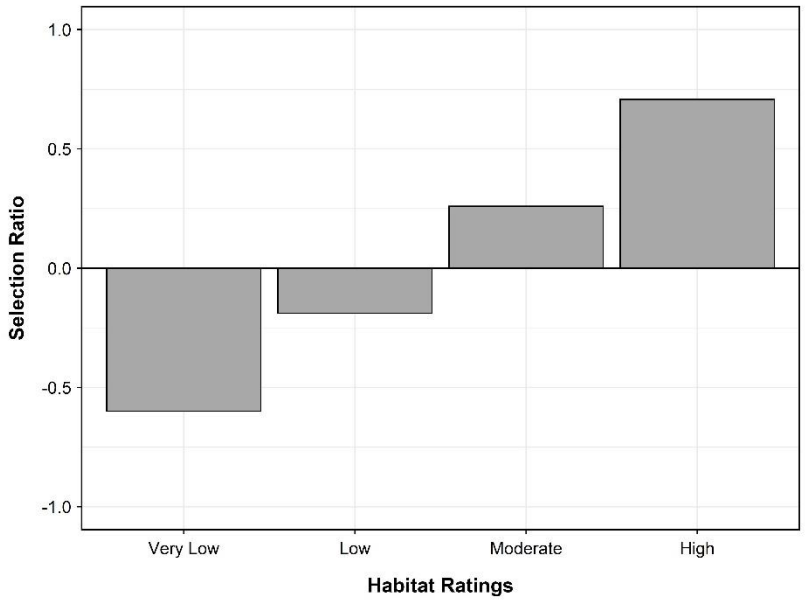
Winter



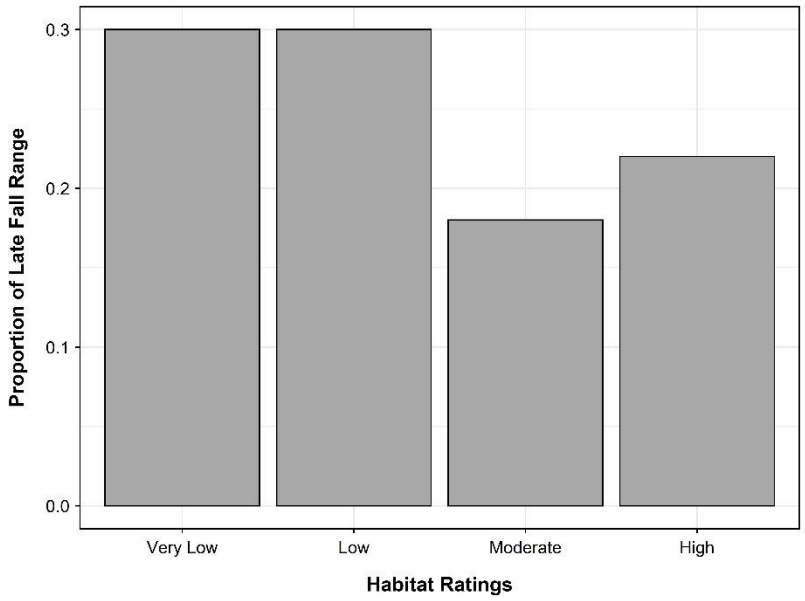
Attachment Figure 15. Proportions of used and available locations across 2-percentile (49 quantiles) interval bins of resource selection predictions during winter, 2012–2021.



Attachment Figure 16. Selection ratios comparing the proportion of used to available locations across 2-percentile (49 quantiles) interval bins of resource selection predictions during winter, 2012–2021.



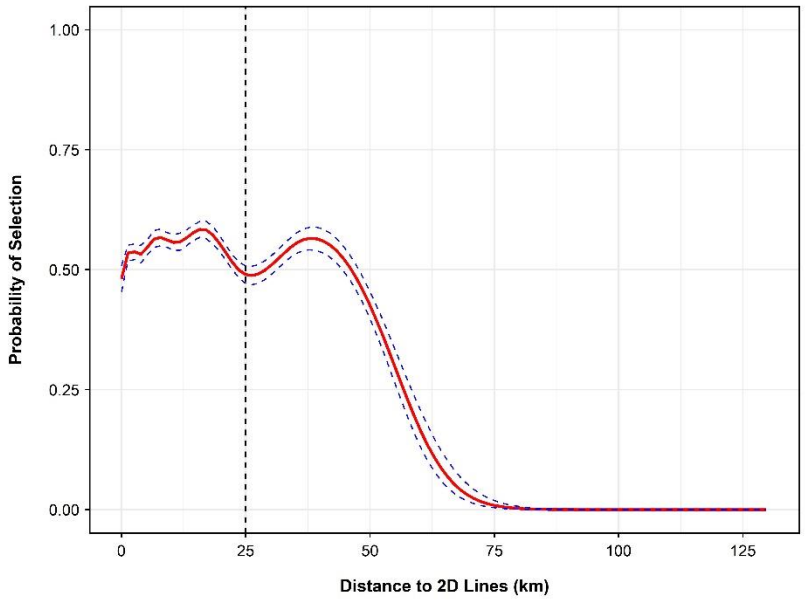
Attachment Figure 17. Selection ratios comparing the proportion of used to available locations across habitat rating classifications during winter, 2012–2021.



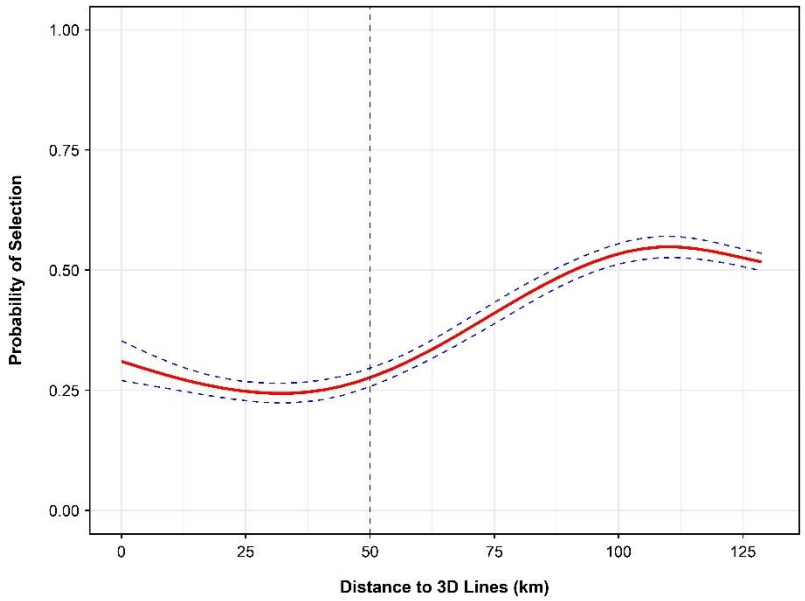
Attachment Figure 18. Proportion of the PCH winter range composed by each habitat rating classification.

6.9.3 ATTACHMENT 6–C — ZONE OF INFLUENCE ANALYSES

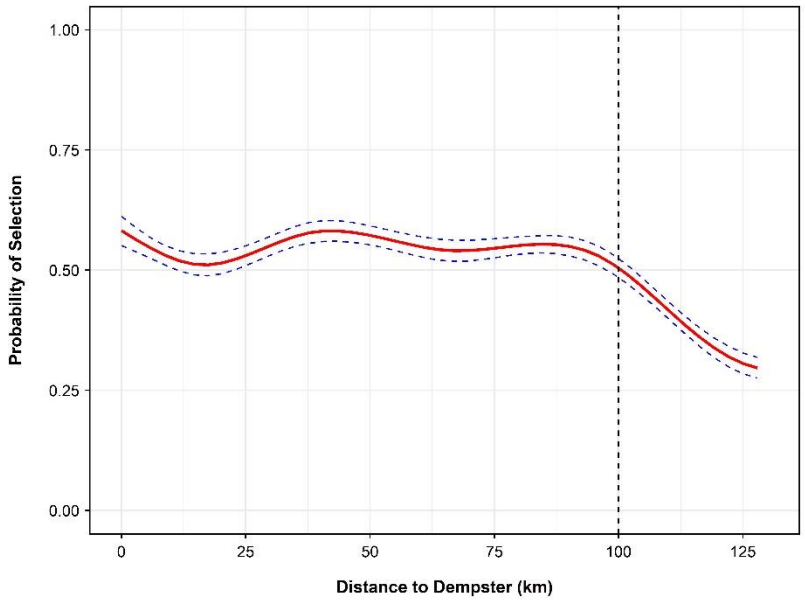
Late Fall



Attachment Figure 19. Marginal effect of distance to 2D seismic lines (including winter roads and trails) on the probability of selection by caribou during late fall (2012–2021) based on a generalized additive model with cubic regression splines. Solid red and dashed blue lines are the fitted mean and 95% confidence intervals, respectively. Vertical dashed line indicates iteration zone cut-off.

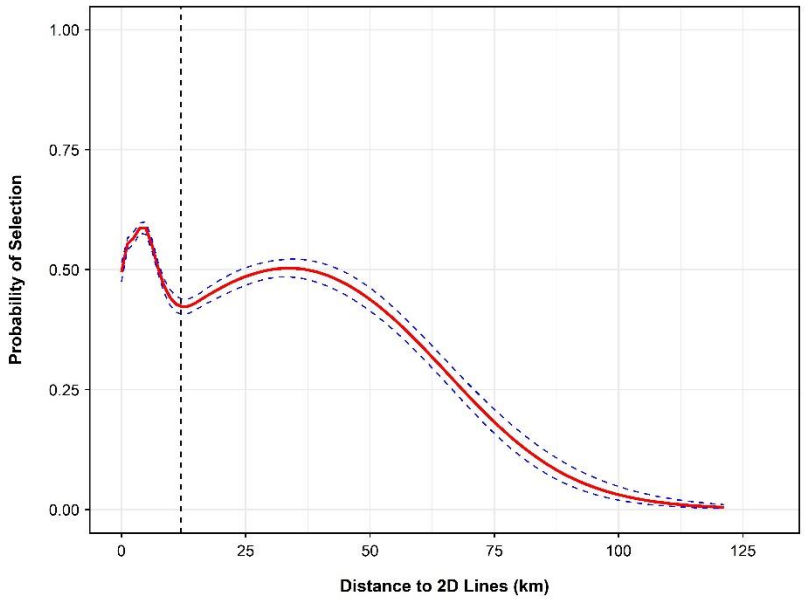


Attachment Figure 20. Marginal effect of distance to 3D seismic lines (single grid in Project RSA) on the probability of selection by caribou during late fall (2012–2021) based on a generalized additive model with cubic regression splines. Solid red and dashed blue lines are the fitted mean and 95% confidence intervals, respectively. Vertical dashed line indicates iteration zone cut-off.

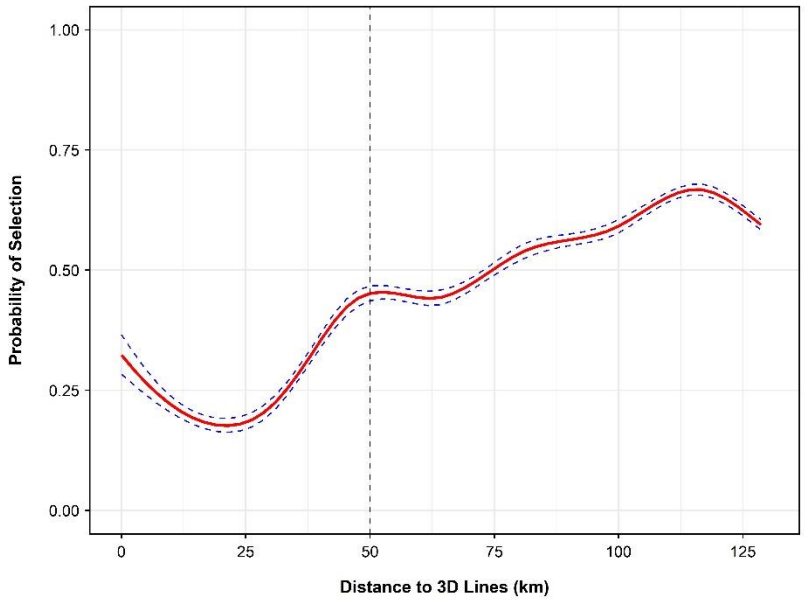


Attachment Figure 21. Marginal effect of distance to the Dempster Highway on the probability of selection by caribou during late fall (2012–2021) based on a generalized additive model with cubic regression splines. Solid red and dashed blue lines are the fitted mean and 95% confidence intervals, respectively. Vertical dashed line indicates iteration zone cut-off.

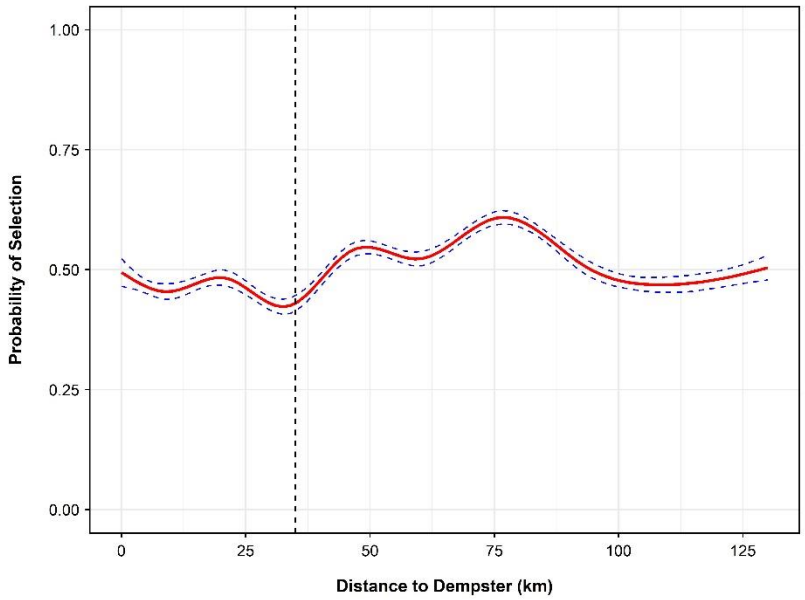
Winter



Attachment Figure 22. Marginal effect of distance to 2D seismic lines (including winter roads and trails) on the probability of selection by caribou during winter (2012–2021) based on a generalized additive model with cubic regression splines. Solid red and dashed blue lines are the fitted mean and 95% confidence intervals, respectively. Vertical dashed line indicates iteration zone cut-off.

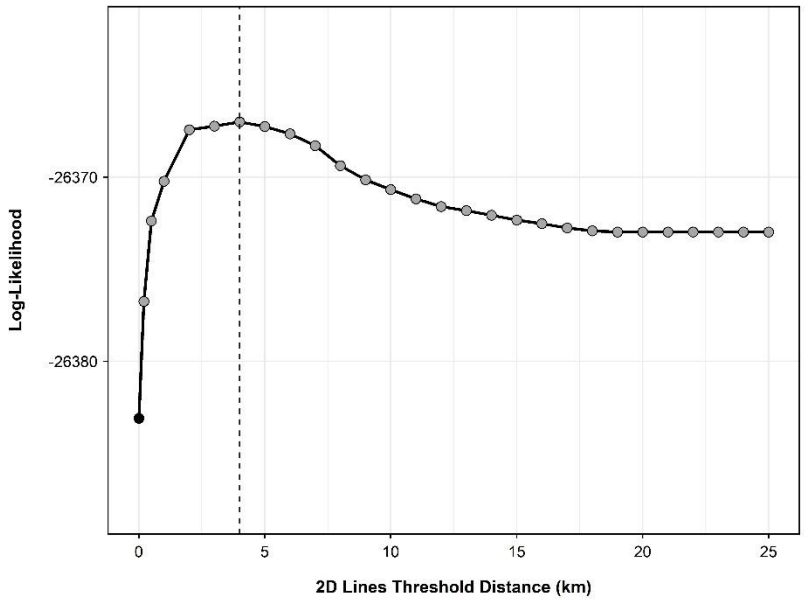


Attachment Figure 23. Marginal effect of distance to 3D seismic lines (single grid in Project RSA) on the probability of selection by caribou during winter (2012–2021) based on a generalized additive model with cubic regression splines. Solid red and dashed blue lines are the fitted mean and 95% confidence intervals, respectively. Vertical dashed line indicates iteration zone cut-off.

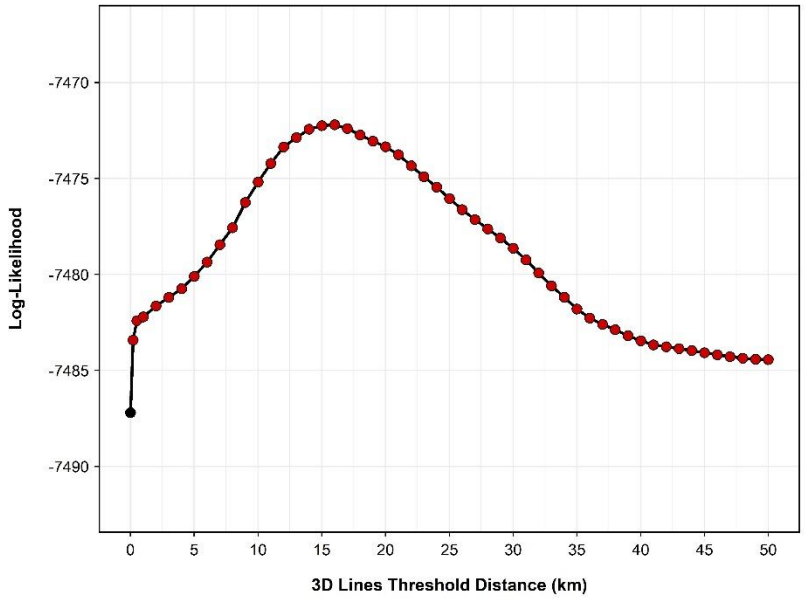


Attachment Figure 24. Marginal effect of distance to the Dempster Highway on the probability of selection by caribou during winter (2012–2021) based on a generalized additive model with cubic regression splines. Solid red and dashed blue lines are the fitted mean and 95% confidence intervals, respectively. Vertical dashed line indicates iteration zone cut-off.

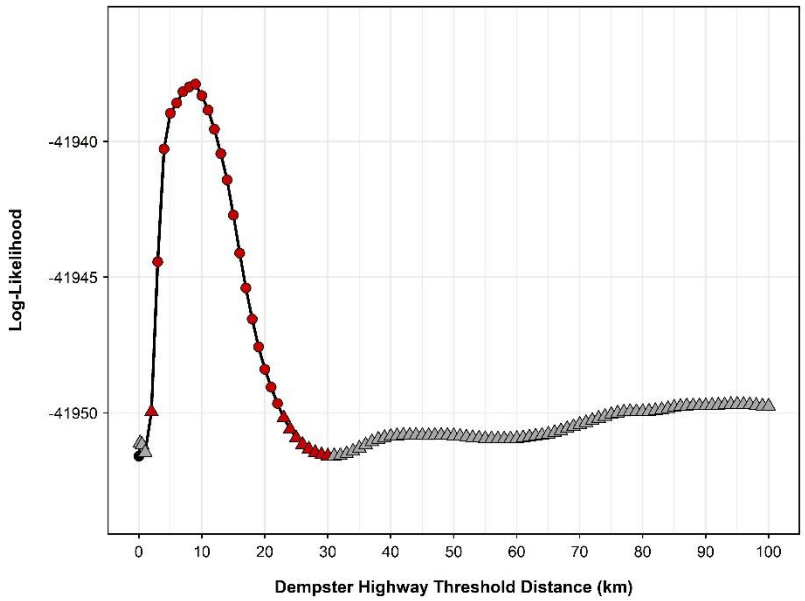
Late Fall



Attachment Figure 25. Segmented regression approach to estimating a zone of influence (ZOI) relative to 2D seismic lines (including winter roads and trails) using GPS collar data from PCH caribou during late fall, 2012–2021. The threshold distance with the highest log-likelihood corresponds with the most likely ZOI. Circles and triangles indicate statistically significant and non-significant ZOI distances, respectively. Grey and red fills indicate positive and negative coefficients, respectively. Vertical dashed line indicates ZOI at 4 km.

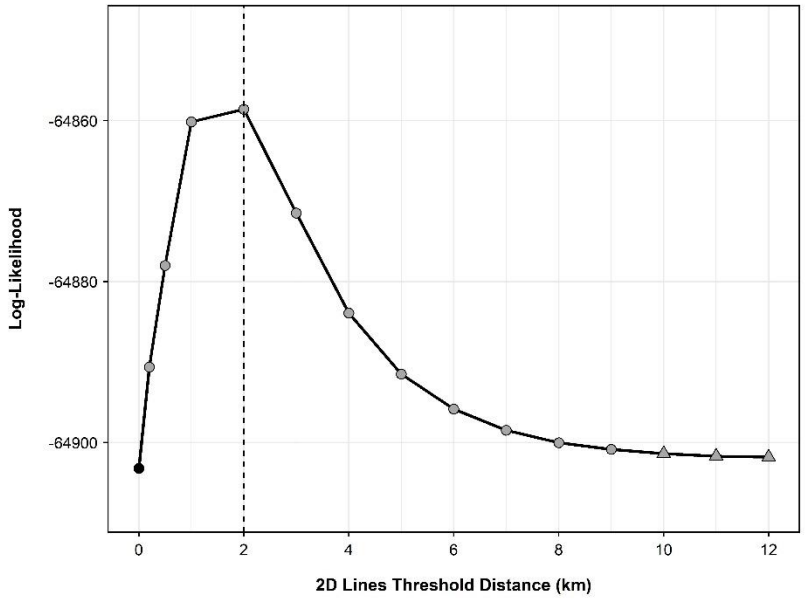


Attachment Figure 26. Segmented regression approach to estimating a zone of influence (ZOI) relative to the lone 3D seismic grid using GPS collar data from PCH caribou during late fall, 2012–2021. The threshold distance with the highest log-likelihood corresponds with the most likely ZOI. Circles and triangles indicate statistically significant and non-significant ZOI distances, respectively. Grey and red fills indicate positive and negative coefficients, respectively.

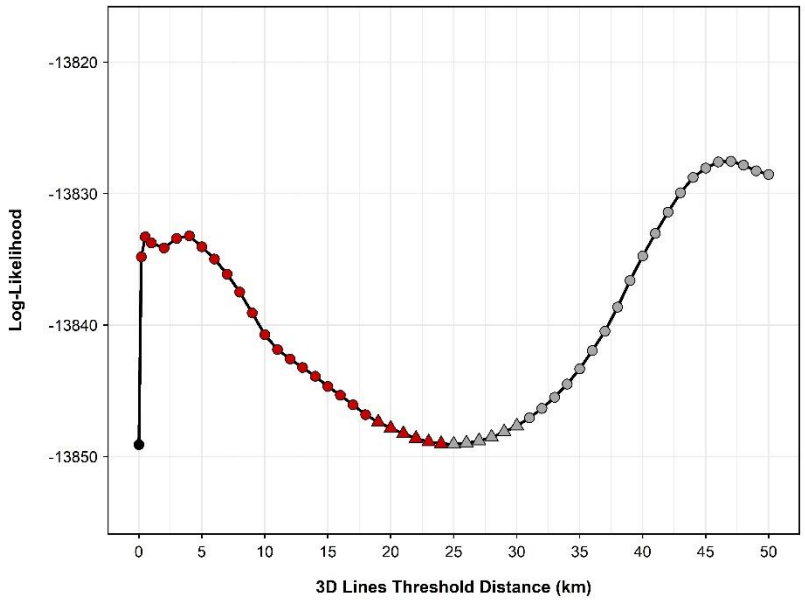


Attachment Figure 27. Segmented regression approach to estimating a zone of influence (ZOI) relative to the Dempster Highway using GPS collar data from PCH caribou during late fall, 2012–2021. The threshold distance with the highest log-likelihood corresponds with the most likely ZOI. Circles and triangles indicate statistically significant and non-significant ZOI distances, respectively. Grey and red fills indicate positive and negative coefficients, respectively.

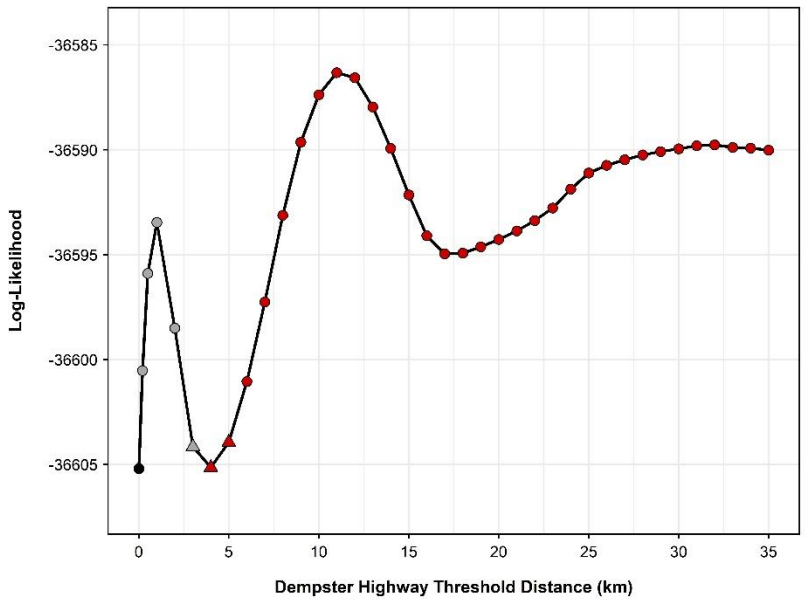
Winter



Attachment Figure 28. Segmented regression approach to estimating a zone of influence (ZOI) relative to 2D seismic lines (including winter roads and trails) using GPS collar data from PCH caribou during winter, 2012–2021. The threshold distance with the highest log-likelihood corresponds with the most likely ZOI. Circles and triangles indicate statistically significant and non-significant ZOI distances, respectively. Grey and red fills indicate positive and negative coefficients, respectively. Vertical dashed line indicates ZOI at 2 km.



Attachment Figure 29. Segmented regression approach to estimating a zone of influence (ZOI) relative to the lone 3D seismic grid using GPS collar data from PCH caribou during winter, 2012–2021. The threshold distance with the highest log-likelihood corresponds with the most likely ZOI. Circles and triangles indicate statistically significant and non-significant ZOI distances, respectively. Grey and red fills indicate positive and negative coefficients, respectively.



Attachment Figure 30. Segmented regression approach to estimating a zone of influence (ZOI) relative to the Dempster Highway using GPS collar data from PCH caribou during winter, 2012–2021. The threshold distance with the highest log-likelihood corresponds with the most likely ZOI. Circles and triangles indicate statistically significant and non-significant ZOI distances, respectively. Grey and red fills indicate positive and negative coefficients, respectively.

EXECUTIVE SUMMARY

The Eagle Plains Exploration Project (the Project) is an oil and gas exploration project located in north Yukon. Chance Oil and Gas Ltd. (Chance) intends to conduct exploratory activities to confirm the quality, quantity, and extent of hydrocarbons over ten years. Work will include seismic exploration and exploratory wells supported by an expanded winter road network. Oil and gas exploration activities create long, narrow clearings through natural vegetation, such as seismic lines and roads, collectively known as 'linear features.' Linear features can be a management challenge because they can affect how people and animals move and plants disperse within a landscape. For example, in southern parts of the boreal forest, linear features appear to affect predator-prey dynamics that can result in increased caribou mortality by wolves. The North Yukon and Peel Watershed Regional Land Use Plans identify mitigations to minimize the potential effects of linear features, including cautionary (0.75 km/km^2) and critical (1.0 km/km^2) indicator levels of linear disturbance.

Intermittent exploration activities in the Eagle Plains area from the 1950s to 2014 have created a network of winter roads, 2D seismic lines, and, most recently, 3D seismic lines in parts of the Regional Study Area (RSA). However, the extent of liner features that currently occur in the RSA, the structural, vegetation, and functional characteristics of different linear feature types, and their degree of regeneration are unknown. EDI Environmental Dynamics Inc. conducted a linear features study to characterize the structural, vegetation, and functional aspects of linear features in the RSA to address these information gaps. The study addressed three objectives: (1) comprehensive mapping and classification of existing linear feature footprints within the RSA; (2) quantification of structural aspects (e.g., widths) and functional aspects (ease of travel and sightlines) of linear features; and (3) quantification of regeneration pathways and structural stages of linear features. This combined information supports assessing potential effects of linear features in the Project application and refinement of mitigation measures for linear features to minimize possible effects.

The linear features inventory was compiled from multiple spatial datasets and was verified and supplemented using satellite imagery in a Geographic Information System. Linear feature densities were estimated for each linear feature type. Estimates were adjusted to account for (i) overlap with open habitats, such as recent burns, where vegetation heights were similar on and off the line, and (ii) for average rates of regeneration determined from field studies.

Site selection used a stratified random design to obtain a representative sample of different feature types across the RSA. Ground and aerial surveys measured specific structural, vegetation, and functional characteristics across the different line types. Measures included width, successional class, structural stage, vegetation composition and height, and sightline distances. A 'walk test' was used to index ease of movement for large mammals. A driving survey documented the visibility of seismic lines from the Dempster Highway (i.e., as an index of potential human access onto the seismic lines). An aerial winter track survey was conducted in March 2020 to assess ungulates' relative use of different linear feature types.

Four primary types of linear features occur in the RSA, totalling 4,269 km: 2D seismic (34%), 3D seismic (51%), winter roads (14%), and the Dempster Highway (1%). The unadjusted linear feature density for the RSA totalled 1.79 km/km^2. After accounting for burns, natural openings and regeneration, the adjusted linear

feature density for the RSA totalled 0.52 km/km², below the cautionary and critical indicator levels in the North Yukon and Peel Watershed Regional Land Use Plans.

Structural, vegetation, and functional characteristics differed substantially among linear feature types. 3D seismic accounts for the largest extent of linear features in the RSA and had the narrowest widths and limited functional effects (e.g., the proportion of features used by ungulates in the winter was less than a third of the rates of use on 2D and winter roads). Winter roads had the widest average widths and the greatest functional effects except for the Dempster Highway. However, a substantial portion (39%) had also regenerated into or past the Tall Shrub stage (which this study suggests may be the best criterion for functional recovery). Most 2D lines had substantial vegetation regeneration, resulting in the shortest average sightlines and slowest movement speeds. However, ungulates still appeared to select them to travel on during winter.

Except for the Dempster Highway, where walking speeds were near twice the rate of other linear feature types, there was relatively little difference in movement rates among linear feature types and control areas. The density of shrubs and trees primarily limited movement rates. 2D lines, which had the highest density of shrubby regeneration, had the slowest average movement rates. For other linear feature types, the combination of vegetation regeneration on linear features and the naturally open nature of most adjacent undisturbed areas did not convey a substantial increase in movement rates on linear features compared to undisturbed areas.

Sightline distances on 2D lines and winter roads were also affected mainly by the degree of vegetation regeneration. Where regeneration was limited, sightlines on 2D lines and winter roads regularly exceeded 150 m. On 3D lines, which have not had enough time since their creation for vegetation to regenerate to the height that restricts vision, sightlines were limited by meanders purposely constructed to reduce sightlines. The meanders employed on 3D lines were also effective in reducing the detectability of the lines from the Dempster Highway. In the blind test, where observers did not know the location of the 3D lines, only 5% (4 out of 74) crossings were spotted. With a map showing the crossing locations, only two additional 3D lines were detected.

These results provide information to assess the potential effects of linear features in the Project application and refine mitigation measures.

ACKNOWLEDGEMENTS

EDI Environmental Dynamics Inc. (EDI) completed the work within the traditional territories of the Vuntut Gwitchin First Nation (VGFN), First Nation of the Na-Cho Nyäk Dun, and the Tetlit Gwich'in Council (Secondary Use Area). Tyrel Kassi, a VGFN citizen, played an active role in the field components of the project. We thank him for his diligence and shared perspectives during the project.

1 INTRODUCTION

1.1 PROJECT OVERVIEW

The Eagle Plains Project (the Project) encompasses a 2,386 km² area in north-central Yukon, approximately 605 km north of Whitehorse and 40 km south and west of Eagle Plains hotel, along the Dempster Highway (Map 1-1). The Project occurs within the Eagle Plains petroleum basin, north of the Ogilvie River and west of the Richardson Mountains. The basin contains proven natural gas and oil reserves (Peel Watershed Planning Commission 2019), including 4.6 billion m³ of gas and 3.2 million m³ of oil (Hannigan 2014).

The Regional Study Area (RSA) has had intermittent periods of oil and gas exploration since the 1950s. That activity has developed winter roads, seismic lines, and exploratory wells across parts of the current RSA. Approximately 40 exploration wells have been drilled at Eagle Plains. Eight wells are maintained in suspended status, and the remaining wells have been plugged and abandoned. Seismic exploration has included approximately 10,000 km of two-dimensional (2D) lines (mainly before 1985), and about 325 km² of three-dimensional (3D) seismic was conducted in 2013–2014 (Northern Cross (Yukon) Ltd. 2014).

The current exploration program will build on past exploration to better define the extent, amount and quality of oil and gas deposits. Under the current program, Chance Oil and Gas Ltd. proposes conducting additional 3D seismic over large extents of the RSA and drilling up to 30 exploratory wells. Depending on the drilling program results, extended flow testing over several months may be conducted at a subset of the wells to determine the quantity and quality of the oil and gas deposit. The existing winter road network will be expanded to support the seismic and drilling programs. Most work is expected to be conducted in the winter (e.g., seismic line clearing and drilling); however, seismic recordings and extended flow testing may also occur during summer.

Oil and gas exploration activities create long, narrow clearings through natural vegetation, such as seismic lines and roads, collectively known as 'linear features.' Linear features can be a management challenge because they can affect how people and animals move and plants disperse within a landscape. For example, in southern parts of the boreal forest, linear features appear to affect predator-prey dynamics that can result in increased caribou mortality by wolves. The North Yukon and Peel Watershed Regional Land Use Plans identify mitigations to minimize the potential effects of linear features. The Plans also include cautionary (0.75 km/km²) and critical (1.0 km/km²) linear density indicator levels.

1.2 PURPOSE AND OBJECTIVES

Intermittent exploration activities in the Eagle Plains area from the 1950s to 2014 have created a network of winter roads, 2D seismic lines, and, most recently, 3D seismic lines in parts of the RSA. However, the extent of liner features that currently occur in the RSA, the physical and functional characteristics of different linear feature types, and their degree of regeneration are unknown.

EDI Environmental Dynamics Inc. (EDI) conducted a linear features study to characterize the physical and functional aspects of linear features in the RSA to address these information gaps. The three objectives of this study were to: (1) conduct comprehensive mapping and classification of existing linear feature footprints within the RSA; (2) determine physical aspects (e.g., widths) and functional aspects (ease of travel and sightlines) of linear features; and, (3) quantify regeneration pathways and stages of linear features. The combined information forms the basis for assessing the potential effects of linear features in the RSA and refining mitigation measures for linear features.

1.3 STUDY AREA

The RSA for the Eagle Plains Project is approximately 2,386 km² (238,566 ha), centred in the Eagle Plains Ecoregion in north Yukon (Map 1-1). The area consists of subdued topography of rolling hills and sloping plains. The RSA is centred on a major watershed divide (denoted by the location of the Dempster Highway), with the northwestern two-thirds of the RSA draining into the Porcupine River watershed to the north, via Chance Creek, and west, via McParlon Creek and the Whitestone River. The southeastern third of the RSA drains into the Peel River watershed via Dalglish Creek.

Development in the RSA and the surrounding Eagle Plains is low. The Dempster Highway is the primary vehicle access corridor, running from approximately Dawson City, Yukon in the south to Inuvik, Northwest Territories in the north, and transiting the RSA. The Eagle Plains settlement is on the Dempster Highway, approximately 40 km northeast of the RSA and includes the Eagle Plains Hotel and the Government of Yukon's Highway Maintenance camp. The Eagle Plains area has had intermittent periods of oil and gas exploration since the 1950s. That activity has created winter roads, seismic lines, and exploratory wells across parts of the RSA. Approximately 40 exploration wells have been drilled at Eagle Plains. Eight wells are maintained in suspended status, and the remaining wells have been plugged and abandoned. Approximately 10,000 km of 2D lines have been developed across the Eagle Plains Ecoregion, mostly between 1961 and 1984 (Access Consulting Group and EBA Engineering Consultants Ltd. 2001, GEOTIR 2014). More recently, approximately 2,200 km of 3D LIS exploration was conducted in a 325 km² area between November 2013 and April 2014 (GEOTIR 2014). This 3D exploration grid is near the centre of the RSA, spanning north and south of the Dempster Highway.

1.3.1 REGIONAL ECOLOGICAL SETTING

The Eagle Plains Ecoregion is a 20,400 km² portion of the Taiga Cordillera Ecozone in north Yukon between the Richardson and Ogilvie Mountains. Unlike much of the mountainous Taiga Cordillera, most of the Eagle Plains Ecoregion occurs as low altitude rolling topography between 300 m and 600 m above sea level (masl), with few scattered peaks above and around 1,000 masl (Ecological Stratification Working Group 1995). Most of the ecoregion is unglaciated terrain, with surficial features formed due to permafrost and frozen ground-related processes, including thermokarst subsidence, soil creeps, cryoturbation, solifluction, and active layer detachment slides on shale (Yukon Ecoregions Working Group 2004).

The Eagle Plains Ecoregion experiences moderate precipitation, with annual amounts around 400 mm. Most precipitation falls as rain throughout the summer, averaging 50 to 80 mm per month, June through August. Precipitation is lighter through September to April and falls as snow, with average winter snowpacks of 80 cm peaking in April. The climate is strongly affected by latitude, with extended winter conditions from October to early May. There is a substantial variation in seasonal temperatures in the Eagle Plains, with cool short summers and long cold winters. Average winter temperatures are between −30°C and −25°C, with extremes as low as −60°C. Average summer temperatures are around 13°C, with extremes as high as 30°C. Due to the northern latitude, this region experiences continuous sun above and below the horizon, in summer and winter, respectively.

Most of the Ecoregion, including the northeast portion of the RSA, drains north into the Yukon River via the Whitestone, Porcupine and Eagle rivers. That part of the RSA includes the headwaters of the Eagle River and several other tributaries of the Porcupine River, along with the Chance and McParlon Creek subdrainages of the Whitestone River. The southeast corner of the Ecoregion drains east to the Mackenzie River via the Peel, Wind and Ogilvie Rivers. Dalglish and Enterprise creeks flow directly into the Peel River. The few lakes in the Ecoregion are generally oxbow or thermokarst lakes (Yukon Ecoregions Working Group 2004). Several wetland complexes are associated with larger creeks in the RSA.

The Eagle Plains Ecoregion is within the continuous permafrost zone where permafrost can be found up to 200 m thick. The Eagle Plains Ecoregion is dominated by the Cryosolic soils that occupy much of the northern third of Canada, characterized by near-surface permafrost. Turbic Cryosols predominate, exhibiting patterned ground formations and hummocks, and are often associated with open stands of black spruce (*Picea mariana*), tamarack (*Larix laricina*) and birch (*Betula* spp.). The active permafrost layer in these ecosystems generally ranges between 20 cm and 90 cm below the surface. The active layer depth is generally deeper directly under hummocks and shallower under inter-hummock areas (Yukon Ecoregions Working Group 2004).

The RSA is entirely within the Subarctic Bioclimate Zone (Environment Yukon 2014). Vegetation in the RSA is characterized by open-canopy, spruce-dominated habitats where permafrost and short cool growing seasons limit tree growth and often result in stunted, disclimax vegetation communities (Environment Yukon 2016). Hummocky, black and white spruce (*Picea glauca*) woodlands with well-developed shrub communities are common in upland areas. White spruce and ground lichens increase in abundance in well-drained sites. Areas with low slope gradients and fine-textured soils often have ground cover dominated by cottongrass tussocks beneath a shrub layer of birch, black spruce, Labrador tea (*Rhododendron groenlandicum*), and occasionally tamarack (*Larix laricina*) (Yukon Ecoregions Working Group 2004).

Forest fires are a common disturbance agent in the region, and burns of various ages occur throughout the RSA. Fires increase the depth of the active permafrost layer and changes in soil moisture and productivity, affecting vegetation regeneration and resulting in terrain disturbances, such as slope failures and erosion. Regenerating burns are dominated by shrubs, such as scrub birch (*Betula glandulosa*), willows (*Salix spp.*) and alder (*Alnus spp.*), with Alaskan paper-birch (*Betula neoalaskana*) often the first tree species to colonize burn areas. As burns regenerate into young and mature forest, black and white spruce typically become the dominant forest species. Residual Alaskan birch in spruce-dominated stands often defines the extent of old burns (Yukon Ecoregions Working Group 2004).

Mammal diversity is relatively low in the Eagle Plains Ecoregion due to its northern location and low productivity. Voles (*Microtus* spp., *Myodes* spp., *Phenacomys* spp.), American marten (*Martes americana*), ermine (*Mustela erminea*), and red fox (*Vulpes vulpes*) are common smaller mammals. Wolves (*Canis lupus*), wolverines (*Gulo gulo*), and both black and grizzly bears (*Ursus americanus* and *U. arctos*.) are present at low densities. Moose (*Alces alces*) inhabit the region year-round. The RSA overlaps a small portion of the winter range of the Porcupine caribou herd (PCH), a subpopulation of the barren-ground caribou (*Rangifer tarandus granti*). The PCH is an iconic species in north Yukon, with high cultural, social, economic, and ecological values. The PCH's population has been increasing over the last several decades and is currently estimated to consist of 202,106 to 234,808 caribou (Caikoski 2017, Porcupine Caribou Technical Committee 2018). The PCH is known to occupy portions of the Eagle Plains Ecoregion in fall and winter when they tend to occur in smaller groups over a larger area than during other seasons.

1.3.2 REGIONAL LAND USE PLANNING

The RSA overlaps four First Nation Traditional Territories. Most of the RSA is within the Traditional Territory of the Vuntut Gwitchin First Nation. The southeastern portion is in an area of overlapping Traditional Territories of Vuntut Gwitchin First Nation, the Tetlit Gwich'in Council, the First Nation of Na-cho Nyäk Dun, and Tr'ondëk Hwëchin. Although the RSA is located outside of any First Nation Settlement Lands, it does abut Vuntut Gwitchin First Nations Settlement Lands on parts of its east and southwest borders. Each First Nations government has provided input to, and approved of, the Regional Land Use Plan(s) on their Traditional Territory under the respective First Nation Final Agreements.

1.3.2.1 North Yukon Regional Land Use Plan

The RSA lies mainly within the North Yukon Planning Region and is subject to the North Yukon Regional Land Use Plan (NYRLUP) (Map 1-1). The NYRLUP was created to protect the natural and cultural resources of the region while allowing sustainable economic development opportunities (Vuntut Gwitchin Government and Yukon Government 2009). It provides management direction for using public and settlement lands based on four principles: sustainable development, precautionary principle, conservation, and adaptive management. The NYRLUP divides the Planning Region into 23 land management units classified into three categories: protected area, integrated management area (IMA), and community area. IMAs are further classified into four zones: Zone 1 (lowest development), Zone II (low development), Zone III (moderate development), and Zone IV (highest development). IMA zones are classified based on the area's sensitivity to landscape disturbance, ecological and cultural values, risk of significant impacts, and level of acceptable change. The RSA is a Zone IV IMA with lower ecological and cultural values in a moderately sensitive biophysical setting. Subsequently, Zone IV IMAs allows for the highest development level to occur.

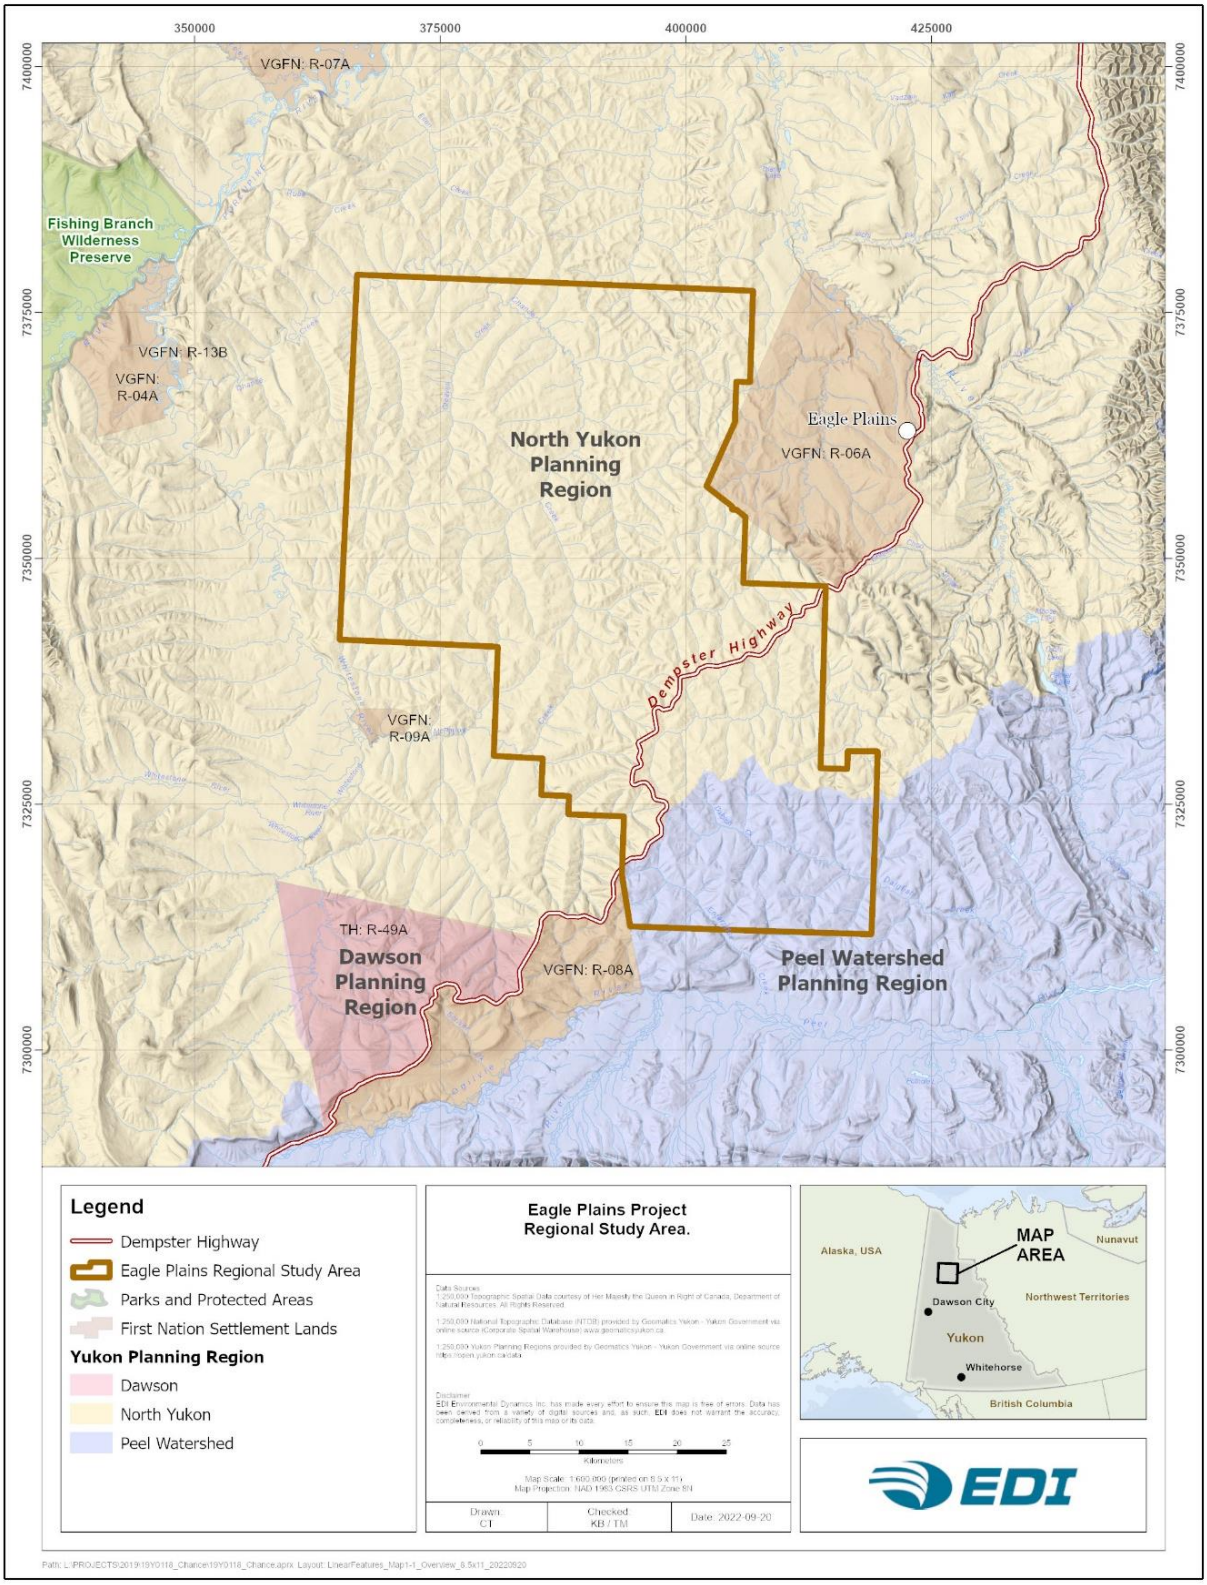
The NYRLUP encourages results-based management and uses cumulative effects indicators to determine if goals and objectives are met. Results-based management allows for innovation and creativity in land-use strategies and approaches. The two cumulative effects indicators included in the NYRLUP are direct surface disturbance and linear density. The NYRLUP guidelines for Zone IV IMAs are 0.75–1.0% surface disturbance and 0.75–1.0 km/km² linear density (Vuntut Gwitchin Government and Yukon Government 2009).

However, as surface disturbances and linear features reach a level of functional recovery and become part of the continuous landscape, they can be subtracted from the total amount of disturbed area (Vuntut Gwitchin Government and Yukon Government 2009). The NYRLUP suggests using a height of 1.5 m for woody vegetation in forested areas, as vegetation above this height would likely no longer allow for travel or access by humans or wildlife and is, therefore, considered functionally recovered. Activities considered exempt from functional disturbance restrictions are (1) new linear features less than 1.5 m wide; (2) land-use activities that occur on frozen water bodies; (3) winter work with no required clearing of trees; and (4) winter work that uses existing disturbances and linear features.

1.3.2.2 Peel Watershed Regional Land Use Plan

The southeastern corner of the RSA lies within the Peel Watershed Planning Region (PWPR) and is subject to the Peel Watershed Regional Land Use Plan (PWRLUP) (Peel Watershed Planning Commission 2019) (Map 1-1). Like the NYRLUP, the PWRLUP was established to provide management direction and ensure long-term sustainable development in the Planning Region. The PWRLUP was founded on three main themes: environmental protection, social considerations, and economic development. It follows a similar framework as the NYRLUP. The PWPR is divided into 16 Landscape Management Units (LMU), which each share similar ecological characteristics, planning issues, and management intent. Each LMU is categorized by a land-use designation system. Conservation Areas are managed to protect ecological and cultural resources, while IMAs are 'working' landscapes where new development and surface disturbance may be allowed. IMAs are further classified into Zones, which correspond to the level of allowable development with comparable justification as the NYRLUP. The RSA is part of LMU 7 (Dalglish Creek), classified as an IMA Zone IV, allowing for the highest level of development.

Like the NYRLUP, the PWRLUP encourages results-based management and uses the same cumulative effects indicators, surface disturbance and linear density to inform decisions. The PWRLUP cautionary and critical indicators are identical to those of the NYRLUP: 0.75–1.0% surface disturbance and 0.75–1.0 km/km² linear density. As surface disturbances reach a level of functional recovery and no longer enable travel or access by wildlife and people, they can be subtracted from the total amount of disturbed area. The PWRLUP suggests using a 1.5 m woody vegetation height as a threshold for functional recovery in forested or shrubland areas. In areas dominated by low-growing vegetation, a feature could be considered functionally recovered when covered by native species roughly the same height and composition as the surrounding vegetation. To be considered as "functionally recovered," features must have similar sediment and run-off compared to background levels, roughly match original contours, and have no human-brought materials on the site. Exceptions to the linear density calculation are identical to those outlined in the NYRLUP.



Map 1-1. Eagle Plains Project Regional Study Area.

2 BACKGROUND

The term "linear feature" refers to any narrow, linear clearings of vegetation on the landscape. They include roads, seismic lines, power lines, and pipelines. Seismic lines are the dominant linear feature class in northern Canada, accounting for approximately 46% of all linear features in the Canadian boreal region (Pasher et al. 2013). Seismic exploration detects underground oil and natural gas reservoirs by analyzing sound waves reflected from the underlying geology (Yukon Energy Mines and Resources 2006). Sound waves are emitted by detonating small charges in a series of drilled shot holes (up to 20 m deep) or by vibrating a heavy metal plate on the ground's surface using a truck-mounted vibrator (Yukon Energy Mines and Resources 2006). Both methods require cleared travel corridors for equipment transportation, which results in a network of seismic lines across the landscape where seismic exploration has occurred.

Until the late 1990s, conventional 2D was the primary form of seismic exploration used in North America. 2D seismic lines were created using bulldozers to clear all vegetation in straight swaths, approximately 5–10 m wide in their earliest form. These wide, straight lines were necessary to enable large, heavy equipment movement. This process resulted in significant physical disturbance, often removing most surface vegetation and roots and the top layer of soil (Bliss and Wein 1972). Progressive improvements in 2D seismic exploration methods reduced the environmental impact, such as clearing in winter instead of summer and raising and adding mushroom shoes to the bulldozer blade to reduce soil disturbance. Despite these improvements, many of the 2D seismic lines created in the 1960s and 1970s in northern Canada remain disturbed, with little evidence of ecological recovery (Lee and Boutin 2006, van Rensen et al. 2015).

3D seismic exploration provides more accurate subsurface geological structure data than 2D technology. 3D seismic exploration techniques were developed in the mid-1990s, and their use became widespread in the early 2000s (Dabros et al. 2018). At the same time as the transition to 3D, the seismic industry was transitioning to smaller and more specialized equipment that reduces cost, improves efficiency and reduces environmental impacts. Modern seismic equipment and methods typically use what is referred to as Low Impact Seismic (LIS) methods that minimize line widths and site disturbance and compaction. Typical 3D seismic lines are 2–3 m wide, constructed in 100–500 m spaced grids, and follow meandering rather than straight routes. There have been substantial improvements in the equipment used for 3D seismic line creation: low ground pressure mulchers, lighter equipment, ATV-mounted equipment, mushroom shoes and smear blades, and 'envirodrills' greatly reduce physical and vegetation disturbance (Dabros et al. 2018). These methods often leave the ground vegetation intact and only remove trees and tall shrubs, reducing overall disturbance and facilitating faster regeneration. The location of the seismic line can be adjusted on the fly in the field to minimize impacts, such as avoiding the cutting of large trees.

Continuous advancements in seismic exploration technology have improved geophysical accuracy while simultaneously reducing environmental impact. Numerous studies have examined the effects of linear disturbances on soil, hydrology, vegetation, regeneration, and wildlife responses (see Dabros et al. 2018 for a comprehensive review). Although the bulk of literature focuses on 2D seismic lines, as they have been part of the landscape for over 60 years, there have been several recent studies investigating the effects of LIS and 3D seismic lines (e.g., Kemper and Macdonald 2009a, Kansas et al. 2015, Golder Associates 2016).

Linear features have been associated with various environmental effects, including permafrost thaw, soil compaction and rutting, increased soil moisture and pooling, altered snow cover, temperature and wind patterns, and varied vegetation and wildlife responses (Dabros et al. 2018). In addition to the immediate loss of vegetation, linear features can create extensive edge effects, facilitate non-native or disturbance-induced species establishment, alter species composition, and positively and negatively affect wildlife (Dabros et al. 2018).

One of the most extensively studied effects of linear features in the southern boreal forest is the indirect effects that linear features can have on mortality risk to woodland caribou (*R. tarandus caribou*). Linear features can result in complex effects on populations dynamics that include (i) increases in secondary prey (moose and deer), which elevate wolf populations (apparent competition) and (ii) more efficient hunting by predators along linear features (facilitated predation) (Wittmer et al. 2007, Latham et al. 2011, Dickie et al. 2017a, Keim et al. 2019b, 2021). Research has also documented the responses of birds to linear features (Bayne et al. 2005, Machtans 2006, Lankau et al. 2013), bears (Tigner et al. 2014, Finnegan et al. 2018), and furbearers (Tigner et al. 2015).

Most studies investigating impacts and recovery of seismic lines and other linear features were conducted in southern boreal forest ecosystems (i.e., Boreal Plains Ecozone; e.g., Lee and Boutin 2006, Kansas et al. 2015, van Rensen et al. 2015, Dickie et al. 2017a). There are fundamental differences in the climate, vegetation communities, wildlife communities, and ecological processes in taiga ecosystems that may result in different patterns and responses to linear features. For example, regeneration patterns of linear features in taiga ecosystems over permafrost can follow different successional trajectories than those of southern boreal regions (Simpson 2008). The few studies that have examined linear features in taiga regions have found similarities and differences to southern studies revegetation (Kemper and Macdonald 2009, Dabros et al. 2018). One of the key objectives of this study was to collect local information from Eagle Plains that can be used to better contextualize or adapt the findings from other studies to the Eagle Plains Project.

3 METHODS

A GIS analyses and field surveys were conducted to characterize linear features within the RSA. The inventory of linear features in the RSA was developed in a GIS by compiling available spatial data and then verifying and updating that against satellite imagery. Field studies quantified the width, vegetation characteristics, ecological function (line-of-sight, large mammal ease of movement assessment), and visibility of lines from the Dempster Highway.

3.1 LINEAR FEATURES INVENTORY

The inventory of existing linear features in the RSA was developed in a GIS by compiling available spatial data and then verifying and updating that against satellite imagery. A preliminary linear feature database was first developed that was used to support field surveys (described below in this section). A second step linked the field data to the linear feature database and conducted a more thorough review and verification process using satellite imagery to produce a final linear feature dataset for the RSA (see details in section 3.5.1).

Linear feature spatial data were obtained from the following sources:

- Yukon Government Energy, Mines and Resources "Oil and Gas Seismic Lines" dataset (a combination of less detailed National Energy Board data pre-1999 and the more detailed company-submitted data post-1999) (Yukon Government 2019)
- Natural Resources Canada CanVec "Roads," "Trails," and "Cut Lines" 1:50,000 scale datasets (Natural Resources Canada 2019)

The two datasets were merged into one dataset of all linear features documented in Yukon and clipped to the RSA. Key attribute data included (if available) the linear feature type (i.e., 2D and 3D seismic lines, winter roads, trails, Dempster Highway), width, year of establishment, and data source. This preliminary linear feature dataset was compared against satellite imagery at a (minimum) 1:10,000 scale to verify its accuracy. Any linear features that did not correspond with features visible in satellite imagery were either corrected or deleted based on satellite imagery interpretation. In the case of duplicate features across datasets, the 'best' data were attributed to a single feature by considering the spatial accuracy and the amount and accuracy of attribute data, as assessed against satellite imagery. Where duplicate widths occurred in the two source datasets, the wider width was retained.

3.2 LINEAR FEATURE CHARACTERISTICS SURVEY

Field studies quantified the width, vegetation characteristics, line-of-sight, and large mammal ease of travel assessment across the linear feature types identified from the GIS inventory. One aspect of the field study was to compare vegetation, line-of-sight, and ease of movement on the linear features to undisturbed areas adjacent to the cleared lines. Three types of surveys collected data for the linear feature study: ground surveys

(finest level of detail), air surveys (medium level of detail), and air calls (coarsest level of detail). EDI crews collected field data between July 28 and August 8, 2019.

3.2.1 SITE SELECTION

All ground surveys and aerial surveys occurred at predetermined, random sites. Sample sites were selected using a clustered, random sampling approach. This approach balanced obtaining a random, representative sample across linear feature types with survey efficiency (i.e., without clustering sites, the travel time between points would have been substantially greater and resulted in smaller sample size). Survey sites were drawn from 5,000 points distributed randomly across the set of mapped linear features (minimum spacing of 200 m between points). Each point was randomly assigned a unique number.

Each survey cluster included options for both ground and air surveys. For ground surveys, the cluster used a 2 km radius designed to accommodate approximately four ground survey sites, intended to be surveyed within a half-day of work (and close enough so crews could walk between sites). The objective was that two ground clusters could be surveyed by a crew each day. For air surveys, a 4 km radius was used that generally provided at least ten random survey site options. The objective for air survey clusters was that they could be surveyed while transiting between ground survey clusters.

Survey sites were selected via a two-stage process. The first stage was randomly drawing 100 points from the 5,000-point dataset. These points defined the survey clusters and served as actual survey sites. In this first stage, site selection was stratified to obtain an approximately equal sample across 2D, 3D and winter roads. This overweighted sampling of 2D and winter roads, relative to their extents in the RSA, but those features had the highest uncertainty in terms of their widths, vegetation characteristics, and functional characteristics. Stratification was necessary to obtain sufficient sample sizes across these less-common features. The second site-selection stage selected additional random points from the 5,000-point dataset in proximity to the first point, using the 2 km radius for ground surveys and the 4 km radius for aerial surveys.

The RSA was divided into 10 work areas to implement the sample design, each corresponding to a day of surveys. Each day the survey crew selected clusters to survey using the ascending order of the random identification number of the first point used to define each cluster. Similarly, points within each cluster were prioritized in ascending order of the random identification number. Normally, at least two ground clusters and two air clusters were sampled each day. However, that varied somewhat depending on the number of sample sites available in each cluster and the availability of the helicopter.

3.2.2 LINEAR FEATURE CHARACTERISTICS AND SURVEY METHODS

3.2.2.1 Linear Feature Characteristics

A range of structural, vegetation, human use, and functional characteristics was assessed in the field. A list of the various characteristics examined, with a description of each, is provided in Table 3-1. Successional classes and structural stages of vegetation are defined in Table 3-2 and Table 3-3, respectively.

Table 3-1. Description of physical, ecological and function characteristics assessed in the Eagle Plains linear feature study.

Parameter	Description	Survey Measured [1]
Plot location	Latitude and longitude using WGS 1984, measured by Garmin GPS units to ~4 m accuracy.	G, AS, AC
Linear feature type	Dempster Highway, winter road, 2D, 3Dc (conductor lines), 3Dr (receiver lines), and 3D5 (3D lines used both for seismic and local equipment/vehicle travel.	G, AS, AC
Linear feature width	During ground surveys, measured to the nearest 0.05 m and replicated four times. During aerial surveys, they were visually estimated to the nearest 1 m.	G, AS
Percent mulch	Percent cover of mulch (wood chips) on the seismic line, estimated to the nearest 1% using visual estimates. In areas with dense trees or large shrubs, the thick mulch layer produced during line clearing can hinder vegetation regeneration.	G, AS
Successional class	Refers to the successional trajectory of vegetation regeneration on the linear feature. Includes normal, magnified, stagnated, retrogressive, no succession, or recent disturbance class following Simpson (2008)[1].	G, AS, AC
Burn status	Burnt or not burnt; based on visual assessment (i.e., burned trees, charred ground vegetation).	G, AS, AC
Structural stage	Categorical descriptor of the dominant vegetation life form in the plot following the *Field Manual for Describing Yukon Ecosystems* criteria (Environment Yukon 2017). Structural stage categories are defined in Table 3-3.	G, AS
Height and species of tallest vegetation	Measured to the nearest 0.1 m for the tallest vegetation layer, approximated by the 90th percentile height to exclude extreme heights of individual plants.	G
Cover and species of dominant trees	Percent cover was recorded to the nearest 1% if less than 10%, and to the nearest 5% if over 10%. One or two dominant tree species were recorded.	G, AS
Cover and species of dominant shrubs	Percent cover was recorded to the nearest 1% if less than 10%, and to the nearest 5% if over 10%. Up to five co-dominant shrub species were recorded. Ground shrubs were excluded.	G, AS
Ecosite	Ecosite was recorded using Predictive Ecosystem Mapping (PEM) Units, available at the time of the survey. However, separate vegetation surveys indicated that the accuracy of the PEM mapping was poor, and ecosites were not used in subsequent analyses.	G
Permafrost activity/degradation	Present or absent. Additional comments (i.e., type of activity, percent cover) were recorded if applicable.	G
Wildlife trails	Present or absent. If present, rated as poorly, moderately, or well defined.	G
Potential for Off-Highway Vehicle (OHV) passage	Present or absent. Based on professional judgment, a 4x4 side-by-side is summer, considering obstructing vegetation, ground conditions (e.g., wetlands, peatlands), and graminoid tussocks.	G, AS
Signs of human activity	Present or absent. If present, applicable comments were recorded.	G
Ground disturbance	Percent cover of visibly disturbed ground. If present, type and additional descriptive comments were recorded.	G

[1] G=Ground Survey, AS=Aerial Survey, AC=Air Call.

[2] Between 2006 and 2008, Yukon Government, Department of Energy, Mines, and Resources investigated the recovery status of linear features in the Eagle Plains, British Mountains, and Peel River Plateau Ecoregions (Simpson 2008). They found that linear features typically regenerated into one of six categories: normal succession, magnified succession, retrogressive succession, successional stagnation, no succession, and recent disturbance (Table 3-2).

Table 3-2. Descriptions of successional classes on linear features in the Eagle Plains area (following Simpson 2008).

Successional Class	Description
Normal succession	Vegetation is similar to the adjacent undisturbed area but often in an earlier seral stage. E.g., often young trees surrounded by early successional shrubs and forbs. The disturbance was likely limited to removing trees and shrubs, with little to no disturbance to soil or permafrost.
Magnified succession	Vegetation on the feature is taller than the adjacent undisturbed area. Deciduous species often dominate tree and shrub layers, but a similar pattern was also observed for coniferous trees on some sites. The response is likely due to increased site productivity (including increased soil moisture, nutrients, and temperature) due to soil disturbance or increased depth to permafrost. Most frequently, but not exclusively, observed in burns.
Retrogressive succession	Sites are typically moss or sedge-dominated (rarely forb or low shrub), with high moisture content, often including standing water (i.e., micro wetlands), that contrast to upland conditions in adjacent undisturbed areas. The condition appears to result from permafrost melting and water pooling associated with vegetation removal and removal/compaction of the peat layer and mostly associated with winter roads.
Successional stagnation	Vegetation is typically dominated by graminoids or shrubs and not progressing to more advanced successional stages. Disturbance to soil or permafrost is likely. The ground may have been compacted. Almost exclusively associated with winter roads.
No succession	No ecological differences between the linear feature and adjacent undisturbed areas except that there is no or very little tree or shrub regeneration on the line, other than what was left after creation of the feature. Disturbance appears to be limited to the removal of trees and shrubs, with little to no disturbance to ground vegetation, soil, or permafrost.
Recent disturbance	Newer seismic line where successional patterns could not be determined. Features in this class were most likely trending to 'normal succession' or 'no succession', but the degree of regeneration was too limited to classify confidently.

Table 3-3. Structural stage categories used in ground and air surveys for the Eagle Plains linear feature study.

Structural Stage Code	Structural Stage Name	Description
1	Non-vegetated	Very recent disturbance (e.g., fire or flood) and no vegetation or less than 5% vegetation.
2	Sparse/Cryptogram	Either the initial stages of primary succession or a cryptogram community maintained by environmental conditions (e.g., bedrock, talus). Sparse tree, shrub and herb cover. Either sparsely vegetated overall (low cover of vascular plants and cryptograms, if present) or dominated by cryptograms.
2a	Sparse	5–10% vegetation cover.
2b	Bryoid	Bryophyte-dominated.
2c	Lichen	Lichen-dominated.
3	Herb	Early successional stage (e.g., post-fire forest succession) or a herb community maintained by environmental conditions or disturbance. Vegetation is dominated by herbs, although if the site overall is sparsely vegetated, herb cover can be low as long as herbs characterize the vegetation. Trees and shrubs are usually sparse or absent; however, shrub cover and stature (compared to herb cover and stature) determine whether the site is considered herbaceous.
3a	Forb-dominated	Includes non-graminoid herbs and ferns.

Structural Stage Code	Structural Stage Name	Description
3b	Graminoid-dominated	Includes grasses, sedges, reeds, and rushes.
3c	Aquatic	Floating or submerged plants dominate.
3d	Ground shrub-dominated	Dominated by dwarf woody species such as kinnikinnick (*Arctostaphylos uva-ursi*) or dwarf willows.
4	Shrub	Early successional stage of a forest or a shrub community maintained by environmental conditions or disturbance. Dominated either by shrubby vegetation, including tree seedlings or saplings; or, if sparsely vegetated overall, dominated by shrubs, which characterize the community as a shrubland.
4a	Tall Shrub	Dominated by woody plants >2 m tall with diameter at breast height (dbh) ≤7 cm.
4b	Low Shrub	Dominated by woody plants <2 m tall.
5	Treed: Pole/Sapling	Trees >2 m tall and with dbh >7 cm, typically densely stocked. Self-thinning and vertical structure are not yet evident in the canopy. Younger stands are vigorous (usually >15 to 20 years old); older stagnated stands (up to 100 years old) are also included; time since disturbance usually <40 years; up to 100+ years for dense (5,000–15,000+ stems per ha) stagnant stands.
6	Treed: Young Forest	Self-thinning has become evident and the forest canopy has begun to differentiate into distinct layers. A more open stand than at the pole/sapling stage.
7	Treed: Mature Forest	Trees established after the last stand-replacing disturbance have matured; a second cycle of shade-tolerant trees may have become established; shrub and herb understoreys become well developed as the canopy opens up.
8	Treed: Old Forest	Stands of old age with complex structure; patchy shrub and herb understoreys are typical; regeneration is usually of shade-tolerant species with a composition similar to the overstorey. Fire-maintained stands may have a single-storey appearance.
9	Treed: Very Old Forest	Very old stands with complex structures, abundant large trees, snags and coarse woody debris (CWD); snags and CWD occurring in all stages of decomposition; stands are comprised entirely of shade-tolerant overstorey species, with well-established canopy gaps.

3.2.2.2 Survey Methods

Three types of surveys assessed linear feature characteristics: ground surveys (finest level of detail), air surveys (medium level of detail), and air calls (coarsest level of detail). The reason for using different survey types was to maximize the sample size obtained, recognizing that the ability to collect certain types of data, or the level of measurement precision, decreased from ground surveys to aerial surveys to air calls. The characteristics that were measured during each survey type are noted in Table 3-1. Surveys were conducted between July 28 and August 8, 2019.

Ground surveys collected the most information and had the highest measurement precision of the three survey methods. All parameters listed in Table 3-1 were recorded. Field measurements generally followed methods in *Field Manual for Describing Terrestrial Ecosystems* (BC MFLNRORD and BC MOE 2010) with parameter specific details noted in Table 3-1. Photographs were taken of representative on-line and off-line plots.

Air surveys collected moderate resolution data on linear features. Air surveys efficiently collected a larger quantity of more generalized data than ground surveys. The subset of parameters recorded for aerial surveys is noted in Table 3-1. The survey methods generally followed procedures outlined for helicopter-based 'visual checks' in *Standard for Terrestrial Ecosystem Mapping in British Columbia* (Resources Inventory Committee 1998). Data were collected by hovering in a helicopter approximately 30 m over the sample sites for approximately three minutes while field crews recorded data for the reduced set of variables. Like ground surveys, relevant data were collected for both on-line and off-line plots. Photographs were taken at representative air survey plots (Attachment A).

Air calls collected data at the coarsest resolution of the three survey types, and no off-line data were collected. The data collected during air calls were limited to linear feature type, successional class, and burn status. Air calls were opportunistically conducted when EDI crews were flying through the RSA and linear features were encountered.

A fundamental aspect of the field study was to compare linear feature characteristics to adjacent undisturbed areas. Hence, field surveys included paired on-line and off-line plots at each sample site (excluding sites assessed via air calls). Off-line plots were located 50 m off the linear feature, with the direction off the feature selected randomly at each site using a coin toss. Data collected for each sample site were recorded on tailored survey forms (Attachment B).

3.2.2.3 Line-of-Sight and Ease of Travel

In addition to the structural and vegetation measures noted above, line-of-site and ease-of-movement were assessed as functional characteristics of the linear features at each ground plot. The sightline, measured to the nearest metre, was calculated as the farthest line that could be sighted using a range finder at the height of 1.5 m off the ground. Two measurements were recorded, one in each direction along the linear feature. Sightline measurements were repeated using the same bearings in the off-line plot.

Ease of travel was assessed using a 'walk test,' as Keim et al. (2019a) described in a study assessing the functional recovery of linear features. They found that ease of travel, as measured by a walk test conducted by human researchers, positively correlated with the intensity of use by several wildlife species. One EDI crew member timed themselves to the nearest second for the walk test while walking an approximately 75 m transect, measured to the nearest metre using a hip chain. This walk test was repeated in both the on-line and off-line plots, the paired transects spaced in parallel, approximately 50 m apart. The same observer conducted both walk tests to minimize observer bias at each site.

3.3 VISIBILITY OF LINEAR FEATURES FROM THE DEMPSTER HIGHWAY

One of the management concerns associated with seismic exploration is that seismic lines create travel routes that humans use. The probability of human use of seismic lines to access the surrounding landscape likely increases if the seismic line is visible and accessible from roads. The intersections of seismic lines and winter roads with the Dempster Highway are the primary locations where this could originate. Driving surveys were conducted along the 47 km section of the Dempster Highway within the RSA to determine the number and

type of linear features that could be located and accessed by the public from the Dempster Highway. Two types of surveys were conducted: a blind search where the location of the linear features was unknown and a 'map search,' where the observers had a map of the linear features that showed where they occurred. Both surveys were conducted on August 8, 2019.

The blind search approximated the proportion and type of linear features that the public could locate and access without prior knowledge of their locations. An EDI field crew drove along Dempster Highway at 35 km/h and attempted to identify linear features by visual inspection alone, unaware of where they intersected the highway. When a linear feature was identified, the crew stopped to record the following parameters:

- linear feature type;
- sight line distance;
- evidence of human use;
- evidence of wildlife use; and
- potential for OHV passage.

Photographs were taken, and relevant comments were recorded for each linear feature intersection where applicable.

The map search was a targeted search designed to approximate the proportion and type of linear features the public could spot from the Dempster Highway with prior knowledge of their locations. Using a map of linear features present in the RSA, an EDI field crew drove along the Dempster Highway, slowing to 10 km/h and attempting to identify the linear features when passing a point where the map showed they intersected the highway. When a linear feature intersection was reached, the crew recorded whether the line was visible or not and the parameters listed above for the blind search where a line was detected.

3.4 WINTER TRACK SURVEY

An aerial survey was conducted to assess the relative frequency of use of different liner feature types by ungulates and humans in late winter (March 2020). The survey consisted of 11 transects spanning the width of the RSA. Three of the transects were established parallel to the Dempster Highway at 50 m, 1 km and 5 km off the highway. The remaining transects were spaced approximately 5 km apart across the remainder of the RSA.

Before the field survey, each transect was established in a GIS. Each intersection with a linear feature was given a unique identification point and used to generate a field form (i.e., with a row for each linear feature intersection). The field survey involved flying along each transect and recording the presence of ungulate tracks or human tracks (e.g., snowmobile tracks) at each linear feature that was traversed. Surveys were conducted via helicopter at approximately 70 km/h, 50 m above the ground, with one navigator/data recorder and one primary observer. The surveyors classified tracks to species and counted the number of unique tracks. However, overlapping tracks and dustings of new snow made track identification and counts uncertain in over

half the detections. Therefore, analyses defaulted to the simple presence/absence of ungulate tracks. The primary metric examined was the proportion of linear features with ungulate tracks.

The original survey plan was also to count tracks in undisturbed areas between linear features. However, tracks were so numerous that surveying the entire area between linear features would have required substantially reducing the aircraft speed. This would have reduced the number of transects that could have been surveyed. As a compromise, field crews subsampled the area between lines by surveying an approximate 200 m band of an undisturbed area adjacent to each linear feature.

In conjunction with winter fish habitat assessments, the transects were surveyed over six days (March 7–13, 2020). Each day, one or two transects were surveyed while transiting to/from the study area. No track-erasing snowfalls occurred during the survey period. Snow depths ranged from 65 to 80 cm.

3.5 DATA PREPARATION AND ANALYSIS

3.5.1 SPATIAL DATA

The project generated two primary spatial datasets — a point database corresponding to all field survey sites and the linear feature database. The Linear Feature Survey Point Database (ArcGIS point feature class) contains all location-specific (point coordinate) field data collected at sample sites in summer 2019. Several fields were added to this database based on calculations and spatial joins (e.g., year of linear feature establishment and most recent fire). Paired on-line and off-line plot data were recorded as part of the same sample site coordinate.

The Linear Feature Inventory (ArcGIS polyline feature class) is a compilation of all documented linear features within the RSA, verified by comparing the preliminary linear feature inventory to aerial and satellite imagery and ground-truthing results.

Several modifications were made to improve the accuracy and detail of the Linear Feature Inventory:

- Linear features were classified into the following categories:
  - 2D (historical seismic lines, typically >3m wide),
  - 3D5 (including 4–5 m wide 3D lines that were used for both seismic and local vehicle/equipment travel);
  - 3Dc (3 m wide 3D seismic conductor lines);
  - 3Dr (2 m wide 3D seismic receiver lines);
  - winter roads (any trails or limited use roads used by vehicle or equipment, generally wider than 5 m and often with an obviously curving path); and,
  - Dempster Highway.
- Overlapping features (within a 3 m tolerance) were addressed according to the following rules:

- If two linear features of the same or unknown age overlapped, the wider feature was saved and the narrower feature deleted.
- If two linear features of the same or unknown width overlapped, the more recent feature was saved and the older feature deleted.
- If a 3D line overlapped with a 2D line, both lines were saved. This is because the older 2D lines were often still evident on the landscape in some state of regeneration, as were the 3D lines. However, both were saved since it was unknown at what state each line was in (i.e., if the 2D line was still evident, or only the 3D line, or both in varying states of regeneration). This occurred for 33 km of linear features within the RSA.

The preliminary linear feature inventory within the RSA was compared against a recent high-resolution satellite or aerial imagery (generally, 0.5–1 m resolution) at a 1:10,000 (or finer) scale to verify the accuracy of the source data. Any features that were visibly offset from georeferenced imagery were corrected to match the imagery.

Some older (1960s and 1970s) 2D seismic lines included in the source databases did not appear in satellite imagery. These 2D lines were compared against the imagery along the length of the feature to search for any sign of linear disturbance and then cross-referenced with field surveys conducted along the line, if present. These unverified linear features were classified as 'not applicable' and excluded from analysis if there was no evidence of linear disturbance along the feature's length in the imagery, which could often be verified with associated surveys noting that the feature was 'not present,' 'not visible,' or 'completely regenerated.' Unverified linear features were retained if there was evidence of linear disturbance along any feature's length in the imagery or if associated surveys had noted that the feature was present and in some state of regeneration, even if the feature was not visible in the imagery. A total of 199,473 m of erroneous or regenerated linear features were deleted from the linear feature inventory within the RSA.

Some linear features were visible on the imagery that had not been included in any of the source databases. In these cases, the linear features were manually digitized and classified into linear feature types based on visual assessment and attributes of adjacent connecting features, if present. Digitized linear features were assigned a year if they were obviously a continuation of a documented feature or if they were surrounded by features of the same type and year. Otherwise, the year was not included. High-resolution imagery was not available for the southernmost portion of the RSA (approximately 25 km by 15 km). This area was compared against lower quality Google Earth imagery, but this was not detailed enough to detect undocumented linear features if any existed (Google Earth 2019). However, existing linear features were verified using this method. A total of 202,945 m of linear features were digitized within the RSA.

After the Linear Feature Inventory was verified and corrected to be consistent with imagery and field observations, it was spatially joined to the Linear Feature Survey Point Database. In cases where the survey point did not correspond with any nearby linear feature, or if a linear feature was deleted (following the methods described above), the data were retained in the survey point database, but the linear feature type was updated to 'not applicable' and excluded from data analysis. Ten survey plots were identified as 'not applicable' and excluded from analyses; thus, the corrected sample size for survey plots is n = 210.

3.5.2 FIELD DATA

After completing field sampling, data forms and field notes were reviewed for completeness and accuracy during an internal data quality-assurance process. All associated digital photographs and GPS coordinates were reviewed to correspond to the appropriate field plots. A summary of field plots by linear feature type and survey type is provided in Table 3-4. All recorded data were entered into MS Excel databases (Microsoft 2019). Spatial data were uploaded to the ArcGIS platform (ESRI 2019).

Field-collected data were summarized primarily using Excel spreadsheets (Microsoft 2019). More detailed statistical analyses were performed on select data using R Statistical Software (R Development Core Team 2020). For example, the variation in ease of travel and vegetation cover as a function of linear feature types, burn history, successional stage, or ecosite were explored. During formal analyses, standard assumptions of normality and homogeneity of variance were assessed, and variance-covariance structures were applied to model heterogeneity (of residuals) if required. For instance, the sightline distance (m) was fourth-root transformed to meet normality. In certain models, random effects were included to account for variance among different subjects. For example, observers were included as a random variable to account for observer bias (i.e., a random intercept model; package "nlme", Pinheiro et al. 2016). Corrected Akaike's Information Criteria (AICc) scores were used to compare sets of candidate models. Models with the lowest AICc score were selected because they yielded the best balance (parsimony) between explained variance and level of complexity.

Table 3-4. The number of sites surveyed using ground surveys, air surveys, and air calls for each linear feature type in the Eagle Plains RSA.

Linear Feature Type	Survey Type			
	Ground Survey	Air Survey	Air Call	Total
2D	31	32	44	107
3D-5m wide	5	0	0	5
3D-Conductor	26	3	0	29
3D-Receiver	23	1	0	24
Winter Road	18	17	8	43
Dempster Highway	2	0	0	2
Not Applicable	3	2	5	10
Total	108	55	57	220

3.5.3 LINEAR FEATURE DENSITY CALCULATION

Linear feature densities were calculated in two ways: (1) using the total linear feature extents, and (2) adjusting the extents to account for (a) lines through 'open' habitats, such as wetlands and recent burns, where the vegetation on the line did not differ from vegetation off the line, and (b) functionally recovered linear features such as 2D lines from the 1960s and 1970s that had advanced regenerated at least to the Tall Shrub structural stage. Adjustments were determined by intersecting the Linear Feature Inventory with a recently developed

Ecological Landscape Classification (ELC) map of the RSA (a companion Eagle Plains Project baseline report). The ELC map documented the type and structural stage of vegetation communities across the RSA. The extent of linear features in open habitats was determined by the lengths of linear features overlapping Low Shrub, Herb and Bryoid structural stages in the ELC maps. This includes seral habitats regenerating from burns and ecosystems that are maintained in those stages over time, such as wetlands and shrub-carrs. The extent of regenerated linear features was determined by integrating the proportion of regenerated lines observed from the field surveys (e.g., 61% for 2D lines) with the length of lines through non-open vegetation types in the ELC map. Adjustments were applied to generate functional linear feature densities for each linear feature type individually (i.e., to compare the relative extents of different feature types) and combined to provide an overall density for all linear feature types. For example, the linear feature density for 2D lines was calculated by starting with the total length of 2D lines in the RSA, reducing that by the length of lines through open vegetation types, then reducing the remaining extent by the average proportion of 2D lines that were observed to be regenerated, and then dividing the remaining total length of lines by the extent of the RSA.

4 RESULTS

4.1 LINEAR FEATURE INVENTORY AND DENSITIES

A total of 4,269 km of linear features were mapped and verified in the RSA (Map 4-1, Table 4-1). Winter roads and 2D seismic occur in varying densities across much of the RSA. The extent of 3D seismic is limited to the one area straddling the Dempster Highway in the centre of the RSA.

The total linear feature density in the RSA was 1.79 km/km², based on a total length of 4,269 km and the RSA area of 2,386 km². 3D seismic lines accounted for approximately half of the total length of linear features in the RSA, 2D seismic lines accounted for about one-third, followed by winter roads and the Dempster Highway (Table 4-1). Adjusting for open habitats (i.e., areas in structural stages Low Shrub, Herb, and Bryoid) and vegetation regeneration[1] resulted in substantially lower densities of 0.52 km/km² (Table 4-2). Relatively large extents of recent wildfires were the greatest factor reducing linear feature densities. The relative proportions of the different linear feature types were similar after adjustments, though the proportion of 3D increased and 2D decreased. This was mainly due to the greater degree of vegetation regeneration on 2D lines, consistent with their age since disturbance.

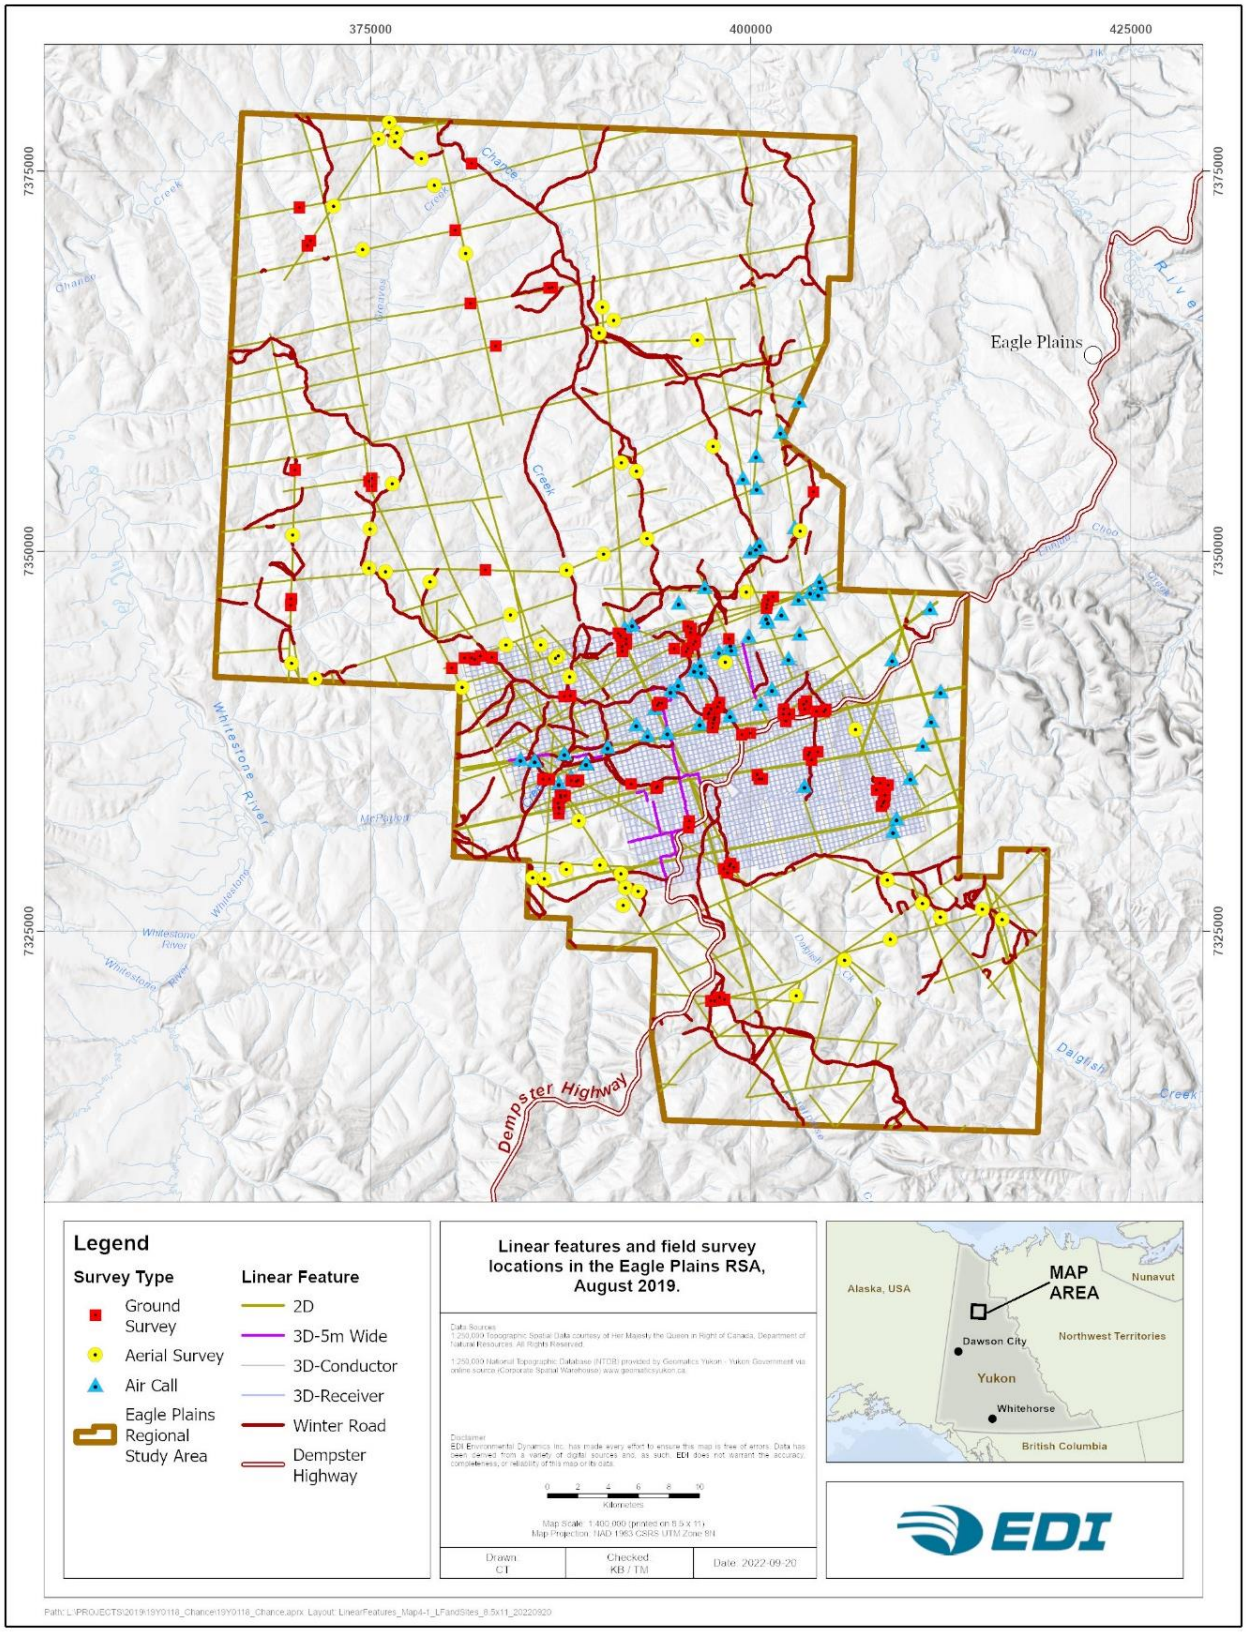
Table 4-1. Summary of total length and density of linear features documented in the Eagle Plains RSA.

Linear Feature Type	Total Length (km)	The Proportion of Total Length	Linear Feature Density (km/km²)
2D	1,452	34%	0.608
3D (combined)	2,165	51%	0.907
3D-5m wide	48	1%	0.020
3D-Conductor	1,189	28%	0.498
3D-Receiver	928	22%	0.389
Winter Road	596	14%	0.250
Dempster Highway	47	1%	0.020
Unknown	8	<1%	0.003
Total	**4,269**	**100%**	**1.788**

[1] See Section 5.5 Functional Recovery of Linear Features for details about vegetation regeneration criteria.

Table 4-2. Summary of total effective length and density of linear features in the Eagle Plains RSA adjusted for open habitat and vegetation regeneration.

Linear Feature Type	Total Length (km)	Proportion of Total Length	Linear Feature Density (km/km²)
2D	289	23%	0.121
3D (combined)	750	60%	0.314
3D-5m wide	21	<1%	0.009
3D-Conductor	401	32%	0.168
3D-Receiver	328	26%	0.138
Winter Road	171	14%	0.072
Dempster Highway	26	<1%	0.011
Unknown	8	<1%	0.003
Total	1,243	100%	0.521



Map 4-1. Linear features and field survey locations in the Eagle Plains RSA, August 2019.

4.2 LINEAR FEATURE CHARACTERISTICS

4.2.1 LINE WIDTHS

Line width varied by linear feature type. Mean line widths ranged from 1.96 m for the narrowest line type (3D receiver lines) to 33.75 m for the Dempster Highway (Table 4-3). Standard error around mean estimates were smallest for 3D seismic lines, which were cleared in the same season using the same equipment and methods, and greatest (by a large margin) for winter roads. The average difference in widths between 3D conductor (wider) and 3D receiver lines was 1.2 m.

Table 4-3. Widths of different linear feature types in the Eagle Plains RSA.

Linear Feature Type	n	Minimum mean width (m)	Maximum mean width (m)	Overall mean width (m)	Standard Error (m)
2D	107	3.97	8.5	5.42	0.11
3D-5m wide	5	5.30	6.40	5.68	0.22
3D-Conductor	29	2.50	4.80	3.17	0.13
3D-Receiver	24	1.63	2.53	1.96	0.04
Winter Road	43	2.53	17.97	7.42	0.66
Dempster Highway	2	33.00	34.50	33.75	0.75

4.2.2 MULCH COVER

Mulching of woody vegetation is common during seismic line clearing activities and was used in the 2013/14 3D program. In areas with thick tree or shrub cover, mulching can create a thick blanket of wood chips that inhibits vegetation regeneration (Golder Associates 2016). There was no evidence that this was an issue with any of the seismic lines within the RSA. On average, the percent cover of mulch was <1% on all line types.

4.2.3 HUMAN USE

No sign of human use was detected along linear features during the summer ground surveys (e.g., OHV tracks, ruts, water crossings, vegetation trampling/scarring, tree blazes, trap sets, garbage, and campsites), except for the two sites on the Dempster Highway.

On average, 42% of on-line sites were deemed passable to an OHV (a 4x4 side-by-side) during summer, considering obstructing vegetation, ground conditions (e.g., wetlands or peatlands), and the presence of graminoid tussocks (Table 4-4).

Table 4-4. Proportion of survey sites deemed passable to OHV in summer across different linear feature types in the Eagle Plains RSA.

Linear Feature Type	No. Survey Sites	% Passable
2D	55	9%
3D-5m wide	5	80%
3D-Conductor	29	59%
3D-Receiver	24	75%
Winter Road	29	55%
Dempster Highway	2	100%
Total	144	42%

4.2.4 SUCCESSIONAL CLASSES

Linear features surveys in the Eagle Plains RSA observed five of the six of the successional classes documented by Simpson (2008): normal succession, magnified succession, stagnated succession, no succession, and recent disturbance (Figure 4-1) (Attachment A). No retrogressive succession sites were observed at official survey sites. However, a small number of retrogressive sites were incidentally observed on winter roads while travelling through the RSA.

Most sites surveyed (79%) were undergoing normal succession. The next most common successional class was magnified succession, occurring in 11% of sites, followed by stagnated succession, occurring in 5% of sites. All 3D seismic lines surveyed followed a normal successional trajectory, except for one site that was classed as recently disturbed. Magnified succession was most common in 2D seismic lines (21%), while stagnated succession was most common in winter roads (19%). Successional classes were defined as 'not present' if the linear feature was not present in the field or had regenerated to a stage that was not discernable from the adjacent areas. The Dempster Highway was classified as recently disturbed due to the regular maintenance of the road.

Fire history appeared to influence some successional classes. Magnified succession was more common at burnt sites (19 burnt versus 5 unburnt). In contrast, stagnated succession was more common at unburnt sites (3 burnt versus 7 unburnt). Sites on a normal successional trajectory did not appear to have any relationship to burnt status. The remaining successional classes were too uncommon to draw any conclusions.

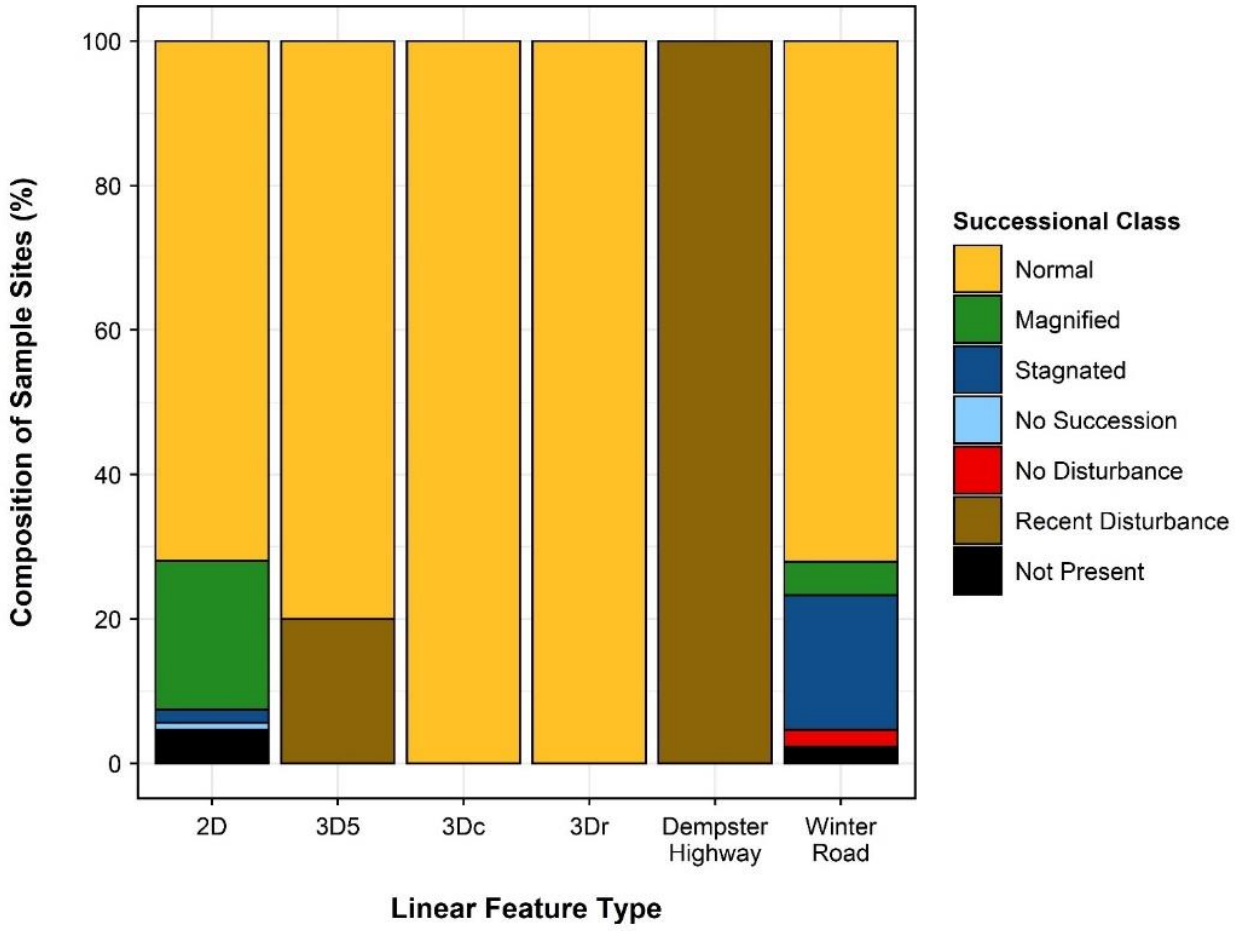


Figure 4-1. Summary of successional classes observed across different linear feature types in the Eagle Plains RSA.

4.2.5 STRUCTURAL STAGE

Most linear features were in a Low Shrub (56.1%) or Tall Shrub (29.0%) structural stage. However, the distribution of structural stages varied substantially across linear feature types (Table 4-5). Although herbaceous and forested stages occurred at some on-line plots, they were not common (less than 5%each). Nearly all forested structural stages were observed on 2D seismic lines and winter roads, reflecting the long time since they were created. Tall Shrub stages were almost twice as frequent in 2D seismic lines than any other linear feature type. Conversely, 83% of 3D linear features were in the Low Shrub structural stage, with most of the remaining in the Tall Shrub stage. The differences in structural stages between 2D and 3D lines appear to be primarily due to the time since disturbance. Winter roads were less consistent in their structural stages; herbaceous, shrubland and forested stages were all observed with moderate frequency. The two Dempster Highway plots were the only non-vegetated stages recorded.

Off-line plots were also mostly in Low Shrub and Tall Shrub stage, but they also included a higher proportion of Young Forest and Mature Forest compared to on-line plots (Table 4-5; Photos A-15 to A-20 in

Attachment A). For off-line plots, the Low Shrub sites were mostly burned areas, and the Tall Shrub sites were mostly stunted, open-canopy, black spruce forest 2–8 m tall.

Fire had a strong effect when comparing structural stages between paired on-line and off-line plots (Figure 4-2). The top two charts in Figure 4-2 show that the pattern of structural stages for burnt areas was very similar between on-line and offline plots. The bottom two charts show that the pattern of structural stages differs substantially between on-line and offline plots in unburnt areas. In unburnt areas, off-line plots had much lower numbers of sites in Low Shrub and much higher numbers of sites in Young Forest and Mature Forest than on-line plots. For burnt areas, the on-line and off-line plots at the same site were the same structural stage in 72% of cases, and within one structural stage of each other 91% of the time (e.g., Tall Shrub vs Pole Sapling). For areas that were not burnt, the on-line and off-line plots at the same site were the same structural stage in only 29% of cases. These results demonstrate that in the absence of fire, pronounced differences between linear disturbances and the surrounding community are evident in both recent (3D) and legacy (2D and winter road) linear feature types. But following a fire, the vegetation structure on-line and off-line are likely to be similar (Photos A-22 to A-24 in Attachment A).

Table 4-5. Vegetation structural stages observed on different linear feature types as a proportion of all plots sampled (n = 156) in the Eagle Plains RSA.

Linear Feature Type	No. Sites	Structural Stage[1]								
		Non-vegetated	Bryoid	Herb	Low Shrub	Tall Shrub	Pole-Sapling	Young forest	Mature forest	Old Forest
2D	62	0%	0%	2%	37%	47%	2%	8%	3%	2%
3D-5m wide	5	0%	0%	20%	80%	0%	0%	0%	0%	0%
3D-Conductor	29	0%	0%	0%	83%	14%	0%	3%	0%	0%
3D-Reciever	24	0%	4%	0%	83%	13%	0%	0%	0%	0%
Dempster Highway	2	100%	0%	0%	0%	0%	0%	0%	0%	0%
Winter Road	33	0%	0%	12%	48%	27%	3%	3%	6%	0%
Off-line	155	0%	1%	1%	33%	29%	1%	18%	17%	1%

[1] See Table 3-3 for structural stage codes and descriptions.

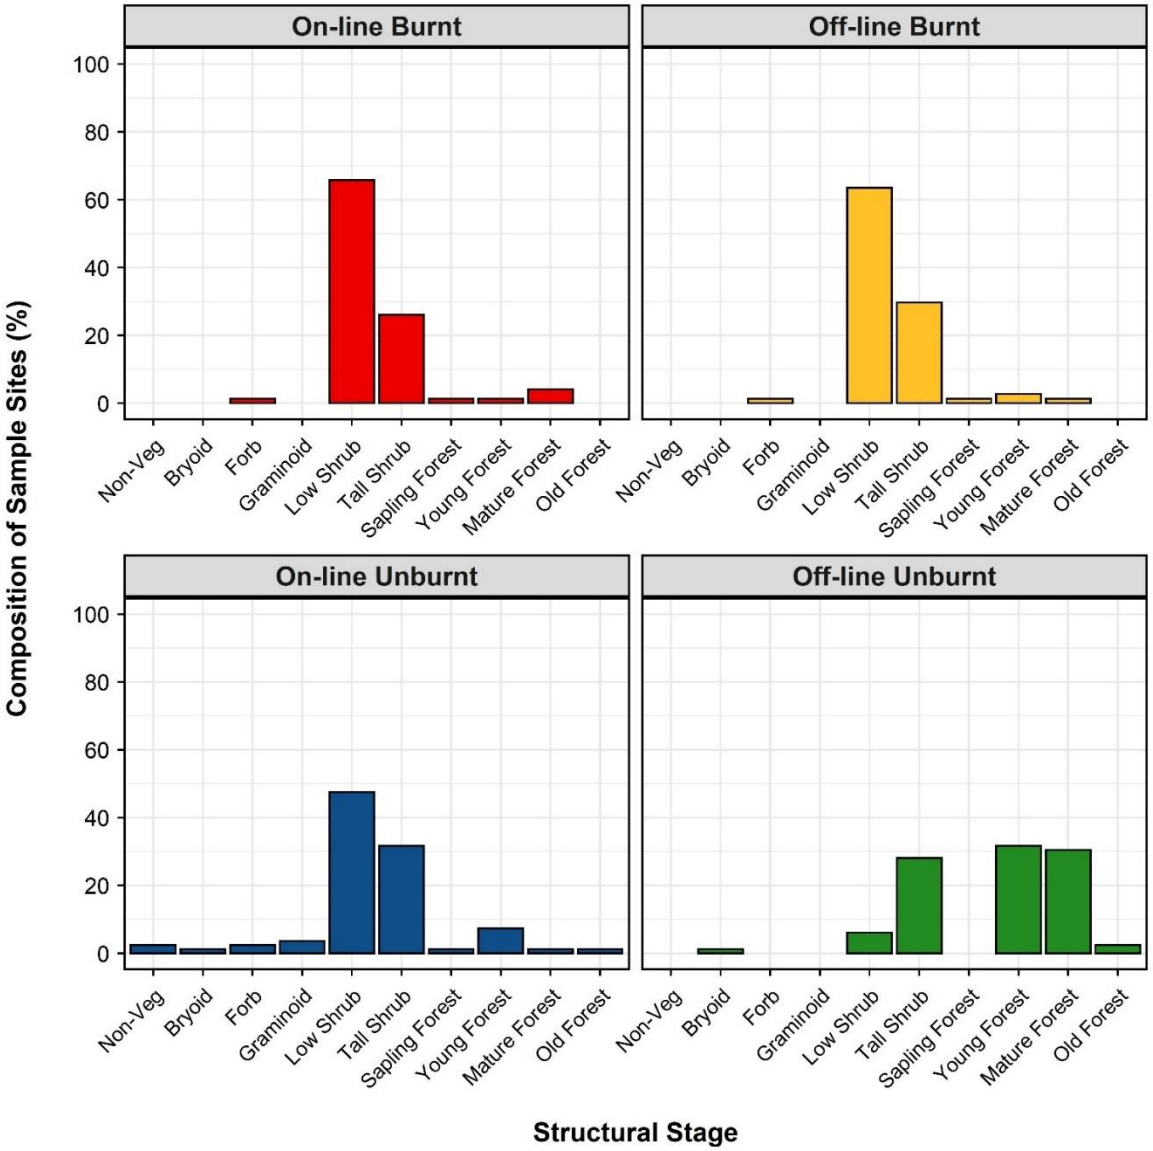

Figure 4-2. Comparison of structural stages on linear features to off-line plots in burnt and unburnt areas, in the Eagle Plains RSA.

4.2.6 VEGETATION HEIGHT

Based on the similarity of patterns in vegetation composition and structure, linear feature types were combined into two groups for assessment of patterns in height: (i) 2D and winter roads and (ii) 3D. A wide range of vegetation heights was recorded at both on-line and off-line plots in the RSA, from 0.3 m to 16 m. Collectively, off-line plots had a normal distribution of vegetation heights between 0 m and 4 m, and then a scattered distribution across heights up to 16 m (Figure 4-3). Plots with ≥4 m tall vegetation accounted for approximately 40% of all off-line reference plots.

In comparison, recovering 2D seismic lines and winter roads shared a relatively uniform distribution between 0 m and 4 m but with a peak occurring at vegetation heights measuring 1.5–2 m tall (Figure 4-4). Only 21% of 2D and winter roads contained dominant vegetation ≥4 m, and only 5% were ≥8 m tall. 3D seismic lines were rarely composed of vegetation ≥2 m, and most of the vegetation (67%) recovering on 3D lines was less than 1 m (Figure 4-5). This is very different from the off-line undisturbed height distribution. However, 3D lines were all only five years old at sampling, and shorter vegetation was expected.

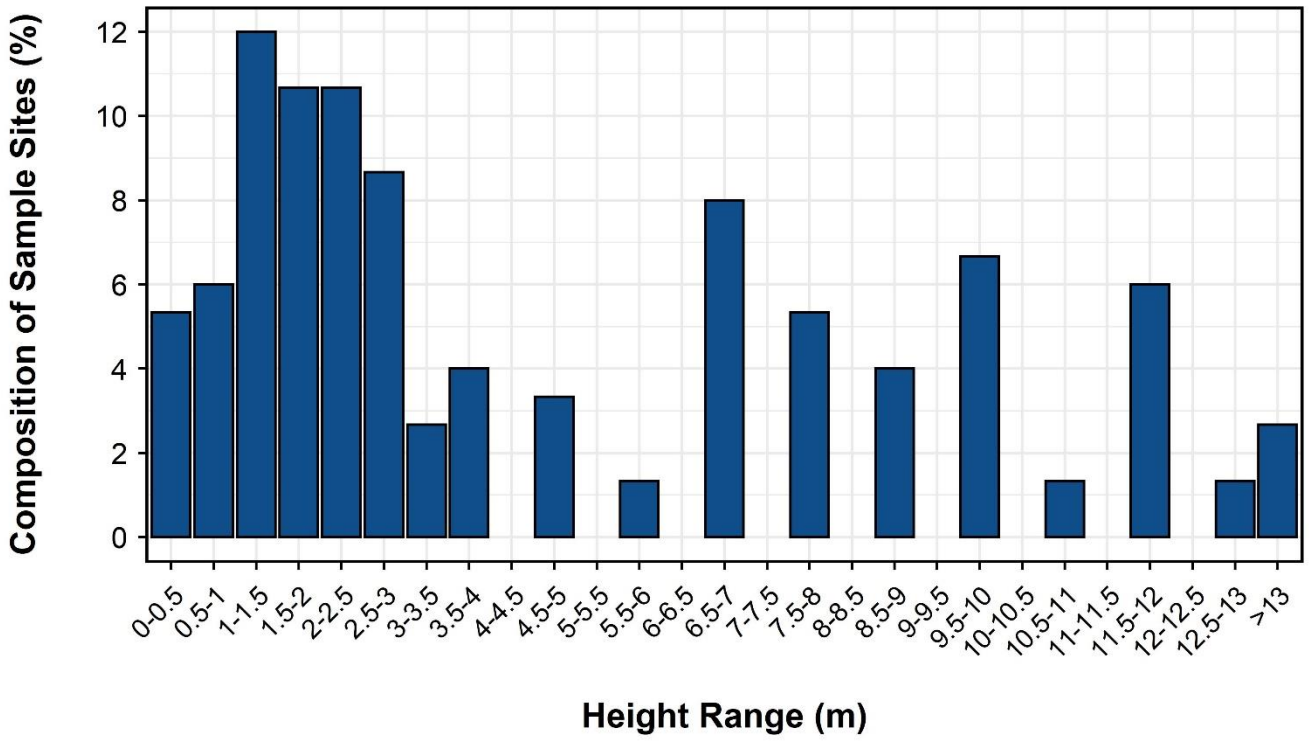

Figure 4-3. Vegetation height distribution of off-line reference plots in the Eagle Plains RSA.

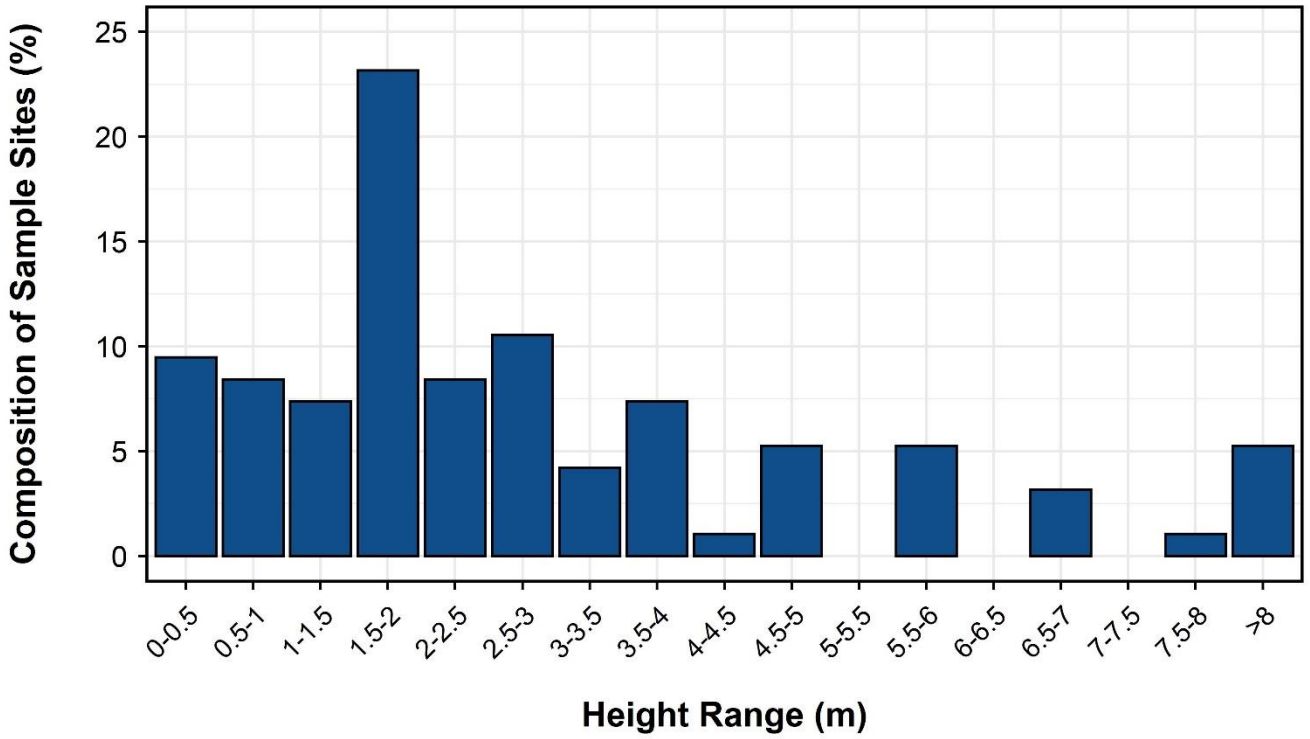

Figure 4-4. Vegetation height distribution of on-line 2D and winter road plots in the Eagle Plains RSA.

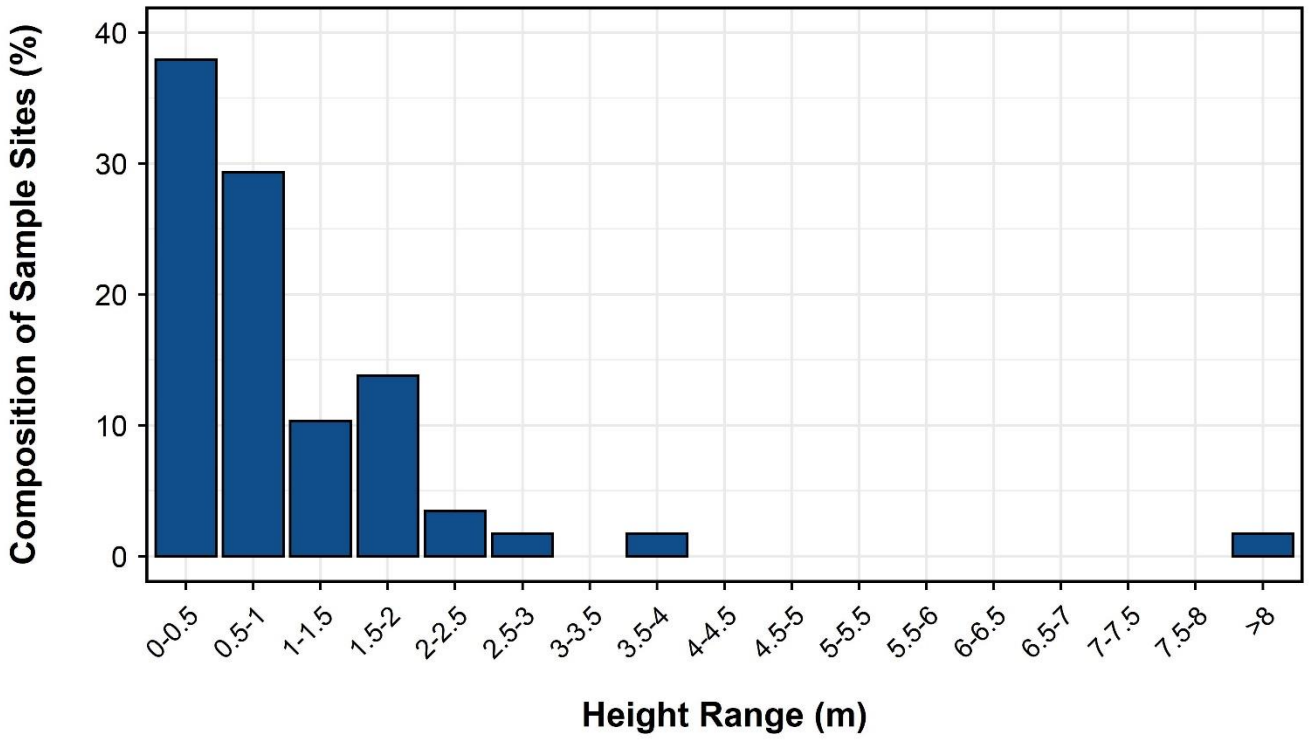

Figure 4-5. Vegetation height distribution of on-line 3D plots in the Eagle Plains RSA.

4.2.7 VEGETATION COVER

Tree and shrub cover varied between linear feature types and burn status (Table 4-6). Generally, tree cover was low on undisturbed reference plots (mean tree cover of 8% on unburnt and 2% on burnt sites). This is typical of the taiga cordillera landscape — forests are generally stunted and sparse due to poor nutrient regime and continuous permafrost conditions (Smith et al. 2004). Of the on-line plots, tree cover was greatest on 2D seismic lines and burnt winter roads (5% to 8%) and lowest on 3D seismic lines and the Dempster Highway (0%), regardless of burn status. This is likely due to the recently disturbed 3D seismic lines that are too young for trees to have re-established. Burnt 2D seismic lines and winter roads had greater tree cover than unburnt lines.

Shrub cover was much greater than tree cover overall. Shrub cover was typically 30–40% on unburnt off-line plots and 40–50% on burnt off-line plots. Shrub cover was highest on 2D seismic lines (~54%), regardless of burn status. Shrub cover was moderate on winter roads (38–45%) and lowest on unburnt 3D seismic lines (8–22%). Burnt 3D seismic lines had approximately twice as much shrub cover as unburnt 3D lines.

Table 4-6. Summary of the mean tree and shrub cover (%) between on-line and off-line, and burnt and unburnt plots surveyed in the Eagle Plains RSA.

Linear Feature Type	Burn Status	Mean Tree Cover (%)		Mean Shrub Cover (%)	
		On-line	Off-line	On-line	Off-line
2D	Burnt	7.0	3.5	54.0	36.0
	Unburnt	5.5	13.4	53.2	32.8
3D5	Burnt	0.0	0.3	41.7	60.0
	Unburnt	0.0	0.5	7.5	42.5

4.2.8 LINE-OF-SIGHT AND EASE OF TRAVEL

Line-of-sight (sightline) distance was examined primarily as a function of line type; however, vegetation height (the primary factor affecting sightlines) was also examined for on-line and off-line plots for each linear feature type using multiple linear regression. Mean sightlines varied significantly by linear feature type (Table 4-7, $F_{4,187} = 3.3$, $P = 0.01$). For reference, the average sightline distance for offline controls was 46.7 m. This relatively far distance reflects the open stand structure on most sites in the region. Burn status had little influence on sightlines (e.g., burnt off-line=50.2 m, unburnt offline=43.6 m). 2D lines had the shortest average sightline distances at 41.2 m. This was mainly due to the advanced stage of regenerating vegetation on the lines. Where regenerating vegetation was limited, sightline distances on 2D lines frequently exceeded 150 m.

On 3D lines, the time since clearing was too recent for regenerating vegetation to obscure sightlines. Instead, sightline distances on 3D lines were generally controlled by bends in the lines, which were specifically designed as mitigation measures to reduce sightlines. For 3D lines, sightline distances decreased from 3D5 to 3Dc to 3Dr lines. The reduction in sightline distances resulted from differences in line width and the average distance between bends across the feature types.

The regression analysis also found a significant interaction between on-line versus off-line occurrence and vegetation height ($F_{1,187}$ = 13.0, P = 0.0004), whereby on-line plots had, on average, more negative slopes than off-line plots. In other words, sightlines at on-line plots decreased more drastically than off-line plots with each incremental increase in vegetation height. This is consistent with the qualitative observations of field crews that the regenerating vegetation on lines was thicker than the vegetation off lines.

Similar to sightline distances, determining differences in ease of travel among line type the primary factor of interest for the walking speed tests. However, burn status, and the percent cover of trees and shrubs were expected to be the most important explanatory variables related to walk speeds, so they were included as secondary variables using a mixed-effects linear regression. Walking speeds across linear feature types and the differences between on- and off-line plots within linear feature types varied significantly (Table 4-8, $F_{5,170}$ = 3.4, P = 0.006). However, the magnitude of the difference between on-line and off-line plots was modest. Even the Dempster Highway only conveyed a 35% increase in walking speed over off-line plots. Other researchers, in other areas, often observed walk speeds on linear features were often at least twice as fast as off-line transects (Keim et al. 2019a).

Notwithstanding the modest magnitude of faster walking speeds on-lines, there were clear patterns in walking speed differences across linear feature types. 2D lines were the one feature type where walking speeds were slower on lines than off lines. This reflected the thick, shrub stage vegetation that had regenerated on most 2D lines, which impeded travel (similar to the effect that regenerating vegetation had on sightline distances in the previous section). Walk speeds decreased across the other feature types in relation to line width and the degree to which ground cover was levelled or compacted.

Statistical analyses indicated that both burn status ($F_{1,170}$ = 17.85, P < 0.0001) and percent cover of shrubs and trees (hereafter woody vegetation; $F_{5,170}$ = 5.29, P = 0.0002) affected walking speeds, both on and off lines. On average, walk speeds in burns were approximately 10% slower than in unburnt areas. This is partly related to thicker woody cover in most burns, which hinders walking speed because of the time it takes to push through or walk around it. Walking speeds significantly decreased, on average, by 0.04 (CI = 0.02–0.06) km/h and with every 10% increase in the percent of woody cover off-line and 0. 11 (0.07–0. 15) km/h on 2D lines.

Table 4-7. Average sightline distances along different linear feature types in the Eagle Plains RSA.

Linear Feature Type	n	Average Sightline Distance (m)	Comments
2D	30	41.2	Sightlines are frequently reduced by regenerating vegetation >1.5m tall
3D-5m	5	105.6	Has fewer bends than 3Dc and 3Dr
3D-Conductor	26	75.9	Sightlines limited by bends in lines; too recent for regenerating vegetation to impede sightlines

4.3 VISIBILITY OF LINEAR FEATURES FROM THE DEMPSTER HIGHWAY

Overall, the blind search identified 11 of 100 possible linear feature intersections with the Dempster Highway (Table 4-9). Five of the features were roads that were classified as winter roads in the GIS inventory, but most (four) were actually short, all-season roads leading to gravel pits or well sites. Two of the observed features were human truck/OHV trails that led to camp sites 100–200 m off the Dempster Highway, and four were 3D seismic lines. The map search detected two more 3D lines, one 2D line, and one old winter road. The 2D line and the old winter road had regenerated into Young Forest structural stages. Excluding the four short secondary roads into gravel pits and well sites, and the two human trails, only 8% of linear features that intersected the Dempster Highway were visible during the two driving surveys.

Only 6 of the 74 3D lines that crossed the Dempster were detected. The combination of construction design (i.e., creating a bend in the 3D line adjacent to the highway) and regenerating vegetation in the right-of-way made it difficult to detect the 3D lines. Evidence of human use (e.g., packed vegetation, tire tracks, rutting, garbage, campfire remnants, tree stumps, or tree blazes) was observed on four of the short, all-season roads

and the two trails. No evidence of human use was noted on any of the 2D or 3D seismic lines, or the three winter roads (including the Chance and Blackie winter roads). However, some types of human use do not leave sign during the snow-free season (e.g., snowmobile use in the winter).

Table 4-9. Summary of linear features identified and intersecting the Dempster Highway during a blind search test.

Linear Feature Type	No. Features Intersecting the Dempster	No. (%) Observed Blind Search	No. (%) Observed Map Search	Total No. (%) Observed	OHV Accessible	Sign of Human Use
2D	18	0 (0%)	1 (6%)	1 (6%)	0	0
3D	74	4 (5%)	2 (5%)	6 (8%)	4	0
Secondary Roads	8	5 (63%)	1 (13%)	6 (75%)	5	4
Trail	n/a	2 (n/a)		2	2	2
Total	100	11 (11%)	4 (4%)	15 (15%)	11	6

4.4 WINTER TRACKS

In total, 462 linear features were surveyed for winter tracks over 358 km along the 11 transects. No human sign was observed on any linear features, except the Dempster Highway. Ungulate tracks were frequently observed travelling along linear features. The proportion of linear features with tracks decreased with decreasing linear feature widths, from 29% on winter roads, 24% on 2D lines, 8% on 3D conductor lines, and 6% on 3D receiver lines (Figure 4-6).

The frequency of use in adjacent undisturbed areas, corrected to account for different survey extents between the linear features and the undisturbed areas, was 1%. As discussed in the methods, it was difficult to compare the frequency of use along linear features to use in undisturbed areas. The issue is that for the comparison to be relevant, the survey design needs to account for the size of the sample units (i.e., the extent of the undisturbed area needs to be comparable to the width of the linear features), and the two samples should be independent. These conditions were not achieved under the current survey design (i.e., the extent of the survey area in the undisturbed area was much larger than the width of the linear feature, and the location of the undisturbed area was spatially correlated to the linear feature). The estimated relative use rate of 1% in undisturbed areas adjusts the total counts within the 200 m survey area to 5 m (i.e., the average linear feature width); however, the adjustment fails to account for spatial correlation between the two samples. Therefore, the estimate of use in undisturbed areas could be biased. Notwithstanding this limitation in the estimate of travel rates in undisturbed areas, it is supported by qualitative observations of the survey crew that travel rates on even the least used linear features (i.e., 3D lines) are higher than undisturbed areas.

The relative use of linear features by ungulates also appeared to vary with distance from the Dempster Highway, with features within 1 km of the highway receiving lower use than features equal to or greater than 5 km from the highway (Figure 4-7). It is worth noting that the Highway and 1 km transects were completed on the first and second day of surveys, respectively, and the other transects were surveyed one to six days later, providing more time for tracks to accumulate. Snowfall data prior to the crew's arrival on site was not

available; however, road crews at Eagle Plains reported that there had not been a major snowfall in the area for at least a week. Based on this information, the issue of time since last snow has less potential to bias results than if a track-erasing snow event had recently occurred.

[1] as characterized by reaching a tall shrub stage, or greater.
[2] including stagnated and disturbed successional patterns.
[3] accounting for burns, natural openings, and regeneration.
[4] percent of lines with ungulate tracks during March 2020.

2D Seismic — 2D lines are, on average, the oldest features in the area and have had the longest time to regenerate. Most features were cleared before 1985, but some were developed in the early 2000s. Historical 2D lines were generally long and straight, with moderate widths of 4–8 m. Lines were typically constructed with bulldozers that cut into the moss layer and often included some patches of soil disturbance. The combination of site disturbance and wider widths generally resulted in a successional reset to pioneering vegetation (including early seral graminoids, forbs, and shrubs). Most sites were following a normal successional pathway (73%). However, 27% of sites exhibited atypical pathways, dominated by magnified succession (21%, mostly in burns), stagnated succession (3%) or no succession (1%). Sixty-one percent of the 2D sites had regenerated to a Tall Shrub or more advanced structural stage. 2D lines had the shortest sightlines and slowest walk test speeds of all feature types (including off-line controls), reflecting the regenerating vegetation's effect on these functional metrics. During winter, ungulates regularly used 2D lines to travel along.

3D Seismic — All 3D lines were created during the last exploration period, during the winter of 2013/14. 3D lines constitute the most extensive combined lengths of the different linear feature types, but their areal extent is limited to a relatively small portion of the RSA along the Dempster Highway. Due to their basic design, as well as specific mitigations, 3D lines minimize environmental effects compared to other linear feature types. They are narrow (averaging 3.2 m and 2.0 m for conductor and receiver, respectively), often

narrower than average tree spacing in the region. They were constructed during winter, over snow, using low-ground pressure equipment, which avoids ground disturbance and maintains vegetation in the moss, herb and low shrub layers. The lines were constructed with a meandering path, and strategically placed sharp angle dogleg bends to reduce the visibility of the lines from roads, reduce sightlines along them, and hamper travel by OHVs. All 3D lines that were surveyed were undergoing a normal successional pathway and were dominated by the same vegetation as in adjacent undisturbed areas. Regenerating vegetation was mostly in a Low Shrub structural stage, consistent with the relatively short six-year period since they were cleared. Sightlines and movement speeds were intermediate compared to other linear feature types, with sightlines primarily controlled by dogleg bends purposely designed to reduce sightline distances. Ungulates occasionally used 3D lines to travel on in winter, but at less than a third of the rate as 2D lines and winter roads.

Winter Roads — A network of winter roads across much of the RSA results from the historical exploration programs that have occurred. Although many of the winter roads were initially developed during the earliest exploration programs, vegetation has not had the same opportunity to regenerate as on 2D lines because the vegetation was re-cleared on several roads during subsequent exploration programs. The average width of winter roads was 7.4 m, but major roads, like the Chance road, were often 10–12 m wide. Historical winter roads were typically cleared with a bulldozer, and then snow was packed and graded to create a road surface. Similar to historical 2D seismic, the combination of site disturbance and wider widths (i.e., that increases solar exposure) generally resulted in a successional reset to pioneering vegetation (including early seral graminoids, forbs, and shrubs). Most sites were following a normal successional pathway (72%), but 26% of sites exhibited atypical pathways, dominated by stagnated succession (19%), magnified succession (6%) and no succession (1%); 2% of the sites were classified as no disturbance (indistinguishable from vegetation community off the road). Thirty-nine percent of the winter road sites had regenerated to a Tall Shrub or older structural stages. Winter roads had the longest sightlines and fastest walk test speeds of all feature types, other than the Dempster Highway, reflecting the variable levels of regenerating vegetation that occurred on winter roads. During winter, ungulates regularly used 2D lines for travel.

Dempster Highway — The Dempster Highway is the only all-season road in the RSA (except for short spurs off the Dempster to well sites and gravel pits). It is fundamentally different from all other linear features in the area in terms of wide width, surface material and maintenance, long sightlines, regular traffic, and base of access for human land use activities such as hunting, camping, and trapping.

5.2 LINEAR FEATURE CHARACTERISTICS

5.2.1 FIRE

The presence or absence of recent forest fires affected several linear feature characteristics, including linear feature width, successional class, structural stage, and vegetation height and cover. Mean measured linear features widths were 0.2–0.6 m wider at burnt sites than at unburnt sites. This may be due to the already shorter vegetation at burnt sites, which would reduce overgrowth occurring from forest edges and decrease the measured width between driplines (branches extending into the linear feature from either side of the line).

Magnified succession was nearly four times more common in burnt plots than unburnt plots, and stagnated succession was half as common. Fire likely facilitates magnified succession by increasing soil temperatures, accelerating decomposition, and releasing stored water and nutrients to promote vegetation growth (Seccombe-Hett and Walker-Larsen 2004, Simpson 2008). Stagnated succession is likely less common at burnt sites because the associated nutrient and water increase allows woody plant species to colonize more easily and advance through successional stages.

Overall structural stage distribution was very similar between burnt on-line and off-line plots, but was markedly different between unburnt on-line and off-line plots. Furthermore, when the structural stages were compared between paired on-line and off-line plots, they matched two to four times more frequently at burnt sites than at unburnt sites and were mismatched two to six more frequently at unburnt sites than at burnt sites. Nearly all burnt plots were in a low shrub, or tall shrub structural stage, which is expected as fires tend to remove overstory trees, and shrubs generally colonize rapidly post-fire (Seccombe-Hett and Walker-Larsen 2004).

Vegetation height was 4.4 m shorter in burnt than unburnt reference plots, and tree cover was approximately 6% less. These modest differences reflect the stunted and open nature of the taiga forest. There was little change in vegetation height between burnt and unburnt linear features, likely because there were very few linear disturbances in a forested structural stage; most of them, even in unburnt conditions, were already in a shrub-dominated stage due to the clearing of trees. For shrub cover, except for 2D seismic lines, the mean was approximately 10% to 20% greater at burnt plots than at unburnt plots. The increase in shrub cover at burnt sites was most prominent in 3D seismic lines due to their comparatively lower pre-fire shrub cover.

Post-burn vegetation was, on average, shorter and shrubbier than unburnt off-line plots, but taller and shrubbier than unburnt on-line plots. Furthermore, burnt paired plots were more similar in vegetation characteristics than unburnt paired plots. This evidence supports the theory that forest fires in taiga ecosystems resets the landscape to some extent and effectively erase signs of anthropogenic disturbance (Seccombe-Hett and Walker-Larsen 2004, Simpson 2008). Forest fire in the taiga returns ecosystems to an early successional stage (i.e., low shrub) and synchronizes baseline biophysical conditions on a landscape scale, allowing previously disturbed and undisturbed areas to recover at equal rates, as has been documented by Seccombe-Hett and Walker-Larsen (2004). Thus, most linear features that have experienced forest fires no longer create different ecological conditions or functional disturbances than the surrounding landscape.

5.2.2 SUCCESSIONAL CLASS

The idea that vegetation regeneration on linear features could follow different successional trajectories came out of work by the Yukon Government in the early 2000s (Simpson 2008). That work described six successional trajectory classes observed in the Eagle Plains area. However, that study did not quantify the relative extents of linear features that followed the different trajectories. This study used the classes that the Yukon Government work developed and quantified the proportion of linear features in each successional class across a random sample of linear features.

Successional classes in the Eagle Plains RSA varied according to linear feature type and burn status. However, one of the key findings was that normal succession was the dominant trajectory observed for all linear features except the Dempster Highway. All 3D seismic lines followed a normal successional trajectory, except for one recently disturbed site. This was likely attributable to the low impact methods used in 3D line creation that minimize ground and vegetation disturbance, creating conditions more likely to result in a normal successional trajectory (Yukon Energy Mines and Resources 2006, Golder Associates 2016). Magnified and stagnated succession were only observed in 2D seismic lines and winter roads. These linear features were generally wider and were created using methods that cause greater disturbance to soils, hydrology, and vegetation, leading to these alternative successional trajectories (Simpson 2008, Jorgenson et al. 2010, Dabros et al. 2018). Magnified succession is unique among the classes in that it results in accelerated vegetation regeneration. Magnified succession was most common on burned 2D seismic lines where the combination of site disturbance associated with the 2D lines and fire is suspected of causing accelerated soil warming, moisture availability, and nutrient flush, which increase on-line vegetation growth (Simpson 2008). Successional stagnation was most common on unburnt winter roads. Stagnation tends to occur on features that have experienced ground disturbance or have been seeded to agronomic species, which may have happened on winter roads in the RSA (Simpson 2008). Repeated disturbance associated with multiple exploration programs over time may also limit successional advancement and contribute to successional stagnation (Lee and Boutin 2006, Jorgenson et al. 2010).

Although some alternative successional pathways were observed in this study, most linear features in the Eagle Plains RSA are following a normal successional trajectory. This implies that most of these disturbances will recover to an ecological condition like that of the surrounding community with adequate time.

5.2.3 STRUCTURAL STAGE

The taiga forest in Eagle Plains presents a unique situation where the Tall Shrub stage is applied to two very different stand conditions. One condition, the more traditional, is of regenerating stands following a natural or anthropogenic disturbance. In this setting, the vegetation consists of deciduous shrubs and 2–8 m tall, 10–30 years old trees. The stage is transitional, with the vegetation expected to advance to the Pole-Sapling stage over time. The second condition where the Tall Shrub stage is applied is to stunted, old, black spruce stands in a disclimax state. In this setting, the vegetation consists of open, stunted, black spruce stands that are typically ≥50 years old and 2–8 m tall. Stands in this condition are expected to remain in the same condition over time(i.e., a disclimax state). Structurally, the stunted black spruce trees function more like shrubs than trees. Both Tall Shrub conditions (referred to as disturbance and disclimax forms hereafter) are widespread across the RSA in off-line sites. Only the disturbance form was observed on linear features.

The structural stage on linear features was predominantly Low Shrub or Tall Shrub, determined mainly by the time since line clearing and burn status. Less than 4% of surveyed features were in forested stages (Pole-Sapling or greater). Off-line plots had a higher proportion of forested structural stages (37%). However, they were still predominantly Low Shrub and Tall Shrub, resulting from extensive burns across the RSA and large extents in the disclimax form for Tall Shrub in un-burned areas.

The structural stage of on-line plots was also influenced by successional class. The small number of forested structural stages observed on features only occurred on sites undergoing normal succession. Stagnated succession was associated with only the Herb structural stage, which was expected as stagnation is defined by its high herbaceous species cover (among other factors) that limits the establishment of other structural groups. Magnified succession was the one atypical successional class with accelerated vegetation growth. Most structural stages on sites with magnified succession were in Tall Shrub and, occasionally, Pole/Sapling. Often the structural stage on magnified succession sites was one stage greater than the off-line plot.

5.2.4 VEGETATION HEIGHT

This study observed a range of vegetation heights across different feature types. Except for the 3D lines, the linear features' age was unknown, so it was impossible to estimate growth rates. Although some regenerating vegetation on 2D seismic lines and winter roads reached 8 m high, most were between 1.5 m and 2 m. Though the ages of specific features were mostly unknown, the minimum age for most was at least 35 years. Having most vegetation heights at only 1.5–2.0 m after this long period suggests regeneration growth rates on linear features may be quite slow. This pattern of slow vegetation growth on linear features may partly reflect the generally poor growing conditions in the taiga region. Still, it is also a pattern that has been observed on linear features in other studies in the southern boreal forest.

Interestingly, the vegetation heights on linear features in Eagle Plains are greater than reported in several other studies. For example, approximately 65% of sites on linear features in northeast Alberta had not advanced beyond a cover low forbs after 35 years (Lee and Boutin 2006). Key factors that have been linked to slow vegetation regeneration on linear features were continued human disturbance (e.g., OHV travel), ecosystem type (bogs and fens regenerated much slower than upland sites), competition from early seral and invasive graminoids and forbs, and soil or site degradation associated with feature construction (Lee and Boutin 2006, van Rensen et al. 2015, Finnegan et al. 2018).

There is limited data on vegetation regeneration in the taiga. A study from NWT found that vegetation regeneration on conventional seismic lines was affected by both a time lag for seedling establishment (as long as 17 years for black spruce) and slow growth rates (83 years to reach 5 m) (Seccombe-Hett and Walker-Larsen 2004). In burned areas, the seedling establishment delay was reduced to five years.

Although the 3D lines in Eagle Plains were only six years old when they were surveyed, a combination of field survey results and information from other studies suggests that vegetation recovery on 3D lines could be much faster than the previous examples for conventional 2D lines. This is because the undisturbed ground conditions and maintenance of the vegetation community in the moss, forb and low shrub layer provide both plants and growing conditions that support faster shrub and tree growth compared to sites beginning primary succession. In northeast British Columbia, Golder Associates (2016) found that in the first year following 3D seismic line creation, there were already black spruce seedlings exceeding 0.5 m in height. These seedlings were plants that were initially present on the site and that had survived line clearing. This is consistent with the results of this study, where nearly all of the 3D plots contained black spruce seedlings. Despite their relatively young age, most 3D seismic lines in Eagle Plains included shrubs and trees between 0.5 m and 1 m

tall. Although growth rates in Eagle Plains are not known, similar species that occur in Eagle Plains were observed to grow 5–10 cm per year on 3D lines in the boreal forest in northeastern British Columbia (Golder Associates 2016). If similar growth rates occur in Eagle Plains, regeneration on the 3D lines can be 2 m over the next 5–20 years.

5.3 HUMAN USE AND ACCESS ALONG LINEAR FEATURES

The NYRLUP and the PWRLUP indicate that one of the primary concerns about linear features is that they can increase human access into remote areas. This has been demonstrated in southern regions, and that access can have secondary effects of inhibiting vegetation regeneration (Lee and Boutin 2006) and, in winter, packing snow that can affect predator-prey dynamics (Latham et al. 2011, McKenzie et al. 2012, Keim et al. 2019a). In the boreal forest in northern Alberta, OHV travel was common on most conventional 2D seismic lines. After 35 years, approximately 20% of the lines were considered to have been converted to tracked access routes (Lee and Boutin 2006). In the same study, about 65% of the lines remained cleared after 35 years, and OHV use along the lines was identified as one factor contributing to the lack of vegetation regeneration. In contrast, there is little evidence of human use along linear features in the Eagle Plains RSA. No sign of human use was detected along linear features during the summer ground surveys (e.g., OHV tracks, ruts, water crossings, vegetation trampling/scarring, tree blazes, trap sets, garbage, campsites, etc.) or the winter track survey (e.g., snowmobile tracks). Although these surveys provided limited snapshots in time, and that some types of human activity leave little sign (e.g., evidence of snowmobile tracks have limited persistence during winter and leave no sign behind after snow melt), the results suggest that human use of the area is very limited outside of the Dempster Highway corridor. This is consistent with general comments from highway workers, staff at the Eagle Plains Hotel, pilots, and some First Nation residents that most areas beyond the Dempster Highway corridor receive very little human use. Specific instances of use of the area outside the Dempster Highway corridor include intermittent activity on the community trapline that occurs in Eagle Plains and occasional forays by hunters (First Nation and non-First Nation), mostly in winter.

People's limited use of the Eagle Plains area is likely due to its far distance from any human settlements and the difficulty of travel off the Dempster Highway. The network of winter roads in the area does provide access via specific types of OHVs in summer and snowmobiles in winter. However, there was no evidence observed that this occurs regularly. Travel along seismic lines, though possible in specific locations, would be hampered over any substantial distance by vegetation regeneration along the historical 2D lines, the narrow widths of and frequent dogleg bends in 3D lines and, during summer, difficult terrain (extensive peatlands and graminoid tussocks).

5.3.1 EFFECTIVENESS OF MITIGATION MEASURES FOR 3D SEISMIC LINES

In addition to the narrow widths of 3D lines, which hampers OHV travel, the 3D lines included regular bends in the lines, which were designed to limit the visibility of the lines at intersections with roads and other seismic lines, and to hamper OHV along the lines further. The driving survey along the Dempster found that this mitigation was very effective in reducing the visibility of the 3D lines from the road (i.e., only 6 of the 74 3D

lines intersecting the Dempster Highway were visible). Incidental observations during ground surveys observed similarly reduced visibility of 3D lines crossing winter roads. Regular bends in the 3D lines away from roads were also designed to limit human access by reducing sightlines and making travel more difficult along the line (i.e., needing to reduce speed to navigate the tight turns of a dogleg bend approximately every 70 m).

5.4 FUNCTIONAL CHARACTERISTICS OF LINEAR FEATURES

In addition to human travel, linear features can also affect how wildlife move within a landscape. Several studies in western Canada have documented the effects of linear features on the movements and population dynamics of large mammals, such as caribou, moose, deer, wolves and bears (Latham et al. 2011, McKenzie et al. 2012, Dickie et al. 2017b, Keim et al. 2019a). EDI focused on two established indicators of human and wildlife access and travel on linear features: sightline distance and ease of travel. These measurements act as a proxy for the functional recovery of disturbed areas. They are mainly dependent on vegetation height, cover, and terrain.

5.4.1 LINE-OF-SIGHT

Line-of-sight or sightline distance is how far one can see under normal conditions and was compared between linear features and paired reference plots. It has been proposed that humans and predators select linear disturbances because it is easier to travel and detect prey using those features (Finnegan et al. 2018). As vegetation grows taller and denser, sightlines diminish, and the use of linear features decreases (e.g., for wolves, Dickie et al. 2017a). This study found that average sightlines were farther on-line versus off-line for most linear feature types, but that sightlines varied substantially across line types. Sightlines were shorter on seismic lines than on roads, especially 2D lines which had more advanced vegetation regeneration than other feature types. On 3D lines, sightlines averaged approximately 30 m farther on lines than off lines. However, this difference probably provides little advantage to predators or human hunters because the increase is still within the olfactory and auditory detection zone for most large prey species. Average sightlines were 60 m farther on winter roads than surrounding forest, which may begin to confer more advantage to predators and hunters.

The range of sightlines observed on most linear features probably do not provide an advantage to detect prey species visually. For 2D lines and winter roads, sightline distances were primarily driven by the height and density of regenerating vegetation. The recovery period for 2D seismic lines appears to be sufficient to support vegetation that reduces visibility to a similar level as the surrounding habitats. The reason for longer sightlines on winter roads is that they are subject to intermittent re-activation, where the vegetation is cleared once again, which resets vegetation recovery and maintains longer sightlines. In contrast to 2D lines and winter roads, where sightlines were largely determined by vegetation regeneration, the sightlines on 3D lines were presently limited by the bends purposely constructed into the lines. Sightlines along all feature types will continue to diminish over time as vegetation regeneration continues.

5.4.2 EASE OF TRAVEL

Ease of travel is a fundamental indicator of functional recovery of linear features. Wolves, bears, and humans have been documented to select linear features with greater ease of travel, which is generally associated with lower and more sparse vegetation and stable, even terrain (Dickie et al. 2017b, Keim et al. 2019a). Access and travel resistance are the main determinants of predator and human use of linear features and the key concern of linear disturbances in the RSA (Vuntut Gwitchin Government and Yukon Government 2009, Peel Watershed Planning Commission 2019).

The walk test used in this study, as an index of ease of travel, found differences among linear feature types and between linear features and controls. However, the magnitude of the differences for both comparisons was modest. Even the Dempster Highway only conveyed a 35% increase in walking speed over off-line plots. Other researchers, in other areas, often observed walk speeds on linear features were often at least twice as fast as off-line transects (Keim et al. 2019a). Two conditions associated with the Eagle Plains area appear to limit the advantage of travelling on linear features. One is that the vegetation in most ecosites and structural stages is relatively open and has a limited effect on impeding movement. The second factor is that ground conditions limiting movement, including soft, thick peat and graminoid tussocks, were similar on both on-line and off-line plots for most linear feature types.

Notwithstanding the modest magnitude of faster walking speeds on-lines, there were clear patterns in walking speed differences across linear feature types. 2D lines were the one feature type where walking speeds were slower on lines than off lines. This reflected the thick, shrub stage vegetation that had regenerated on most 2D lines, which impeded travel (similar to the effect that regenerating vegetation had on sightline distances in the previous section). Walk speeds decreased across the other feature types in relation to line width and the degree to which ground cover was levelled or compacted. 3D seismic lines allowed slightly easier travel than paired off-line plots. They usually had lower vegetation cover and clearer route selection. As linear feature width decreased in 3D lines, walking speed also decreased. This implies that width may be related to functional recovery, with narrower lines having smaller impacts than wider lines, even within an already narrow linear feature type. Although ease of travel was greater in 3D seismic lines than surrounding community, it is expected that this will decrease in future years as vegetation increases in height and density.

5.5 FUNCTIONAL RECOVERY OF LINEAR FEATURES

Functional disturbance is defined in the NYRLUP and PWRLUP as "*physical land use disturbance that results in disruption of soil or hydrology, or that requires the cutting of trees*." One of the main concerns with linear disturbances under these land use plans is that such features can technically allow increased access to previously remote areas, potentially leading to a greater harvest of wildlife and fish, higher predation rates, and a change in how people and wildlife use the land (Vuntut Gwitchin Government and Yukon Government 2009). A disturbance can be considered functionally recovered and subtracted from the overall linear density when it no longer facilitates access or travel by humans or wildlife (Vuntut Gwitchin Government and Yukon Government 2009), or otherwise no longer functions as a surface disturbance (Peel Watershed Planning Commission 2019). Both plans use 1.5 m vegetation height as a threshold for functional recovery in forested communities. The

PWRLUP includes the following additional criterion for recovery "*in non-forested areas (dominated by vegetation under 1.5 m), when the disturbed area is covered by native species roughly the same height and composition as the surrounding dominant vegetation*" (Peel Watershed Planning Commission 2019):

One limitation of using height alone as a functional recovery criterion is that it does not consider vegetation density. Although regeneration may meet the recommended height criteria, if it is very sparse (as is often the case in the Eagle Plains Ecoregion), it may still facilitate access and travel by humans and wildlife. Attachment Photo A-25 provides an example in the Eagle Plains RSA where tall but sparse regeneration meets the 1.5 m criteria but does not inhibit access or travel.

The combined results of this study indicate that using regeneration to the Tall Shrub structural stage may be a more appropriate criterion for functional recovery. Attachment Photo A-3 and Attachment Photo A-10 provide examples of linear features that have regenerated to a tall shrub structural stage. Using the Tall Shrub criterion, 38% of all linear features in the RSA would be considered functionally recovered compared to 53% using the 1.5 m height criterion. For this study, the more conservative criterion of reaching the Tall Shrub structural stage was used to adjust (reduce) linear feature densities.

5.6 LINEAR FEATURE INVENTORY AND DENSITY

This study was successful in mapping all linear features within the RSA. The combined results of the mapping exercise and the field studies found that the extent of open habitats (burns and naturally open habitats like wetlands and shrublands), and the degree of vegetation regeneration, played a significant role in the effective density of linear features across the RSA. Before accounting for open areas and regeneration, the total linear feature density was 1.79 km/km². After accounting for open areas and vegetation regeneration (to the Tall Shrub structural stage), the effective linear feature density was 0.52 km/km². The NYRLUP and PWRLUP suggest cautionary levels for linear density of 0.75 km/km² and critical levels of 1.0 km/km² (Vuntut Gwitchin Government and Yukon Government 2009, Peel Watershed Planning Commission 2019).

The Yukon Land Use Planning Council (YLUPC) was conducting a pilot study of surface disturbance across the broader Eagle Plains Ecoregion (Skinner 2021) at the same time as this study. The methods they used consisted of mapping and attributing human-caused disturbances solely using high-resolution satellite imagery. The YLUPC classified vegetation into eight broad classes based on whether the surrounding area was forested or non-forested, the similarity of vegetation on-line to off-line, and the presence or absence of woody cover (i.e., shrubs or trees). The features were then classified as recovered or not-recovered based on the presence of woody cover (recovered) or, if woody cover was not present, the similarity to surrounding vegetation (i.e., if similar then recovered, if not similar, then not-recovered). Historical field data and photographs from the area (Simpson 2008) were used to verify interpretations.

The spatial data from the YLUPC work was not available to compare in detail to the linear feature inventory compiled in this study. However, the mapping linework is expected to be very similar because satellite imagery was used to verify and supplement the linear feature geospatial data compiled in this study (presumably the same satellite imagery that YLUPC used because the imagery was obtained from Yukon Geomatics). One

difference between the two products is that the YLUPC completed the inventory for the entire Eagle Plains Ecoregion, while this study was restricted to the RSA. Another difference is that the attribute data in this study is expected to be more detailed and more precise than the YLUPC data because (i) the original geospatial data includes some information, like date of creation, that would be impossible to estimate from imagery, and (ii) because this study linked field surveys to the mapping exercise to determine line widths and other characteristics more precisely.

Although it is impossible to directly compare the linear feature density estimates between the two studies, due to the different study extents, the general pattern of results is similar. The YLUPC estimated the linear density (accounting for recovery) to be 0.38 km/km² across the entire Eagle Plains Ecoregion. This is consistent with the estimate from this study for the RSA of 0.52 km/km² because the portion of the Ecoregion outside the RSA has lower linear feature density than the RSA.

6 CONCLUSION

This study successfully mapped all linear features within the RSA and measured a suite of structural, vegetation, and functional characteristics across different feature types. Generally, the effects associated with linear features (i.e., differences between conditions on-line and adjacent off-line areas) correlated to feature width and the degree of ground disturbance. In terms of combined effects across the range of feature types that occur in the Eagle Plains RSA, the ranks were:

Dempster Highway >>> Winter Roads > 2D Seismic > 3D-5m >> 3D Conductor > 3D Receiver[2]

The effects of 3D lines (both conductor and receiver lines) appear to be substantially lower than other feature types. This reduced magnitude of effects is important because 3D lines have the longest combined length of exiting linear features. They are also the predominant feature planned for the next exploration program. Important findings for 3D lines include:

- Relatively narrow line widths of 2–3 m are often smaller than natural tree spacing and minimize the potential for changes to microsite conditions (e.g., solar radiation, air and ground moisture) reported in other studies.
- Minimal ground disturbance and maintenance of the moss, herb, and low shrub layers, which retains the natural vegetation community and accelerates vegetation regeneration.
- Successful application of mitigations, notably dogleg bends that minimize sightlines, ease of human travel, and visibility of lines from roads.
- Ungulate use of 3D lines in winter was less than a third of the rate observed on 2D lines and winter roads.

The adverse effects of linear features in other areas are often caused or exacerbated by human use after the lines are initially constructed, including effects on vegetation regeneration and predator-prey dynamics. Human use does not appear to be a significant factor in Eagle Plains. No sign of human use was observed outside the Dempster Highway corridor.

Substantial vegetation regeneration has occurred on existing features in the Eagle Plains RSA. Previous work by the Yukon Government identified the potential for atypical successional trajectories to occur on linear features in the region. Although atypical succession occurred to a limited extent, this study determined that 81% of the sites exhibited a normal succession (100% on 3D lines). Only 5% exhibited inhibited regeneration trajectories (mostly stagnated succession on winter roads). Regarding functional recovery, 53% of sites met the NYRLUP and PWRLUP criterion of vegetation reaching 1.5 m, and 38% of sites met the criterion of attaining a Tall Shrub structural stage. Using the Tall Shrub structural stage as a criterion of functional recovery may be a more ecologically appropriate criterion to meet LUP objectives.

The extent of open habitats (e.g., burns, wetlands and shrublands) and the degree of regeneration on existing linear features (mostly the older 2D lines and winter roads) play an important role in calculating effective linear

[2] Relative magnitudes of effects: >>> large effect, >> moderate effect, > small effect.

feature density in the RSA. Before accounting for open areas and regeneration, the total linear feature density was 1.79 km/km². After accounting for open areas and vegetation regeneration (to the Tall Shrub structural stage), the effective linear feature density was 0.52 km/km².

APPENDIX 2-A-31. *2D and 3D Seismic Plain Language Summary – Chance Eagle Plains Exploration Project*

2D and 3D Seismic Plain Language Summary – Chance Eagle Plains Exploration Project

Both 2D and 3D seismic by definition are used to remotely image the subsurface. Both use the same sources, usually a small amount of dynamite buried greater than 3m in the ground, to create a compressional wave. Geophones are placed on the surface to receive and record the waves that are reflected back by the rock layers.

2D seismic, an older less accurate method, places sources and receivers intermingled on a meandering line. This creates a vertical line of seismic data that is subject to online and offline scatter and structures. Therefore the geophysicist needs to interpret along the line as well as extrapolate between the lines of a 2D program. The image created by the interpretation of the collected wave data of the subsurface layers of rock is akin to a two dimensional slice of the earth from the surface to the depth of investigation (3-4,000 metres subsurface). There is no true image of the subsurface layers outside of this two dimensional plane.

3D seismic places the sources and geophones on a grid of lines perpendicular to one another. Source lines are meandering straight lines set up in parallel to each other and shot holes charged with a small amount of dynamite are made along these lines. Receiver lines are meandering lines built parallel to each other oriented across the source lines in a perpendicular fashion. The compressional waves created by the detonation of the dynamite in the source lines is recorded by the receiver lines such that the subsurface image is three dimensional. This is a method that is much more accurate in terms of being able to properly map the subsurface geological layers.

Today, both of these methods use Low Impact Seismic (LIS) methods with much narrower lines. These lines are cut to widths that accommodate the new narrower tracked drilling equipment for the source, and even narrower lines for laying equipment using long line helicopter and personnel on foot and/or on UTVs. The mulchers try to cut as little as possible by meandering through the forest and missing as many larger trees as possible. This is the quickest, easiest, and least intrusive method for both the forest and the mulching equipment.

N/A	N/A
NND0010	15-Mar-18	Phone call	Outgoing	First Nation of Na-cho Nyäk Dun	Richard Wyman (Chance)	Richard Wyman (Chance)	Chief Simon Mervyn (First Nation of Na-cho Nyäk Dun)	Engagement Plan	Chance called and left a message for Chief of First Nation of Na-Cho Nyäk Dun at 10:15AM following up on the email request of Feb 27th, 2018 about the Engagement and Communications Plan.	N/A	N/A
NND0011	20-Mar-18	Phone call	Incoming	First Nation of Na-cho Nyäk Dun	Chief Simon Mervyn (First Nation of Na-cho Nyäk Dun)	Richard Wyman (Chance)	Chief Simon Mervyn (First Nation of Na-cho Nyäk Dun)	Engagement Plan	Chief of First Nation of Na-Cho Nyäk Dun called Chance about potentially setting up a meeting. Chance suggested the first half of April and provided First Nation of Na-Cho Nyäk Dun with an update of Chance's progress to date.	N/A	N/A
NND0012	22-Mar-18	Email	Outgoing	First Nation of Na-cho Nyäk Dun	Richard Wyman (Chance)	Richard Wyman (Chance)	Chief Simon Mervyn (First Nation of Na-cho Nyäk Dun)	Meeting	Chance sent an email following up recent email correspondence and telephone conversations about setting up a meeting the week of April 9-13th. Chance notes that they met with the CEO of Na-cho Nyäk Dun Development Corporation that they expressed interest in discussing opportunities that are potentially available if Chance's exploration project moves forward.	N/A	N/A
NND0013	22-Mar-18	Email	Incoming	First Nation of Na-cho Nyäk Dun	Chrystal Lattie (Fist Nation of Na-cho Nyäk Dun)	Richard Wyman (Chance)	Richard Wyman (Chance)	Meeting	The Executive Assistant, First Nation of Na-Cho Nyäk Dun, sent an email to Chance indicating that Chief and Council are available to meet on April 9 and asked about Chance's time of preference between 8:30AM and 4:30PM.	N/A	N/A
NND0014	26-Mar-18	Email	Outgoing	First Nation of Na-cho Nyäk Dun	Richard Wyman (Chance)	Richard Wyman (Chance)	Chrystal Lattie (Fist Nation of Na-cho Nyäk Dun)	Meeting	Chance sent an email to First Nation of Na-Cho Nyäk Dun indicating that the Director and Chair of the Community Relations Committee at Chance would also be able to attend and would be able to fly participants to Mayo for the meeting on April 9th, 2018. Chance asked if it would be possible for participants to be picked up at the airport and to discuss expected arrival times closer to the date.	N/A	N/A
NND0015	27-Mar-18	Email	Outgoing	First Nation of Na-cho Nyäk Dun	Richard Wyman (Chance)	Richard Wyman (Chance)	Chrystal Lattie (Fist Nation of Na-cho Nyäk Dun)	Meeting	Chance sent First Nation of Na-Cho Nyäk Dun an email to let First Nation of Na-Cho Nyäk Dun know that Chance would call on morning to inform First Nation of Na-Cho Nyäk Dun as to whether or not Chance would be flying in or driving to Mayo (weather permitting).	N/A	N/A
NND0016	28-Mar-18	Email	Outgoing	First Nation of Na-cho Nyäk Dun	Richard Wyman (Chance)	Richard Wyman (Chance)	Chrystal Lattie (Fist Nation of Na-cho Nyäk Dun)	Meeting	Chance sent First Nation of Na-Cho Nyäk Dun a draft agenda for the meeting as well as a map of the Eagle Plains area showing the settlement lands, traditional territories and location of the exploration permits and significant discovery licenses owned by Chance.	First Nation of Na-Cho Nyäk Dun sent Chance an email on March 28, 2017 at 1:42PM indicating that they received the email with the draft agenda and forwarded it to Council in preparation for the April 9th meeting.	N/A

NND0017	09-Apr-18	Meeting	N/A	First Nation of Na-cho Nyäk Dun	Richard Wyman (Chance)	Richard Wyman (Chance), Cindy Dickson (Chance), Greg Charlie (Chance), Rick Nielson	Chief Simon Mervyn (First Nation of Na-cho Nyäk Dun), Deputy Chief Mary Olsen, Council Members Irene Johnny, Melody Hutton, Ronald Peters, Chrystal Lattie (Fist Nation of Na-cho Nyäk Dun), and Chief Dawna Hope (Fist Nation of Na-cho Nyäk Dun), Lands Manager, Emily Mann (Hemmera).	Engagement Plan	The purpose of this meeting was to begin to build a new relationship between Chance and First Nation of Na-Cho Nyäk Dun and allow opportunities for participants to share their views about what they would like their relationship and Engagement and Communication plan to look like.	A representative from First Nation of Na-Cho Nyäk Dun said that they must maintain the unity of the Northern Chiefs. A representative from Chance asked if there has been any discussion between the three Northern Chiefs. A representative from First Nation of Na-Cho Nyäk Dun responded yes, saying that it is very important that they work together. First Nation of Na-Cho Nyäk Dun said that they need to get into the process, and that everything is very high-level right now. They do not want to dictate to other Nations but identify a process for working together without creating conflict.	N/A
NND0024	23-Apr-18	Email	Outgoing	First Nation of Na-cho Nyäk Dun	Kelly Constable	Greg Charlie (Chance), Cindy Dickson (Chance), Richard Wyman (Chance), Rick Neilsen (Chance)	Albert Peter (First Nation of Na-cho Nyäk Dun) (First Nation of Na-cho Nyäk Dun), Chrystal Lattie (Fist Nation of Na-cho Nyäk Dun), Dawna Hope (Fist Nation of Na-cho Nyäk Dun), Kelly Constable (Hemmera)	Engagement	Hemmera sent draft meeting notes from April 9th, 2018 between the First Nation of Na-Cho Nyäk Dun and Chance for review and comment and asked First Nation of Na-Cho Nyäk Dun to provide any comments via tracked changes, if possible, by May 7th, 2018. Hemmera offered to draft a Communications and Engagement Plan for First Nation of Na-Cho Nyäk Dun to review and consider. There was an interest by First Nation of Na-Cho Nyäk Dun during the meeting on April 9th for Hemmera to assist with this.	N/A	N/A
NND0025	01-May-18	Phone call	Outgoing	First Nation of Na-cho Nyäk Dun	Richard Wyman (Chance)	Richard Wyman (Chance)	Chief Simon Mervyn (First Nation of Na-cho Nyäk Dun)	Engagement Plan	Chance spoke to the Chief of First Nation of Na-Cho Nyäk Dun on May 1st, 2018 to update him on the progress made regarding Communications and Education Plans being developed with each of the First Nations that have an interest in Eagle Plain. Chance also followed up with the Chief of First Nation of Na-Cho Nyäk Dun's idea to have a meeting of all the North Yukon Chiefs and said that a meeting is tentatively being planned after the May long weekend, probably in Dawson.	N/A	N/A
NND0026	01-May-18	Email	Outgoing	First Nation of Na-cho Nyäk Dun	Kelly Constable	Greg Charlie (Chance), Cindy Dickson (Chance), Richard Wyman (Chance), Rick Neilsen (Chance),	Chrystal Lattie (Fist Nation of Na-cho Nyäk Dun), Albert Peter (First Nation of Na-cho Nyäk Dun) (First Nation of Na-cho Nyäk Dun), Dawna Hope (Fist Nation of Na-cho Nyäk Dun)	Engagement	Hemmera sent an email out to First Nation of Na-Cho Nyäk Dun and colleagues thanking them for the revision they had sent for the Chance and First Nation of Nacho-Nyak Dun meeting of April 9th, 2018. Hemmera asked if First Nation of Na-Cho Nyäk Dun had considered the offer for Hemmera to provide a draft Engagement and Communication Plan for their review and input and asked them to advise. An update was provided about the interest from the Gwich'in Tribal Council, Tetl'it Gwich'in Council, Vuntut Gwitchin Government, Tr'ondëk Hwëch'in First Nation and Yukon Government. There was a discussion around an all-party meeting being of interest and tentatively proposed a meeting on May 22nd and 23rd.	N/A	N/A
NND0027	01-May-18	Email	Incoming	First Nation of Na-cho Nyäk Dun	Albert Peter (First Nation of Na-cho Nyäk Dun) (First Nation of Na-cho Nyäk Dun)	Greg Charlie (Chance)	Greg Charlie (Chance)	Engagement	First Nation of Na-Cho Nyäk Dun's representative sent Chance an email stating that First Nation of Na-Cho Nyäk Dun Council has limited capacity to engage and required proponents active in their traditional territory to fund their engagement.	N/A	N/A
NND0028	02-May-18	Email	Outgoing	First Nation of Na-cho Nyäk Dun	Greg Charlie (Chance)	Greg Charlie (Chance), Cindy Dickson (Chance), Richard Wyman (Chance), Rick Neilsen (Chance)	Chrystal Lattie (Fist Nation of Na-cho Nyäk Dun), Albert Peter (First Nation of Na-cho Nyäk Dun) (First Nation of Na-cho Nyäk Dun), Dawna Hope (Fist Nation of Na-cho Nyäk Dun)	Meeting	As further correspondence to the email string started by Hemmera to First Nation of Na-Cho Nyäk Dun on May 1st, 2018, Chance replied to First Nation of Na-Cho Nyäk Dun that the meeting would take place in Dawson City, May 22nd and 23rd. This would be also attended by Vuntut Gwitchin Government, Tr'ondëk Hwëch'in First Nation, Gwich'in Tribal Council, Tetlit Gwich'in Council, and Yukon Government.	N/A	N/A
NND0029	02-May-18	Email	Outgoing	First Nation of Na-cho Nyäk Dun	Shena Shaw (Hemmera)	Greg Charlie (Chance), Cindy Dickson (Chance), Richard Wyman (Chance), Rick Neilsen (Chance)	Chrystal Lattie (Fist Nation of Na-cho Nyäk Dun), Albert Peter (First Nation of Na-cho Nyäk Dun) (First Nation of Na-cho Nyäk Dun), Dawna Hope (Fist Nation of Na-cho Nyäk Dun)	Meeting	Hemmera said it would be important to find a date that works for everyone, and asked First Nation of Na-Cho Nyäk Dun to let everyone know when there is another two-day window in May or June that could be provided as an option to the rest of the participants.	N/A	N/A
NND0030	07-May-18	Email	Outgoing	First Nation of Na-cho Nyäk Dun	Richard Wyman (Chance)	Richard Wyman (Chance)	Chief Simon Mervyn (First Nation of Na-cho Nyäk Dun)	Engagement Plan	Details around capacity funding were discussed. The development of Engagement Plans with each of the First Nations who have a presence in Eagle Plain was discussed. At the meeting in April 2018, First Nation of Na-Cho Nyäk Dun's employee provided a document prepared by the First Nation of Na-Cho Nyäk Dun government that may be helpful to draft an Engagement Plan.	N/A	N/A
NND0031	07-May-18	Email	Outgoing	First Nation of Na-cho Nyäk Dun	Richard Wyman (Chance)	Richard Wyman (Chance)	Chief Simon Mervyn (First Nation of Na-cho Nyäk Dun), Chrystal Lattie (Fist Nation of Na-cho Nyäk Dun)	Tenure Extension	A representative from Chance sent a letter to First Nation of Na-Cho Nyäk Dun to provide notification that Chance would be submitting a request to extend the tenure of the exploration permits numbered 0012-117, which were set to expire in August if not extended. The representative indicated to call him if there were any questions or concerns.	N/A	N/A
NND0032	08-May-18	Email	Outgoing	First Nation of Na-cho Nyäk Dun	Richard Wyman (Chance)	Richard Wyman (Chance)	Maureen Huggard	Tenure Extension	A representative from Chance forwarded the email attachment he had sent earlier to Chief and Council as well as First Nation of Na-Cho Nyäk Dun's Lands & Resources Manager, who was out of the office from May 4th to 22nd. In their absence, the contact listed for Environmental Dynamics Inc.ate assistance was the Natural Resources Coordinator.	N/A	N/A
NND0034	14-May-18	Phone call	Outgoing	First Nation of Na-cho Nyäk Dun	Richard Wyman (Chance)	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance)	Chief Simon Mervyn (First Nation of Na-cho Nyäk Dun)	Engagement	A representative of Chance left a voice message to Chief of First Nation of Na-Cho Nyäk Dun to discuss details around capacity funding. Chance mentioned that would be in Whitehorse the following day and invited Chief of First Nation of Na-Cho Nyäk Dun to lunch, dinner or coffee if he had time.		N/A
NND0035	14-May-18	Email	Outgoing	First Nation of Na-cho Nyäk Dun	Richard Wyman (Chance)	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance)	Chief Simon Mervyn (First Nation of Na-cho Nyäk Dun)	Engagement	A representative of Chance sent the Chief of First Nation of Na-Cho Nyäk Dun an email letting him know he just left him a voice message, to follow up on the email that Chance sent last week to ask for some clarity about the request received by Greg Charlie (Chance) from Albert Peter (First Nation of Na-cho Nyäk Dun) (First Nation of Na-cho Nyäk Dun) to discuss details around capacity funding. Richard said that he is in town on the 16th and will be there for the rest of the week so perhaps Chief Simon Mervyn (First Nation of Na-cho Nyäk Dun) would like to have coffee or go for lunch or dinner. Chief of First Nation of Na-Cho Nyäk Dun wrote back to Chance on May 15th indicating that he would be in town until and he would be available anytime after 5PM. Subsequent emails between Chance and First Nation of Na-Cho Nyäk Dun set the time and place.	N/A	N/A
NND0036	16-May-18	Email	Outgoing	First Nation of Na-cho Nyäk Dun	Kelly Constable	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance)	Chief Simon Mervyn (First Nation of Na-cho Nyäk Dun), Albert Peter (First Nation of Na-cho Nyäk Dun) (First Nation of Na-cho Nyäk Dun)	Engagement Plan	Hemmera sent a draft Engagement and Communication plan between the First Nation of Na-Cho Nyäk Dun and Chance for review and feedback. Hemmera also indicated not to hesitate to reach out should their be any questions or immEnvironmental Dynamics Inc.ate revisions. Hemmera also indicated they'd be happy to set up a teleconference for a joint review of the draft at a date and time that suits participants' schedules in the coming days.	N/A	N/A

NND0037	16-May-18	Email	Outgoing	First Nation of Na-cho Nyäk Dun	Richard Wyman (Chance)	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance)	Chief Simon Mervyn (First Nation of Na-cho Nyäk Dun)	Engagement Plan	Chance sent Chief of First Nation of Na-Cho Nyäk Dun an email indicating he was glad he was able to join Chance for dinner and also to meet Chance's main investor, who had a long history with working in northern Canada and especially in the Eagle Plain area. The Chance representative also reiterated that as the Chief of First Nation of Na-Cho Nyäk Dun suggested during dinner, Chance, by copy of this email, asked the advisors at Hemmera to forward the Chief of First Nation of Na-Cho Nyäk Dun and the First Nation of Na-Cho Nyäk Dun representative a draft Engagement Plan that they prepared using the document that First Nation of Na-Cho Nyäk Dun's employee provided to Chance the previous month for reference. Chance requested that Chief of First Nation of Na-Cho Nyäk Dun let Chance know First Nation of Na-Cho Nyäk Dun's thoughts on the draft and whether amendments needed to be considered. The Chief of First Nation of Na-Cho Nyäk Dun followed up thanking Chance for the evening and for the discussion.	N/A	N/A
NND0039	24-May-18	Email	Incoming	First Nation of Na-cho Nyäk Dun	Chrystal Lattie (Fist Nation of Na-cho Nyäk Dun)	Richard Wyman (Chance)	Chrystal Lattie (Fist Nation of Na-cho Nyäk Dun)	Engagement Plan	First Nation of Na-Cho Nyäk Dun sent Chance an email advising them that their inquiry of May 7th, 2018 about capacity funding would be on the Council's agenda on May 30th, 2017. First Nation of Na-Cho Nyäk Dun indicated they would be in touch thereafter.	N/A	N/A
NND0040	24-May-18	Email	Outgoing	First Nation of Na-cho Nyäk Dun	Richard Wyman (Chance)	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance)	Chrystal Lattie (Fist Nation of Na-cho Nyäk Dun)	Engagement Plan	Chance sent First Nation of Na-Cho Nyäk Dun an email thanking them for advising them of the upcoming Council discussion regarding Engagement and Communication Plan matters. Chance asked if the discussion would be about the draft plan that was sent by email from Hemmera last week to Chief of First Nation of Na-Cho Nyäk Dun and the First Nation of Na-Cho Nyäk Dun representative, or if the focus of the meeting would be to discuss details around capacity funding? The Chance representative asked if the meeting was about the Plan, if they should forward the draft that was sent last week to distribute to Council.	N/A	N/A
NND0042	24-May-18	Email	Outgoing	First Nation of Na-cho Nyäk Dun	Richard Wyman (Chance)	Greg Charlie (Chance), Cindy Dickson (Chance)	Chrystal Lattie (Fist Nation of Na-cho Nyäk Dun)	Engagement Plan	Chance sent First Nation of Na-Cho Nyäk Dun an email with the attached Draft Engagement and Communications Plan that was prepared by Hemmera using the reference material that was provided to Chance after the meeting in Mayo last month. The Chance representative asked the First Nation of Na-Cho Nyäk Dun representative to circulate the draft to anyone that needed to know about this topic. The Chance representative indicated that the First Nation of Na-Cho Nyäk Dun representative let them know anything else was required to help bring this effort to a conclusion. The representative of First Nation of Na-Cho Nyäk Dun sent Chance an email back on May 24th, 2018 indicating that the information was shared with Council and it was added as a discussion item for the following week's Chief and Council Meeting.	N/A	N/A
NND0043	28-May-18	Phone call	Incoming	First Nation of Na-cho Nyäk Dun	Greg Charlie (Chance)	Greg Charlie (Chance)	Chief Simon Mervyn (First Nation of Na-cho Nyäk Dun)	Engagement Plan	Chance received a call from Chief of First Nation of Na-Cho Nyäk Dun seeking clarification about capacity funding. Details around capacity funding were discussed.	N/A	N/A
NND0044	28-May-18	Email	Outgoing	First Nation of Na-cho Nyäk Dun	Kelly Constable	Greg Charlie (Chance), Richard Wyman (Chance), Cindy Dickson (Chance)	Chrystal Lattie (Fist Nation of Na-cho Nyäk Dun)	Engagement Plan	Hemmera sent an email with an attached "Chance Engagement Plan Memo" to support the First Nation of Na-Cho Nyäk Dun's Chief and Council meeting on May 30th, 2018. Hemmera said do not hesitate to reach out should they have any questions. First Nation of Na-Cho Nyäk Dun replied on May 28th, 2018 saying they have added the Memo for Council's meeting on .	A representative from Hemmera forwarded an email sent by First Nation of Na-Cho Nyäk Dun on May 31st. First Nation of Na-Cho Nyäk Dun informed Hemmera that the Nacho Nyak Dun First Nation Council meeting was postponed until June 5th and that they would get back to Hemmera.	N/A
NND0045	11-Jun-18	Text message	Outgoing	First Nation of Na-cho Nyäk Dun	Greg Charlie (Chance)	Chance	Chief Simon Mervyn (First Nation of Na-cho Nyäk Dun)	Meeting	A representative from Chance sent a text to the Chief of First Nation of Na-Cho Nyäk Dun to ask him if they would be able to move forward on an Engagement Plan. The chief stated that they could have Hemmera meet with an First Nation of Na-Cho Nyäk Dun representative to finalize the draft. The Chief sent a text back indicating that due to a series of unforeseen circumstances it was necessary to postpone a Council meeting as there was a death in the community. The Chief indicated that the meeting tomorrow (June 12th, 2018) would still be convened and offered to keep the Chance representative in the loop.	N/A	N/A
NND0046	06-Jul-18	Email	Outgoing	First Nation of Na-cho Nyäk Dun	Emily Mann (Hemmera)	N/A	Chrystal Lattie (Fist Nation of Na-cho Nyäk Dun)	Engagement Plan	Hemmera sent First Nation of Na-Cho Nyäk Dun an email to let them know they would be touching base on the Communications and Engagement Plan, as the deadline of August 1st, 2018, with Yukon Government was fast approaching. They indicated that a status update on the Plan would be appreciated.	Chrystal Lattie (Fist Nation of Na-cho Nyäk Dun) emailed Hemmera on July 9th, 2018 and let her know there is no update at this time. She said she would add this for discussion to the Council's next meeting on July 11th. She said due to time constraints they were not able to complete their last meeting agenda on June 12th. She said it was an extremely busy at this time due to General Assemblies and apologized for any inconveniences this has caused.	N/A
NND0047	06-Jul-18	Phone call	Outgoing	First Nation of Na-cho Nyäk Dun	Greg Charlie (Chance)	Greg Charlie (Chance)	Chief Simon Mervyn (First Nation of Na-cho Nyäk Dun)	Engagement Plan	A representative of Chance had a telephone call with the Chief of First Nation of Na-Cho Nyäk Dun about who Chance should be in contact with regarding the draft Communications and Engagement Plan.	N/A	N/A
NND0048	06-Jul-18	Email	Outgoing	First Nation of Na-cho Nyäk Dun	Greg Charlie (Chance)	Greg Charlie (Chance)	Chrystal Lattie (Fist Nation of Na-cho Nyäk Dun), Emily Mann (Hemmera)	Engagement Plan	A representative from Chance sent an email to Hemmera and First Nation of Na-Cho Nyäk Dun and explained that they had spoken directly to the Chief and asked them to work with Lands and Resources to review the draft Engagement Plan.	A representative from First Nation of Na-Cho Nyäk Dun emailed Chance Oil & Gas back on July 9th, 2018 and thanked them for the update and said they would strike this from the Council's agenda on .	N/A
NND0049	06-Jul-18	Email	Outgoing	First Nation of Na-cho Nyäk Dun	Greg Charlie (Chance)	Greg Charlie (Chance)	Dawna Hope (Fist Nation of Na-cho Nyäk Dun)	Engagement Plan	Chance sent a representative of First Nation of Na-Cho Nyäk Dun an email regarding his phone call to the Chief of First Nation of Na-Cho Nyäk Dun. Chance explained to the representative of First Nation of Na-Cho Nyäk Dun that the Chief had directed this person as the contact to review the draft attached Engagement Plan. Chance apologized for not sending a draft when it was sent in May but at that time there was no direction given from First Nation of Na-Cho Nyäk Dun as to who should receive a copy. Chance let them know the deadline was August 1st, 2018 to complete the plan and that they were hoping to set up a call with Hemmera and First Nation of Na-Cho Nyäk Dun to go through the plan. Chance stated their understanding that the timeline was short and with that in mind, they indicated that they were prepared to assist and have Hemmera facilitate. Chance explained they would make changes and provide a re-draft for Chief and Council's review.	N/A	N/A
NND0050	12-Jul-18	Email	Incoming	First Nation of Na-cho Nyäk Dun	Emily Mann (Hemmera)	N/A	Chrystal Lattie (Fist Nation of Na-cho Nyäk Dun), Dawna Hope (Fist Nation of Na-cho Nyäk Dun)	Engagement Plan	Hemmera sent First Nation of Na-Cho Nyäk Dun an email to follow up on the previous day's Council meeting to see if Chance's Communication and Engagement Plan was discussed, and if any direction was given regarding its completion.	N/A	N/A

NND0066	21-Sep-18	Email	Outgoing	First Nation of Na-cho Nyäk Dun	Richard Wyman (Chance)	Richard Wyman (Chance)	Dawna Hope (Fist Nation of Na-cho Nyäk Dun)	Engagement Plan	Chance emailed First Nation of Na-Cho Nyäk Dun in the interest of maintaining positive momentum created by the creation of the Engagement and Communications Plan. The Plan called for Chance and First Nation of Na-Cho Nyäk Dun to hold a meeting within 3-months of finalizing the plan. Chance noted that there were procedures that needed to be developed to implement the Plan such as a Terms of Reference for ongoing engagement and a confidentiality arrangement, among other considerations. Chance suggested having the first meeting by conference call and asked for First Nation of Na-Cho Nyäk Dun's availability. Chance noted to First Nation of Na-Cho Nyäk Dun that Chance would like to continue using Hemmera's services if First Nation of Na-Cho Nyäk Dun was in agreement. Chance enclosed an updated land disposition map.	N/A	N/A
NND0067	29-Oct-18	Email	Outgoing	First Nation of Na-cho Nyäk Dun	Richard Wyman (Chance)	Richard Wyman (Chance)	Dawna Hope (Fist Nation of Na-cho Nyäk Dun)	Meeting	Chance forwarded a draft Confidentiality Agreement for First Nation of Na-Cho Nyäk Dun to consider as part of the process of implementing the Engagement and Communication Plan that was approved in August 2018. Since Chance had four or five First Nation parties with interests in the Eagle Plain area, they expressed that they would like to have a common form of agreement for all parties to minimize the administration of the agreement. The draft that was attached was prepared by legal counsel to Chance and Chance made a correction and also added some Notes To Draft (NTD's) in places where they expected further input from everyone. Chance noted there were also several places in the agreement marked by "•" where additional information was required by each of the parties. Chance also noted that the duration of this agreement might be better to be longer than the indicated in the draft agreement. Chance requested that First Nation of Na-Cho Nyäk Dun review the agreement and to notify Chance about any changes that they would like to see. Chance asked if the Confidentiality Agreement could be discussed at the November 6th conference call between Chance and First Nation of Na-Cho Nyäk Dun.	N/A	N/A
NND0068	06-Nov-18	Teleconference	N/A	First Nation of Na-cho Nyäk Dun	Richard Wyman (Chance)	Richard Wyman (Chance)	Dawna Hope (Fist Nation of Na-cho Nyäk Dun)	Engagement Plan	Chance and First Nation of Na-Cho Nyäk Dun met to discuss the implementation of the Communications and Engagement Plan.	Details around capacity funding were discussed.	N/A
NND0069	06-Nov-18	Email	Incoming	First Nation of Na-cho Nyäk Dun	Rob Wood (First Nation of Na-cho Nyäk Dun)	Richard Wyman (Chance)	Rob Wood (First Nation of Na-cho Nyäk Dun)	Meeting	An First Nation of Na-Cho Nyäk Dun representative contacted Chance saying that they are working for First Nation of Na-Cho Nyäk Dun as a strategic advisor, and were hoping Chance and them might be able to have a conversation some time this week or next. The First Nation of Na-Cho Nyäk Dun Advisor wanted to provide Chance an update on some of the work they were doing and to catch up on Chance's opportunities in the Eagle Plains area. The Advisor indicated that if Chance could suggest a time when they might be available for a call, they would try to accommodate Chance's schedule.	N/A	N/A

NND0070	07-Nov-18	Email	Outgoing	First Nation of Na-cho Nyäk Dun	Dawna Hope (Fist Nation of Na-cho Nyäk Dun)	Richard Wyman (Chance)	Dawna Hope (Fist Nation of Na-cho Nyäk Dun)	Meeting	As a follow up to the conference call held on November 6, 2018, Chance forwarded a description of what oil and gas exploration might look like at Eagle Plains which included a summary of the objectives that Chance was trying to achieve. Chance also attached an updated map showing the current land dispositions at Eagle Plains where oil and gas exploration permits were located. The new map had removed Exploration Permit 0005, which was located at the northern end of the exploration lands. Chance surrendered this permit to Yukon to facilitate the formation of the Ch'lhilii Chik Habitat Protection Area in the Whitefish Lakes Area.	N/A	N/A
NND0071	20-Nov-18	Email	Outgoing	First Nation of Na-cho Nyäk Dun	Emily Mann (Hemmera)	N/A	Dawna Hope (Fist Nation of Na-cho Nyäk Dun), Emily Mann (Hemmera)	Meeting	Chance sent First Nation of Na-Cho Nyäk Dun the meeting summary for the November 6, 2018 teleconference. First Nation of Na-Cho Nyäk Dun was asked to make any Environmental Dynamics Inc. in tracked changes and send back to Chance.	N/A	N/A
NND0072	26-Nov-18	Email	Incoming	First Nation of Na-cho Nyäk Dun	Dawna Hope (Fist Nation of Na-cho Nyäk Dun)	N/A	Dawna Hope (Fist Nation of Na-cho Nyäk Dun), Emily Mann (Hemmera)	Meeting	An First Nation of Na-Cho Nyäk Dun representative informed Chance that they were not available to attend the teleconference meeting scheduled for November 26, 2018.	N/A	N/A
NND0073	26-Nov-18	Email	Outgoing	First Nation of Na-cho Nyäk Dun	Emily Mann (Hemmera)	N/A	Dawna Hope (Fist Nation of Na-cho Nyäk Dun), Emily Mann (Hemmera)	Meeting	Hemmera asked First Nation of Na-Cho Nyäk Dun if they could still attend the meeting that was scheduled for 1:30pm on November 26, 2018.	N/A	N/A
NND0074	26-Nov-18	Email	Outgoing	First Nation of Na-cho Nyäk Dun	Emily Mann (Hemmera)	N/A	Dawna Hope (Fist Nation of Na-cho Nyäk Dun), Emily Mann (Hemmera)	Meeting	Hemmera asked First Nation of Na-Cho Nyäk Dun to let them know when First Nation of Na-Cho Nyäk Dun was available to meet to have the second Plan implementation meeting. Chance suggested a few dates.	N/A	N/A
NND0075	27-Nov-18	Email	Outgoing	First Nation of Na-cho Nyäk Dun	Emily Mann (Hemmera)	N/A	Dawna Hope (Fist Nation of Na-cho Nyäk Dun), Emily Mann (Hemmera)	Meeting	Hemmera stated that because the November 25, 2018 meeting was postponed, Chance emailed First Nation of Na-Cho Nyäk Dun to let them know about an All-Party Meeting that Chance was interested to plan for February 1, 2019. Chance was hoping to start confirming attendance so they wanted to let First Nation of Na-Cho Nyäk Dun know in advance of the next schedule meeting. Chance described that the All-Party Meeting was meant to bring together the First Nation of Na-Cho Nyäk Dun, Vuntut Gwitchin First Nation, Gwich'in Tribal Council, Tetlit Gwich'in Council, Tr'ondëk Hwëch'in, and Yukon Government to discuss matters related to Chance's upcoming exploration project. The following topics were proposed for the agenda: An overview of the First Nations' and Chance's work with the Engagement Plans over the past year; North Yukon Regional Land Use Plan; Yukon Oil and Gas Act; In-camera First Nations session to discuss collaboration and leadership; and Chance's exploration project plans and expected YESAB application process. Chance indicated that they would like to host the meeting in Vancouver on February 1st, 2019, the day after AME Roundup (BC's Annual Mining Conference). Chance was hoping that scheduling this meeting immEnvironmental Dynamics Inc.ately after this widely attended conference would allow for maximum participation. Chance indicated that they would fund three Citizens from each First Nation to travel to and from Vancouver, and for accommodation for two nights. Chance was anticipating that the First Nations representatives who attended the meeting would include:The Chief; The staff member managing the Chance file; and The Director of Lands and Resources, or another staff member who has been working closely with Chance. Chance indicated that they were still in the early stages of planning this event, but wanted to ask about availability in advance so that the date could be reserved. Chance indicated that they would be happy to have further conversations regarding attendance and meeting logistics. Chance listed Emily at Hemmera as a contact for a call at any time if they had any questions and provided her contact information. Chance indicated that they were looking to know if this date would work for the above mentioned representatives to attend. Chance noted to send a response to Emily if they were available to attend the meeting and that once confirmed Chance would send a meeting scheduler to specific attendees.	N/A	N/A
NND0076	27-Nov-18	Email	Outgoing	First Nation of Na-cho Nyäk Dun	Emily Mann (Hemmera)	N/A	Chief Simon Mervyn (First Nation of Na-cho Nyäk Dun), Emily Mann (Hemmera)	Meeting	Hemmera informed the Chief of First Nation of Na-Cho Nyäk Dun of the All-Party Meeting on February 1, 2019.	N/A	N/A
NND0077	01-Dec-18	Email	Incoming	First Nation of Na-cho Nyäk Dun	Rob Wood (First Nation of Na-cho Nyäk Dun)	Richard Wyman (Chance)	Rob Wood (First Nation of Na-cho Nyäk Dun)	Meeting	First Nation of Na-Cho Nyäk Dun followed up with Chance and stated that they understand that there will be a meeting in February and will try and attend this meeting. First Nation of Na-Cho Nyäk Dun asked that Emily keep First Nation of Na-Cho Nyäk Dun in the loop as the February 1, 2019 All-Party Meeting materializes.	N/A	N/A
NND0078	03-Dec-18	Email	Incoming	First Nation of Na-cho Nyäk Dun	Dawna Hope (Fist Nation of Na-cho Nyäk Dun)	N/A	Dawna Hope (Fist Nation of Na-cho Nyäk Dun), Emily Mann (Hemmera)	Meeting	A First Nation of Na-Cho Nyäk Dun representative informed Chance that, at this time, they do not know who else would be attending the tentative meeting planned for February 1, 2019. First Nation of Na-Cho Nyäk Dun indicated that they would follow-up with Chance in the new year once they knew more. First Nation of Na-Cho Nyäk Dun stated they would not be available for a meeting on any of the suggested dates for December. The First Nation of Na-Cho Nyäk Dun representative stated they would be taking some vacation time starting December 10th, right up until First Nation of Na-Cho Nyäk Dun's office closure for Christmas Break at the end of day December 21, 2018 and reopening January 7, 2019. The First Nation of Na-Cho Nyäk Dun representative indicated they had more availability the first week after reopening on January 7, 2019 and suggested that they meet at that time.	N/A	N/A
NND0079	03-Dec-18	Email	Outgoing	First Nation of Na-cho Nyäk Dun	Emily Mann (Hemmera)	N/A	Rob Wood (First Nation of Na-cho Nyäk Dun), Emily Mann (Hemmera)	Meeting	Hemmera thanked First Nation of Na-Cho Nyäk Dun for responding about the February 1, 2019 All-Party Meeting, and stated that she would keep them informed as the details of the meeting are developed. Emily described that the event would be at the Vancouver Convention Centre on February 1, 2019, and would be a whole day meeting. She stated that they had invited the staff members with whom they had been working closely from First Nation of Na-Cho Nyäk Dun, Vuntut Gwitchin, TH, Tetlit Gwich'in Council and GTC. Chance would cover two nights accommodation in Vancouver and travel to and from Vancouver for up to three Citizens from each First Nation. Emily shared that Chance was thinking each person should book their own travel and accommodation and submit the details for reimbursement, and to please let them know if more information was needed. Emily stated she would be in touch with more details, such as the meeting agenda the following weeks, and to please identify when they can confirm their attendance.	N/A	N/A

Proposed the following logistics for First Nation participation: 1) Each FN with territory overlapping Project area could have up to two Citizens participate 2) Work would be physically demanding, require hiking steep, rugged terrain and thick bush, requiring average or above-average fitness to participate 3) Limited spots available for participants due to helicopter constraints and availability at Eagle Plains Hotel, and asked that First Nation of Na-Cho Nyäk Dun please respond as soon as possible to Emily or Callista (Hemmera) to confirm availability 4) Participants should arrive on start date, but not mandatory to stay for duration of field study 5) All travel, including flights, vehicle travel to Eagle Plains Hotel, and stay in hotel were to be booked by the FN and billed to Chance. Table of Opportunities were provided by date. Purpose of participation would be to observe fieldwork and gain first hand understanding of the research. Deadline for Vegetation Survey # 1 was shared to be June 19th.	Attachment: Chance FN Participant Information	E00261_Chance Field Surveys-First Nation of Na-cho Nyäk Dun

They indicated that they left a voice mail, and also followed up with Ronalda (First Nation of Na-Cho Nyäk Dun) yesterday, but have not hear back. Hemmera explained that the final report would be due to Yukon Government tomorrow, and they were hoping that First Nation of Na-Cho Nyäk Dun could review and sign off on the content. They asked to please let Hemmera know if First Nation of Na-Cho Nyäk Dun would like to provide revisions by noon the next day so Hemmera had the opportunity to revise with First Nation of Na-Cho Nyäk Dun's feedback, otherwise Hemmera indicated they would submit to Yukon Government tomorrow at 4 pm.	attached: 190715_Draft Plan Implementation Report_FNFirst Nation of Na-cho Nyäk Dun, 190715_DRAFT Plan Implementation Report_FNFirst Nation of Na-cho Nyäk Dun_RMW.docx	E00536_RE_ Draft Plan Implementation Report to Review_8
E00543	31-Jul-19	Email	Outgoing	First Nation of Na-cho Nyäk Dun	Hemmera	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance)	Chief Simon Mervyn (First Nation of Na-cho Nyäk Dun), Josee Tremblay (First Nation of Na-cho Nyäk Dun), Ronalda Moses (First Nation of Na-cho Nyäk Dun), Hemmera	Engagement Reports/OIC Requirements	Hemmera indicated they had prepared reports for Yukon Government on behalf of Chance on the implementation of the Communications and Engagement Plan that First Nation of Na-Cho Nyäk Dun and Chance completed last summer (Draft Plan Implementation Report). It was previously discussed that both First Nation of Na-Cho Nyäk Dun and Chance would review this report and sign to demonstrate both parties agreed to the report's contents. Hemmera indicated that they had not heard back with revisions or approval of the report, and explained they would submit the report to Yukon Government as a draft, however any feedback was welcome.	attached: 190715_Draft Plan Implementation Report_FNFirst Nation of Na-cho Nyäk Dun, 190715_DRAFT Plan Implementation Report_FNFirst Nation of Na-cho Nyäk Dun_RMW.docx	E00543_FW_ Draft Plan Implementation Report to Review
E00544	31-Jul-19	Email	Outgoing	First Nation of Na-cho Nyäk Dun	Hemmera	N/A	Derek Fraser (Yukon Government) Josee Tremblay (First Nation of Na-cho Nyäk Dun), Chief Simon Mervyn (First Nation of Na-cho Nyäk Dun), Hemmera	Engagement Reports/OIC Requirements	Hemmera sent the attached annual report on the implementation of the First Nation of Na-Cho Nyäk Dun and Chance Engagement and Communication Plan (Draft Plan Implementation Report) to Yukon Government. Hemmera indicated that the report had been reviewed and signed by Chance, but had not yet been reviewed or signed by First Nation of Na-Cho Nyäk Dun despite their efforts to send the draft report and follow-up. Hemmera indicated they would let Yukon Government know if they had received any feedback.	attached: 190731_FNFirst Nation of Na-cho Nyäk Dun and Chance Plan Implementation Report.pdf	E00544_Annual Plan Implementation Report - FNFirst Nation of Na-cho Nyäk Dun and Chance
E00346	09-Aug-19	Email	Outgoing	First Nation of Na-cho Nyäk Dun	Richard Wyman (Chance)	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance)	Chief Simon Mervyn (First Nation of Na-cho Nyäk Dun), Hemmera	Meeting Coordination/Planning	Richard (Chance) sent Chief Simon Mervyn (First Nation of Na-cho Nyäk Dun) (First Nation of Na-Cho Nyäk Dun) a note indicating it was great to connect by telephone earlier that morning. Richard was following up to bring awareness to colleagues and advisors at Hemmera of the potential to meet with Chief Simon Mervyn (First Nation of Na-cho Nyäk Dun) and First Nation of Na-Cho Nyäk Dun's new council on August 13 in Mayo. Richard indicated it would be an opportunity to introduce themselves to those unfamiliar with Chance and to summarize Chance's exploration plans. He indicated they were presently in Old Crow attending the GA but travelling to Dawson on Saturday to meet with Tr'ondëk Hwëch'in officials. Richard indicated if Chief Simon Mervyn (First Nation of Na-cho Nyäk Dun) was able to arrange to meet with them at Chance, they would drive to Mayo morning, so they could arrive around 10am. Richard explained the Chance team would have to be back in Dawson for 3:30pm. Richard thanked Chief Simon Mervyn (First Nation of Na-cho Nyäk Dun) in advance for setting up this meeting on short notice and indicated that Chance looked forward to meeting with him and members of the First Nation of Na-Cho Nyäk Dun council.	N/A	E00346_FW August 13 Meeting
E00388	09-Aug-19	Phone Call	Outgoing	First Nation of Na-cho Nyäk Dun	Richard Wyman (Chance)	Richard Wyman (Chance)	Chief Simon Mervyn (First Nation of Na-cho Nyäk Dun) (Chief of First Nation of Na-cho Nyäk Dun)	Meeting Coordination/Planning	Richard (Chance) called Chief Simon Mervyn (First Nation of Na-cho Nyäk Dun) (First Nation of Na-Cho Nyäk Dun) about meeting with Council at 10am on August 13, 2019. First Nation of Na-Cho Nyäk Dun indicated they would organize a group for the meeting and would call back on August 12 to confirm the meeting.	N/A	N/A
E00390	12-Aug-19	Phone Call	Incoming	First Nation of Na-cho Nyäk Dun	Chief Simon Mervyn (First Nation of Na-cho Nyäk Dun)	Greg Charlie (Chance)	Chief Simon Mervyn (First Nation of Na-cho Nyäk Dun) (Chief of First Nation of Na-cho Nyäk Dun)	Meeting Coordination/Planning	Greg (Chance) called Chief Simon Mervyn (First Nation of Na-cho Nyäk Dun) (First Nation of Na-Cho Nyäk Dun) and First Nation of Na-Cho Nyäk Dun confirmed they were unable to meet on August 13 and requested to meet at another time.	N/A	E00390_190812_FW_First Nation of Na-cho Nyäk Dun Canceled Meeting
E00602	28-Jan-20	Email	Outgoing	First Nation of Na-cho Nyäk Dun	Richard Wyman (Chance)	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance)	Chief Simon Mervyn (First Nation of Na-cho Nyäk Dun)	Tenures/Dispositions/Permits DO Project Engagement/Consultation	Richard (Chance) indicated they would be applying to the Yukon Government very shortly to extend the tenure of Exploration Permit 20. The application would be for the maximum period allowable under the Oil and Gas Act of 5 years. This permit included one suspended well at McParlon A-25 which Chance was hoping to use for fluid disposal of any produced water associated with the proposed exploration Project. Chance was at an interm Environmental Dynamics Inc.ate stage of discussions with the Manager of Oil and Gas Operations with Yukon to extend the suspended well status on the suspended wells at Eagle Plain. A manager had indicated that Chance would need to do some physical assessments of the legacy wells to confirm the integrity of the wells before granting an extension. The assessments would require access to 3 suspended wells at SDL M-08, G-08, and J-19 as well as M-59 in order to do the work. Chance was anticipating a service rig, cement pumping equipment, and wireline services to be used to conduct the assessments. They anticipated taking temperature measurements in wells to evaluate permafrost depth. The program was expected to take 1-2 months. This would be a winter operation and would be done during the winter of 2020-2021 and may require a designated office screening by YESAB. Chance explained that they would provide more information as soon as possible.	N/A	E00602_FW_ Suspended wells and Exploration Permit 20_4

E00646	23-Mar-20	Email	Outgoing	First Nation of Na-cho Nyäk Dun	Richard Wyman (Chance)	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance)	Chief Simon Mervyn (First Nation of Na-cho Nyäk Dun), Roberta Hager (First Nation of Na-cho Nyäk Dun), Barb Buyck (First Nation of Na-cho Nyäk Dun), Irene Johnny(First Nation of Na-cho Nyäk Dun), Andy Lucas (First Nation of Na-cho Nyäk Dun), Elders Councilor (First Nation of Na-cho Nyäk Dun), Sharon Peter (First Nation of Na-cho Nyäk Dun), Josee Tremblay (First Nation of Na-cho Nyäk Dun)	Information Sharing	Richard (Chance) shared information about Chance's ongoing initiatives, some of which were time sensitive, and all required engagement with the affected First Nations. A summary of these initiatives was provided below: 1. Application to the Yukon Government to get tenure extension on Exploration Permit 0020 which was set to expire on August 30, unless extended. This permit was located mostly in the Traditional Territory of the Vuntut Gwichin, but a portion is in the Secondary Use Area of the Tetlit Gwich'in and in the overlap area with First Nation of Na-Cho Nyäk Dun Traditional Territory. There was a suspended well in this Permit at McParlon A-25 which has ongoing value to Chance. 2. There were several suspended wells at the Chance Significant Discovery License (SDL 022) and one at the Blackie SDL (SDL 021) which the Yukon Government requires Chance to undertake some maintenance work. This activity would require an impact assessment by the Designated Office (DO) of YESAB in Dawson prior to permissions being granted by Yukon Government to undertake the work. The plan was to submit to the DO of the program in the next month with the objective of being able to do the work over approximately a 6 week to two month period in the winter of 2020-2021. This was a regulatory requirement made by the Manager of Oil and Gas Operations with the Yukon Government. Importantly for First Nation of Na-Cho Nyäk Dun's knowledge, there was no indication that these suspended wells had any problems, but they were wells that were drilled in the 1960's so the regulator had asked for work to be done in order to be able to continue the suspended status of these wells. 3. Continuing engagement with respect to the multi-well drilling and seismic data acquisition Project that had been described to First Nation of Na-Cho Nyäk Dun in the past couple of years. A current map of Chance landholdings was attached for First Nation of Na-Cho Nyäk Dun's reference. Chance indicated that because of the COVID 19 outbreak, travel and face to face get togethers were not appropriate, if not prohibited, so they would have to make arrangements to exchange information in writing, electronically and by conference call. They explained there was quite a geographic spread for everyone to manage and that Chance looked forward to	Attachment:Chance_Permits_geoscience_9 Sept2019.pdf	E00646_Chance Update_FNFirst Nation of Na-cho Nyäk Dun

E00909	28-Aug-20	Email	Outgoing	First Nation of Na-cho Nyäk Dun	Hemmera	Richard Wyman (Chance), Cindy Dickson (Chance), Greg Charlie (Chance)	Josee Tremblay (First Nation of Na-cho Nyäk Dun), Chief	DO Project Description/Activities	Hemmera indicated that further to Richard's email dated August 7, Chance had made revisions to the Project Description for the Designated Office Evaluation of the proposed Well Maintenance Program. As a result of those changes, Hemmera had also revised the effects assessment sections of the Project Proposal. Hemmera outlined the reasons for the revisions that were been provided to them by Chance and a brief summary of the amendment itself:1. Ongoing conversations between Chance and Yukon Government, Oil and Gas Branch at the Yukon Government necessitated the changes. While Chance was previously of the impression wells could continue to be suspended, Yukon Government was now directing Chance to conduct inspection and maintenance activities for all eight suspended wells and then abandon those wells or bring them into active status. Chance was now proposing to abandon six wells and to bring the remaining two wells into active status as deep-injection wells. Waste fluid produced during the abandonment of the six wells would then be disposed of via injection into the deep-injection wells. No oil or gas was expected to be produced from the two wells proposed to be activated; they would specifically be used for disposal of waste fluid from activities associated with these maintenance activities. 2. At that time, Chance could not confirm whether it would use the Eagle Plains Hotel or the existing Chance Camp for housing workers over the duration of the Project. The decision to utilize the Eagle Plains Hotel or the Chance Camp would be made when the Project schedule is finalized. It would also have to take into consideration the Hotel's ability to accommodate Chance workers over the full duration of the Project as well as COVID-19 related self-isolation requirements at that time. As a result both options were considered in the effects assessment for the housing of the Project workforce.3. When the Chance field team were at Eagle Plain early August, they observed that the route used to access M-59 would require realignment of the final portion of Blackie Winter Road. The section of the original route that proceeded north for the final kilometer was not ideal for traffic due to steeper terrain. The steeper route would result in a significant risk to the trucks bearing heavy loads, fuel supply, and other fluid handling shipments. Chance was proposing shifting the final portion of Blackie Winter Road east of the original route in order to attain a much gentler gradient. Chance stated that they hoped this would help with the beginning of their discussion on the Workover Project. They asked to please feel free to let Chance know what would be the next steps to begin their discussion.	Attachment: 2013 BA - Northern Cross-4 party.pdf	E00857_Section 68 Agreement
E00928	17-Sep-20	Email	Outgoing	First Nation of Na-cho Nyäk Dun	Richard Wyman (Chance)	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance)	Chief Simon Mervyn (First Nation of Na-cho Nyäk Dun), Josee Tremblay (First Nation of Na-cho Nyäk Dun)	Benefits/Capacity Agreement DO Project Engagement/Consultation	Richard (Chance) provided a short update to initiate discussions beginning as soon as possible regarding a Benefits Agreement among the First Nation of the First Nation of Na-Cho Nyäk Dun (First Nation of Na-Cho Nyäk Dun), the Vuntut Gwitchin First Nation (VGFN), Yukon Government, and Chance in accordance with Section 68 of the Yukon Oil and Gas Act. Hemmera, acting on behalf of Chance, filed a Project description with the Designated Office of the YESAB in Dawson last week concerning required work on eight suspended wells operated by Chance at Eagle Plain. The Project was small scale and was anticipated to be completed in a two to three-month period during the winter of 2020-2021. The plan would be to prepare for and abandon six of these wells and convert two others to be used for disposal of well bore fluids used in the abandonment procedures and/or recovered in the process. The activities were governed by Yukon Government oil and gas regulations and are routine oilfield practices. Details were provided in the submission document, but if there were any questions or comments, Richard said to please feel free to contact them or any of their colleagues at Chance. The Project area was mostly in the traditional territory of the VGFN, but one of the wells to be abandoned was located in the overlap area on the east side of the Dempster at Blackie M-59 which was also in Significant Discovery License 021. Although small scale, the Project triggered the need for a benefits agreement with the First Nations who are affected by the activities, Yukon Government acting on behalf of all Yukoners and the proponent, namely Chance. Chance asked to please advise who from the First Nation of Na-Cho Nyäk Dun would be negotiating this Benefits Agreement so arrangements could be made to begin discussions.	N/A	E00928_Fw_ Benefits Agreement discussion
E00883	18-Sep-20	Email	Outgoing	First Nation of Na-cho Nyäk Dun	Greg Charlie (Chance)	Greg Charlie (Chance), Richard Wyman (Chance), Cindy Dickson (Chance)	Erika Tizya-Tramm, Derek Fraser (Yukon Government), Josee Tremblay (First Nation of Na-cho Nyäk Dun), Hemmera	DO Project Engagement/Consultation Meeting Coordination/Planning	Greg (Chance) followed up with First Nation of Na-Cho Nyäk Dun, VGFN, and Yukon Government to see if everyone had a chance to review the last BA agreement. Chance would suggest that they set up a call sometime soon with everyone to discuss how they would like to proceed with section 68 negotiations. Greg stated they would be away all the following week, but included Richard (Chance) and Cindy (Chance) in the thread so they could make themselves available if the parties agreed to discuss next steps. Greg stated they looked forward to their response.	N/A	E00883_BA Discussion

E00834	02-Nov-20	Email	Outgoing	First Nation of Na-cho Nyäk Dun	Hemmera	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance)	Josee Tremblay (First Nation of Na-cho Nyäk Dun), Chief Simon Mervyn (First Nation of Na-cho Nyäk Dun), Hemmera	Engagement/Consultation DO Project	Hemmera explained that after further consideration of the proposed Project (Eagle Plains Well Maintenance and Winter Activities) activities and the requirements of the Yukon Oil and Gas Act, Chance determined that changes were required to the Project submitted to the Dawson Designated Office on September 11, 2020 (Project #2020-0151). As such, Chance decided to withdraw its Project Proposal and would be informing the YESAB on the present day, November 2, 2020. Chance still intended to incorporate changes into a revised Project Proposal. Once the revised proposal was drafted, Chance would notify First Nation of Na-Cho Nyäk Dun by sharing a draft and requesting a Meeting to discuss the changes further. After Chance had discussed those changes with the First Nation of Na-Cho Nyäk Dun, the Project Proposal would be finalized and resubmitted to the Dawson Designated Office. Hemmera explained that Chance understands and appreciates that making changes to this Project a second time would be requesting additional effort and capacity of the First Nation of Na-Cho Nyäk Dun. Chance looked forward to continuing to work with the First Nation of Na-Cho Nyäk Dun and would do its best to ease this process. E00890	19-Nov-20	Email	Outgoing	First Nation of Na-cho Nyäk Dun	Hemmera	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance)	Josee Tremblay (First Nation of Na-cho Nyäk Dun), Chief Simon Mervyn (First Nation of Na-cho Nyäk Dun), Skeeter Wright (First Nation of Na-cho Nyäk Dun), Hemmera	DO Project Engagement/Consultation Project Description/Activities	Hemmera sent an email further to an earlier email dated November 2nd (attached) to notify First Nation of Na-Cho Nyäk Dun that Chance had revised its Project Proposal (including updated Project Description and Effects Assessment) for Designated Office Evaluation. Key Project components that changed were included: 1) Extended Flow Testing: After maintenance activities were complete and depending on well bore integrity (as confirmed through maintenance activities), Chance proposed to conduct Extended Flow Testing (EFT) on up to three of the wells which had the highest potential for natural gas reserve. The reason for this change was to allow Chance to gather important information about the nature of the natural gas resource accumulation and its productive capability. a) Wells proposed for EFT are M-59, M-08, and J-19 (see PDF attached for Figure 2-1). Figure 2-1 was currently being updated to reflect this change. b. Revert up to three wells to suspended status (if the EFT results proved to have sufficient resources). c. Abandon three to six wells (the three remaining wells (G-08, B-73, and H-28) would be abandoned and up to additional three wells may be abandoned if wellbore integrity was not confirmed or if EFT results proved to have insufficient resources). Timelines: If work could not be completed that winter season (due to low snow pack, COVID-19 considerations, or permitting delays), Chance would complete the Project during the winter of December 2021 to March 2022. Additional details were included within the attached revised Draft Project Proposal. Hemmera stated that while revisions were made throughout the document, Section 2.1.3 was the substantive addition with respect to EFT. They had attached both a clean version and a version with tracked changes to facilitate First Nation of Na-Cho Nyäk Dun's review. Given the very short time frame for winter work, Chance would be submitting the application to YESAB on , November 20. Hemmera anticipated First Nation of Na-Cho Nyäk Dun requiring additional discussions with Chance to review these changes and looked forward to scheduling a meeting where they could discuss these matters further to support your future submissions to the YESAA process. E00840	26-Nov-20	Email	Outgoing	First Nation of Na-cho Nyäk Dun	Hemmera	N/A	Skeeter Wright (First Nation of Na-cho Nyäk Dun), Hemmera	DO Project Engagement/Consultation Project Description/Activities	Hemmera attached an email they sent to First Nation of Na-Cho Nyäk Dun June 2019. It included the draft Project description for Chance's Eagle Plains Exploration Project and a presentation that Chance gave to First Nation of Na-Cho Nyäk Dun at that time. This Project would go through a YESAB Executive Committee level screening. Hemmera clarified to Skeeter (First Nation of Na-Cho Nyäk Dun) that this was the Project they were referring to with respect to including them on any future emails pertaining to Chance's Executive Committee Project. Although, Hemmera explained that Chance (and Hemmera) hadn't been actively engaging on that Project this year. Hemmera indicated that Chance (and Hemmera) had been focused on Chance's Eagle Plains Well Maintenance Project (or subsequently called Eagle Plains Well Maintenance and Winter Activities) which would be going through the YESAB Designated Office (DO) in Dawson City. That is the proposal they had been engaging with First Nation of Na-Cho Nyäk Dun on for the past few months. It's this Project that has changed a couple times and which Chance withdrew from YESAB a couple weeks ago. Hemmera attached a number of emails that "tell the story" and that I hope answer Skeeter's question: 1. Email with original draft of the DO submission (Eagle Plains Well Maintenance Project). 2. Email from Richard Wyman (Chance) (Chance) stating the submission had been delayed because Chance was considering additional changes to the proposed Project. 3. Email from Hemmera with revised DO submission, including a high level overview of the changes and Chance's reasons for those changes. a. Note: This was the draft ultimately submitted to YESAB and which Chance then withdrew. 4. Email Hemmera sent the previous week. Contained the current version of Chance's DO submission. The email highlighted the main change (inclusion of Extended Flow Testing or EFT). The red-line version that was attached would be the best resource for seeing/reviewing the recent changes. COVID-19 combined with an internal discussion regarding responses to development proposals were delaying First Nation of Na-Cho Nyäk Dun's responses. Skeeter said that while a virtual Meeting is now mandatory due to recent COVID-19 outbreaks, the matter of responding to development proposals was still not finalized. Skeeter said that they'd let Hemmera and Chance know when they knew more.	N/A	E01245_Re_ Chance_FNFirst Nation of Na-cho Nyäk Dun - Engagement Next Steps.msg
E01213	16-Jul-21	Email	Outgoing	First Nation of Na-cho Nyäk Dun	Hemmera	Greg Charlie (Chance), Cindy Dickson (Chance), Richard Wyman (Chance)	Skeeter Wright (First Nation of Na-cho Nyäk Dun), Josee Tremblay (First Nation of Na-cho Nyäk Dun), Hemmera	Engagement Reports/OIC Requirements	Hemmera prepared a draft report on the implementation of the First Nation of Na-Cho Nyäk Dun and Chance Engagement and Communication Plan for First Nation of Na-Cho Nyäk Dun and Chance to review. This report summarized Meetings/correspondence that had occurred between First Nation of Na-Cho Nyäk Dun and Chance since completing the 2020 Annual Report. Hemmera attached the draft as a word document. Hemmera stated that if both First Nation of Na-Cho Nyäk Dun and Chance could make revisions to that document in tracked changes, that would assist them in creating a final version. Hemmera said that if there were any issues that arose between the parties' revisions, those could be addressed via email and/or a quick call. Once revisions have been incorporated and the document would be considered final by First Nation of Na-Cho Nyäk Dun and Chance, Hemmera stated they would send the final version to both parties to sign. Either later today, or , Hemmera indicated they would send a follow-up email with a draft of First Nation of Na-Cho Nyäk Dun and Chance's Engagement Log which would serve as Appendix D.	210716_EngagementPlan_2021ImplementationReports_FNFirst Nation of Na-cho Nyäk Dun_v0.2.docx	E01213_DRAFT 2021 Annual Report of FNFirst Nation of Na-cho Nyäk Dun and Chance Engagement Activities - For Review.msg

N/A	E01492 - January 26th 2023 Meeting from 2-5PM - Skwachàys Lodge 31 W Pender St Vancouver BC.
E014810	26-Jan-23	Meeting	N/A	First Nation of Na-cho Nyäk Dun	N/A	Cindy Dickson (Chance), Greg Charlie (Chance), (joined by telephone), Mike Chernoff, Richard Wyman (Chance)	Adrienne Hill (First Nation of Na-cho Nyäk Dun), Chief Pauline Frost (Vuntut Gwitchin First Nation), Chief Simon Mervyn (First Nation of Na-cho Nyäk Dun), Eliza Bethune (Two Worlds Consulting), Elizabeth Staples (Vuntut Gwitchin First Nation) (Vuntut Gwitchin First Nation), Erin Prelypchan (Two Worlds Consulting) (Two Worlds Consulting), Grand Chief Ken Kyikavichik (Gwich'in Tribal Council), James Smith (Vuntut Gwitchin First Nation) (Vuntut Gwitchin First Nation), President President Abe Wilson (Gwich'in Tribal Council) (Gwich'in Tribal Council), Roy Erasmus Jr. (Gwich'in Tribal Council) (Gwich'in Tribal Council), Tara Kyikavichik (Gwich'in Tribal Council), Willard Hagen (Gwich'in Tribal Council)	Engagement	Chance hosted an in-person meeting with leadership and technical advisors from First Nation of Na-Cho Nyäk Dun, Gwich'in Tribal Council, and Vuntut Gwitchin First Nation in Vancouver. The purpose of the meeting was to re-establish collaborative working relationships, discuss engagement preferences going forward, and provide a Project update.	N/A	N/A
E014814	01-Feb-23	Email	Outgoing	First Nation of Na-cho Nyäk Dun	Richard Wyman (Chance)	Greg Charlie (Chance), Cindy Dickson (Chance)	Chief Pauline Frost (Vuntut Gwitchin First Nation), Grand Chief Ken Kyikavichik (Gwich'in Tribal Council), Chief Simon Mervyn (First Nation of Na-cho Nyäk Dun), Mike Chernoff, Tara Kyikavichik (Gwich'in Tribal Council), Willard Hagen (Gwich'in Tribal Council), Roy Erasmus, James Smith (Vuntut Gwitchin First Nation) (Vuntut Gwitchin First Nation), Elizabeth Staples (Vuntut Gwitchin First Nation) (Vuntut Gwitchin First Nation), Adrienne Hill (First Nation of Na-cho Nyäk Dun), Erin Prelypchan (Two Worlds Consulting) (Two Worlds Consulting)	Engagement, Land Tenure, Baseline Studies	Richard sent Chief Pauline Frost (Vuntut Gwitchin First Nation), Grand Chief Ken Kyikavichik (Gwich'in Tribal Council), and Chief Simon Mervyn (First Nation of Na-cho Nyäk Dun) a thank you letter for a constructive meeting and noted Chance would wait the First Nations to provide direction on engagement going forward. Richard also informed that Chance had commissioned several studies to gather and evaluate baseline environmental data using experts at Environmental Dynamics, Palmer Environmental, Ecofor, Mountford Consulting, Peer Solutions, Tetratech, Ausenco, and Two Worlds Consulting.	N/A	E01502 - FW email to Chiefs of Vuntut Gwitchin Government Gwich'in Tribal Council and First Nation of Na-cho Nyäk Dun

NND0083	01-Feb-23	Email	Outgoing	First Nation of Na-cho Nyäk Dun	Richard Wyman (Chance)	Greg Charlie (Chance), Cindy Dickson (Chance)	Abe Wilson, Adrienne Hill (First Nation of Na-cho Nyäk Dun), Chief Pauline Frost (Vuntut Gwitchin First Nation), Chief Simon Mervyn (First Nation of Na-cho Nyäk Dun), Elizabeth Staples (Vuntut Gwitchin First Nation) (Vuntut Gwitchin First Nation), Erin Prelyphan, Grand Chief Ken Kyikavichik (Gwich'in Tribal Council), James Smith (Vuntut Gwitchin First Nation) (Vuntut Gwitchin First Nation), Mike Chernoff, Roy Erasmus, Tara Kyikavichik (Gwich'in Tribal Council)	Engagement	Richard W. emailed Chief Pauline Frost (Vuntut Gwitchin First Nation), Grand Chief Ken Kyikavichik (Gwich'in Tribal Council), and Chief Simon Mervyn (First Nation of Na-cho Nyäk Dun) and stated Chance had commissioned Environmental Dynamics Inc. and Palmer Environmental to cover several studies to gather and evaluate baseline environmental data. Chance stated heritage resource studies have begun by Ecofor. Chance noted Chance has retained supervision of drilling and completions, well maintenance, and follow testing activities help from Mountford Consulting; Peer Solutions for seismic program design and project management; TetraTech for civil engineering advice; Ausenco for preparing YESAB submission documents and project management; and Two Worlds Consulting for engagement and communication processes and gathering socio-economic data to complete YESAB submissions. Chance stated that all information that is gathered can be shared with the Nations and their feedback is welcome. Chance noted that Chance intended to extend the Land Tenure of Exploration Permits that are due to expire August 30, 2023. Chance stated a Benefits Agreement needs to be completed by First Nation of Na-Cho Nyäk Dun, Gwich'in Tribal Council, and Vuntut Gwitchin First Nation. Chance said that accommodation in Old Crow is difficult to arrange and Chance had tentatively arrange accommodation on March 7, 2023 in Old Crow and March 8 to 9, 2023 in Inuvik and Fort McPherson for consideration. Chance noted no meetings in Mayo or other communities in the Yukon have been committed to.	N/A	N/A

Greg (Chance) thanked Skeeter (First Nation of Na-Cho Nyäk Dun) for attending and representing First Nation of Na-Cho Nyäk Dun. Greg (Chance) said they provided another timeline for Chance submission which is in early/mid February 2024.	N/A	N/A

NND0107	17-Oct-23	Email	Outgoing	First Nation of Na-cho Nyäk Dun	Eliza Bethune (Two Worlds Consulting)	Greg Charlie (Chance), Richard Wyman (Chance), Cindy Dickson (Chance)	Kevin Simpson (Two Worlds Consulting) (Two Worlds Consulting), Jennifer (Environmental Dynamics Inc.), Skeeter Wright (First Nation of Na-cho Nyäk Dun)	Traditional Knowledge Sources for First Nation of Na-Cho Nyäk Dun's Review, Comment, and Permission for Use	Eliza (Two Worlds Consulting) emailed Skeeter (First Nation of Na-Cho Nyäk Dun) and cc'd Kevin (Two Worlds Consulting), Jennifer (Environmental Dynamics Inc.), Richard (Chance), Greg (Chance), Cindy (Chance), stating that Two Worlds Consulting on behalf of Chance had identified some existing secondary sources of Traditional Knowledge for First Nation of Na-Cho Nyäk Dun's review, comment, and permission for use. The table provided listed secondary sources related to First Nation of Na-Cho Nyäk Dun that, based on Two World's understanding, may contain Traditional Knowledge related to the Project area. Chance requested First Nation of Na-Cho Nyäk Dun's feedback including any protocols or guidance for the use of Traditional Knowledge and permission to use the listed secondary sources by , October 27, 2023. Chance also invited First Nation of Na-Cho Nyäk Dun to share any additional Traditional Knowledge sources that may not be listed to help inform the development of the socio-economic assessment and Project Proposal. Eliza stated that if First Nation of Na-Cho Nyäk Dun wanted to use alternative submission options for certain Traditional Knowledge sources, Chance would be happy to meet and discuss further.	N/A	N/A

Chance provided a catered dinner and presented Project information to the Open House attendees. The Open House event had door prizes that were drawn throughout the event which included 2 Air North gift cards, 2 Co-op grocery gift cards, and Ecofor packages.	N/A	Summary Report

APPENDIX 2-B. Gwich'in Tribal Council and Residents of Inuvik, Fort McPherson, Tsiigehtchic, and Aklavik Consultation and Engagement Records

APPENDIX 2-B-01. Eagle Plains Multi-Well Exploration Program – Northern Cross (Yukon) Ltd. Letter

NORTHERN CROSS

September 26, 2016

President Bobby Jo Greenland-Morgan
Gwich'in Tribal Council
P.O. Box 1509
Inuvik, NT

sent by fax: (867) 777-7919

Dear President Greenland-Morgan:

On behalf of Northern Cross (Yukon) Limited ("NCY"), I would like to congratulate you on your recent election victory to become the new President of the Gwich'in Tribal Council ("GTC"). We wish you a successful term as President and look forward to working with you and the GTC in the future.

As you likely know, NCY is involved in a small scale project exploring for oil and natural gas in the Eagle Plains area of northern Yukon. At this time, there is no activity pending the outcome of a Judicial Review and future Yukon Environmental and Socio-Economic Assessment Board ("YESAB") assessment and eventual regulatory approval processes.

Since mid 2012, NCY has drilled four exploration wells and completed a 325 square kilometer seismic program on some of the exploration lands awarded to NCY by the Yukon Government. There is a plan to drill up to 20 more exploration wells over a multi-year period to continue the evaluation of the oil and natural gas resource potential on prospects identified using the recently obtained seismic data. NCY has also relied on information available from other wells drilled by other companies in the area over the past fifty years and data obtained from wells drilled by NCY to help generate these drilling locations. Whether all 20 wells get drilled will depend on results as the program unfolds. This planned program is designed to minimize environmental impacts by operating only one drilling rig. Spreading the program out over several years gives northern businesses the visibility to invest in training, equipment and services to be able to participate in this project more effectively than if the work is compressed into a shorter time period using more drilling rigs. The maximum areal impact if the entire drilling program is completed is about 1 square kilometer in an area that is about 325 square kilometers. The maximum area of impact is smaller than the town site of Fort McPherson.

The exploration work that NCY has done to date and the future exploration work described above is not situated in the drainage of the Peel River Watershed, but some of the activities that NCY has done and proposes to do are in the Secondary Use Area. Lastly NCY has not done any hydraulic fracturing and does not plan to use hydraulic fracturing in the proposed exploration program.

Northern Cross (Yukon) Limited

Whitehorse Office:
201 B, 1191 Front Street

Telephone (403) 699-0055
Fax (403) 699-0044

Depending on the results of the exploration work, there is potential to develop resources to serve the regional market, including the Mackenzie Delta region, which could bring significant economic benefits to the region and displace very high cost imported fuel. There will also be significant reductions in greenhouse gas emissions by dramatically reducing the transportation fuel consumption to bring fuel from current sources like North Dakota, Washington State, Alaska, British Columbia and Alberta. Using modern designs and best operating practices, the environmental impact of any development of resources at Eagle Plain is expected to be minimized.

In addition to the environmental benefits described above, there are employment and business opportunities. NCY has retained the services of several Gwich'in businesses in Ft. McPherson and Inuvik during past exploration work and anticipates using them again in the future.

In case there is some misconception, I want to clarify the reason for NCY to apply to the Federal Court for a Judicial Review of a recent YESAB evaluation report and the Designated Office referral to Executive Committee for further review. NCY took this step to ensure that the project under review gets a fair hearing and address procedural practices of YESAB that NCY considers to be unfair. In accordance with the rules of the Federal Court, all participants in the YESAB process evaluating the proposed 20 well exploration project were served with the Judicial Review Application, but the objectives of the application are not directed at First Nations nor are they aimed at diminishing any rights under land claim agreements. This is purely a matter of achieving procedural fairness.

I have also attached a summary of key aspects of NCY's project, partnership opportunities for First Nations, the Judicial Review and protecting caribou for your reference.

Once you have settled into your new role, NCY would be pleased to meet with you to discuss the exploration program, efforts we take to minimize environmental impacts, economic benefits and other matters that are important to you.

Please contact me if you have any questions and to advise when you wish to meet. We look forward to working with the GTC in the future. I can be reached at (587) 390 4136 or by email at rwyman@northerncrossyukon.ca.

Yours truly,
Northern Cross (Yukon) Limited

Richard Wyman
President

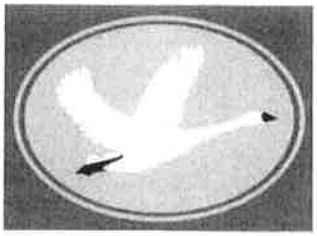
Cindy Dickson



Exploration Project

- Small size impact: less than 1 square kilometer of total impact if all 20 of the proposed exploration wells are drilled and all are discoveries of oil or natural gas that proceed to extended flow testing, which also includes building up to 87 kilometers of year round access roads
- For perspective, excluding the airfields, the town sites of Mayo and Old Crow each cover an area similar to the maximum impact of the exploration drilling program. Dawson City covers an area that is more than 30 times the size of the area of maximum impact.
- The proposed exploration project is planned to occur within the 325 square kilometer area where 3D seismic data was obtained during the winter of 2013-2014
- This project proposal is exploration related work and is not development. More YESAB screening is expected on any discoveries that become development projects
- Exploration activities have uncertain outcomes.
- How many of the proposed 20 wells actually get drilled depends on results as the drilling program proceeds because many of the planned wells depend on successful outcomes from the initial wells drilled
- If drilling results are discouraging, fewer exploration wells will get drilled
- The most likely outcome is that only a few discoveries will be made and undergo extended flow testing, which means the impact will be much less than the maximum described above.
- Any wells undergoing flow testing provide useful information to be able to design development plans
- Nothing in the proposed exploration project is resource development
- Northern Cross has an excellent track record of environmental protection and minimizing impacts
- Activities are designed to be small scale and extend over a longer time period to create more job and business opportunities for Yukoners and to minimize environmental impacts
- Hydraulic fracturing is not part of the proposed exploration drilling and evaluation program.
- The proposed exploration activities are not in the Peel River Watershed

Partnership Opportunities

- Northern Cross recognizes the important role that First Nations offer in the longer term success of resource exploration and development
- Environmental stewardship (base line studies, monitoring, adaptive management plans, protecting traditional uses)
- Business development opportunities (oil field services, direct investment similar to the VG ownership of Air North, synergies with other VG businesses)

Judicial Review

- Northern Cross has challenged YESAB on grounds of procedural unfairness
- YESAB made a referral to Executive Committee based on reasons that had never been presented to Northern Cross
- Northern Cross was never given the opportunity to address these new concerns
- In the interest of fairness, Northern Cross wants the opportunity to respond to the new issues identified by YESAB in its Evaluation Report of February 8, 2016
- The judicial review is a challenge only against the Government of Canada, who is acting on behalf of YESAB in this court process.
- Northern Cross is NOT challenging any First Nation or any legal rights of First Nations under Umbrella Final Agreements in this Judicial Review
- However, all parties who participated in the YESAB review of the exploration drilling program were served with the court application made by Northern Cross for a Judicial Review in the normal course of the legal process

Caribou protection

- Northern Cross cares deeply about caribou and the environment and manages its activities to minimize or eliminate impacts.
- Northern Cross has a demonstrated track record of environmental protection, including protecting caribou
- Northern Cross has prepared several management plans with the help of professional experts in their fields including recognized experts knowledgeable in the Porcupine Caribou Herd
- The management plans have been reviewed by VG government departments and are designed to be adaptable based on experience gained in the field.
- Northern Cross has proposed forming a Caribou Stakeholder Advisory Board comprised of interested stakeholders to provide guidance in the management of project activities in situations where caribou are present.

APPENDIX 2-B-02. Chance Oil and Gas Limited Introductions and Engagement and Communication Plan Letter

Chance
OIL AND GAS LIMITED

December 1, 2017

Chief [redacted]
Tetlit Gwich'in Council
PO Box 30
Fort McPherson, NT
X0E 0J0

Attention: Chief [redacted]

Re: Chance Oil and Gas Limited Introductions and Engagement and Communication Plan

Firstly, we would like to congratulate you on the recent news regarding the Peel Watershed decision; in addition to ensuring that the spirit and intent of modern day treaties and subsequent processes out of it are honoured, it will also provide much certainty of process for industry looking to develop projects within the Yukon.

In March of 2017, the structure of Northern Cross Yukon Limited substantially changed and Chance Oil and Gas Limited (Chance) was formed. As a result of these changes, the management team at Chance is looking to renew and reinvigorate the relationships we have with the First Nations our proposed exploration program may impact. We recognize that First Nations are very busy, and that the Tetlit Gwich'in Council (TGC) has many files that demand the attention of many of your resources. However, we hope that TGC is available as we work to develop engagement and communication plans with all of our potentially affected First Nations.

As you may know, the permits of interest that Chance currently holds were extended to August 30, 2018 under Order in Council (OIC) 2016/169. Permits 7, 9, 13, 14, 15, 17, 19, and 20 fall within TGC Secondary Use area and permit 15 falls within TGC Primary Use Area; Chance is seeking to engage TGC on our exploration program activities within these permits. The engagement and communication plan that we wish to develop through dialogue with you will also support our desire to continue holding these permits beyond August 30, 2018, and to work collaboratively with you to our mutual benefit into the future.

an Executive Committee Screening in February 2016. We welcome the greater level of scrutiny an Executive Committee Screening provides, as we recognize that First Nations and other Yukon citizens will need a more comprehensive public discussion on the benefits and potential risks associated with oil and gas development in the Yukon. Further to this point, as we work toward preparing our revised Project Proposal, it is our sincere desire to work in closer partnership with all our affected First Nations throughout all phases of the project.

As Chance pursues the oil and gas exploration program, we are also seeking to build strong, collaborative relationships based on transparency, openness, and respect with the First Nations in whose territories we will be active. As such, an invitation to meet with you and representatives of your choosing at your Government office, or a location of your preference, in coming months would be most appreciated. This meeting will provide an opportunity for the Chance team to introduce ourselves and begin collaborative discussions with you to jointly establish an appropriate a framework for developing an engagement and communication plan that suites the needs of both TGC and Chance.

To support Chance's renewed approach to engagement, we have retained Hemmera, a Whitehorse-based consultancy, to support us in facilitating dialogue between ourselves and affected First Nations and Yukoners. As such, Hemmera will also be engaged in the meeting we wish to schedule with you to set forward a framework for developing an engagement and communication plan. We look forward to hearing from you at your earliest convenience.

Sincerely,

[redacted]

President, Chance Oil and Gas

APPENDIX 2-B-12. *Gwich'in Tribal Council and Chance Oil and Gas Limited Communications and Consultation Plan*

Gwich'in Tribal Council and Chance Oil and Gas Limited Communications and Consultation Plan

1.0 Introduction

Chance Oil and Gas Limited ("Chance") is an oil and gas exploration company that holds permits to perform oil and gas exploration activities in the Eagle Plain basin of the Yukon Territory, Canada. The Gwich'in Tribal Council ("GTC") is an Indigenous organization that holds rights under Section 35 of the *Constitution Act*, 1982, *Treaty 11* and the *Gwich'in Comprehensive Land Claim Agreement* ("GCLCA"), including Appendix C – *Yukon Transboundary Agreement* ("YTA"). Under the YTA, "Tetlit Gwich'in" is defined as a Gwich'in who either: (a) resides in the Peel River watershed, including the community of Fort McPherson, Northwest Territories; or (b) is descended from an aboriginal person who used or occupied the Peel River watershed on or before December 31, 1921. Under this definition, Tetlit Gwich'in and their descendants currently reside in Aklavik, Inuvik, Tsiigehtchic and Fort McPherson, as well as elsewhere in Canada and abroad. Under the GCLCA, the GTC is the body responsible for representing the collective rights of GCLCA participants, including all Tetlit Gwich'in as defined in the YTA.

As part of Chance's exploration program, Chance, as the proponent, seeks to develop a communication and consultation plan ("the Plan") with the GTC, as a rights holder for these Yukon lands that could potentially be affected by Chance's exploration program activities. These Yukon lands are identified in the YTA as the Primary Use Area and the Secondary Use Area lands. With the exception of permit 15 which straddles the Primary Use Area, all of the permits held by Chance, namely 7, 9, 13, 14, 15, 19, and 20, are located within the Secondary Use Area.

The Plan will reflect and be consistent with the GTC's role as the Indigenous organization responsible for upholding the collective rights held by Gwich'in in the Primary Use Area and Secondary Use Area within the Yukon. This Plan will acknowledge the GCLCA organizational structure, and as such, is intended to extend to and encompass the GTC, the Designated Gwich'in Organizations, and including the Tetlit Gwich'in Council (the "Gwich'in Partners"). The Gwich'in Partners will seek to establish an internal Memorandum of Understanding (MOU).

2.0 Purpose

This document serves as a Plan to provide a mutually agreed upon framework to support collaborative and effective communication and consultation between Chance and the Gwich'in Partners.

3.0 Relationship

Chance and the Gwich'in Partners will execute this Plan according to the following principles:

- Transparency;
- Timeliness; and
- Mutual respect, trust and understanding.

4.0 Key Gwich'in Tribal Council and Chance Connections

Communication and consultation between Chance and the Gwich'in Partners will be generally associated with the proposed works and potential effects associated with Chance's oil and gas exploration program, and with potential new opportunities or benefits received by the Gwich'in people, from Chance, as the project proponent. Once the scope of Chance's specific plans are determined, the Gwich'in Partners, together with Chance, will discuss the anticipated impacts on Gwich'in rights within the Primary and Secondary Use Areas, as well as the best way of addressing the impacts defined at that time.

This section of the Plan identifies the key contacts related to these overarching communication and consultation themes. Key representatives involved in communication and consultation are expected to be as follows:

- Grand Chief/President of the Gwich'in Tribal Council;
- President of the Tetlit Gwich'in Council (TGC);
- Gwich'in Tribal Council's Chief Operating Officer (COO); and
- Chance Management and designated staff and advisors.

Communication and consultation with the Gwich'in Partners will be coordinated through the Gwich'in Tribal Council's Chief Operating Officer.

Key Chance representatives involved in communication and consultation are expected to be as follows:

- Chance Oil and Gas Chairman and Chief Executive Officer (CEO)
- President of Chance Oil and Gas;
- Vice President of Government and Community Relations; and
- Regulatory, Environmental, and Community Relations Coordinator.

5.0 Communication and Consultation Methods

Chance and the Gwich'in Partners will employ the following communication and consultation methods:

- In person meetings;
- Email;
- Sharing Power Point Presentations (to support in person meetings);
- Sharing reports and documents (as requested and as required);
- Telephone correspondence (teleconferences and less formal phone calls); and

- Identifying and documenting issues of concern raised by the Gwich'in Partners during consultation meetings, and Chance providing written responses to the identified issues within 30 days of the meeting, to serve as the basis for ongoing dialogue and resolution.

5.1 Meetings Process

Communication and consultation meetings will be executed in the following manner:

1. Chance and/or the Gwich'in Partners will request a meeting in writing to the other party according to the connections iterated in Section 4.0, no less than ten business days of the proposed meeting date;
2. The parties to meet will develop the agenda collaboratively;
3. The party requesting the meeting will develop supporting materials (collaboratively, where possible), and share those at least two days in advance of the meeting; and
4. The meeting will take place in a mutually agreeable location.

The above general process applies to meetings with subject matter leads, and where reasonable, meetings with communities at large.

5.2 Documentation

The following documentation sharing and review protocols support the communication and consultation methods described above:

- Action items and meeting outcomes will be logged during meetings and reviewed by both Chance and by the Gwich'in Partners at the end of the meeting to ensure that there is general agreement on the list of actions and entities responsible for those actions. The list of action items and meeting outcomes will be recorded in writing and shared between Chance and the Gwich'in Partners, within ten business days following the meeting date;
- Chance and the Gwich'in Partners will agree upon and use a file sharing platform to facilitate sharing of large files, such as Power Point presentations, reports and documents exchange relating to specific issues identified that were the object of specific consultations;
- Should Chance and the Gwich'in Partners employ a third party for records development and management, the third party will follow the process described above for recording and providing meeting minutes;
- Pursuant to Section 5.1, Chance and the Gwich'in Partners will exchange documents pertaining to issues identified in the communications and consultation process that may affect Gwich'in rights pertaining to the Primary and Secondary Use Areas in the Yukon. These documents will include written summaries of decisions reached collectively and agreed upon concerning these issues.

6.0 Records Management

Summarized records of communication and consultation between Chance and the Gwich'in Partners will be kept in a records log. Chance will ultimately submit the items below to regulators and assessors for review if and when a potential project is assessed in the future:

- Meeting Agendas;
- Meeting Action Items as described in **Section 5.0;**
- Invitee/Attendees lists and/or meeting sign-in sheets;
- Records log, which will include summaries of the following:
    - In person meetings;
    - Phone calls and teleconferences;
    - Incoming and outgoing emails between Chance and the Gwich'in Partners.
- Reports and documents provided to the Gwich'in Partners by Chance and reports and documents provided to Chance by the Gwich'in Partners for review and consideration;
- Copies of Power Point presentations delivered by Chance to the Gwich'in Partners;
- Copies of any presentations delivered by the Gwich'in Partners to Chance; and
- Documents exchanged pertaining to issues raised during the communications and consultations process, as identified in Section 5.0.

7.0 Adaptive Management of the Communication and Consultation Plan

Chance and the Gwich'in Partners will review and assess the effectiveness and success of this Plan on at least a six-month basis.

Chance and the Gwich'in Partners agree to establish a *Chance-Gwich'in Communications and Consultation Management Committee* of senior officials to serve as a focal point for the co-development and co-management of current and future plans and activities associated with Chance's exploration program activities. Chance and the Gwich'in Partners will nominate representatives to serve on this Committee. Those representatives will determine the required frequency of meetings, but it is envisaged that for the first year following agreement on the Plan that meetings of the Committee would be held one time per each season. It is also understood by Chance and Gwich'in Partners, that a Terms of Reference will be developed by the Committee. The Committee will be supported by a Secretariat, both of which will be wholly funded by Chance. Chance and Gwich'in partners will hold the first meeting within 60 days of finalizing this Plan.

8.0 Cost and Economic Opportunity

The Gwich'in Partners, together with Chance, have discussed their mutual interest in working towards ensuring that GCLCA Participants are able to derive and participate in benefits arising from Chance's proposed oil and gas exploration activity within the Primary and Secondary Use Areas in the Yukon. Chance recognizes the importance of, and commits to, working respectfully and collaboratively with the GTC and Gwich'in partners during engagement, consultation, and any negotiations on agreements that will take place in the future, to the same degree and manner as Chance would with any Yukon First Nation, whose settlement land or traditional territory may be affected by oil and gas activity in the Eagle Plain Basin.

As the Communications and Consultation Plan is implemented, Chance and GTC agree to discuss a Cooperation Agreement wherein opportunities or benefits are defined that the Gwich'in people, as represented by the Gwich'in Partners, would receive from Chance. Benefits could include such things as, capacity funding, employment opportunities, contracting opportunities, scholarships and education and training opportunities, other financial and implementation payments, and equity participation.

9.0 Signatures of the Parties

This Plan is approved by the following parties:

Chance Oil and Gas limited

APPENDIX 2-B-13. February 1, 2019, Meeting Summary

Summary

Chance Oil and Gas Limited All-Party Meeting

Date: February 1st, 2019 **Time:** 8:00 am to 4:15 pm

Location: Princess Louisa Room, Fairmont Waterfront Hotel, Vancouver, BC V6C 3L5

Meeting Participants:

Vuntut Gwitchin Government:

- Chief [redacted]
- [redacted] Fish and Wildlife Manager
- [redacted] Lands Manager
- [redacted] Intergovernmental Coordinator

First Nation of Na-cho Nyak Dun:

- [redacted] Deputy Chief
- [redacted] Lands and Resources Manager
- [redacted] Strategic Advisor

Gwich'in Partners (Gwich'in Tribal Council and Tetlit Gwich'in Council):

- Chief [redacted]
- [redacted] Director, Lands and Resources

Yukon Government

- Minister [redacted] Energy, Mines and Resources and Economic Development
- [redacted] Assistant Deputy Minister, Oil, Gas and Mineral Resources, Energy, Mines and Resources
- [redacted] Director, Oil, Gas and Mineral Resources, Energy, Mines and Resources

Chance Oil and Gas Limited:

- [redacted] Chairman/ CEO
- [redacted] President
- [redacted] Vice President of Community and Government Relations
- [redacted] Regulatory, Environmental and Community Relations Coordinator

Hemmera:

- [redacted] VP Human Environment
- [redacted] Business Leader, Human Environment
- [redacted] Human Environment Specialist
- [redacted] Human Environment Specialist

DRAFT

Summary:

Topic	Lead
Introduction to Meeting • Review of Agenda • Meeting purpose and objectives Summary: Hemmera was hired in 2017 to assist with the consultation and engagement activities for Chance's exploration project in Eagle Plains.	[redacted]
Round Table Introductions and Opening Statements by Chiefs Summary: Chief [redacted], Minister [redacted] Chief [redacted], and [redacted] provided opening statements.	All Parties
First Nation Engagement Plans • Overview of how we got here and an update on implementation Summary: Chance's current round of engagement was spurred by the 2016 OIC, followed by the 2017 Ministerial Order. A series of meetings started in 2018 to collaboratively create engagement plans, starting with a template, then building out from there. This resulted in unique documents between Chance and each First Nation. Annual reports are required under the 2018 Ministerial Order. Likely not an onerous task, and along the lines of a communication summary. Level of detail will likely be decided by individual First Nations. ***See Appendix 1 – Chance All-Party Meeting: Engagement Plan Presentation***	[redacted]
Overview of Vuntut Gwitchin Government Oil and Gas Engagement Policy Summary: Vuntut Gwitchin Government (VGG) wanted an opportunity to share with the group the work VGG has done over the past year. Guiding principles of the VGG Oil and Gas Engagement Policy (Policy): sustainable development; the NYRLUP; VGG Final Agreement; past learning experiences with YESAB (e.g., gaps in regulatory regime in the Yukon); international standards. The development of oil and gas is a community decision. The Policy is two pieces/themes: internal engagement within the community and how the community will decide on oil and gas; and, external engagement with industry (i.e., the Policy establishes a committee). The Policy itself has three phases. All phases are meant to occur prior to a YESAB submission. VGG believes the new YESAB process (i.e., Pre-Submission Engagement process) largely aligns with the objectives of the Policy. Currently, we are before stage one – waiting for notification from Chance Question: Regarding the format/structure diagram – in terms of YESAB, once an application is complete and there is feedback, does that go to the Council? VGG: Feedback goes back into the whole loop – the loop including Council, the committee, and citizens. The committee isn't an interface between the VGG and YG. The committee would be tasked, as per its specific role, and then they would	[redacted]

DRAFT

report back to the Chief and Council after having done their work. At a later date VGG could expand on the internal processes for clarity.

See Appendix 2 – Chance All-Party Meeting: VGG Oil and Gas Engagement Policy Presentation

Exploration Project Description and Discussion

- Overview of the exploration project plans, oil and gas disposition plans, and YESAB application
- Answer questions or provide clarity on the Exploration Project Description

[redacted]

Summary: First exploration of oil and gas occurred in the Yukon when it was still being permitted by Ottawa back in the 50s, 60s, 70s. Red polygons on the permit map – legacy of exploration done approximately 1959-1968 when oil was found in the Yukon. These properties by themselves are not adequate to move forward with development – more needs to be discovered.

Question: For the discoveries, are conventional or non-conventional means required?

Chance: Do not need to stimulate the rock to facilitate production. Conventional means of extraction would be used.

Winter 2013/2014 had 3D seismic activity, the first in the Yukon. Chance has a base camp that can house 75 people. A limiting factor is man power (i.e., limited places to stay). Land tenure is the period of time that a permit is valid. On the Permits Map, the colour pertains to how the tenures have been extended.

Exploration activities can entail a number of things. Seismic: now lines carved through the bush are not straight, there is no line of sight, and the line are much narrower than those in the 1950s and 1960s. 3D seismic allows you to collect subsurface information in all directions. Exploration activities will include running a basecamp. Chance has to bring up everything needed in order to undertake an activity. Exploration is the riskiest part of the oil and gas industry, and the hardest part of the industry to get money allocated. A population of wells, in order to drill, learn more, and increase your probability of success is preferred.

Question: If Chance went with a 35 well program – is it 35 well pads on the surface with horizonal drilling under ground, or 35 wells total?

Chance: Not certain if we've thought well enough ahead to know that. Not all 30 wells will be exploratory. If something is found, then may need to drill in the vicinity. Possibly drill from the same well pad or one close to it in order to get a better idea of the resource.

YTG: Each well would be authorized. Not by pad.

Question: Would activities be primarily seismic first?

Chance: We do not necessarily have to shoot seismic in order to drill right now as there is legacy data. Chance does not have to do new seismic in all cases.

Chance's goal is to discover and develop a resource that meets the needs of the North and then expand. Chance wants to build local capacity. Around 80% of what Chance needs to

DRAFT

execute a program they cannot get from the Yukon (i.e., a supply line from the Edmonton area is required). If the supply chain can be shortened, it is building capacity and economy in the Yukon. Additionally, it is cheaper to operate in a continuous fashion as opposed to stopping and starting (more costly).

Question: Would activity be year-round?

Chance: Depends on the production, depends on the nature of the access. All weather access is the Dempster. However, if discoveries are made elsewhere, may need to consider all weather access off the Dempster.

Chance would assess before going out on the land to minimize footprint (e.g., build winter access on existing access routes is preferable)

Chance's drilling plan would have one rig maybe two at any given point. Trying to have a smaller scale over a longer period of time. This gives people/community time to get ready, buy equipment, get training.

Question: The concept around winter road versus summer road. All season road would be required if you need to flow test, correct? A year-round fixture on the land?

Chance: Yes, if you are flow testing then you are taking a product out of the ground, over longer periods of time, and you need to get equipment to test it (e.g., trucking operations in the testing period).

Question: For the purpose of the proposal, would that be addressed?

Chance: Yes, it would be covered off in the proposal.

First Chance would go with winter access. and then explain what would happen in the future with a well (e.g., if a well bears fruit, then this is where permanent access would need to be). This would be in the proposal to YESAB.

A multi-well program in an identified area of interest would ensure flexibility. If something is discovered, there will be a significant green house gas reduction (i.e., supply line will be reduced). The camp location was the location used when the highway was under construction – Chance is trying to reactivate/reuse previously disturbed areas.

Question: What does 300 million litres mean?

Chance: The amount of fuel trucked around the Yukon. Fuel is carried in two truck trailers that carry 50,000L each. Chance is likely not going to take out the full 300 million litres but could reduce it to 200 million litres. 2000-3000 barrels a day would remove the need to get fuel to the Yukon. The source would be local instead of foreign. 2000 barrels is about 11 truck loads.

Question: VGG has about 20 monitoring stations to keep a close eye on what's going on in the watershed – how can Chance participate in that?

DRAFT

Chance: Will need clarification, but Chance will be identifying data gaps. E.g., creeks in the area of interest. There is going to be monitoring place for parties to track what's going on. With respect to the Policy. There are stages to go through, and they align well with YESAB processes. Fairly soon Chance is going to have to work on/refine its project scope. Chance's objective is to build capacity and try to operate as continuously as possible. Sequencing of project activities would need to meet Chance's capacity. In the start limited to winter activities. Steady work gives the basis for local businesses to commit to local training. YESAB takes quite a bit of time, and the tenure clock is always ticking. There is a cost associated with multiple entries into YESAB. Question: 400 km/sq area? What area? Chance: Area of interest is about 40% of the total area under permits (See Appendix 3) Question: Expectation of timing for field work and the YESAB process? Chance: Ideally, field work two years from now, after YESAB. Also, likely an application to the Yukon Water Board. Confirming scale and scope with the hope to enter YESAB later this year. Have to satisfy the Policy and any new changes to YESAB. VGG: Can see the benefits but weigh it with concerns for the land and waters. Parties have different mandates but there is overlap. Cooperation Agreement and the front-end approach could be beneficial. Time pressure yes, but it will facilitate YESAB and YOGA agreement. A balance to be struck with timelines and capacity. There is limited oil and gas experience in the Yukon, and the Yukon is nothing like the rest of the country because there is robust land use planning and the power of the people. Mandates come from the people and this will benefit the people. Both sides have significant investments. Acknowledges that parties have and are seeking different requirements: certainty versus flexibility. Question: Is the NYRLUP up for review? It was completed in 2009, parties to the plan have been talking about what a review looks like. Currently assessing the plan to see where it's doing its job and where it might not be (Note: the plan will have new lines/boundaries). Minister Ranj Pillai departed 11:26 am. ***See Appendix 4 – Chance All-Party Meeting: Chance Oil and Gas Project Description Presentation***	
In-camera First Nations Session	
Review of Afternoon Agenda and Opportunity for Statements/Questions Following In-camera Session and Lunch Summary: No questions or comments.	[redacted] All Parties

DRAFT

Presentations and Discussion • Yukon Environmental Assessment Process • Other regulatory processes such as YOGA and the Water Act Summary: YESAA, YOGA, and the Water Act each have various regulations that could apply to any number of activities. There are other departments involved as well (e.g., workers compensation). No work or activity can occur before a decision document and a water license has been issued. Question: What will be the decision body be for Chance's project? YG: Likely Oil and Gas Branch if YESAB process is District Office (DO), or Major Projects Office if it is an Executive Committee (EC). There are three types of processes. DO, EC (typically a longer process and handled out of the head office in Whitehorse, has timelines, specific requirements for consultation prior to submitting an application to YESAB), and panel process. January 2019 YESAB released information around a new process. Pre-Submission Engagement process (PSE). Currently, proponents are creating the entirety of the project proposal and submitting it all at once. Proponents have not had a facilitated process with YESAB prior to submission (i.e., opportunity to receive feedback on scope and size) and this has downsides. It's possible to have 5-10 years of exploration and baseline data. Then have YESAB require baseline data on a separate matter. Providing guidance and direction around scope and valued components would be beneficial to the process and ensure that a proposal is moving in the right direction during development. There are information sessions in the coming weeks, and the process may come into force fall 2019. It is possible that this could reduce time spent on information requests. The intention being to take time away for the stages/process after submission. Question: How will this mirror or link into VGG Oil and Gas Policy? VGG: VGG is also new to what is being proposed by YESAB. After looking at preliminary materials, it appears to align well with the Policy. Question: If Chance proceeds through the three stages of VGG, is the new YESAB process a requirement? Hemmera: Not a requirement yet, but it will be. If a proposal is submitted to YESAB before the new process is in effect, it would proceed under the old/current process. The new PSE process is consistent with what the Federal Government has done and also what BC has done with their new Environmental Assessment process. Question: If Chance proceeded prior to the implementation of the PSE and followed the Policy, would Chance be doing the same activity? Hemmera: The Policy is only for VGG. The PSE process is for everyone, including VGG. Additionally, YESAB collects the views of all of the Yukon. Question: Should Chance implement the PSE process before it is mandatory?	[redacted] All Parties

DRAFT

Hemmera: That is for the group to weigh the pros and cons and decide. Nov 2019 is an estimated date and a Federal election may cause more delays. Question: Is this legislation? Is parliamentary time required? Is this a policy, regulatory, or legislative change? Hemmera: This is a question for YESAB. YESAB is independent of the government and they are changing their rules. Maybe gazetting? Because YESAA is a Federal act. YESAA will set out the rules for processes and what consultation is necessary. ***See Appendix 5 – Chance All-Party Meeting: Regulatory Processes Presentation***	
YESAB Application Process • Where are we? • Anticipated timelines and mapping next steps Suggestion (Chance): Moving forward there will need some form of information exchange. Depending on the information, may need to be exchanged in a confidential manner. Finish Confidentiality Agreements. Chance has shared project ideas. Chance is open to feedback. Look into which steps can be done concurrently. Budget estimates and items associated with capacity will assist Chance with internal approval processes. Suggestion (Chance): Future discussion on whether or not there could be agreement or interest in using common consultants – where needed for professional and technical advice. Trying to get common recommendations. Feedback: This may be a good idea on the technical front and a capacity one. However, a biological or cultural assessment, First Nations may want to do that independently. Question: Is YG interested in doing oil and gas 101? YG: YG is amenable to doing oil and gas 101s. Different presentations could be tailored for different audiences Suggestion (VGG): Use previous documents (multi-well project) and analyze the criticism against them, to work on the areas within them, and bring them to a place where the parties support them. E.g., are concerns some that were raised by multiple people, or ones born of miscommunication? Feedback: Hemmera will be conducting a gap analysis to evaluate what is needed to apply to YESAB again (i.e., looking at everything from the DO screening and, if there is an EC, what more is needed). Take those comments from the registry (from the DO process) and evaluate whether there were adequate responses or if since then, different information has arisen, or more adequate best practices have been developed. Suggestion (VGG): Put our minds to the monitoring plan and whether mitigation measures are doing what they should (i.e., applying adaptive management). **Next steps as they were listed on the flipchart** • **Confidentiality Agreements**	[redacted] All Parties

DRAFT

• **Project Scope** • **Processes in Parallel vs. Sequentially** • **Shared consultants – technical disciplines** • **Oil and Gas 101** • **Adaptive Management**	
Wrap Up and Closing Statements Question: Is it useful to have All-Party meetings? Summary: Parties agreed it was valuable. Future All-Party meetings could be timed with key milestones and planned to proceed/follow other key dates/events. VGG: Offered to send a list of key dates/events that could be used. Summary: Chief [redacted], Chief [redacted], and Yukon Government provided closing statements.	S. Shaw

The Engagement Plans:
Development and Next Steps

Hemmera
An Ausenco Company

Creating the Engagement Plans

- Chance's current engagement with First Nations was prompted by M.O. 2017/37
- M.O. 2017/37 requested that Chance file Engagement Plans with each of the affected First Nations listed in the M.O.
- All Engagement Plans were filed in summer 2018

O.I.C. 2016/169
OIL AND GAS ACT

OIL AND GAS ACT

Pursuant to section 10 of the *Oil and Gas Act* and subsection 12(6) of the *Oil and Gas Disposition Regulations*, the Commissioner in Executive Council orders

1 In this Order

"subject permit" means each of the following oil and gas permits held by the subject permittee

(a) oil and gas permit No. 0005,

(b) oil and gas permit No. 0006,

M.O. 2017/37

OIL AND GAS ACT

Pursuant to the *Oil and Gas Act*, the Minister of Energy, Mines and Resources orders

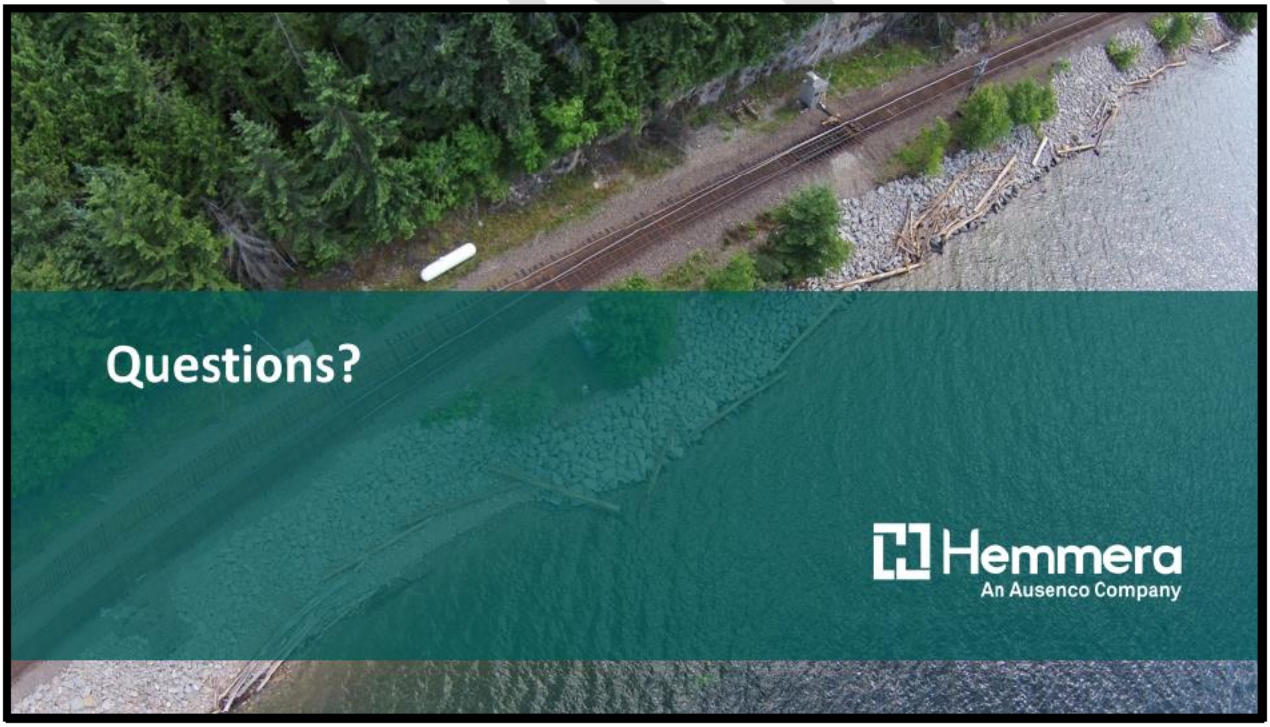
1 In this Order

"subject permit" means each of the following oil and gas permits held by Chance Oil and Gas Limited:

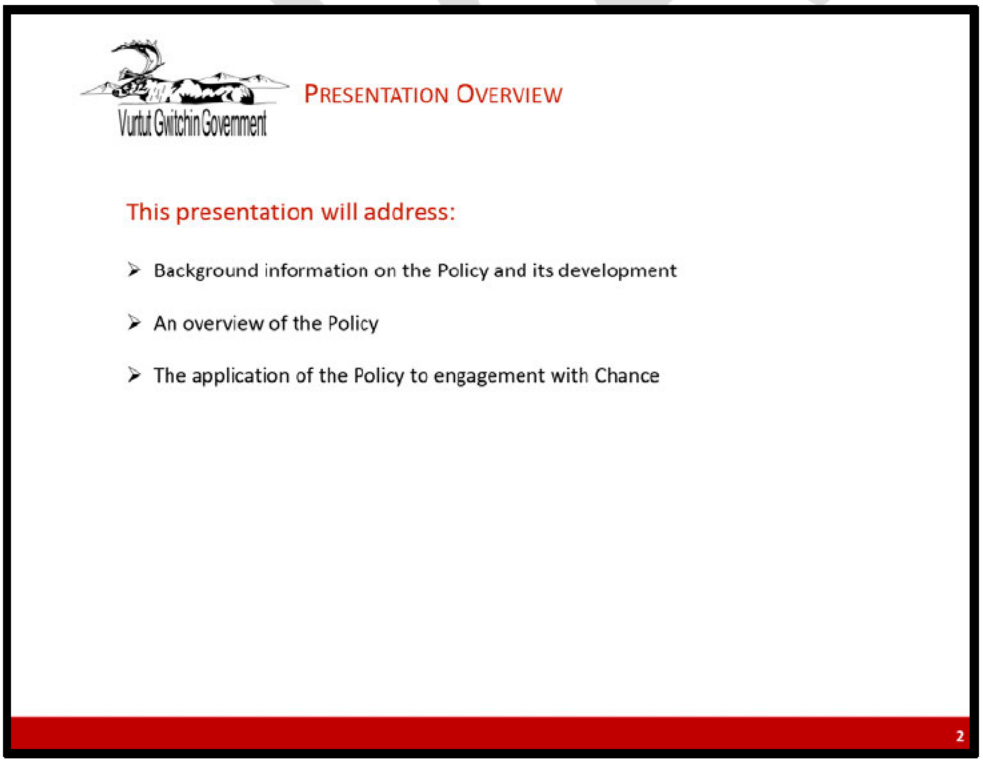
(a) oil and gas permit No. 0012,

(b) oil and gas permit No. 0013,

(c) oil and gas permit No. 0014,



VUNTUT GWITCHIN GOVERNMENT
OIL AND GAS ENGAGEMENT POLICY:
BACKGROUND AND OVERVIEW
Vuntut Gwitchin Government
This presentation was prepared by the Vuntut Gwitchin Government for discussions with Chance Oil and Gas on December 12, 2018 in the traditional territories of the Kwanlin Dün and Ta'an Kwäch'än



Vuntut Gwitchin Government
PRESENTATION OVERVIEW
This presentation will address:
Background information on the Policy and its development
An overview of the Policy
The application of the Policy to engagement with Chance
2

Vuntut Gwitchin Government

BACKGROUND

The development of the Policy was informed by:

- The principle of sustainable development as enshrined in the VGFN Final Agreement and North Yukon Regional Land Use Plan
  - "'Sustainable Development' means beneficial socio-economic change that does not undermine the ecological and social systems upon which communities and societies are dependent" [VGFN Final Agreement, Chapter 1].
  - "The core principle that guides the Plan is sustainable development, as defined in the VGFNFA... Sustainable development requires consideration of the economic, social and ecological consequences of land use decisions, and management of lands and resources in an integrated and coordinated manner" [NYRLUP]
- The principles, goals, recommendation and best management practices provided for in the North Yukon Regional Land Use Plan

3

Vuntut Gwitchin Government

BACKGROUND

The development of the Policy was informed by:

- Past experience of engagement activities with proponents and in participating in the YESAB assessment process
  - "The Designated Office is unable to determine if adverse effects to the access to and use of the PCH are or are not significant... development in the region is not intrinsically adverse, but rather that additional information is required to make confident effects predictions and to determine the significance of those adverse effects. The requirement for confidence in predicting effects in this assessment is elevated for two reasons: first, the significant importance for the First Nation and the Inuvialuit way of life that is intrinsically linked to the PCH; and second, the unprecedented scale of the Project within this region" [YESAB DO Report].

4

BACKGROUND

The development of the Policy was informed by:

- Shortcomings in the existing territorial regulatory regime
  - "VGG would like to address our concerns with provisions of the Yukon Oil and Gas Act, R.S.Y. 2002, c. 216 and its associated regulations as it relates to benefits agreements and permit extensions. Additionally, VGG would like to resume the development of resource access roads regulations under the Territorial Lands (Yukon) Act, S.Y. 2003, c. 17" [VGG Letter to Premier Silver, May 10, 2017].
  - "The most recent annual report for the NYRLUP stresses the need for baseline data collection and development of best management practices in order to better understand and predict effects. Industrial development in the region is predicated upon fulfillment of goals for information collection as set out in the NYRLUP and associated annual reports" [YESAB DO Report].

5

BACKGROUND

The development of the Policy was informed by:

- An identified need for public policy that establishes a framework for respectful, meaningful and transparent engagement
  - "It is a condition of this Order that Chance Oil and Gas Limited must, in consultation with each affected First Nation, revise the first nations communications and engagement plan filed under O.I.C. 2016/169 to the satisfaction of the Minister on or before August 1, 2018" [Ministerial Order 2017/37].
  - "[THEREFORE BE IT RESOLVED] That VGG proceed with efforts that lead to constructive engagement with oil and gas industry proponents and government agencies including partnerships in the areas of employment and training, environmental stewardship and business development" [VGFN GA Resolution No. 2017-02].

6

Vuntut Gwitchin Government

BACKGROUND

The development of the Policy was informed by:

- International standards and best practices
  - "Indigenous peoples have the right to determine and develop priorities and strategies for the development or use of their lands or territories and other resources... [and to] free and informed consent prior to the approval of any project affecting their lands or territories and other resources, particularly in connection with the development, utilization or exploitation of mineral, water or other resources" [UNDRIP, Article 32].
  - "FPIC is relevant... in relation to development projects encompassing the full project cycle, including but not limited to assessment, planning, implementation, monitoring, evaluation and closure" [UN Permanent Forum on Indigenous Issues, Report of the International Workshop on Methodologies regarding Free, Prior and Informed Consent and Indigenous Peoples].

7

Vuntut Gwitchin Government

BACKGROUND

The development of the Policy was informed by:

- International standards and best practices
  - "Due to the fragility of arctic environments, with high vulnerability to climate change, the high proportions of Indigenous peoples within arctic populations, and increasing resource development pressures, Indigenous-led impact assessment is particularly important... [Indigenous-led impact assessment] is a process that is completed prior to any approvals or consent being provided for a proposed project, which is designed and conducted with meaningful input and an adequate degree of control by Indigenous parties—on their own terms and with their approval. The Indigenous parties are involved in the scoping, data collection, assessment, management planning, and decision-making about a project" [Gwich'in Council International, Impact Assessment in the Arctic: Emerging Practices of Indigenous-Led Review].

8

Overview of the Policy

The main components of the Policy include:

- A clearly defined purpose section
  - "The purpose of this policy is to establish a respectful, transparent and meaningful framework to guide the engagements of the Vuntut Gwitchin Government in relation to Oil and Gas Activities and Oil and Gas Dispositions in a manner that supports and upholds the objective of Sustainable Development" [section 3].
- The establishment and mandating of a committee to facilitate the participation of Citizens in the engagement and decision-making process
  - Membership consists of Standing Committee Chair on Natural Resources, Director of Natural Resources, Elders Representative, Youth Representative and Citizen Representative [section 12].
  - Mandate includes informing and seeking views from Citizens, and assisting and providing recommendations to the Council throughout the Engagement Process [section 11].

9

Overview of the Policy

The main components of the Policy include:

- A process to guide the organizing and carrying out consultations with Citizens regarding Oil and Gas Activities and Oil and Gas Dispositions
  - Director of Natural Resources has primary responsibility for organizing and carrying out any consultation between the Vuntut Gwitchin Government and Citizens regarding Oil and Gas Activities and Oil and Gas Dispositions with the assistance of the Committee as necessary [section 20].
  - Proponents are to coordinate any of its consultation with Citizens by submitting written notice to the Director of Natural Resources that sets out proposed date, location, agenda, description of the purpose of the meeting and any materials to be shared with Citizens [section 21].

10

Overview of the Policy

The main components of the Policy include:

- A three stage process for engagement with Proponents in relation to any Oil and Gas Activity to be completed prior to the Proponent submitting any Proposal to the Board
- Stage 1: Notice Period
  - Sufficient notice of a proposed Oil and Gas Activity must be provided to the Director of Natural Resources at the earliest opportunity [section 24].
  - Director of Natural Resources will refer the notice it receives from the Proponent to the Committee who will review it for sufficiency. The Committee will notify the Proponent in writing of its determination. If notice is not sufficient then more information will be requested. If notice is sufficient then engagement on the Oil and Gas Activity can proceed to Stage 2 [section 25].

11

Overview of the Policy

The main components of the Policy include:

- Stage 2: Cooperation
  - A Cooperation Agreement must be negotiated and entered into following Stage 1 and before proceeding to Stage 3 [section 26].
  - Prior to entering into a Cooperation Agreement, Council must refer the Cooperation Agreement to the Committee. The Council can enter into the Cooperation Agreement if the Committee determines that the Cooperation Agreement adequately addresses items related to compliance with the policy, communications, information sharing and capacity funding [section 27].
  - If a Cooperation Agreement is entered into in relation to an Oil and Gas Activity then the engagement process proceeds to Stage 3. A Cooperation Agreement does not provide free, prior and informed consent to any Oil and Gas Activity.

12

Vuntut Gwitchin Government

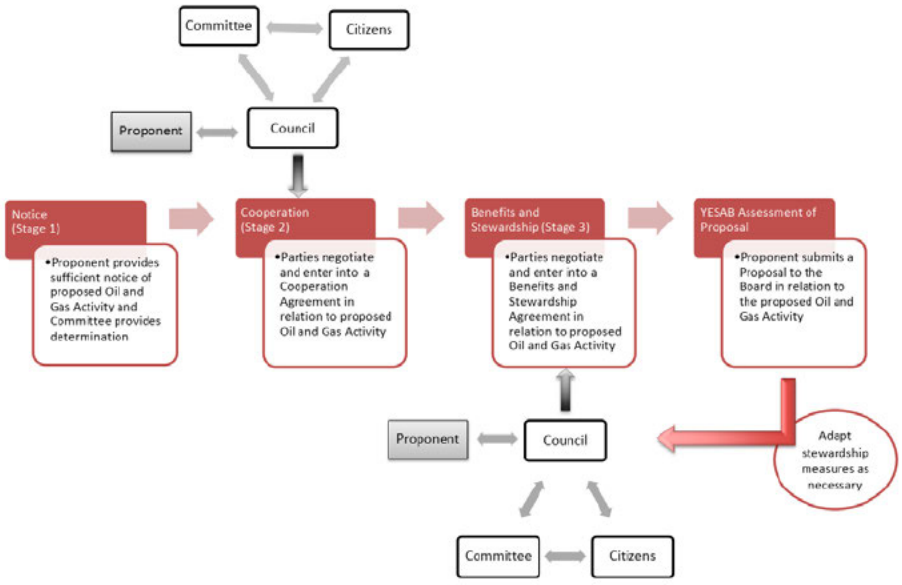
Overview of the Policy

The main components of the Policy include:

- Stage 3: Benefits and Stewardship

  - A Benefits and Stewardship Agreement must be negotiated and entered into following Stage 2 and before proceeding to the Board with a Proposal. It is the mechanism in which the free, prior and informed consent of the Vuntut Gwitchin First Nation is effectively to be provided in relation to any Oil and Gas Activity [section 28].
  - Prior to entering into a Benefits and Stewardship Agreement, Council must refer the Benefits and Stewardship Agreement to the Committee. The Council can enter into the Benefits and Stewardship Agreement if the Committee determines that the Benefits and Stewardship Agreement adequately addresses various items related to economic benefits and environmental stewardship [section 29].
  - Benefits and Stewardship Agreement will be subject to an approval and ratification process deemed adequate by the Committee.

13



14

Application of the Policy to Engagement with Chance

The Policy applies to engagement with Chance:

- Chance review of the draft Policy
- Chance acceptance of the final Policy
  - "Chance will comply with the Policy and any other applicable VGG policies. To the extent that there may be any inconsistency between this Plan and the Policy, the Policy will prevail" [Joint Communication and Engagement Plan]
  - "The Plan, which incorporates the Vuntut Gwitchin Government Oil and Gas Engagement Policy (the "Policy"), sets the framework for all communication and engagement between Chance Oil and Gas Limited ("Chance") and the Vuntut Gwitchin Government ("VGG") moving forward. Chance's commitment to the Plan and Policy is a significant achievement and provides an example for the outside world on how industry ought to approach oil and gas exploration and development in the North within a framework premised on free, prior and informed consent" [VGG June 11, 2018 Letter to Chance]

15

Application of the Policy to Engagement with Chance

The Policy applies to engagement with Chance:

- VGG and Chance engagement is currently in Stage 1 (Notice)
- Chance has shared scenarios for various Oil and Gas Activities at different scales but has not submitted notice of an Oil and Gas Activity it wishes to advance for further consideration under the Policy
- VGG has shared a draft Cooperation Agreement for discussion purposes prior to the completion of Stage 1 (Notice) and in advance of Stage 2 (Cooperation)
- Next steps: Chance to provide written notice of any proposed Oil and Gas Activity to the Director of Natural Resources at the earliest possible opportunity as provided under section 24 of the Policy

Chance
OIL AND GAS LIMITED
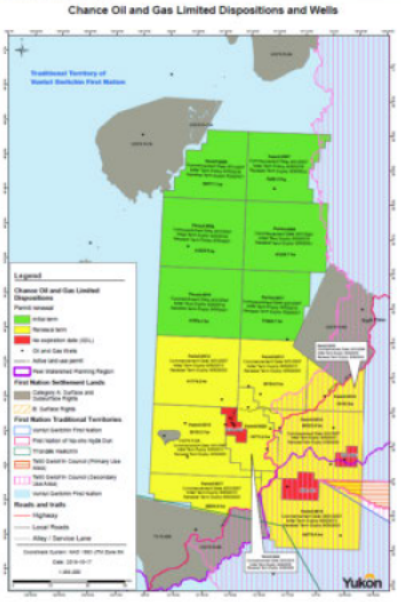
Presentation Outline
[redacted]
• Exploration Context
• Corporate Objectives and Plans
• Exploration Activity Scenarios

Land Holdings Eagle Plain, Yukon



- 14 Exploration Permits (0006-0017, 0019-0020 expiring between Aug 30, 2019 and Aug 30, 2023
- 3 Significant Discovery Licenses ("SDL's") with indefinite tenure with discovered oil and natural gas
- Landholdings total about 490,000 hectares
- North Yukon Regional Land Use Plan indicates that this area is suitable for multiuse, including oil and gas industry activities
- Chance surrendered ep. 0005 in 2018 to allow the creation of Ch'ihilii Chik - HPA

3

Infrastructure and Support

- Eagle Plains is an underexplored sedimentary basin
- Discovered resources located at the SDL's is not sufficient to proceed to development
- Oil and gas exploration began in the 1950's and both oil and natural gas have been discovered
- Almost 40 wells have been drilled at Eagle Plains
- Over 10,000 kms. of 2D and about 325 sq. kms. of 3D seismic data has been acquired

4

Land Tenure

- Tenure is the length of time that exploration permits or leases are valid
- Tenure has a large influence on obtaining financing, planning activities and doing the work
- For a remote area like Eagle Plains, longer tenure is better than shorter tenure
- How the legal action against Yukon gets resolved will have an impact on tenure

5

Exploration Activities

- Field work to investigate the geological opportunities
- Acquiring more seismic data (both 2D and 3D)
- Exploration drilling of new wells
- Production testing of any discoveries showing commercial potential
- Construction of seasonal and year-round access trails and roads
- Installing and operating processing facilities connected with production testing

6

Exploration Activities

- Operating the base camp
- Converting wells for injection of water produced with oil and natural gas
- Logistical support for the camp and exploration activities
- Environmental data gathering and monitoring of operations
- No plan to do hydraulic fracturing

Exploration Activities

- Exploration work is the most expensive and most uncertain activity which affects funding commitments
- Exploration activities are unpredictable because results guide the future steps
- Plans are subject to change as priorities change with new information
- Even though Chance has several prospects to evaluate, drilling may find something that could not be predicted before hand that changes the plans
- Flexibility is needed from Assessors, regulators and goods and service providers to accommodate the uncertainties and need to adapt the activity as the work progresses

Objectives and Plans

- Based on current geological understanding, the area of exploration focus includes parts or all of Exploration Permits 0012-0016 and 0019-0020 and the three SDL's
- Acquire more seismic data and drill more wells to evaluate the resource potential
- Discover sufficient oil and natural gas resources to support future development
- Develop discoveries to serve the regional market needs and possibly export markets if the resource base is large enough
- Undertake the exploration program on a small scale over a long period of time to minimize the environmental and social impacts
- Try to operate as continuously as possible to provide steady employment and minimize the high costs of starting up and shutting down

9

Benefits

- Develop local capacity to participate in the projects and displace high cost imported services and equipment
- Diversify the regional economy
- New business, training and employment opportunities
- Reduced GHG's by substituting imported fuel that is shipped thousands of kilometres with Yukon sourced fuel
- Potential to reduce the cost of fuel in the Yukon and surrounding area

10

Project Alternatives

- YESAB assessments are required in order to obtain regulatory approvals to undertake any exploration work
- Depending on the scale and scope of the program, the YESAB assessment could be done by the Designated Office in Dawson or by Executive Committee in Whitehorse
- Two project execution scenarios can be considered: 1) a series of short duration, limited activity projects each with its own YESAB assessment; or 2) one longer duration, but limited scale project over the entire exploration region that undergoes one comprehensive YESAB assessment
- All work is exploration to evaluate the resource potential in order to understand whether the opportunities can eventually be developed commercially

11

Activity Scenarios- Issues to Manage

- YESAB processes are expensive and lengthy
- Lengthy assessment processes grind the tenure clock
- The cost of multiple assessments could hurt the amount of exploration work
- Multiple YESAB assessments of shorter duration, limited scope exploration work means intermittent employment
- Financial and project management are more efficient under a regional YESAB assessment of exploration in a broader area, but still small-scale operation (e.g. a single drilling rig or a single seismic survey)

YESAA Assessment Process

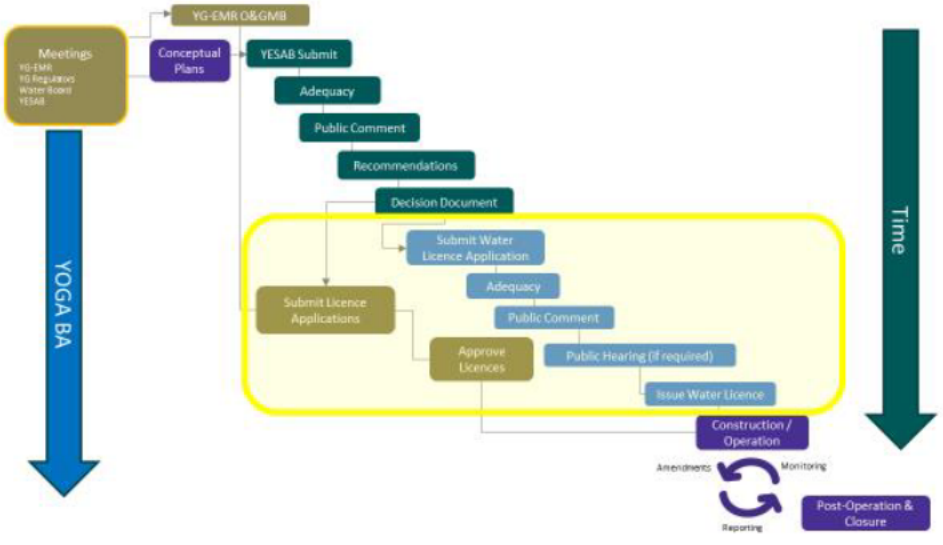
New: Pre-Submission Engagement (PSE) process

- YESAB approved the PSE and it will come into effect late Fall 2019 (estimated).
- For Executive Committee screenings only.
- Brings parties together to review project requirements in advance of proposal submission.
- Helps identify gaps and issues of concern, define values and baseline information requirements, and ensure a timely and certain screening process.
- "Terms of Reference" style of process

Licensing Process



Yukon Water Use Licence [1/2]

- Use of water or deposit waste into water
- Petroleum exploration/development are "Industrial Undertakings"
- Interim - Oil and Gas Information Package for Applicants (2013)
- Quasi-judicial board supported by Yukon Water Board Secretariat

Yukon Water Use Licence [2/2]

Choice of Type A vs Type B will drive information requirements, process, and timelines

- Hearing required for Type A
- Both require YESAA decision document prior to issuance

Permitting and Licensing

1. Land Use Permit (YG – EMR, Land Management)
2. Well Licence and Well Operation Approval (YG – EMR, Oil and Gas Resources)
3. Permit for Air Emissions (YG – ENV)
4. Temporary Highway Access Permits (YG – HPW, Transportation Branch)
5. Water Licence/Notification of Water Use (YG, Water Board)
6. Dempster Highway Area Authority Authorization

YOGA Well Licence

- First Nation and community consultation prior to application
- Benefits Agreement for projects >$1M/year
- Requires YESAA decision document prior to issuance

APPENDIX 2-B-14. Request to extend tenure on Exploration Permits 0006-0011 and 0019 at Eagle Plains Letter

March 26, 2019.

Gwich'in Tribal Council
3 Council Crescent
Inuvik, NT
X0E 0T0

sent by email: [redacted]

Attention: Grand Chief [redacted], **Director** [redacted] **President** [redacted]
COO [redacted]

Dear Grand Chief [redacted], Director [redacted] President [redacted] and COO [redacted]:

Re: Request to extend tenure on Exploration Permits 0006-0011 and 0019 at Eagle Plains

As you know, the Chance Oil and Gas Limited ("Chance", the "Company") currently has fourteen exploration permits located in the Eagle Plains area of northern Yukon. The permits are numbered 0006 to 0017 and 0019 to 0020. Of these, exploration permits 0006-0011 and 0019 will expire on August 30, 2019 unless extended in accordance with some combination of Sections 27, 28 and 31.01 of the Yukon *Oil and Gas Act* (the "Act"). For convenience, I have attached a map showing all the existing exploration permits held by the Company.

Pursuant to the Communication and Consultation Plan dated August 1, 2018 and following up the All Party meeting in Vancouver in January, I am writing to advise you that Chance wishes to extend the tenure of the expiring permits for a period of five years in order to continue exploring for crude oil and natural gas in the area of these Expiring Permits.

CHANCE OIL AND GAS LIMITED

☐ **Whitehorse Office:**
Suite 202, 208 Main Street
Whitehorse, YT Y1A 2A9
Telephone (867) 456-7805

☒ **Calgary Office:**

Calgary, AB T2R 1L5
Telephone (403) 699-0055
Fax (403) 699-0044

With the expiry deadline for the permits fast approaching and knowing that Yukon Government consultation needs to occur in relation to any tenure extension request of existing exploration permits, I wish to inform you that Chance will be submitting the tenure extension application this week to the Oil and Gas Branch of the Department of Energy, Mines and Resources.

We would be pleased to discuss the tenure extension request at your convenience. We look forward to working together on this and other matters in the future.

Please contact either Greg Charlie or me if you require additional information and to share your views on this course of action.

Yours truly,
Chance Oil and Gas Limited

APPENDIX 2-B-15. Fieldwork Email

From: Emily Mann
To: David MacMartin
Cc: Richard Wyman; Greg Charlie; Cindy Dickson; Shena Shaw; Calista Morrison; Todd Mahon
Subject: Chance Field Surveys
Date: June 17, 2019 5:16:03 PM
Attachments: [redacted]

Hello,

We have dates set for participation in the Field Surveys that are being conducted in Chance's project area this summer. We are proposing the following logistics for First Nations participation:

- Each First Nation with Traditional Territory overlapping the project area can have up to two members participate in the Field surveys
- This work will be physically demanding requiring hiking in steep, rugged terrain and thick bush under production oriented work conditions. Participants require average to above average fitness to participate and must meet the requirements in the attached role profiles
- There are limited spots for participants to join field surveys due to helicopter constraints and availability at the Eagle Plains Hotel. As such, we are making two spots available to each First Nation with Traditional Territory overlapping the project area. Please respond as soon as possible with the name of the participant, the field survey they would like to take part in, and the dates they would like to attend and Emily and Calista (Hemmera) will confirm availability.
- Participants are encouraged to arrive on the day that the field survey starts, but it is not mandatory that they stay for the duration of the field survey. For example, a participant could join Vegetation Survey #1 from June 25-28 if those are the dates the participant is available.
- All travel, including flights, vehicle travel to Eagle Plains Hotel, and stay in the Eagle Plains Hotel must be booked by the First Nation and billed to Chance.

This table shows the type of survey, details of the work and the number of spots available to participants

Survey	Lead Consultant	Date	Shift	# EDI crews	Participation Opportunities
Vegetation surveys (#1)	EDI	June 25- June 29 July 1 – July 7	4am-3pm	1	1 participant June 25 – June 29 AND 1 Participant July 1 – July 7
Vegetation surveys (#2)	EDI	July 25- 29 Aug 1 - 6	7am-6pm	1	1 participant July 25-29 AND 1 participant Aug 1-6
Seismic line study	EDI	July 25- 29 Aug 1 - 6	7am-6pm	1	1 participant July 25-29 AND 1 participant Aug 1-6
Fish and Water	EDI	July 25- 29	7am-6pm	1	1 participant July 25-29

The purpose of participation will be to observe the fieldwork and gain a firsthand understanding of the research that will inform Chance's project proposal. As space is limited to only a few participants

from each First Nation, there will be future site visit opportunities that will be made available to more participants. Hemmera will approach First Nations about planning these site visits later in the summer.

We apologise for the late notice in getting the above dates sorted.
To participate in Vegetation Survey #1 (starting June 25), the deadline for informing Hemmera is Wednesday June 19 at 5:00pm. Then we can coordinate the logistics on Thursday. For all the other field surveys, please let Hemmera know as soon as possible.

If you have any questions please direct them to Emily or Calista at Hemmera.

Best,

Emily

APPENDIX 2-B-16. June 7, 2019, Meeting Summary

Gwich'in Partners and Chance Oil and Gas Limited Meeting Notes

Date: June 7, 2019

Location: Gwich'in Tribal Council Office, Inuvik

Attendees:

Gwich'in Partners:

[redacted], Director, Intergovernmental Relations, Gwich'in Tribal Council
[redacted] Transboundary Specialist, Gwich'in Tribal Council
[redacted] ciate Director, Intergovernmental Affairs, Gwich'in Tribal Council
[redacted], Executive Assistant, Tetlit Gwich'in Council

Chance Oil and Gas Limited:

[redacted] President
[redacted] Vice President of Community and Government Relations
[redacted], Regulatory, Environmental and Community Relations Coordinator

Hemmera:

[redacted], Business Leader, Human Environment
[redacted], Human Environment Specialist

Introduction: Purpose and Objectives

The purpose of this meeting was for Chance to present a Draft Project Description of exploration activities proposed for the Eagle Plain Basin to Gwich'in Tribal Council (GTC) and Tetlit Gwich'in Council (TGC) as well as to discuss the annual reporting required on the Implementation of the Communications and Engagement Plan.

Meeting Objectives:

- Presentation of Draft Project Description
- Discuss Draft Project Description in more detail and provide clarity on any items if needed
- Discuss annual reporting requirement

DRAFT

Key Meeting Outcomes

Outcome	Notes
The engagement practices that GTC and Chance have developed are being used as a model for GTC's engagement on other Yukon-based projects.	GTC is using these practices to inform the Canadian government on what transboundary agreements mean to Land Claims, and to educate Canada on funding requirements for trans-boundary land claims.
Chance presented the Draft Project Description for Exploration in the Eagle Plain Basin. There was discussion on the project details and timing and location of activities such as roads and wells.	
Chance shared what fieldwork is planned for Summer 2019 – including bird, vegetation, fish and water, seismic line, and geologic surveys.	There was interest in having GTC participation in the field work.
Chance suggested that all First Nations share a common advisor for each area of study, for example have a common caribou advisor. Chance is concerned that multiple advisors could cause conflicting viewpoints.	
Hemmera provided an overview of the Yukon Environmental and Socio-economic Assessment Board's process for screening projects, explaining that there are three levels of assessment: 1. Designated Office (small, locally reviewed projects) 2. Executive Committee (large projects, reviewed by YESAB head office) 3. Panel Review (very large projects, reviewed by an established panel) Chance's past multi-well project proposal was referred from a Designated Office level screening to an Executive Committee level screening. The draft project that Chance presented to GTC on June 7, 2019 will be developed into a submission for the Executive Committee. During the Executive Committee screening, the proponent is required to consult with First Nations to inform their project proposal, and during screening, YESAB is required to determine that proponent consultation was adequate, and Yukon Government is required to do their own consultation.	
Hemmera provided a proposed schedule to align the YESAB Project Proposal preparation with consultation topics.	Chance confirmed that they would be doing public consultation in communities.

DRAFT

Outcome	Notes
To satisfy Ministerial Order 2018-42, Chance and First Nations must report annually on implementation of the Communications and Consultation Plan. The deadline for the 2018/2019 annual report is July 31, 2019. Hemmera proposed to prepare a draft report for Chance and Gwich'in Partners to review.	GTC and Chance will review the draft report before submission.
GTC has a new engagement protocol in place wherein proponents must meet with the four Designated Gwich'in Organizations (DGOs): • Tetlit Gwich'in Council in Fort McPherson • Gwichya Gwich'in Council in Tsiigehtchic • Ehdiitat Gwich'in Council in Aklavik • Nihtat Gwich'in Council in Inuvik	GTC will help arrange meetings to discuss the Draft Project Description with the DGOs.

Action Items

Action Item	Responsible Party	Date Required
Send further details on Chance field surveys and opportunities for GTC participation.	Hemmera	ASAP These details were sent in two emails on June 14 and June 17, 2019.
Discuss the idea of having common advisors for various project matters or "issue leads" among First Nations.	GTC	As project conversations develop.
Schedule meetings with the four DGOs for Chance to present the Draft Project Proposal.	GTC	Conversations to schedule these meetings have been ongoing since meeting on June 7, 2019.
Share lidar and/or aerial imagery of the Tetlit Gwich'in Council Primary and Secondary Use areas.	Chance	When imagery is finalized.
Send shape files of the project area to GTC.	Hemmera	Sent to GTC on June 19, 2019.
Prepare Communication and Consultation Plan Implementation report for submission to Yukon Government.	To be drafted by Hemmera and reviewed by all	Draft to GTC and Chance by mid July. Final to Yukon Government by July 31, 2019.

APPENDIX 2-B-17. November 22, 2019, Meeting Summary – document not available at time of submission.

APPENDIX 2-B-18. July 22, 2020, Meeting Summary

GWICH'IN PARTNERS AND CHANCE OIL AND GAS

DRAFT MEETING SUMMARY – CHANCE WELL MAINTENANCE PROPOSAL

Date: July 22, 2020

Location: Conference Call

Attendees:

Gwich'in Partners:

- [redacted], President, Tetlit Gwich'in Council
- [redacted], Director of Lands and Resources
- [redacted], Economic Development Officer
- [redacted], Heritage Specialist
- [redacted], Transboundary Specialist, Lands and Resources
- [redacted] Lands and Resources Specialist

Chance Oil and Gas Limited:

- [redacted], President
- [redacted], VP Government and Community Relations
- [redacted], Regulatory, Environmental and Community Relations Coordinator

Hemmera/EDI:

- [redacted], Biologist, Hemmera
- [redacted], Human Environment Specialist, Hemmera
- [redacted], Senior Wildlife Ecologist, Environmental Dynamics Inc.

Purpose and Objectives

The purpose of this meeting is for Chance Oil and Gas (Chance) and Gwich'in Partners to continue their discussion with respect to Chance's proposed Eagle Plain Well Maintenance Project. Chance will also take this opportunity to provide an overview of changes to the project design that have occurred as a result of engagement activities and refinement during proposal development.

Meeting Discussion:

The meeting opened with identifying participants on the call.

GTC informed Chance and Hemmera that the Lands Department has all new staff as of January 2020.

[redacted] – Provided a brief overview of aspects to the project design that had changed since the draft Project Description shared with Gwich'in Partners June 18th. There are no changes with respect to using the Chance and Blackie winter roads. However, we have added more contingencies with respect to ensuring adequate snowpack. Roads will follow height of land and use the same routes that

were used historically. The roads will be left to melt (i.e., reclamation plan). Pertaining to water withdrawal, Eagle River and Ogilvie River are still the potential water resources. Chance camp will be used as storage, but the crew will stay at Eagle Plains Hotel. Crews will be flown from Alberta into Inuvik via a private charter. We have added language with respect to COVID, for health and safety, however that section is dynamic and may need to change. We have added more clarification pertaining to scenarios when a well would be abandoned. The Project schedule is still the same: Winter 2020/2021. We added detail, and the design of the project itself hasn't changed much.

[redacted] Crew changes are only applicable to the specialty services coming from Alberta and BC. There will be other people working, such as wildlife monitors or people building the winter roads. Those people will likely be sourced from the north. There may be some positions on the service rig, for the oil field service of the program, that local folks may be able to join. Approximately, 25-30 people throughout an entire day. Some stuff, like water hauling and fuel hauling. A few people will have to stay on the site around the clock.

[redacted] – Thank you for the clarity on the positions that will be sourced in the north. It was not clear in the written response that Chance/Hemmera provided. Point #1 from GTC's comments pertaining to a Wildlife monitor on site. GTC would require a bi-weekly update on the findings of the wildlife monitor. For example, wildlife seen and progress of work. Is that something that Chance can commit?

[redacted] – We could certainly issue bi-weekly reports. This will likely be a requirement set by YESAB.

[redacted] – Would this be a meeting/call? Or a written email report?

[redacted] – Email written would be great. If there is a need to follow-up, we can do that. We can review and then determine if we need further discussion.

[redacted] Who should it be sent to?

[redacted] – Myself and our Chief Operating Officer. Then we will review internally. James Thorbourne.

[redacted] – Would like to discuss which Gwich'in business and individuals may be able to contribute.

[redacted] – Anticipate 25-30 people on site. Majority will be speciality service crew from down south. There are possibilities for northern employment though. For example, wildlife monitors, winter road construction, and water and fuel hauling. We are not using our camp – not a long enough program to justify opening it. Eagle Plains Hotel will serve the crew. Rig managers, safety medic – are some of the personnel that will be on site around the clock. There are some opportunities for northern businesses. The size of the project will impact the number of people we're able to hire. Hoping to enter YESAB by the end of the week. There may be things (measures, requirements) identified during that process. Northern businesses are better designed for hauling, logistical support, wildlife monitors, etc.

[redacted] – Gwich'in services can definitely satisfy Chance's need for winter roads. Gwich'in companies would be excited to bid on this opportunity. In the areas you described, they do have a lot of experience.

[redacted] – From our previous work, I have a lot of great experience with LJ, Arctic Allen, Bob's Welding etc. These businesses could be called upon. However, under Yukon Oil and Gas Act we need to negotiate

DRAFT

economic benefits with affected Yukon First Nations. In term of implementing the opportunities, we have a fine line where and how we will/can manage the benefits associated with this work.

[redacted] – That's good to know, we recognized the constraints you have. Equipment rentals is another opportunity.

[redacted] – Two wells in particular may have sour gas. This may require specific certification in order to be on site. So we'll have to find a way to get people certified, so that's not a constraint. Or maybe for first aid training.

[redacted] – Would that training have to be done before time, or would Chance help with that?

[redacted] – Sometimes done through Yukon College or Aurora College – we'll have to investigate how that can be arranged. We would like to be through YESAB by end of September. That would allow us time to do some of these logistic/training items. To source services and make sure everyone is trained to be on site. The whole project will take about 2-3 months.

[redacted] – How would your staff handle wildlife encounters? Will there be training, or suspending activities when encountered within 1 km of the project.

[redacted] – In the YESAB proposal, we have mitigation measure with respect to caribou. Such as giving animals the right of way. There will be a wildlife component to the initial training, and a reporting program for workers to record what they see. Those items are in addition to what the wildlife monitors actually see during their activities. Our ability to detect wildlife within 1 km is difficult, our activities are ground based and we may only be able to see 100 m. However, if there is a collared caribou in the area, that would help us. We'd like to have a data sharing agreement with PCMB. For the 1 km distance, our hurdle is detection.

[redacted] – What are ways to detect those animals?

[redacted] – Using telemetry data is one option. We thought about aerial drones to provide wider coverage. Not committed to the latter. Operating the drones could cause more disturbance, with the noise.

[redacted] – Another limiting factor is decreased daylight hours. Drones would have to fly during the day. Daylight during the project limits what we can do to detect.

[redacted] – Is it possible for wildlife monitors to be provided binoculars?

[redacted] – Depending on the area, the site line will be the edge of the winter road or the edge of the well site. During this operation, when we have a service rig on top of the wall, when that well is open, there are safety issues that have to be managed. You cannot stop instantaneously. That would/could take hours (i.e., stopping). Not only do we have the risk of an open hole, we have to have heat to keep everything from freezing up. Either the equipment continues to run, or the boilers have to keep running. You are not going to be able to shut down completely without an increase in risk to people and the environment.

[redacted] – Just make sure that there are mitigation measures to carry out work in a different ways.

[redacted] – In the proposal we talk about scheduling where the work will occur to minimize impacts to animals. Have wildlife monitors at potential sites to see if anything is there.

[redacted] – We have looked at the project description, we would like to receive the full package.

DRAFT

[redacted] – Any thought into other ways to keep caribou away? Noise to keep them away?

[redacted] – It's a double edge sword, sometimes people are concerned about noise keeping caribou away from places they may like to be, so that suggestion could compound negative impacts to caribou.

[redacted] – Maybe not a loud/continuous noise. Maybe every hour. An idea.

[redacted] – We're hoping that the noise created by general project activities may accomplish that.

[redacted] – With respect to GSN wanting the full package of information. Should be able to posal soon. It could not be provided previously as it was still being developed. Delays in project design, YESAB timelines, needing to do work winter 2020/2021 – factors causing timeline issues.

[redacted] – I understand, but getting more complete info in the future would help GTC with respect to resourcing and making our review more whole/complete.

[redacted] – We initiated engagement with the Project Description and your comments were very helpful. They helped shaped development of the documents we are finishing now.

[redacted] – [redacted] can you expand on timelines?

[redacted] – Yukon Government (YG) is largely responsible for the timeline. This started last October when we applied to YG to extend the suspended status of these wells. Then worked with a consultant to determine what tests would need to be done on the wells to satisfy regulations. Then COVID happened. We are also trying to stay on top what people and equipment will be available from the south given a recent federal funding program. We're sorry for how the timeline is restricting people.

[redacted] – A project of this nature, and not a lot of information, could be a hinderance. We had to stretch ourselves. For us to work better in the future. We would need to have the necessary amount of information.

[redacted] – Moving forward, that's our goal. Previously, we have had meetings with GTC and the Gwich'in about Chance's Executive Committee Project (Eagle Plain Exploration Program).

[redacted] – To avoid any confusion between Chance's different projects, I'd like to bring us back to the Well Maintenance Project. However, a good action item would be for us to schedule a meeting with the GTC lands group (i.e., the new staff) in order to provide background information and activities to date on the Executive Committee Project.

[redacted] – Can we have the spill response plan?

[redacted] – Yes, that will be included in the project proposal. We can share that in the next couple of days.

[redacted] – With respect to culture and heritage. The points about caribou, would recommend engagement with Tetlit Gwich'in Renewable Resource Council. Increased risk of ski-doo traffic? How will that be handled. Perhaps for a later time, we are wondering about archaeological training for the wildlife monitors? Can that be a part provided? Because this project is close to an area with paleontological remains.

DRAFT

[redacted] – We have a traffic/access plan. Access will be restricted for safety (e.g., the sour gas). Also, project related traffic on the winter roads will all be able to communicate with each other. If others use the trails, then no one will know, and it could be dangerous. We will want to keep people off the trails.

[redacted] – Feel this conversation should be happening with the Tetlit Gwich'in Renewable Resource Council.

[redacted] – We have not spoken with the renewable resource council. Chance is not developing new roads, but clearing brush and the tree regeneration of previous roads. There will be some enhanced access after this work clears the routes of those roads. We did a survey/study to observe human use in the area (e.g., snow tracks). Didn't find any evidence that people were accessing the area.

[redacted] – Personally not familiar with the area. Did you compare your findings (i.e., study of human use) with the migration pattern for that area, for that particular year?

[redacted] – Thinking along those lines. If caribou are in the area, then people are more likely to be in the area.

[redacted] – Possibly, but those questions should be discussed with the harvesters.

[redacted] – We did look at the number of years that collared caribou were in the area. They certainly don't occupy the area of every year. They also don't have collars on all the caribou out there.

[redacted] – We can reach out to Resource Council?

[redacted] – At this time, we haven't no. Our engagement activities are usually guided by the engagement plan we have with the Gwich'in Partners. We may have to look at how other groups are considered.

[redacted] – Any ground altering impacts?

[redacted] – No soil disturbing at all.

[redacted]– Chance had work done by previous consultants during an earlier project. Contacted GTC and their Culture and Heritage Department on a previous project. Those studies identified some areas that could use more investigation. But right now, we are using existing roads and existing well sites.

[redacted] – Heritage resources was selected as a valued component. There was an effects assessment and that information will be in the draft proposal we provide.

[redacted]– When will negotiations with VG and FNNND happen, with respect to economic opportunities, and when will we know about the Gwich'in opportunities?

[redacted] – The Project is in the territory of the VG and FNNND. Have to complete agreements with those two Yukon First Nations. Those negotiations include YG. We're thinking, as early as this fall to commence negotiations with those First Nations. It puts Chance in a difficult position, even though we have used GTC business in the past. That is the law of the land, we are required to follow those requirements with Yukon First Nations.

[redacted] – Concerned about the protection of wildlife habitat. Project is designed to happen in the winter, but you have said "there won't be clearing" and you have said you "will require minimal clearing". What is the situation with respect to clearing and what is the reclamation plan?

[redacted] – Regarding the winter roads, all of which was disturbed at some point in the past, the width is approximately 10 metres. Then each well site is roughly one hectare. Though not a perfect square. The sites themselves haven't been in production, so not much disturbance has occurred at the site.

DRAFT

[redacted] – The winter roads will require a minimum of 10 cm of snow. Mulching will be done/used to reduce the effects on the soil. Trying to push vegetation aside to try preserve the root mass. The roads will be left to melt fully. The roads will be restricted. To prevent folks from causing additional degradation. The nature of winter roads and working on well sites in the winter – is designed to maintain the dust layer and the moss layer. Retaining the ground plants that are growing there, as opposed to disturbing the soil and triggering/causing primary succession.

[redacted] – Part of this project is happening in the Peel, Land Management Unit 7. There are High environmental standards there. Any disturbance needs to be reclaimed. That's why I'm asking. Chance road is a new road. Look to the Peel plan. Add some more details with respect to reclamation for the area. Even if your area is small, there are other activities in the area by other projects. The negative effects and disturbances will add up/cumulate.

[redacted] – GTC will be updating our comments given the conversation today. Then will send that updated version along.

Action Items/Next Steps:

Action Item	Responsible Party	Date Required
Chance to share draft Project Proposal with Gwich'in Partners, including Spill Response Plan.	Chance/ Hemmera	Sent July 24, 2020
Schedule a meeting between Chance and GTC Lands Department for Chance to introduce the Executive Committee Project (Eagle Plains Exploration Project) and provide an overview of activities to date.	Hemmera to schedule	ASAP
GTC is updating their comments on Chance's Well Maintenance Project and will provide an updated version when it is ready.	GTC	When Available

1.0 INTRODUCTION

This report demonstrates implementation of the *Gwich'in Partners and Chance Oil and Gas Limited Communications and Consultation Plan* (Plan) (see **Appendix A**) finalized on August 1, 2018. It summarizes discussions held between Gwich'in Tribal Council (GTC), Tetlit Gwich'in Council (TGC), collectively referred to as Gwich'in Partners, and Chance Oil and Gas Limited (Chance) since the *2019 Annual Report: Implementation of Gwich'in Partners and Chance Oil and Gas Communications and Consultation Plan* was submitted July 31, 2019. The purpose, objectives, and outcomes of each discussion are described below to fulfill the requirements of Ministerial Order (MO) 2018/42 (see **Appendix B**) issued to Chance on August 30, 2018.

2.0 BACKGROUND

The development of communications and engagement plans began with Order in Council (OIC) 2016/169. OIC 2016/169 required Chance to file a First Nations communication and engagement plan with the Minister of Energy, Mines and Resources in order to extend tenure on their northern permits: 0005, 0006, 0007, 0008, 0009, 0010, and 0011 (see **Appendix C**). Chance complied with OIC 2016/169 and received their tenure extension.

Chance subsequently received MO 2017/37 when applying for tenure extension on six of eight southern permits: 0012, 0013, 0014, 0015, 0016, and 0017. MO 2017/37 required Chance to revise, in consultation with affected First Nations, the consultation and engagement plan filed under OIC 2016/169. The affected First Nations listed in MO 2017/37 were Vuntut Gwitchin First Nation, Tr'ondëk Hwëch'in, First Nation of Na-Cho Nyäk Dun, Gwich'in Tribal Council, and Tetlit Gwich'in Council.

Gwich'in Partners and Chance developed the Plan collaboratively through a series of in-person meetings and conference calls. Hemmera was retained by Chance in November 2017 to facilitate the development and completion of the communications and engagement plans with the affected First Nations and facilitated all discussions between the Gwich'in Partners and Chance.

The Gwich'in Partners and Chance submitted their finalized Plan to Minister Ranj Pillai on August 1, 2018. To satisfy its obligations under MO 2017/37, Chance filed a total of four communications and engagement plans. All four plans were approved by the Minister, and Chance received a five-year tenure extension on the six southern permits.

A condition of the five-year tenure extension, issued via MO 2018/42, required that Chance submit annual reports summarizing actions taken to implement each communications and engagement plan.

See **Appendix C** for a map of Chance's current permits.

DRAFT

3.0 ENGAGEMENT AND COMMUNICATION PLAN IMPLEMENTATION SUMMARY

3.1 Summary

In the past year, the Gwich'in Partners and Chance have continued to build their relationship. Parties have advanced discussions in Chance's proposed Eagle Plains Exploration Project and Chance's proposed Eagle Plain Well Maintenance Project (see **Table 1**).

Table 1 Chance proposed projects

Project Name	Date Draft Project Description was Shared with VGG	YESAB Assessment Process	Anticipated Submission to YESAB
Eagle Plains Exploration Project	June 2019	Executive Committee Screening	Spring 2021
Eagle Plain Well Maintenance Project	May 2020	Designated Office Evaluation	July/August 2020

Between August 1, 2019 and June 30, 2020, Chance and the Gwich'in Partners have had 5 in-person meetings and exchanged informal phone calls and emails. The main themes of discussions between the Gwich'in Partners and Chance have been:

- Creation of Chance-Gwich'in Communications and Consultation Management Committee (including Terms of Reference)
- Confidentiality Agreement
- Cooperation Agreement
- Draft Project Description and scope of activities for Chance's proposed Eagle Plains Exploration Project
- Draft Project Description for Chance's proposed Eagle Plain well Maintenance Project
- Proposal submission processes to Yukon Environmental and Socio-economic Assessment Board (YESAB)
- Explanation and understanding of oil and gas activities
- Employment and training opportunities

Chance is abiding by GTC's consultation protocol/preferences and has met with each Designated Gwich'in Organization (DGOs) and Gwich'in community.

The correspondence between Chance and the Gwich'in Partners is documented in the Engagement Log (see **Appendix D**).

3.2 August 19, 2020 – Gwichya Gwich'in Council / Tsiigehtchic Community Meeting (In-Person)

Location: Tsiigehtchic, NWT

Attendees: Gwichya Gwich'in Council, Community Members of Tsiigehtchic, Chance Management, Hemmera

DRAFT

This meeting was the first in a series of community meetings. The purpose was to provide background information on Chance's proposed Eagle Plains Exploration Project background and to have an open discussion with the Gwichya Gwich'in Council and community members.

During the meeting, Chance described their exploration project, proposed timeline, and the Project's geographic location in relation to the Traditional Territories of Yukon First Nations and the Gwich'in Settlement Region. Chance presented the well drilling and extended flow testing processes, described the seismic exploration program, workforce requirements, and the closure and reclamation activities.

Hemmera presented information on the consultants retained by Chance to assist with the preparation of the Project Proposal. Hemmera also provided an overview of the YESAB Executive Committee Screening process and expected timelines.

Attendees asked questions and sought additional detail on various project components: drilling history and licences, drilling operations and processes, camp operations, and previous engagement activities. Attendees asked about project feasibility in the area, watershed impacts, potential impacts on the permafrost, and ongoing research.

Attendees requested information regarding the Project's potential to build local capacity and a desire to see local employment opportunities. Community members expressed a desire to see Gwich'in working on the Project.

Discussion regarding how information is mutually shared between Tsiigehtchic community members and GTC occurred. A recommendation was made to involve the Development Corporations. Attendees recommended that all consultants should attend community meetings in order to answer questions.

3.3 August 20, 2019 – Gwich'in Partners and Chance Meeting (In-Person)

Location: GTC Main Office, Inuvik

Attendees: GTC Grand Chief, GTC Senior Officials, Chance Management, Hemmera

The purpose of this meeting was for Chance to provide GTC with an activity update and to discuss engagement processes going forward. The Confidentiality Agreement and Cooperation Agreement were also discussed.

GTC and Chance both stated that confidentiality provisions could be incorporated into a Cooperation Agreement and that a separate Confidentiality Agreement would not be required. GTC and Chance also discussed the preferred approach of having one Cooperation Agreement with GTC representing the four DGOs (i.e., as opposed to five separate Cooperation Agreements).

During this meeting, Chance provided an overview of fieldwork activities that were completed by Chance's consultants over the 2019 summer months. It was decided that fieldwork reports would be provided to GTC once they were available in mid to late September of 2019.

3.4 August 20, 2019, Nihtat Gwich'in Council / Inuvik Community Meeting (In-Person)

Location: Inuvik, NWT

DRAFT

Attendees: Nihtat Gwich'in Council (NGC), GTC representatives, Community Members of Inuvik, Chance Management, Hemmera

This meeting was the second in a series of community meetings. The purpose was to provide background information on Chance's proposed Eagle Plains Exploration Project background and to have an open discussion with the NGC and community members.

During the meeting, Chance described their exploration project, proposed timeline, and the Project's geographic location in relation to the Traditional Territories of Yukon First Nations and the Gwich'in Settlement Region. Chance presented the well drilling and extended flow testing processes, described the seismic exploration program, workforce requirements, and the closure and reclamation activities.

Hemmera presented information on the consultants retained by Chance to assist with the preparation of the Project Proposal. Hemmera also provided an overview of the YESAB Executive Committee Screening process, and expected timelines.

During and after the presentation, attendees asked questions and sought additional detail on various project components: boundaries between oil and gas underground, project timelines, seasonal timing of project activities, camp capacity, emissions regulations, winter road construction, airstrip use and construction, and local capacity building.

It was emphasized that caribou (i.e., Porcupine Caribou Herd) would be a topic of importance to the community and NGC moving forward. Chance stated that caribou considerations will be a key part of engagement with GTC, NGC, and the other DGOs.

NGC President explained that NGC Council members are currently working for, or have previously worked for, local and regional regulatory regimes. It was suggested that members may be able to contribute to the Project in that aspect. It was also noted that NGC is not opposed to the Project but will continue to have further internal discussions and follow up questions for Chance to address.

All parties agreed to work together to plan and strategize information sharing among members and relay meeting updates for those unable to attend.

3.5 August 21, 2019 – Ehdiitat Gwich'in Council / Aklavik Community Meeting (In-Person)

Location: Aklavik, NWT

Attendees: Ehdiitat Gwich'in Council, Community Members of Aklavik, Chance Management, Hemmera

This meeting was the third in a series of community meetings. The purpose was to provide background information on Chance's proposed Eagle Plains Exploration Project background and to have an open discussion with the Ehdiitat Gwich'in Council and community members.

During the meeting, Chance described their exploration project, proposed timeline, and the Project's geographic location in relation to the Traditional Territories of Yukon First Nations and the Gwich'in Settlement Region. Chance presented the well drilling and extended flow testing processes, described the seismic exploration program, workforce requirements, and the closure and reclamation activities.

DRAFT

Hemmera presented information on the consultants retained by Chance to assist with the preparation of the Project Proposal. Hemmera also provided an overview of the YESAB Executive Committee Screening process and expected timelines.

Attendees asked questions and sought additional details on various project components including Chance's history with oil production, YESAB processes, and employment/training opportunities. It was noted that a main concern for the community is potential impacts on caribou (i.e., Porcupine Caribou Herd).

All parties discussed a potential caribou workshop and brainstormed potential workshop objectives.

3.6 August 22, 2019 – Tetlit Gwich'in Council / For McPherson Community Meeting (In-Person)

Location: Fort McPherson, NWT

Attendees: TGC, Community Members of Fort McPherson, Chance Management, Hemmera

This meeting was the fourth, and final, in a series of community meetings. The purpose was to provide background information on Chance's proposed Eagle Plains Exploration Project background and to have an open discussion with the TGC and community members.

During the meeting, Chance described their exploration project, proposed timeline, and the Project's geographic location in relation to the Traditional Territories of Yukon First Nations and the Gwich'in Settlement Region. Chance presented the well drilling and extended flow testing processes, described the seismic exploration program, workforce requirements, and the closure and reclamation activities.

Hemmera presented information on the consultants retained by Chance to assist with the preparation of the Project Proposal. Hemmera also provided an overview of the YESAB Executive Committee Screening process and expected timelines.

Attendees asked questions pertaining to the proposed timeline, partnerships with local businesses, and potential for local employment opportunities.

Attendees also expressed concerns regarding treaty rights. Attendees recommended having access to meeting notes which are shared with GTC and raised concerns with respect to community members being kept informed. A suggestion to have a large meeting in Dawson City with all parties and interested community members was made. It was noted that the Tetlit Gwich'in Band should be included in communications moving forward.

3.7 Spring 2020

Chance is currently developing a YESAB Designated Office submission for its proposed Eagle Plain Well Maintenance Project. Chance sent a letter to the Gwich'in Partners May 25th, 2020 with the purpose of introducing the project and initiating engagement. GTC provided feedback to Chance, and Chance and Hemmera are currently working on follow-up activities to respond to GTC's comments. Parties intend to schedule a meeting to continue discussions.

DRAFT

4.0 PLANS FOR ONGOING ENGAGEMENT AND NEXT STEPS

Gwich'in Partners and Chance will continue to hold discussions at regular intervals. Upcoming engagement activities are expected to involve the following:

- Detailed discussion on Chance's proposed Eagle Plain Well Maintenance Project
- Negotiation of a Cooperation Agreement with GTC (including confidentiality provisions)
- Updating/revising Plan to include all DGOs as well as Band Offices
- Share data collected during 2019 Summer/Fall field season

5.0 APPROVAL OF IMPLEMENTATION SUMMARY

Gwich'in Partners and Chance have reviewed this report and agree to its contents as an accurate summary of engagement activities carried out between August 1, 2019 and June 30, 2020.

Gwich'in Partners and Chance Oil and Gas Limited Communications and Consultation Plan

DRAFT

July 2020

Chance OIL AND GAS LIMITED

Gwich'in Tribal Council
Gwich'in land, culture & economy for a better future

Gwich'in Tribal Council and Chance Oil and Gas Limited Communications and Consultation Plan

1.0 Introduction

Chance Oil and Gas Limited ("Chance") is an oil and gas exploration company that holds permits to perform oil and gas exploration activities in the Eagle Plain basin of the Yukon Territory, Canada. The Gwich'in Tribal Council ("GTC") is an Indigenous organization that holds rights under Section 35 of the *Constitution Act*, 1982, *Treaty 11* and the *Gwich'in Comprehensive Land Claim Agreement* ("GCLCA"), including Appendix C – *Yukon Transboundary Agreement* ("YTA"). Under the YTA, "Tetlit Gwich'in" is defined as a Gwich'in who either: (a) resides in the Peel River watershed, including the community of Fort McPherson, Northwest Territories; or (b) is descended from an aboriginal person who used or occupied the Peel River watershed on or before December 31, 1921. Under this definition, Tetlit Gwich'in and their descendants currently reside in Aklavik, Inuvik, Tsiigehtchic and Fort McPherson, as well as elsewhere in Canada and abroad. Under the GCLCA, the GTC is the body responsible for representing the collective rights of GCLCA participants, including all Tetlit Gwich'in as defined in the YTA.

As part of Chance's exploration program, Chance, as the proponent, seeks to develop a communication and consultation plan ("the Plan") with the GTC, as a rights holder for these Yukon lands that could potentially be affected by Chance's exploration program activities. These Yukon lands are identified in the YTA as the Primary Use Area and the Secondary Use Area lands. With the exception of permit 15 which straddles the Primary Use Area, all of the permits held by Chance, namely 7, 9, 13, 14, 15, 19, and 20, are located within the Secondary Use Area.

The Plan will reflect and be consistent with the GTC's role as the Indigenous organization responsible for upholding the collective rights held by Gwich'in in the Primary Use Area and Secondary Use Area within the Yukon. This Plan will acknowledge the GCLCA organizational structure, and as such, is intended to extend to and encompass the GTC, the Designated Gwich'in Organizations, and including the Tetlit Gwich'in Council (the "Gwich'in Partners"). The Gwich'in Partners will seek to establish an internal Memorandum of Understanding (MOU).

2.0 Purpose

This document serves as a Plan to provide a mutually agreed upon framework to support collaborative and effective communication and consultation between Chance and the Gwich'in Partners.

3.0 Relationship

Chance and the Gwich'in Partners will execute this Plan according to the following principles:

- Transparency;
- Timeliness; and
- Mutual respect, trust and understanding.

4.0 Key Gwich'in Tribal Council and Chance Connections

Communication and consultation between Chance and the Gwich'in Partners will be generally associated with the proposed works and potential effects associated with Chance's oil and gas exploration program, and with potential new opportunities or benefits received by the Gwich'in people, from Chance, as the project proponent. Once the scope of Chance's specific plans are determined, the Gwich'in Partners, together with Chance, will discuss the anticipated impacts on Gwich'in rights within the Primary and Secondary Use Areas, as well as the best way of addressing the impacts defined at that time.

This section of the Plan identifies the key contacts related to these overarching communication and consultation themes. Key representatives involved in communication and consultation are expected to be as follows:

- Grand Chief/President of the Gwich'in Tribal Council;
- President of the Tetlit Gwich'in Council (TGC);
- Gwich'in Tribal Council's Chief Operating Officer (COO); and
- Chance Management and designated staff and advisors.

Communication and consultation with the Gwich'in Partners will be coordinated through the Gwich'in Tribal Council's Chief Operating Officer.

Key Chance representatives involved in communication and consultation are expected to be as follows:

- Chance Oil and Gas Chairman and Chief Executive Officer (CEO)
- President of Chance Oil and Gas;
- Vice President of Government and Community Relations; and
- Regulatory, Environmental, and Community Relations Coordinator.

5.0 Communication and Consultation Methods

Chance and the Gwich'in Partners will employ the following communication and consultation methods:

- In person meetings;
- Email;
- Sharing Power Point Presentations (to support in person meetings);
- Sharing reports and documents (as requested and as required);
- Telephone correspondence (teleconferences and less formal phone calls); and

- Identifying and documenting issues of concern raised by the Gwich'in Partners during consultation meetings, and Chance providing written responses to the identified issues within 30 days of the meeting, to serve as the basis for ongoing dialogue and resolution.

5.1 Meetings Process

Communication and consultation meetings will be executed in the following manner:

1. Chance and/or the Gwich'in Partners will request a meeting in writing to the other party according to the connections iterated in Section 4.0, no less than ten business days of the proposed meeting date;
2. The parties to meet will develop the agenda collaboratively;
3. The party requesting the meeting will develop supporting materials (collaboratively, where possible), and share those at least two days in advance of the meeting; and
4. The meeting will take place in a mutually agreeable location.

The above general process applies to meetings with subject matter leads, and where reasonable, meetings with communities at large.

5.2 Documentation

The following documentation sharing and review protocols support the communication and consultation methods described above:

- Action items and meeting outcomes will be logged during meetings and reviewed by both Chance and by the Gwich'in Partners at the end of the meeting to ensure that there is general agreement on the list of actions and entities responsible for those actions. The list of action items and meeting outcomes will be recorded in writing and shared between Chance and the Gwich'in Partners, within ten business days following the meeting date;
- Chance and the Gwich'in Partners will agree upon and use a file sharing platform to facilitate sharing of large files, such as Power Point presentations, reports and documents exchange relating to specific issues identified that were the object of specific consultations;
- Should Chance and the Gwich'in Partners employ a third party for records development and management, the third party will follow the process described above for recording and providing meeting minutes;
- Pursuant to Section 5.1, Chance and the Gwich'in Partners will exchange documents pertaining to issues identified in the communications and consultation process that may affect Gwich'in rights pertaining to the Primary and Secondary Use Areas in the Yukon. These documents will include written summaries of decisions reached collectively and agreed upon concerning these issues.

6.0 Records Management

Summarized records of communication and consultation between Chance and the Gwich'in Partners will be kept in a records log. Chance will ultimately submit the items below to regulators and assessors for review if and when a potential project is assessed in the future:

- Meeting Agendas;
- Meeting Action Items as described in **Section 5.0;**
- Invitee/Attendees lists and/or meeting sign-in sheets;
- Records log, which will include summaries of the following:
    - In person meetings;
    - Phone calls and teleconferences;
    - Incoming and outgoing emails between Chance and the Gwich'in Partners.
- Reports and documents provided to the Gwich'in Partners by Chance and reports and documents provided to Chance by the Gwich'in Partners for review and consideration;
- Copies of Power Point presentations delivered by Chance to the Gwich'in Partners;
- Copies of any presentations delivered by the Gwich'in Partners to Chance; and
- Documents exchanged pertaining to issues raised during the communications and consultations process, as identified in Section 5.0.

7.0 Adaptive Management of the Communication and Consultation Plan

Chance and the Gwich'in Partners will review and assess the effectiveness and success of this Plan on at least a six-month basis.

Chance and the Gwich'in Partners agree to establish a *Chance-Gwich'in Communications and Consultation Management Committee* of senior officials to serve as a focal point for the co-development and co-management of current and future plans and activities associated with Chance's exploration program activities. Chance and the Gwich'in Partners will nominate representatives to serve on this Committee. Those representatives will determine the required frequency of meetings, but it is envisaged that for the first year following agreement on the Plan that meetings of the Committee would be held one time per each season. It is also understood by Chance and Gwich'in Partners, that a Terms of Reference will be developed by the Committee. The Committee will be supported by a Secretariat, both of which will be wholly funded by Chance. Chance and Gwich'in partners will hold the first meeting within 60 days of finalizing this Plan.

8.0 Cost and Economic Opportunity

The Gwich'in Partners, together with Chance, have discussed their mutual interest in working towards ensuring that GCLCA Participants are able to derive and participate in benefits arising from Chance's proposed oil and gas exploration activity within the Primary and Secondary Use Areas in the Yukon. Chance recognizes the importance of, and commits to, working respectfully and collaboratively with the GTC and Gwich'in partners during engagement, consultation, and any negotiations on agreements that will take place in the future, to the same degree and manner as Chance would with any Yukon First Nation, whose settlement land or traditional territory may be affected by oil and gas activity in the Eagle Plain Basin.

Chance OIL AND GAS LIMITED

Gwich'in Tribal Council
Gwich'in land, culture & economy for a better future

As the Communications and Consultation Plan is implemented, Chance and GTC agree to discuss a Cooperation Agreement wherein opportunities or benefits are defined that the Gwich'in people, as represented by the Gwich'in Partners, would receive from Chance. Benefits could include such things as, capacity funding, employment opportunities, contracting opportunities, scholarships and education and training opportunities, other financial and implementation payments, and equity participation.

9.0 Signatures of the Parties

This Plan is approved by the following parties:

APPENDIX B

Ministerial Order 2018/42

DRAFT

YUKON

CANADA

MINISTERIAL ORDER 2018/ 42

OIL AND GAS ACT

Pursuant to the *Oil and Gas Act*, the Minister of Energy, Mines and Resources orders

1 In this Order

"subject permit" means each of the following oil and gas permits held by Chance Oil and Gas Limited:

(a) oil and gas permit No. 0012,

(b) oil and gas permit No. 0013,

(c) oil and gas permit No. 0014,

(d) oil and gas permit No. 0015,

(e) oil and gas permit No. 0016,

(f) oil and gas permit No. 0017. « *permis visé* »

2 The renewal term of each subject permit is extended by five years (so that it ends on August 30, 2023).

3 The resulting total length of the initial term and the renewal term of a subject permit is 16 years.

ARRÊTÉ MINISTÉRIEL 2018/42

LOI SUR LE PÉTROLE ET LE GAZ

Le ministre de l'Énergie, des Mines et des Ressources, conformément à la *Loi sur le pétrole et le gaz*, arrête :

1 La définition suivante s'applique au présent arrêté.

« permis visé » Les permis suivants de pétrole et de gaz détenus par Chance Oil and Gas Limited :

a) permis de pétrole et de gaz nº 0012;

b) permis de pétrole et de gaz nº 0013;

c) permis de pétrole et de gaz nº 0014;

d) permis de pétrole et de gaz nº 0015;

e) permis de pétrole et de gaz nº 0016;

f) permis de pétrole et de gaz nº 0017. "*subject permit*"

2 La durée du renouvellement de chaque permis visé est prolongée de cinq ans, de façon à ce qu'elle se termine le 30 août 2023.

3 La durée totale d'un permis visé, y compris la durée initiale et la durée du renouvellement, est de 16 ans.

2018/42

4(1) In this section

"first nations communications and engagement plan" means the plan filed under O.I.C. 2016/169 and revised in accordance with M.O. 2017/37. *« plan de participation et de communication avec les premières nations »*

(2) It is a condition of this Order that Chance Oil and Gas Limited must file annual reports with the Division Head, in accordance with subsection (3) and to the satisfaction of the Division Head, about the implementation of the first nations communications and engagement plan.

(3) For the purposes of subsection (2), Chance Oil and Gas Limited must file

(a) the first annual report on or before July 31, 2019, in respect of the period beginning on September 1, 2018, and ending on May 31, 2019; and

(b) each subsequent annual report on or before July 31 of each year in respect of the period beginning on June 1 of the preceding year and ending on May 31 of the year in which the report is to be filed.

4(1) La définition suivante s'applique au présent article.

« plan de participation et de communication avec les premières nations » Le plan déposé en vertu du Décret 2016/169 et révisé en conformité avec l'Arrêté 2017/37. *"first nations communications and engagement plan"*

(2) À titre de condition du présent arrêté, Chance Oil and Gas Limited dépose des rapports annuels auprès du chef de division, en conformité avec le paragraphe (3) et à la satisfaction du chef de division, concernant la mise en œuvre du plan de participation et de communication avec les premières nations.

(3) Pour l'application du paragraphe (2), Chance Oil and Gas Limited dépose :

a) le premier rapport annuel au plus tard le 31 juillet 2019, pour la période débutant le 1er septembre 2018 et se terminant le 31 mai 2019;

b) chaque rapport annuel subséquent, au plus tard le 31 juillet de chaque année pour la période débutant le 1er juin de l'année précédente et se terminant le 31 mai de l'année au cours de laquelle le rapport doit être déposé.

Dated at Whitehorse, Yukon,
~~30~~ August 30th 2018.

Fait à Whitehorse, au Yukon,
le August 30th 2018.

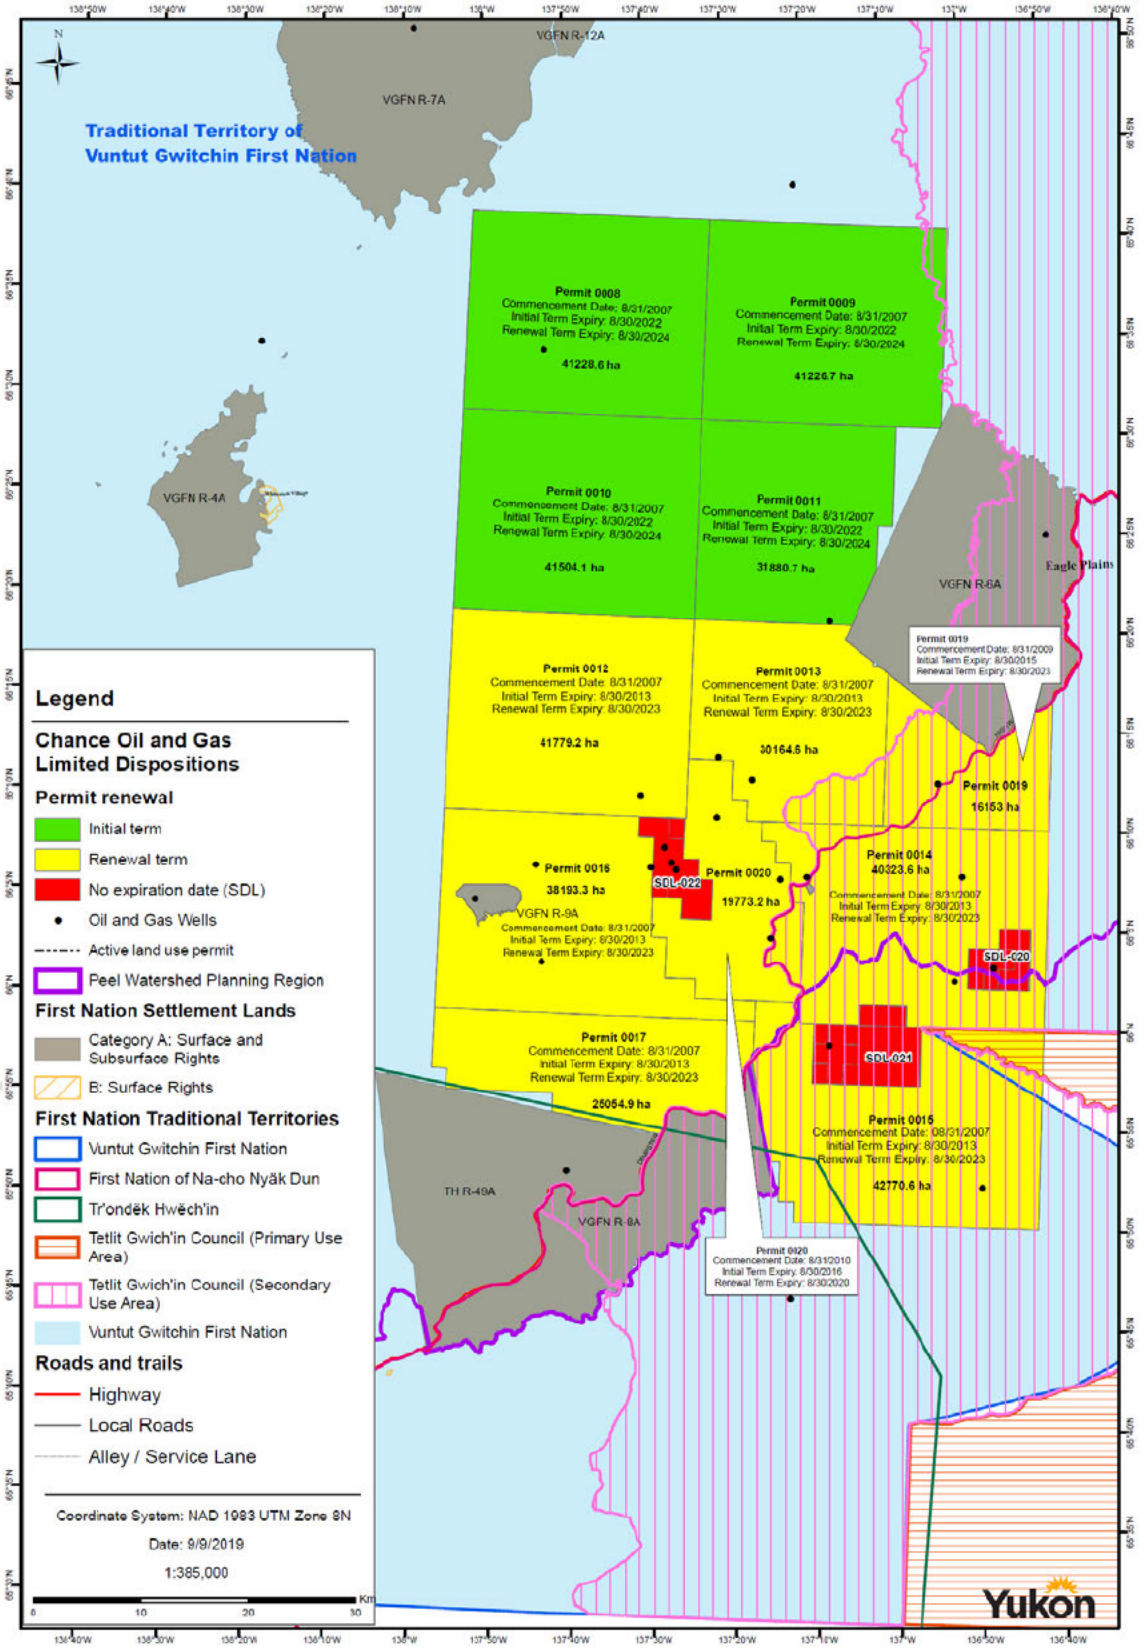
Map of Chance Dispositions and Wells

DRAFT

Chance Oil and Gas Limited Dispositions and Wells



APPENDIX D
Engagement Log

- I assume that the specifics of mitigating culture/heritage impacts will be covered in the specific conversations and negotiations that will follow?

- The special relationship that the TG (and therefore all citizens of Gwich'in nation) have with these lands should be acknowledged, although again, perhaps this is not the place for it.

Page 12 (or Page 4)

7.0 - It states that parties agree to establish a communications management committee. Perhaps it should state something to the effect that the communications and management committee "has been established".

Do we have the Terms of Reference for the Committee? Perhaps I've overlooked that, just asking.

Page 11 (or Page 3)

6.0 - I don't believe w've seen the records log. Does GTC have access to this?

DRAFT

APPENDIX 2-B-20. November 16, 2020, Meeting Summary

GWICH'IN TRIBAL COUNCIL AND CHANCE OIL AND GAS

DRAFT MEETING SUMMARY – CHANCE WELL MAINTENANCE AND WINTER ACTIVITIES PROPOSAL

Date: November 16, 2020

Location: Conference Call

Attendees:

Gwich'in Tribal Council:

- [redacted], Grand Chief
- [redacted], Deputy Grand Chief
- [redacted], Interim Chief Operating Officer
- [redacted], Director Culture Heritage
- [redacted], Heritage Specialist
- [redacted], Director of Lands and Resources

Chance Oil and Gas Limited:

- [redacted], President
- [redacted], VP Government and Community Relations
- [redacted], Regulatory, Environmental and Community Relations Coordinator

Hemmera:

- [redacted], Business Leader
- [redacted], Senior Environmental Specialist
- [redacted], Human Environment Specialist

Purpose and Objectives

The purpose of this meeting was to introduce Chance Oil and Gas and its projects to Gwich'in Tribal Council's (GTC) new leadership.

Meeting Discussion:

[Participants identified themselves and provided a brief introduction, including a summary of their title and role within their respective institutions and brief overview of their history.]

Grand Chief [redacted] – Have driven by Chance's camp at Eagle Plains in the past and have often wondered what was going on. Suspect that other Gwich'in have had the same thoughts. I welcome the opportunity to introduce myself to Chance. The Designated Gwich'in Organization for Fort McPherson is very complementary of Chance's outreach. Also note that Chance has supported our hockey team. This represents a collaborative approach, that myself and the Deputy Grand Chief expect and support. We don't always need to convene a meeting though, there is strength in us having access to each other.

Where we are able to pick up the phone and clarify things when we have questions Willingness to have open and transparent dialogue that's frequent. That's our expectation. If there are opportunities for GTC participants and businesses to participate, that's what we're looking for, and to ensure practices work with our use in the area.

[redacted] – I agree, our relationship over the last four years, under a more formalized process, has been working well and we really appreciate the efforts of the GTC and the DGOs in giving us advice. With respect to history, Chance had its 26th birthday in September. In those 26 years, we've only been able to operate in the field for perhaps 3 years. In the early years, the plan was to focus on local standard resources to develop in the local regional market, in later 90s, the commodity markets collapsed. Another 7-8 years after that, there was enough of a rebound for Chance to start up. Another change during that time, switched from dealing with Ottawa to the Yukon when it came to oil resources. In the past, Chance was called Northern Cross Yukon and was successful in being awarded 16 permits in the Eagle Plain basin. Most permits are within the Traditional Territory of the Vuntut Gwitchin (VG). A portion of the overlap with the VG, is also with First Nation of Na-cho Nyäk Dun and some of the Secondary Use Area of the Tetlit Gwich'in. Fast forward, we did go through Yukon Environmental and Socio-economic Assessment Board (YESAB) (Designated Office evaluation) to undertake an exploration drilling project. For 12 months we were able to drill 4 wells. Assessing opportunities in shale formations and identifying resource mass to be able to support resource development. Undertook a 3-dimensional seismic data program. Since then, tried to go through various processes to continue exploration, but its been a challenge to get through YESAB. Last time we did a field program in 2014, we implemented Engagement Plans with each of the affected First Nations. In relative terms of exposure, the VG would have the most exposure since their Traditional Territory covers all the areas of our project/s. Chance has been communicating its plans to each of the affected First Nations. The Yukon moratorium on fracking resulted in Chinese investors leaving Northern Cross (i.e., previous iteration of Chance). Chance is now Canadian owned. We have plans to continue exploration work and look forward to working with the communities.

[redacted] – Chance will speak to each project in more detail through the call. For now, I will provide overview of the Communications and Consultation Plan that was agreed to between the Gwich'in Partners and Chance. Yukon Government issued a Ministerial Order for Chance to make engagement plans with affected First Nations. In the order, Yukon Government listed both GTC and Tetlit Gwich'in Council (TGC). Hemmera was brought in late 2017 to help create those plans. GTC and TGC worked collaboratively to develop a plan that addressed both interests of both parties. [redacted] walked through the different sections of the Communications and Consultation Plan. Plan attached.] Someone from Hemmera takes notes, then sends out those notes to GTC and Chance for comments. Those notes are sent as a draft and for records management. Moving forward, as we get into more substantive discussions, they will need to be documented in a potential submission to YESAB. Section 7.0 of the Communications and Consultation Plan hasn't been fully implemented at this time. Largely because the main goal of the plan was to develop the Executive Committee project. Work on that larger project has slowed down and, in the interim, the smaller Designated Office project has ramped up. We would be happy to work with GTC and Chance to develop the items in Section 7.0. In the absence of formally implementing the items in this section, it has been implemented in spirit.

[redacted] – I don't have any questions, seems pretty straight forward at this point.

[redacted] – I think it's working well. There may have to be amendments to it, but the feedback has been good.

[redacted] – These documents are great to frame out the info that's been flowing. However, the expectation is that your technical people are dealing with ours. If there is a need for leadership, then I would be pulled in (i.e., pulled into the nitty and gritty). If there are activities in the area, there is an expectation that we'd have some business opportunities.

[redacted] – Executive Committee screening project. Chance has been working on its exploration plans for a number of years. That plan has always been evolving as we learn more about the geological opportunities. The focus is on opportunities that do not require hydraulic fracturing. Within our exploration license we have 3 Significant Discovery Licences (SDLs). These were drilled between 1959-1972. Two SDLs are located in the Tetlit Gwich'in Secondary Use Area. Four wells were drilled in the 1960s to make those discoveries. As time passed and technology evolved, Chance would explore new opportunities. Eagle plain has had close to 40 wells drilled in its life. We've drilled 4. Most of that work happened in 1959-1972.

[redacted] – Have you heard of Eagle Plain Resources?

[redacted] – Yes, it is a mining company. Related to a discovery in the fishing branch area. An iron deposit near a Vuntut Gwitchin protected area.

[redacted] – I saw them at a conference before, but the projects they were pitching were not near Eagle Plains.

[redacted] – The multiyear exploration project (project for Executive Committee level screening) is intended to take 8-10 years. Our intention is to keep it small scale, but have it run for a long enough period of time so that the environmental impact is limited but that local businesses are given opportunities to invest (e.g., businesses, people, and training). Since the time we've been in the north, we've seen that people want opportunities. We are trying to do this in a manner that sets the stage for consistency and longer-term activity. We want to establish capacity in the north so that services don't have to be brought from the south. The only place you can get services for the oil industry is out of Alberta. That's a long ways – to bring things to the Yukon. If we can start getting that expertise in the north, that is economically advantageous to us, Chance, and the North. [Eagles Plains Exploration Project Description attached.] The lands where we want to undertake this wide area of exploration activity is outlined in black. Within that area are SDL 20 (Birch), SDL 21 (Blackie), and SDL 22 (Chance). Within this area of interest, we hope to drill up to 30 exploratory wells, those locations have not been determined. Need access to data, some of that data is seismic data, gathered by other operators that we have acquired or seismic that we would gather ourselves. There is 2D [seismic] data, and first 3D data was collected in 2013-2014 which we shot. Chance would shoot 1500 sq KM of 3D and 2,000-line kilometers of 2D. The methods for seismic today are less intrusive than the lines of the 1950s. Seismic lines are no longer straight, and they are thinner than they were in the past. Chance's draft project description has been provided to the predecessors of GTC's leadership. Chance would deploy one drilling rig or perhaps 2. The camp you've driven by has a maximum of 75-80 people. This limits the number of drilling programs and how the drilling program is combined with the seismic program. It will be winter access, so there are also seasonal constraints. For extended flow testing, those activities would require year-round roads. That product (i.e., from the extended flow tests) would either be trucked to market, used onsite, flared, or disposed of in disposal wells. The goal of extended flow testing is to understand the capability of the well, the size of the resource, and help with long-term planning. Could take up to 2 years for extended testing for oil, or for natural gas could take a few weeks. Oil

DRAFT

accumulation takes longer to assess than a natural gas accumulation. There are opportunities for First Nations to participate in the oil industry, some of which is exemplified in Alberta.

[redacted] – When will you start?

[redacted] – we have to go through YESAB's Executive Committee process. Have been trying to get that document (i.e., project proposal) ready for a few years now. However, we need to set up cooperation and benefits arrangements with First Nation. I can't tell you when we would get started. Executive Committee screening is maybe a 2-year process. However, YESAB is starting/initiating a Pre-Submission Engagement Process, this may affect our timelines. I think this project is still a couple/few years away. Hopefully not much longer than that.

[redacted] – Essentially moving forward, will be engaging with affected FNs on ecological Valued Components, for example, Caribou. We know this is a top priority. We are well aware of the Artic Wildlife Refuge and the issues/concerns being raised there. It is very important for us to get into the communities and engage the communities. We have[redacted] (with Environmental Dynamics Inc.), who is a biologist who will help facilitate those conversations along with Hemmera. It is a detailed process, but it is a very important process. Gathering feedback from the community to inform plans and mitigation measures. With regards to capacity building, there is the technical component, but also economic opportunities. I think there is a huge appetite to look at the broader picture when having discussions.

[redacted] – If approved, will this project run into the next decade?

[redacted] – In YESAB 2021. Then a couple years in YESAB, permits in 2023/2024, and then go from there, depending on what the results are.

[redacted] – I think some of the businesses that we have at our disposal and that we are looking to create, will be able to support Chance. We have businesses with experience in arctic operations and experience in that specific area. There hasn't been enough done, to utilize northern business and services provides. For Mackenzie, a lot of firms came from the south.

[redacted] – Because this is still fairly early stage, the areas where we have had success hiring from northern businesses is in access construction (e.g., winter roads), camp operations, and supply drivers.

[redacted] – What is the Rough value of the drilling program?

[redacted] – Project would roll out based on results as we went along. A typical well, might be 7-12 million dollars to drill. The camp will limit activities. We'd have an airstrip, 800-meter strip by our camp. I think Vuntut Gwitchin is thinking about a new airstrip, off the dempster. However, those are just ideas right now.

[redacted] - If you come aware of any opportunities that could align with this work, please let us know.

[redacted] – Occupational health and safety and labour codes have changed. Almost like an apprenticeship program now. First, they start with book work and then on the job training. Having lead time to get this organized is a good idea.

[redacted] – Those are good changes. More training is a good thing. Worst thing we could do is train people and have them waiting for a year. Timing will be very important.

DRAFT

[redacted] – Will gather info on training requirements and labour code requirements and we will share that information with the group. In the near term, Yukon oil and gas regulators have asked us to undertake a maintenance program on 8 wells. Yukon Government instructions are to put those wells into operation or abandon them. Hopefully, this winter. However, COVID has impacted timelines. Plans to enter the field this winter. Would take approximately 70 days to undertake the work on the 8 wells. Godlove, my next comments on the Designated Office project will be new to you. Changes have occurred. M59 is a natural gas discovery. M08, G08 and J19 are on the SDL. A25, E78, H28, and B73 are wells Chance drilled. We are revising our document that went into YESAB. Now we propose to abandon 3 wells: H28, B73, and G08. Convert two into downhole disposal wells: E78 and A25. It's environmentally safer to have a location near the working sites that can be used for disposal. Conduct extended flow testing on M59, M08, J19. This is the component that is new. The extended flow testing would be new to Godlove. One service rig would come up from the south (Alberta) to do the well maintenance work. As for well abandonment, it's brining all wells up to current standard. Cement trucks will be required. Winter roads will be needed for access routes.

[redacted] – The project proposal provided as a draft this past spring. GTC provided comments. That project was submitted to YESAB as a Designated Office evaluation. We received 6 information requests and we were in the process of responding to those requests when Chance informed Hemmera of the project changes. We talked through those changes with YESAB and they advised Chance to withdraw its proposal and resubmit. So Chance will re-engage on this new project design and then resubmitted. Godlove would have received the email from Calista Morrison (Hemmera) notifying GTC that the proposal was being withdrawn.

[redacted] – Received the email from Calista, and look forward to the new proposal.

[redacted] – Hope to have the new document maybe this week.

[redacted] – Making the final edits now, should be ready this week.

[redacted] - The YESAB process takes an uncertain amount of time. Typically Designated Office evaluations take a couple months. However, oil and gas in the Yukon is a hot button topic. Knowing that the proposed work should take 70 days. We will probably have to get the permits in January for the timing to work. If that doesn't happen, then we will have to wait until next year. Also, have to wait until there is enough snow. That will impact our start time as well. COVID affects timing as well. Equipment and people will have to come up from Alberta and that could affect our ability to execute. We will need input from government, GTC, and TGC. Your thoughts on COVID management. We have a plan that has not been approved yet by the Yukon Government. It is a plan that is independent of the Yukon Government's polices. For example, it's requesting going to work and quarantining at the same time. As opposed to quarantine for 14 days and then work. We need to find a plan that will be suitable. We will be using facilities at the Eagle Plain Hotel. Doesn't make sense to open up the camp. The Eagle Plain Hotel will be our base camp. We will have to get a plan, that is different to what the Yukon is currently requiring, approved by the Minister of Communities Services. Getting feedback from First Nation leadership and businesses will be helpful for us.

[redacted] – Odd situation. We don't have a bubble with the Yukon. I don't have to isolate when I go to Yukon, but when I come back into NWT, I have to isolate. Isolation is not fun, but it is for the best of our communities. Important that people coming in, are following the rules. It's a shame that YT opened their border to BC. Then we likely would have had the northern bubble. There are pros and cons to

DRAFT

everything. There are cons for people from the Mackenzie Delta that go into Whitehorse and then when they come back have to isolate. Border control is important. Working with GNWT to establish a 24-hour border control on the Dempster. Its not a matter of "if" but when. That we will have more cases in the Mackenzie Delta. Increased measures, border control, and maybe even lock-down measures, may be needed in the future.

[redacted] – We already initiated conversations at a high level, e.g., with the Vuntut Gwitchin. To inform affected First Nations on the Yukon side and start working with their development corporation.

[redacted] – Couple more long-term questions. What is the broader business case for this? You mentioned earlier production in the Yukon, where would it go, the desired customer?

[redacted] – Flow testing of natural gas. Yukon power generation is relying increasingly on diesel. Yukon Energy. The idea would be to deliver natural gas for power generation. Would mean changes to the equipment that is currently used. I think what Yukon Energy is doing in Faro and in Whitehorse is fairly temporary. I think if we were to look long-term, the best place to put electricity generation is near Dawson at the intersection of the Klondike and Dempster highways. An alternative use for the heat. We have not investigated all these options yet. Natural gas could be used to provide home heating or space heating just like it is in Alberta or even Inuvik. The idea would be similar. We have to demonstrate flow. Before we can get anyone to listen to us. Exploration project, the preference is to focus on liquids. Have a facility to get diesel, and sell that into the regional market. The volume and composition of the liquid. Diesel is an easily made product.

[redacted] - Having it sent north to the NWT?

[redacted] – Had a conversation with GNWT folks. However, first we need to draw attention to the site and the project by looking at the flow rate. One we have that information we can engage with the market.

[redacted] – What flow rate would you need?

[redacted] – 20-30 million cubic feet a day. I'd like to get that. The north has a unique dynamic when it comes to resource use, i.e., peek in the winter, low in the summer. However flow rates don't change with the season.

[redacted] – Purpose of our meeting was to give GTC's new leadership an overview of Chance's projects. Godlove has been our primary point of contact.

[redacted] – We have hired consultants to do baseline studies. Environmental Dynamics Inc. out of Whitehorse is looking into aquatics, fish, birds, caribou, and impacts of old and new seismic lines. They have been gathering and interpreting data. They are getting to a stage where they can share their findings more broadly. Close to the point where we can share this information with the First Nations and communities and combine that data with information that the communities can share. Palmer, another consultant, is looking into permafrost and changes in the permafrost. In order to move this forward.

[redacted] – The primary concerns, trapping and caribou hunting. There isn't as much trapping any more. However, historically that area has been used in the past. Those will likely be the primary concerns for our residents. Difference from ANWAR, Eagle Plains isn't calving grounds.

[redacted] – Going forward, GTC always takes the collaborative approach. Even if a project is in the Primary or Secondary Use Area, we still talk to the other Designated Gwich'in Organizations and we

include our Department of Culture and Heritage. If we could have enough time to provide a review, that would be very helpful. It would help the Gwich'in work with each other.

[redacted] – What is the technology available in the communities, with respect to online meetings with Microsoft Teams or Skype.

[redacted] – Would have to test and prepare ahead of time to make sure the connection is good. Also ensure technician is there.

[redacted] – We will need to think about what would work best. For example, with respect to workshops?

[redacted] – We have used Teams in the past.

[redacted] – That's just how we have to plan to engage moving forward. Thank you. This provided me with necessary context. If I have any questions, I will reach out t[redacted]. Hope [redacted] reaches out to me. I'm willing to exchange cell numbers.

APPENDIX 2-B-21. June 3, 2021, Meeting Summary

GWICH'IN TRIBAL COUNCIL AND CHANCE OIL AND GAS MEETING

Date: June 3rd, 2021

Location: Microsoft Teams

Attendees:

Gwich'in Tribal Council:
Grand Chief [redacted]
[redacted], Manager, Lands & Resources
[redacted], Associate Director, Intergovernmental Relations

Chance Oil and Gas Limited:
[redacted], President
[redacted], VP Government and Community Relations
[redacted], Regulatory, Environmental and Community Relations Coordinator

Hemmera:
[redacted], Human Environment Specialist
[redacted], Human Environment Specialist

Purpose and Objectives

The purpose of this meeting was for Chance Oil and Gas (Chance) to present a Draft Project Description of exploration activities proposed for the Eagle Plain Basin, and for Chance to provide updates regarding baseline information gathered by consultants (Environmental Dynamics Inc. (EDI), Peer Solutions, Palmer) and Parties discussed next steps with community engagement and consultation schedules for the Gwich'in Tribal Council (GTC) and communities (Inuvik, Aklavik, Fort McPherson, Tsiigehtchic).

Discussion:

[redacted]: [Reviewed agenda] Chance will provide updates on the Eagle Plains Exploration Project. Chance will provide presentation on project description, almost the same presentation as that shared in 2019, but we will highlight any changes that have happened since. Then we will go over next steps on developing the project proposal, community consultation and engagement schedules, and preferences of the GTC and communities. Grand Chief [redacted], would you like to make any opening statements?

Grand Chief: Good afternoon everyone. It is great to reconnect with everyone. As I recall we had a discussion back in January. It's a good opportunity for us to have a reconnection. [redacted] will be responsible for managing and implementing any lands and resources communication. Looking forward to hearing what has changed with this project.

[redacted]: Grateful for the opportunity to provide an update on this project. I would say that our company relationship with GTC and Chance is very good, with great communication exchanged.

In terms of our projects, we have had 2 information requests with YESAB in regard to the well maintenance project. The plan is that the well maintenance project will occur in 2022. The project will run about 70 days. We will likely use the Eagle Plains Hotel as our camp. There is a benefit agreement that has to be concluded. Then we will be moving ahead with the bigger project that requires drilling new wells and further assessing the potential for oil and gas in the Eagle Plains Basin.

[redacted]: Any updates from the Gwich'in Tribal Council?

Grand Chief: For the Tribal Council, we have had a number of changes to our staff. We are activity recruiting a new Chief Executive Officer. Our Chief Operating Officer will be starting in July. For us right now, our primary concern is keeping our people safe from COVID. We are undertaking a review of our bylaws and will provide updates on our point of view in terns of economic development. Right now we have several projects: the wind energy project, the extension of the air strip in Inuvik, and the installation of the fiber optic line.

[redacted]: This presentation will cover what has changed since the 2019 presentation and provide an overview of the new plans for the exploratory project. It is about 18 slides and I'll cover the various parts in the project; where it's going to happen, wells and drilling components, the workforce potential, the reclamation process, and an overview of the YESAB process. The project area of interest is within Chance's exploration permits. We hope to dispose of the drill cuttings in local areas so that it doesn't have to be taken to British Columbia. Part of this project includes a seismic program. [Reference to presentation] The 2014 program shown here was much different than the seismic work done decades ago. The lines no longer have to be straight. They are less visible. It's also harder for people to access these lines from the road than the ones done decades ago.

This map [redacted] referred to presentation], outlines the area of interest. It shows the traditional territories and settlements blocks. Green shapes are settlement blocks. Chances permits are shown in the tan colour. The pink, blue, green, and yellow lines show the Vuntut Gwich'in, Tr'ondëk Hwëch'in, Tetlit Gwich'in, and First Nation of Na-cho Nyäk Dun traditional territories. The red line on the map represents the Dempster Highway.

On the drilling side of things. We plan on drilling up to 30 wells over 10 years. A given well site is about 1.44 ha, but isn't necessarily square. Will conform to the different areas or landscapes. We intend to be positioning these on high land to avoid permafrost issues. The ground is better drained and creates less issues on the top of ridges. We'll avoid heritage areas and sensitive areas. We also must avoid waterways. All governed by the Yukon Oil and Gas Act.

We have also undertaken a number of field studies. Work on ecosystem characteristics was performed by EDI. Permafrost processes by Palmer Environmental. Technical design by Peer Solutions who is working on the seismic program. EDI had several teams go into the field in 2019 and 2020. They were looking at bird studies, old seismic lines, fish, and surface water. Those old lines are a result of the technology at the time and the lack of understanding of the geology in the region. During the 50s to mid 80s there was 2D seismic activity. We did 3D seismic. Now, the seismic footprint is much smaller today than it was 60 years ago. EDI looked at old seismic lines, and if those lines get any sort of use from animals. If they are regenerating, if humans use the area, etc. They obtained porcupine caribou information/data from the Porcupine Caribou Management Board; they have not finished their interpretation.

[redacted]: A change from the previous 2019 presentation on the Project Description is drilling up 5 wells per years rather than 8.

[redacted]: We're expecting to find oil, gas, and water. The water found in this mixture is not potable. The technology has evolved over the years. Directional drilling allows us to access areas horizontally underground without further surface disturbances. [redacted] referred to presentation] The photo here is of a Chance well drilled in 2013/2014. The diagram shows the mud storage, mixing, and the connection to the drilling operation. This is the layout of a drilling operation, and how the equipment would be organized around the operation. The trailers, the mud tanks, the boilers, etc. that are needed to run the rig. There are often a few other buildings on site. At any given time, there are 8 to 20 people on site. The idea would be that the bulk of the crew would housed at the camp. There would be a handful of people housed at the actual site.

Extended flow testing would be done to separate what we find. We would dispose of the test fluids in the abandoned wells. The flow testing gives us a better idea of the rock formation, the resource, and potential future development of the resources. We don't know much about the rock properties in this region compared to Alberta. The drilling operation would occur during the winter, to begin with, but move into year-round trials with the extended flow testing. The well head is a sequence of valves. [redacted] referred to presentation] The fluids come up on the left side to the separator, and the initial bits of natural gas come off the crude oil. There would be some initial separation of gas, water, and oil. The gas would be used for the operation and provide heat. The oil would be trucked somewhere in BC to be shipped off. We would use our own wells to dispose of unwanted fluids. There shouldn't be any issue from a contamination point of view. The soil characteristics in that area are good for using mix-bury-cover. Natural gas can be flared or re-injected into the wells. Possibility that we liquify it and truck it to a place like Inuvik. This is an estimate, but we could be getting up to 4,000 barrels per day.

When we do this work, our camp will be a limiting factor. We would be doing either seismic or drilling. The seismic is up to 1500km² of 3D and 2000km² lines of 2D. This may happen all in one season, but likely split up into different years. The techniques used today for seismic are much better than they were decades ago. There are no long sight lines, and the devices used for drilling the shotes holes are much thinner. This all fits in with the disturbance criteria in the North Yukon Regional Land Use Plan. The footprint really is not that big in reality. We can share our consultants' work around this.

Workforce is around 75 people whether it's drilling or seismic. 24 hours operations with 4-6 people per shift on each drill. 20 days on and 10 days off. We will cycle them through by air on 1 or 2 flights per week. Potentially add an airstrip. If we have overflow, they would move into the Eagle Plains Hotel. We are also thinking of using remote shelters to make things warmers for workers. Even though there's not many projects of this nature, there's a lot of work opportunities. 20% of money spent on this project will stay within northern communities.

[redacted]: Any technical information is important for us regarding the mix- bury-cover. There are quite a few relic sumps that have been exposed by water erosion.

[redacted]: Couple of things. The soil situation and water situation is different in our Project region compared to the Delta. The nature of the soil is different. If thawed, it would just turn into muck in the Delta. Eagle Plains doesn't have enough water to create those erosional experiences/issues. There is not the same kind of ground material in Eagle Plains as in the Mackenzie Delta region. The current mix-bury-cover sumps in the Yukon are doing well and it doesn't look like there are any issues with them.

Grand Chief: What is the size of the mix-bury-cover sumps?

[redacted]: Depends on how much rock and what you've taken out from the sump. Devon's dimensions are approximately 20 meters by 8 meters.

Grand Chief: How deep would they be?

[redacted]: Probably be around 3 meters deep. All depends on the mixture of the soil and cuttings. So we're looking at around 20 meters by 5-8 meters.

[redacted]: Do you mean the soil on top of the mixture?

[redacted]: The soil would be a couple of feet thick on top.

Grand Chief: The most concerning things to us would be the sumps.

[redacted]: The methodology that we would apply would be patterned after best practices in Alberta and Alberta regulations.

Grand Chief: It might be helpful for us to see baseline information of the other sites in the Yukon.

[redacted]: The Devon site is at about KM 336 up the Dempster Highway.

[redacted]: Richard, would it possible to take a look at the Devon sump when you go to visit the camp?

[redacted]: We are going up in early July and August. We could look then.

[redacted]The last slides here are on the YESAB screening process. We're at the Executive Committee level. Right now we are in the pre-submission engagement step.

[redacted]: Like Richard mentioned, the goal is to submit this fall to YESAB. Hemmera is responsible for the majority of the project planning for this project, as well as gathering the information from other consultants on the project. Palmers is looking at permafrost, EDI is looking at the fish, wildlife, and vegetation, Vertex does the design of the drilling, and Peer Solutions does the seismic work.

[redacted] has photos of the sump that he can share.

[redacted]: We have presented to leadership at GTC as well as DGOs in 2019. Each of those presentations were essentially what you've seen today. The presentations from other consultants go into detail on the different subject areas. We are wondering how best to proceed with engagement in general with the DGOs and subsequent meetings with GTC. Would it be your preference for us to come to the communities to present this information? We can present to both technical staff and community members.

[redacted]: All this would occur before this August?

[redacted]: Before late fall. That is Chance's goal. We have started community meetings in Old Crow. We're looking at potentially heading to Dawson City soon. We're also re-engaging with Tr'ondëk Hwëch'in and First Nation of Na-cho Nyäk Dun.

[redacted]: I'm not comfortable speaking for the community yet. It's up to [redacted].

Grand Chief: We'll get back to you. I think something for both public and leadership meetings. Band Councils also need to be included.

R. Wyman: In August of 2019 we visited each of the Gwich'in communities. I imagine that there's been changes in staff all around.

Grand Chief: All four Gwich'in communities will be helpful. Everyone drives by the camp.

R. Wyman: If travel limitations are an issue, we can use teams and zoom.

Grand Chief K[redacted]: We should be seeing further easing of restrictions in the next coming months.

R. Wyman: I'm going to get my next shot soon, so hopefully I can make it up this summer.

Grand Chief: Thank you for the presentation, the main things we would be concerned about is water usage, depths of disposal wells, in general the mix-bury-cover sumps, and the presence of aquifers in those areas.

Action Items:

- Summary of meeting with be drafted by Hemmera. That draft will be shared with Chance and GTC.
- Copy of presentation, and the original draft project description from 2019 will be sent to GTC by Hemmera.
- Chance/Hemmera will send the updated Project Description once it is complete.
- GTC will discuss internally and advise on next steps for future meetings e.g., community meetings, meetings with the DGOs
- Hemmera to send Palmer report and mapping (permafrost, terrain, and suitability mapping)to GTC
- Chance to share photos and reports of mix bury cover sumps in Yukon.

APPENDIX 2-B-22. *Draft 2021 Annual Report Implementation of the Gwich'in Partners and Chance Oil and Gas Communications and Consultation Plan*

1.0 INTRODUCTION

This report demonstrates implementation of the *Gwich'in Partners and Chance Oil and Gas Limited Communications and Consultation Plan* (Plan) (see **Appendix A**) finalized on August 1, 2018. It summarizes discussions held between Gwich'in Tribal Council (GTC), Tetlit Gwich'in Council (TGC), collectively referred to as Gwich'in Partners, and Chance Oil and Gas Limited (Chance) between June 1, 2020 and May 31, 2021. The purpose, objectives, and outcomes of each discussion are described below to fulfill the requirements of Ministerial Order (MO) 2018/42 (see **Appendix B**) issued to Chance on August 30, 2018.

2.0 BACKGROUND

The development of communications and engagement plans began with Order in Council (OIC) 2016/169. OIC 2016/169 required Chance to file a First Nations communication and engagement plan with the Minister of Energy, Mines and Resources in order to extend tenure on their northern permits: 0005, 0006, 0007, 0008, 0009, 0010, and 0011 (see **Appendix C**). Chance complied with OIC 2016/169 and received their tenure extension.

Chance subsequently received MO 2017/37 when applying for tenure extension on six of eight southern permits: 0012, 0013, 0014, 0015, 0016, and 0017. MO 2017/37 required Chance to revise, in consultation with affected First Nations, the consultation and engagement plan filed under OIC 2016/169. The affected First Nations listed in MO 2017/37 were Vuntut Gwitchin First Nation, Tr'ondëk Hwëch'in, First Nation of Na-Cho Nyäk Dun, Gwich'in Tribal Council, and Tetlit Gwich'in Council.

Gwich'in Partners and Chance developed the Plan collaboratively through a series of in-person meetings and conference calls. Hemmera was retained by Chance in November 2017 to facilitate the development and completion of the communications and engagement plans with the affected First Nations and facilitated all discussions between the Gwich'in Partners and Chance.

Gwich'in Partners and Chance submitted their finalized Plan to Minister Ranj Pillai on August 1, 2018. To satisfy its obligations under MO 2017/37, Chance filed a total of four communications and engagement plans. All four plans were approved by the Minister, and Chance received a five-year tenure extension on the six southern permits.

A condition of the five-year tenure extension, issued via MO 2018/42, required that Chance submit annual reports summarizing actions taken to implement each communications and engagement plan.

See **Appendix C** for a map of Chance's current permits.

3.0 ENGAGEMENT AND COMMUNICATION PLAN IMPLEMENTATION SUMMARY

3.1 Overview

Parties have advanced discussion in Chance's proposed Eagle Plains Exploration Project and Chance's proposed project for Well Maintenance and Extended Flow Testing. The following sections provide separate

summaries of engagement activities that occurred for Chance's projects between June 1, 2020 and May 31, 2021.

3.2 Summary of Engagement – Well Maintenance and Extended Flow Testing Project

Chance initially notified the GTC and TGC on May 25, 2020. That package included a high-level overview of the project (e.g., project activities, components, goals, outcomes), the regulatory submissions Chance would be making, a brief introduction to Hemmera and its role, as well as a request to discuss any concerns the affected party may have and an offer to arrange a conference call should they so desire. Also included was a 4-page project summary and map of the project location.

On June 12, 2020, the GTC provided input from its departments of Lands and Resources, Cultural Heritage, and Economic Development. The following themes were raised by the GTC:

- High environmental standards in the Peel River watershed and protection of scattered wetlands within the LMU 7
- Protection of wildlife and wildlife habitats
- Protection of the environment, water quality and quantity, and risks related to potential spills
- Protection of cultural heritage resources and values.

The GTC also requested that Chance share the full project description and any other materials related to the Project that might be available. Chance sent a draft project description (dated May 22, 2020) to both the GTC and TGC; however no other materials (e.g., effects assessments, summaries of mitigation measures, management plans) were available at that time.

The GTC's original feedback, provided June 12, 2020, helped Chance select valued components, identify mitigation measures, and identify where additional detail was needed in the project description. Chance provided a formal response to the GTC on July 9, 2020. Chance and the GTC then organized a conference call for July 22, 2020 where parties were able to further discuss the project. During this call, Chance provided an update on changes that had been made to the project design since the draft project description (dated May 22, 2020) and GTC asked follow-up questions about potential project-related impacts. A draft of the project proposal was subsequently shared with the GTC and TGC on July 24, 2020.

Following additional conversations with the regulator (Government of Yukon), Chance was required to make changes to its project design. On August 7, 2020, GTC and TGC was provided notice that revisions were being made to the project and that additional information would be forthcoming. A revised project proposal was provided, via email, to GTC and TGC on August 28, 2020, along with a cover letter summarizing the revisions and providing a rationale for each.

On September 2, 2020, GTC provided updated feedback on the project via email. GTC was explicit in stating that their feedback only considered the additional information provided in the July conference call and that they had not yet had a chance to review the revised project proposal sent August 28, 2020. GTC indicated that they would review the revised project proposal and provided additional input where required. GTC also informed Chance that Renewable Resources Council members in Fort McPherson were interested in meeting to discuss the project and that GTC would be proving contact information to facilitate that meeting. Chance submitted an initial project proposal to Yukon Environment and Socio-Economic Assessment Board (YESAB) on September 11, 2020. However, after further consideration, Chance

determined that additional changes were required. On November 2, 2020, via email, Chance notified GTC and TGC that it had decided to withdraw its project proposal from YESAB and submit a revised version. In that email Chance stated that once a revised proposal had been drafted, Chance would notify GTC and TGC by sharing a draft and requesting a meeting to discuss the changes further, and Chance stated at that time that after it had the opportunity to discuss those changes with GTC and TGC, the project proposal would be finalized and resubmitted to the Dawson Designated Office.

On November 16, 2020, Chance and GTC had a meeting wherein Chance introduced itself and its projects to GTC's new leadership (i.e., new Grand Chief and new Deputy Grand Chief). While Chance provided a high-level overview of its Eagle Plains Exploration Project, this meeting largely focused on the proposed Well Maintenance and Extended Flow Testing Project. During this meeting, Chance provided an overview of changes to the project design and indicated that the draft would be ready to share with GTC later in the week. GTC inquired about the business case for Chance's projects and potential for future employment opportunities and how training should be timed to allow Gwich'in to benefit from employment opportunities. GTC mentioned that the primary concerns for the region were likely trapping and caribou hunting, and that compliance with COVID-19 measures were important to health and safety.

The revised draft project proposal was provided via email to GTC and TGC on November 19, 2020, and in that email Hemmera indicated that Chance would be submitting the proposal to YESAB the following day. On November 20, 2020, Hemmera informed GTC and TGC that Chance would delay submission until the following week. However, to allow for additional revisions, the submission was delayed until December 24, 2020During engagement, the GTC flagged potential services that Gwich'in businesses might be able to offer Chance and inquired as to what project-related employment opportunities would be available. Chance indicated that it welcomes the opportunity for additional discussions with the GTC to identify and facilitate potential economic development and employment opportunities, however, it would have to balance those interests with requirements to source specific equipment and professions for the maintenance work as well as requirements under section 68 of YOGA (i.e., benefits agreements with Yukon First Nations).

3.3 Summary of Engagement – Eagle Plains Exploration Project

Between June 1, 2020 and May 31, 2021, Chance and Gwich'in Partners did not have a meeting that specifically targeted the Eagles Plains Exploration Project. When GTC and Chance met November 16, 2020, the purpose of the meeting was for Chance to introduced itself and its projects to GTC's new leadership (i.e., new Grand Chief and new Deputy Grand Chief). While Chance provided a high-level overview of the Eagle Plains Exploration Project, the meeting largely focused on the proposed Well Maintenance and Extended Flow Testing Project.

3.4 Communication Log

The correspondence between the Gwich'in Partners and Chance is documented in the Engagement Log (see **Appendix D**).

4.0 PLANS FOR ONGOING ENGAGEMENT AND NEXT STEPS

No additional engagement activities are expected for the Well Maintenance and Extended Flow Testing Project while it is undergoing YESAB's review.

Gwich'in Partners and Chance will continue to hold discussions at regular intervals as Chance develops its project proposal for the Eagle Plains Exploration Project.

Upcoming engagement activities for the Eagle Plains Exploration Project are expected to involve the following:

- Negotiation of a Cooperation Agreement with GTC (including confidentiality provisions).
- Discussion and establishment of the Chance-Gwich'in Communications and Consultation Management Committee for the purpose of, among other things, planning and organizing future engagement activities.
- Updating/revising Plan to include all DGOs, as well as Band Offices, and to revisit the meeting frequency of Chance and the Gwich'in Partners.
- Ongoing discussions between Chance and Gwich'in Partners on how parties can facilitate and identify training opportunities and employment opportunities for qualified Gwich'in professionals and Gwich'in businesses.
- Sharing baseline data
- Meetings between Gwich'in Partner's technical staff and Chance's technical consultants preparing the project proposal for proposed Eagle Plains Exploration Project
- Community engagement events for Gwich'in citizens.

5.0 APPROVAL OF IMPLEMENTATION SUMMARY

Gwich'in Partners and Chance have reviewed this report and agree to its contents as an accurate summary of engagement activities carried out between June 1, 2020 and May 31, 2021.

APPENDIX A

Gwich'in Partners and Chance Oil and Gas Limited Communications and Consultation Plan

Chance OIL AND GAS LIMITED

Gwich'in Tribal Council
Gwich'in land, culture & economy for a better future

Gwich'in Tribal Council and Chance Oil and Gas Limited Communications and Consultation Plan

1.0 Introduction

Chance Oil and Gas Limited ("Chance") is an oil and gas exploration company that holds permits to perform oil and gas exploration activities in the Eagle Plain basin of the Yukon Territory, Canada. The Gwich'in Tribal Council ("GTC") is an Indigenous organization that holds rights under Section 35 of the *Constitution Act*, 1982, *Treaty 11* and the *Gwich'in Comprehensive Land Claim Agreement* ("GCLCA"), including Appendix C – *Yukon Transboundary Agreement* ("YTA"). Under the YTA, "Tetlit Gwich'in" is defined as a Gwich'in who either: (a) resides in the Peel River watershed, including the community of Fort McPherson, Northwest Territories; or (b) is descended from an aboriginal person who used or occupied the Peel River watershed on or before December 31, 1921. Under this definition, Tetlit Gwich'in and their descendants currently reside in Aklavik, Inuvik, Tsiigehtchic and Fort McPherson, as well as elsewhere in Canada and abroad. Under the GCLCA, the GTC is the body responsible for representing the collective rights of GCLCA participants, including all Tetlit Gwich'in as defined in the YTA.

As part of Chance's exploration program, Chance, as the proponent, seeks to develop a communication and consultation plan ("the Plan") with the GTC, as a rights holder for these Yukon lands that could potentially be affected by Chance's exploration program activities. These Yukon lands are identified in the YTA as the Primary Use Area and the Secondary Use Area lands. With the exception of permit 15 which straddles the Primary Use Area, all of the permits held by Chance, namely 7, 9, 13, 14, 15, 19, and 20, are located within the Secondary Use Area.

The Plan will reflect and be consistent with the GTC's role as the Indigenous organization responsible for upholding the collective rights held by Gwich'in in the Primary Use Area and Secondary Use Area within the Yukon. This Plan will acknowledge the GCLCA organizational structure, and as such, is intended to extend to and encompass the GTC, the Designated Gwich'in Organizations, and including the Tetlit Gwich'in Council (the "Gwich'in Partners"). The Gwich'in Partners will seek to establish an internal Memorandum of Understanding (MOU).

2.0 Purpose

This document serves as a Plan to provide a mutually agreed upon framework to support collaborative and effective communication and consultation between Chance and the Gwich'in Partners.

3.0 Relationship

Chance and the Gwich'in Partners will execute this Plan according to the following principles:

Gwich'in Tribal Council

Gwich'in land, culture & economy for a better future

- Transparency;
- Timeliness; and
- Mutual respect, trust and understanding.

4.0 Key Gwich'in Tribal Council and Chance Connections

Communication and consultation between Chance and the Gwich'in Partners will be generally associated with the proposed works and potential effects associated with Chance's oil and gas exploration program, and with potential new opportunities or benefits received by the Gwich'in people, from Chance, as the project proponent. Once the scope of Chance's specific plans are determined, the Gwich'in Partners, together with Chance, will discuss the anticipated impacts on Gwich'in rights within the Primary and Secondary Use Areas, as well as the best way of addressing the impacts defined at that time.

This section of the Plan identifies the key contacts related to these overarching communication and consultation themes. Key representatives involved in communication and consultation are expected to be as follows:

- Grand Chief/President of the Gwich'in Tribal Council;
- President of the Tetlit Gwich'in Council (TGC);
- Gwich'in Tribal Council's Chief Operating Officer (COO); and
- Chance Management and designated staff and advisors.

Communication and consultation with the Gwich'in Partners will be coordinated through the Gwich'in Tribal Council's Chief Operating Officer.

Key Chance representatives involved in communication and consultation are expected to be as follows:

- Chance Oil and Gas Chairman and Chief Executive Officer (CEO)
- President of Chance Oil and Gas;
- Vice President of Government and Community Relations; and
- Regulatory, Environmental, and Community Relations Coordinator.

5.0 Communication and Consultation Methods

Chance and the Gwich'in Partners will employ the following communication and consultation methods:

- In person meetings;
- Email;
- Sharing Power Point Presentations (to support in person meetings);
- Sharing reports and documents (as requested and as required);
- Telephone correspondence (teleconferences and less formal phone calls); and

Gwich'in Tribal Council

Gwich'in land, culture & economy for a better future

- Identifying and documenting issues of concern raised by the Gwich'in Partners during consultation meetings, and Chance providing written responses to the identified issues within 30 days of the meeting, to serve as the basis for ongoing dialogue and resolution.

5.1 Meetings Process

Communication and consultation meetings will be executed in the following manner:

1. Chance and/or the Gwich'in Partners will request a meeting in writing to the other party according to the connections iterated in Section 4.0, no less than ten business days of the proposed meeting date;
2. The parties to meet will develop the agenda collaboratively;
3. The party requesting the meeting will develop supporting materials (collaboratively, where possible), and share those at least two days in advance of the meeting; and
4. The meeting will take place in a mutually agreeable location.

The above general process applies to meetings with subject matter leads, and where reasonable, meetings with communities at large.

5.2 Documentation

The following documentation sharing and review protocols support the communication and consultation methods described above:

- Action items and meeting outcomes will be logged during meetings and reviewed by both Chance and by the Gwich'in Partners at the end of the meeting to ensure that there is general agreement on the list of actions and entities responsible for those actions. The list of action items and meeting outcomes will be recorded in writing and shared between Chance and the Gwich'in Partners, within ten business days following the meeting date;
- Chance and the Gwich'in Partners will agree upon and use a file sharing platform to facilitate sharing of large files, such as Power Point presentations, reports and documents exchange relating to specific issues identified that were the object of specific consultations;
- Should Chance and the Gwich'in Partners employ a third party for records development and management, the third party will follow the process described above for recording and providing meeting minutes;
- Pursuant to Section 5.1, Chance and the Gwich'in Partners will exchange documents pertaining to issues identified in the communications and consultation process that may affect Gwich'in rights pertaining to the Primary and Secondary Use Areas in the Yukon. These documents will include written summaries of decisions reached collectively and agreed upon concerning these issues.

6.0 Records Management

Summarized records of communication and consultation between Chance and the Gwich'in Partners will be kept in a records log. Chance will ultimately submit the items below to regulators and assessors for review if and when a potential project is assessed in the future:

- Meeting Agendas;
- Meeting Action Items as described in **Section 5.0;**
- Invitee/Attendees lists and/or meeting sign-in sheets;
- Records log, which will include summaries of the following:
  - In person meetings;
  - Phone calls and teleconferences;
  - Incoming and outgoing emails between Chance and the Gwich'in Partners.
- Reports and documents provided to the Gwich'in Partners by Chance and reports and documents provided to Chance by the Gwich'in Partners for review and consideration;
- Copies of Power Point presentations delivered by Chance to the Gwich'in Partners;
- Copies of any presentations delivered by the Gwich'in Partners to Chance; and
- Documents exchanged pertaining to issues raised during the communications and consultations process, as identified in Section 5.0.

7.0 Adaptive Management of the Communication and Consultation Plan

Chance and the Gwich'in Partners will review and assess the effectiveness and success of this Plan on at least a six-month basis.

Chance and the Gwich'in Partners agree to establish a *Chance-Gwich'in Communications and Consultation Management Committee* of senior officials to serve as a focal point for the co-development and co-management of current and future plans and activities associated with Chance's exploration program activities. Chance and the Gwich'in Partners will nominate representatives to serve on this Committee. Those representatives will determine the required frequency of meetings, but it is envisaged that for the first year following agreement on the Plan that meetings of the Committee would be held one time per each season. It is also understood by Chance and Gwich'in Partners, that a Terms of Reference will be developed by the Committee. The Committee will be supported by a Secretariat, both of which will be wholly funded by Chance. Chance and Gwich'in partners will hold the first meeting within 60 days of finalizing this Plan.

8.0 Cost and Economic Opportunity

The Gwich'in Partners, together with Chance, have discussed their mutual interest in working towards ensuring that GCLCA Participants are able to derive and participate in benefits arising from Chance's proposed oil and gas exploration activity within the Primary and Secondary Use Areas in the Yukon. Chance recognizes the importance of, and commits to, working respectfully and collaboratively with the GTC and Gwich'in partners during engagement, consultation, and any negotiations on agreements that will take place in the future, to the same degree and manner as Chance would with any Yukon First Nation, whose settlement land or traditional territory may be affected by oil and gas activity in the Eagle Plain Basin.

Chance OIL AND GAS LIMITED

Gwich'in Tribal Council
Gwich'in land, culture & economy for a better future

As the Communications and Consultation Plan is implemented, Chance and GTC agree to discuss a Cooperation Agreement wherein opportunities or benefits are defined that the Gwich'in people, as represented by the Gwich'in Partners, would receive from Chance. Benefits could include such things as, capacity funding, employment opportunities, contracting opportunities, scholarships and education and training opportunities, other financial and implementation payments, and equity participation.

1.0 INTRODUCTION

This report demonstrates implementation of the *Gwich'in Partners and Chance Oil and Gas Limited Communications and Consultation Plan* (Plan) (see **Appendix A**) finalized on August 1, 2018. It summarizes discussions held between Gwich'in Tribal Council (GTC), Tetlit Gwich'in Council (TGC), collectively referred to as Gwich'in Partners, and Chance Oil and Gas Limited (Chance) between June 1, 2020 and May 31, 2021. The purpose, objectives, and outcomes of each discussion are described below to fulfill the requirements of Ministerial Order (MO) 2018/42 (see **Appendix B**) issued to Chance on August 30, 2018.

2.0 BACKGROUND

The development of communications and engagement plans began with Order in Council (OIC) 2016/169. OIC 2016/169 required Chance to file a First Nations communication and engagement plan with the Minister of Energy, Mines and Resources in order to extend tenure on their northern permits: 0005, 0006, 0007, 0008, 0009, 0010, and 0011 (see **Appendix C**). Chance complied with OIC 2016/169 and received their tenure extension.

Chance subsequently received MO 2017/37 when applying for tenure extension on six of eight southern permits: 0012, 0013, 0014, 0015, 0016, and 0017. MO 2017/37 required Chance to revise, in consultation with affected First Nations, the consultation and engagement plan filed under OIC 2016/169. The affected First Nations listed in MO 2017/37 were Vuntut Gwitchin First Nation, Tr'ondëk Hwëch'in, First Nation of Na-Cho Nyäk Dun, Gwich'in Tribal Council, and Tetlit Gwich'in Council.

Gwich'in Partners and Chance developed the Plan collaboratively through a series of in-person meetings and conference calls. Hemmera was retained by Chance in November 2017 to facilitate the development and completion of the communications and engagement plans with the affected First Nations and facilitated all discussions between the Gwich'in Partners and Chance.

Gwich'in Partners and Chance submitted their finalized Plan to Minister Ranj Pillai on August 1, 2018. To satisfy its obligations under MO 2017/37, Chance filed a total of four communications and engagement plans. All four plans were approved by the Minister, and Chance received a five-year tenure extension on the six southern permits.

A condition of the five-year tenure extension, issued via MO 2018/42, required that Chance submit annual reports summarizing actions taken to implement each communications and engagement plan.

See **Appendix C** for a map of Chance's current permits.

3.0 ENGAGEMENT AND COMMUNICATION PLAN IMPLEMENTATION SUMMARY

3.1 Overview

Parties have advanced discussion in Chance's proposed Eagle Plains Exploration Project and Chance's proposed project for Well Maintenance and Extended Flow Testing. The following sections provide separate

DRAFT

summaries of engagement activities that occurred for Chance's projects between June 1, 2020 and May 31, 2021.

3.2 Summary of Engagement – Well Maintenance and Extended Flow Testing Project

Chance initially notified the GTC and TGC on May 25, 2020. That package included a high-level overview of the project (e.g., project activities, components, goals, outcomes), the regulatory submissions Chance would be making, a brief introduction to Hemmera and its role, as well as a request to discuss any concerns the affected party may have and an offer to arrange a conference call should they so desire. Also included was a 4-page project summary and map of the project location.

On June 12, 2020, the GTC provided input from its departments of Lands and Resources, Cultural Heritage, and Economic Development. The following themes were raised by the GTC:

- High environmental standards in the Peel River watershed and protection of scattered wetlands within the LMU 7
- Protection of wildlife and wildlife habitats
- Protection of the environment, water quality and quantity, and risks related to potential spills
- Protection of cultural heritage resources and values.

The GTC also requested that Chance share the full project description and any other materials related to the Project that might be available. Chance sent a draft project description (dated May 22, 2020) to both the GTC and TGC; however no other materials (e.g., effects assessments, summaries of mitigation measures, management plans) were available at that time.

The GTC's original feedback, provided June 12, 2020, helped Chance select valued components, identify mitigation measures, and identify where additional detail was needed in the project description. Chance provided a formal response to the GTC on July 9, 2020. Chance and the GTC then organized a conference call for July 22, 2020 where parties were able to further discuss the project. During this call, Chance provided an update on changes that had been made to the project design since the draft project description (dated May 22, 2020) and GTC asked follow-up questions about potential project-related impacts. A draft of the project proposal was subsequently shared with the GTC and TGC on July 24, 2020.

Following additional conversations with the regulator (Government of Yukon), Chance was required to make changes to its project design. On August 7, 2020, GTC and TGC was provided notice that revisions were being made to the project and that additional information would be forthcoming. A revised project proposal was provided, via email, to GTC and TGC on August 28, 2020, along with a cover letter summarizing the revisions and providing a rationale for each.

On September 2, 2020, GTC provided updated feedback on the project via email. GTC was explicit in stating that their feedback only considered the additional information provided in the July conference call and that they had not yet had a chance to review the revised project proposal sent August 28, 2020. GTC indicated that they would review the revised project proposal and provided additional input where required. GTC also informed Chance that Renewable Resources Council members in Fort McPherson were interested in meeting to discuss the project and that GTC would be proving contact information to facilitate that meeting. Chance submitted an initial project proposal to Yukon Environment and Socio-Economic Assessment Board (YESAB) on September 11, 2020. However, after further consideration, Chance

DRAFT

determined that additional changes were required. On November 2, 2020, via email, Chance notified GTC and TGC that it had decided to withdraw its project proposal from YESAB and submit a revised version. In that email Chance stated that once a revised proposal had been drafted, Chance would notify GTC and TGC by sharing a draft and requesting a meeting to discuss the changes further, and Chance stated at that time that after it had the opportunity to discuss those changes with GTC and TGC, the project proposal would be finalized and resubmitted to the Dawson Designated Office.

On November 16, 2020, Chance and GTC had a meeting wherein Chance introduced itself and its projects to GTC's new leadership (i.e., new Grand Chief and new Deputy Grand Chief). While Chance provided a high-level overview of its Eagle Plains Exploration Project, this meeting largely focused on the proposed Well Maintenance and Extended Flow Testing Project. During this meeting, Chance provided an overview of changes to the project design and indicated that the draft would be ready to share with GTC later in the week. GTC inquired about the business case for Chance's projects and potential for future employment opportunities and how training should be timed to allow Gwich'in to benefit from employment opportunities. GTC mentioned that the primary concerns for the region were likely trapping and caribou hunting, and that compliance with COVID-19 measures were important to health and safety.

The revised draft project proposal was provided via email to GTC and TGC on November 19, 2020, and in that email Hemmera indicated that Chance would be submitting the proposal to YESAB the following day. On November 20, 2020, Hemmera informed GTC and TGC that Chance would delay submission until the following week. However, to allow for additional revisions, the submission was delayed until December 24, 2020During engagement, the GTC flagged potential services that Gwich'in businesses might be able to offer Chance and inquired as to what project-related employment opportunities would be available. Chance indicated that it welcomes the opportunity for additional discussions with the GTC to identify and facilitate potential economic development and employment opportunities, however, it would have to balance those interests with requirements to source specific equipment and professions for the maintenance work as well as requirements under section 68 of YOGA (i.e., benefits agreements with Yukon First Nations).

3.3 Summary of Engagement – Eagle Plains Exploration Project

Between June 1, 2020 and May 31, 2021, Chance and Gwich'in Partners did not have a meeting that specifically targeted the Eagles Plains Exploration Project. When GTC and Chance met November 16, 2020, the purpose of the meeting was for Chance to introduced itself and its projects to GTC's new leadership (i.e., new Grand Chief and new Deputy Grand Chief). While Chance provided a high-level overview of the Eagle Plains Exploration Project, the meeting largely focused on the proposed Well Maintenance and Extended Flow Testing Project.

3.4 Communication Log

The correspondence between the Gwich'in Partners and Chance is documented in the Engagement Log (see **Appendix D**).

4.0 PLANS FOR ONGOING ENGAGEMENT AND NEXT STEPS

No additional engagement activities are expected for the Well Maintenance and Extended Flow Testing Project while it is undergoing YESAB's review.

DRAFT

Gwich'in Partners and Chance will continue to hold discussions at regular intervals as Chance develops its project proposal for the Eagle Plains Exploration Project.

Upcoming engagement activities for the Eagle Plains Exploration Project are expected to involve the following:

- Negotiation of a Cooperation Agreement with GTC (including confidentiality provisions).
- Discussion and establishment of the Chance-Gwich'in Communications and Consultation Management Committee for the purpose of, among other things, planning and organizing future engagement activities.
- Updating/revising Plan to include all DGOs, as well as Band Offices, and to revisit the meeting frequency of Chance and the Gwich'in Partners.
- Ongoing discussions between Chance and Gwich'in Partners on how parties can facilitate and identify training opportunities and employment opportunities for qualified Gwich'in professionals and Gwich'in businesses.
- Sharing baseline data
- Meetings between Gwich'in Partner's technical staff and Chance's technical consultants preparing the project proposal for proposed Eagle Plains Exploration Project
- Community engagement events for Gwich'in citizens.

DRAFT

5.0 APPROVAL OF IMPLEMENTATION SUMMARY

Gwich'in Partners and Chance have reviewed this report and agree to its contents as an accurate summary of engagement activities carried out between June 1, 2020 and May 31, 2021.

DRAFT

APPENDIX A

Gwich'in Partners and Chance Oil and Gas Limited Communications and Consultation Plan

DRAFT

Chance OIL AND GAS LIMITED

Gwich'in Tribal Council
Gwich'in land, culture & economy for a better future

Gwich'in Tribal Council and Chance Oil and Gas Limited Communications and Consultation Plan

1.0 Introduction

Chance Oil and Gas Limited ("Chance") is an oil and gas exploration company that holds permits to perform oil and gas exploration activities in the Eagle Plain basin of the Yukon Territory, Canada. The Gwich'in Tribal Council ("GTC") is an Indigenous organization that holds rights under Section 35 of the *Constitution Act*, 1982, *Treaty 11* and the *Gwich'in Comprehensive Land Claim Agreement* ("GCLCA"), including Appendix C – *Yukon Transboundary Agreement* ("YTA"). Under the YTA, "Tetlit Gwich'in" is defined as a Gwich'in who either: (a) resides in the Peel River watershed, including the community of Fort McPherson, Northwest Territories; or (b) is descended from an aboriginal person who used or occupied the Peel River watershed on or before December 31, 1921. Under this definition, Tetlit Gwich'in and their descendants currently reside in Aklavik, Inuvik, Tsiigehtchic and Fort McPherson, as well as elsewhere in Canada and abroad. Under the GCLCA, the GTC is the body responsible for representing the collective rights of GCLCA participants, including all Tetlit Gwich'in as defined in the YTA.

As part of Chance's exploration program, Chance, as the proponent, seeks to develop a communication and consultation plan ("the Plan") with the GTC, as a rights holder for these Yukon lands that could potentially be affected by Chance's exploration program activities. These Yukon lands are identified in the YTA as the Primary Use Area and the Secondary Use Area lands. With the exception of permit 15 which straddles the Primary Use Area, all of the permits held by Chance, namely 7, 9, 13, 14, 15, 19, and 20, are located within the Secondary Use Area.

The Plan will reflect and be consistent with the GTC's role as the Indigenous organization responsible for upholding the collective rights held by Gwich'in in the Primary Use Area and Secondary Use Area within the Yukon. This Plan will acknowledge the GCLCA organizational structure, and as such, is intended to extend to and encompass the GTC, the Designated Gwich'in Organizations, and including the Tetlit Gwich'in Council (the "Gwich'in Partners"). The Gwich'in Partners will seek to establish an internal Memorandum of Understanding (MOU).

2.0 Purpose

This document serves as a Plan to provide a mutually agreed upon framework to support collaborative and effective communication and consultation between Chance and the Gwich'in Partners.

3.0 Relationship

Chance and the Gwich'in Partners will execute this Plan according to the following principles:

Chance OIL AND GAS LIMITED

Gwich'in Tribal Council
Gwich'in land, culture & economy for a better future

- Transparency;
- Timeliness; and
- Mutual respect, trust and understanding.

4.0 Key Gwich'in Tribal Council and Chance Connections

Communication and consultation between Chance and the Gwich'in Partners will be generally associated with the proposed works and potential effects associated with Chance's oil and gas exploration program, and with potential new opportunities or benefits received by the Gwich'in people, from Chance, as the project proponent. Once the scope of Chance's specific plans are determined, the Gwich'in Partners, together with Chance, will discuss the anticipated impacts on Gwich'in rights within the Primary and Secondary Use Areas, as well as the best way of addressing the impacts defined at that time.

This section of the Plan identifies the key contacts related to these overarching communication and consultation themes. Key representatives involved in communication and consultation are expected to be as follows:

- Grand Chief/President of the Gwich'in Tribal Council;
- President of the Tetlit Gwich'in Council (TGC);
- Gwich'in Tribal Council's Chief Operating Officer (COO); and
- Chance Management and designated staff and advisors.

Communication and consultation with the Gwich'in Partners will be coordinated through the Gwich'in Tribal Council's Chief Operating Officer.

Key Chance representatives involved in communication and consultation are expected to be as follows:

- Chance Oil and Gas Chairman and Chief Executive Officer (CEO)
- President of Chance Oil and Gas;
- Vice President of Government and Community Relations; and
- Regulatory, Environmental, and Community Relations Coordinator.

5.0 Communication and Consultation Methods

Chance and the Gwich'in Partners will employ the following communication and consultation methods:

- In person meetings;
- Email;
- Sharing Power Point Presentations (to support in person meetings);
- Sharing reports and documents (as requested and as required);
- Telephone correspondence (teleconferences and less formal phone calls); and

Gwich'in Tribal Council
Gwich'in land, culture & economy for a better future

- Identifying and documenting issues of concern raised by the Gwich'in Partners during consultation meetings, and Chance providing written responses to the identified issues within 30 days of the meeting, to serve as the basis for ongoing dialogue and resolution.

5.1 Meetings Process

Communication and consultation meetings will be executed in the following manner:

1. Chance and/or the Gwich'in Partners will request a meeting in writing to the other party according to the connections iterated in Section 4.0, no less than ten business days of the proposed meeting date;
2. The parties to meet will develop the agenda collaboratively;
3. The party requesting the meeting will develop supporting materials (collaboratively, where possible), and share those at least two days in advance of the meeting; and
4. The meeting will take place in a mutually agreeable location.

The above general process applies to meetings with subject matter leads, and where reasonable, meetings with communities at large.

5.2 Documentation

The following documentation sharing and review protocols support the communication and consultation methods described above:

- Action items and meeting outcomes will be logged during meetings and reviewed by both Chance and by the Gwich'in Partners at the end of the meeting to ensure that there is general agreement on the list of actions and entities responsible for those actions. The list of action items and meeting outcomes will be recorded in writing and shared between Chance and the Gwich'in Partners, within ten business days following the meeting date;
- Chance and the Gwich'in Partners will agree upon and use a file sharing platform to facilitate sharing of large files, such as Power Point presentations, reports and documents exchange relating to specific issues identified that were the object of specific consultations;
- Should Chance and the Gwich'in Partners employ a third party for records development and management, the third party will follow the process described above for recording and providing meeting minutes;
- Pursuant to Section 5.1, Chance and the Gwich'in Partners will exchange documents pertaining to issues identified in the communications and consultation process that may affect Gwich'in rights pertaining to the Primary and Secondary Use Areas in the Yukon. These documents will include written summaries of decisions reached collectively and agreed upon concerning these issues.

6.0 Records Management

Summarized records of communication and consultation between Chance and the Gwich'in Partners will be kept in a records log. Chance will ultimately submit the items below to regulators and assessors for review if and when a potential project is assessed in the future:

Gwich'in Tribal Council
Gwich'in land, culture & economy for a better future

- Meeting Agendas;
- Meeting Action Items as described in **Section 5.0;**
- Invitee/Attendees lists and/or meeting sign-in sheets;
- Records log, which will include summaries of the following:
    - In person meetings;
    - Phone calls and teleconferences;
    - Incoming and outgoing emails between Chance and the Gwich'in Partners.
- Reports and documents provided to the Gwich'in Partners by Chance and reports and documents provided to Chance by the Gwich'in Partners for review and consideration;
- Copies of Power Point presentations delivered by Chance to the Gwich'in Partners;
- Copies of any presentations delivered by the Gwich'in Partners to Chance; and
- Documents exchanged pertaining to issues raised during the communications and consultations process, as identified in Section 5.0.

7.0 Adaptive Management of the Communication and Consultation Plan

Chance and the Gwich'in Partners will review and assess the effectiveness and success of this Plan on at least a six-month basis.

Chance and the Gwich'in Partners agree to establish a *Chance-Gwich'in Communications and Consultation Management Committee* of senior officials to serve as a focal point for the co-development and co-management of current and future plans and activities associated with Chance's exploration program activities. Chance and the Gwich'in Partners will nominate representatives to serve on this Committee. Those representatives will determine the required frequency of meetings, but it is envisaged that for the first year following agreement on the Plan that meetings of the Committee would be held one time per each season. It is also understood by Chance and Gwich'in Partners, that a Terms of Reference will be developed by the Committee. The Committee will be supported by a Secretariat, both of which will be wholly funded by Chance. Chance and Gwich'in partners will hold the first meeting within 60 days of finalizing this Plan.

8.0 Cost and Economic Opportunity

The Gwich'in Partners, together with Chance, have discussed their mutual interest in working towards ensuring that GCLCA Participants are able to derive and participate in benefits arising from Chance's proposed oil and gas exploration activity within the Primary and Secondary Use Areas in the Yukon. Chance recognizes the importance of, and commits to, working respectfully and collaboratively with the GTC and Gwich'in partners during engagement, consultation, and any negotiations on agreements that will take place in the future, to the same degree and manner as Chance would with any Yukon First Nation, whose settlement land or traditional territory may be affected by oil and gas activity in the Eagle Plain Basin.

Chance OIL AND GAS LIMITED

Gwich'in Tribal Council
Gwich'in land, culture & economy for a better future

As the Communications and Consultation Plan is implemented, Chance and GTC agree to discuss a Cooperation Agreement wherein opportunities or benefits are defined that the Gwich'in people, as represented by the Gwich'in Partners, would receive from Chance. Benefits could include such things as, capacity funding, employment opportunities, contracting opportunities, scholarships and education and training opportunities, other financial and implementation payments, and equity participation.

3 La durée totale d'un permis visé, y compris la durée initiale et la durée du renouvellement, est de 16 ans.

4(1) In this section

"first nations communications and engagement plan" means the plan filed under O.I.C. 2016/169 and revised in accordance with M.O. 2017/37. *« plan de participation et de communication avec les premières nations »*

(2) It is a condition of this Order that Chance Oil and Gas Limited must file annual reports with the Division Head, in accordance with subsection (3) and to the satisfaction of the Division Head, about the implementation of the first nations communications and engagement plan.

(3) For the purposes of subsection (2), Chance Oil and Gas Limited must file

(a) the first annual report on or before July 31, 2019, in respect of the period beginning on September 1, 2018, and ending on May 31, 2019; and

(b) each subsequent annual report on or before July 31 of each year in respect of the period beginning on June 1 of the preceding year and ending on May 31 of the year in which the report is to be filed.

4(1) La définition suivante s'applique au présent article.

« plan de participation et de communication avec les premières nations » Le plan déposé en vertu du Décret 2016/169 et révisé en conformité avec l'Arrêté 2017/37. *"first nations communications and engagement plan"*

(2) À titre de condition du présent arrêté, Chance Oil and Gas Limited dépose des rapports annuels auprès du chef de division, en conformité avec le paragraphe (3) et à la satisfaction du chef de division, concernant la mise en œuvre du plan de participation et de communication avec les premières nations.

(3) Pour l'application du paragraphe (2), Chance Oil and Gas Limited dépose :

a) le premier rapport annuel au plus tard le 31 juillet 2019, pour la période débutant le 1er septembre 2018 et se terminant le 31 mai 2019;

b) chaque rapport annuel subséquent, au plus tard le 31 juillet de chaque année pour la période débutant le 1er juin de l'année précédente et se terminant le 31 mai de l'année au cours de laquelle le rapport doit être déposé.

Dated at Whitehorse, Yukon,
~~the~~ August 30th 2018.

Fait à Whitehorse, au Yukon,
le August 30th 2018.

E00235	May 8, 2019	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	Apologies for wrong date. Will be in Old Crow June 6 and can be in Inuvik June 7th. Please let me know if that date works.
E00236	May 9, 2019	Email	In	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	Grand Chief [redacted] is unavailable June 7th. Will confirm with President [redacted] and GTC staff on their availability.
E00237	May 9, 2019	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	Confirming that will meet with President [redacted], and GTC staff at 2 pm. Flight arrives as 12:25 and listed Chance and Hemmera attendees [redacted] will send a draft agenda to be reviewed.
E00238	May 9, 2019	Email	In	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	GTC confirm June 7th meeting. Attending will be TGC [redacted] and GTC Staff: [redacted]
E00248	May 21, 2019	Email	Out	Tetlit Gwich'in Council (DGO)	[redacted]	[redacted]	[redacted]	Site Visit/Field Work	Required to consult under geoscience license guideline to inform TGC that field work is planned July 10-24, 2019. Will be based out of Eagle Plains Lodge with helicopters. Will be flying to remote outcrop locations through out Eagle Plains Basin to extract rock samples with geological hammer. No mechanical tools will be used.
E00463	June 3, 2019	Email	Out	Gwich'in Tribal Council Tetlit Gwich'in Council (DGO)	[redacted]	[redacted]	[redacted]	Engagement/Consultation Meeting Coordination/Planning	Meeting invitation and agenda. All call-in details included for participants that need to call in.
E00467	June 4, 2019	Email	In	Gwich'in Tribal Council Tetlit Gwich'in Council (DGO)	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	Just to confirm, the meeting is 1500-1700 Mountain time? 1400-1600 Pacific time, correct? On the agenda, we suggest two additional items would be useful to include: 1. Process for reviewing Gwich'in Project Effects 2. Economic Opportunity and Cooperation Agreement(s) Update (Reference Section 8.0 of the Communications and Consultation Plan).
E00468	June 4, 2019	Email	Out	Gwich'in Tribal Council Tetlit Gwich'in Council (DGO)	[redacted]	[redacted]	[redacted]	Engagement/Consultation Meeting Coordination/Planning	The time is actually 2-4 pm MST. Does that work for you? Our flight lands at 12:25pm, so we would have to rush to make a 1pm meeting. Please let me know if you and your colleagues are still able to meet from 2-3pm.
E00464	June 4, 2019	Email	In	Tetlit Gwich'in Council (DGO)	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	I cannot take part in this meeting. I will try to have someone available. We are having trouble opening the agenda
E00465	June 4, 2019	Email	Out	Tetlit Gwich'in Council (DGO)	[redacted]	[redacted]	[redacted]	Engagement/Consultation Meeting Coordination/Planning	We worked with GTC to plan this meeting a few weeks ago and were under the impression that you could attend. Sorry for the miscommunication. This last minute meeting invitation was just to share the agenda as we through everyone had already been informed of the meeting. I have re-attached the agenda for you.
E00466	June 4, 2019	Email	Out	Tetlit Gwich'in Council (DGO)	[redacted]	[redacted]	[redacted]	Engagement/Consultation Meeting Coordination/Planning	Meeting invitation and agenda. All call-in details included for participants that need to call in.
E00294	June 5, 2019	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning Project Description/Activities	Draft Project Description and presentation for meeting attached. Please distribute to those attending the meeting.
E00473	June 5, 2019	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning Project Description/Activities	Attached Draft Project Description and the presentation for tomorrow's meeting. Please distribute electronically among those who are attending the meeting. We will bring paper copies of the Draft Project Description and the presentation for all attending the meeting. It is not an expectation that meeting attendees will have time to read through the whole document.
E00469	June 5, 2019	Email	Out	Gwich'in Tribal Council Tetlit Gwich'in Council (DGO)	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning Project Description/Activities	Clarifying meeting time will be 2-4pm MST, and updated agenda.
E00474	June 5, 2019	Email	Out	Tetlit Gwich'in Council (DGO)	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning Project Description/Activities	Attached is the meeting material for this afternoon. Are you still planning to call in?
E00414	June 7, 2019	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	We have not left Old Crow yet, and are anticipating being a bit late for our 2pm meeting. I will let you know when we land in Inuvik and the time we anticipate being at your office
E00415	June 7, 2019	Email	In	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	Thanks, I will watch for your update message
E00416	June 7, 2019	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	We just landed. Will probably be there around 2:10
E00417	June 7, 2019	Email	In	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	Ok
E00475	June 7, 2019	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	We are just driving into town. Will be there by 2:30 at the latest.
E00291	June 9, 2019	Email	Out	Nihtat Gwich'in Council	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	Meeting with council not fixed yet, but between July 8 - 11. We hope to meet with the individual councils representing the communities under the GTC umbrella (Ft. McPherson, Tsiigehtchic, Aklavik and Inuvik). July 10th was proposed for the next meeting. Unclear whether with GTC alone or with some or all of the other councils too. Otherwise will travel to each of the communities to meet with the councils individually which will add to the time and may complicate the schedule. We are advised that the GTC officials will be organizing this.
E00263	June 10, 2019	Email	Out	Nihtat Gwich'in Council	[redacted]	[redacted]	[redacted]	Project Description/Activities Engagement/Consultation Information Sharing	Attached Draft Project Description

Reference	Date	Contact Type	In / Out	Organization	Author	Proponent/Proponent Rep	External Organization Names	Topic/Regarding	Meeting/Correspondence Summary
E00292	June 10, 2019	Email	In	Nihtat Gwich'in Council	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	A meeting with NGC would need to be in the evening, as council works full time. Will try to set it up with whatever Tribal is doing as well. Can you provide a project description, so I can review.
E00289	June 14, 2019	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Site Visit/Field Work	Attached details for First Nation's participation in Chance's fieldwork this summer. Still finalizing dates and logistics. Role profiles are in attachment, and aiming to have dates finalized next week. Please give thought to potential participants.
E00270	June 14, 2019	Email	Out	Gwich'in Tribal Council Tetlit Gwich'in Council (DGO)	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	Thanks for meeting. Asking about meetings with Council during July 9-11, and possibility of combining meetings with various councils to help with travel and accommodations. Richard looking at flights, and hoping to plan meetings. Would like to confirm timing and locations of meetings.
E00407	June 16, 2019	Email	In	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Engagement	I'll be in Yellowknife from Monday to Wednesday, so I could speak to you late in the day Wednesday or Thursday afternoon.
E00260	June 17, 2019	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Site Visit/Field Work Engagement/Consultation	Dates set for participation in Field Surveys. Proposing following logistics for First Nation participation: 1) Each FN with territory overlapping project area can have up to two members participate 2)Work will be physically demanding, require hiking steep, rugged terrain and thick bush, requiring average or above-average fitness to participate 3)Limited spots for participants due to helicopter constraints ad availability at Eagle Plains Hotel, so please respond as soon as possible to [redacted]) to confirm availability 4) Participants should arrive on start date, but not mandatory to stay for duration of field study 5) all travel, including flights, vehicle travel to Eagle Plains Hotel, ad stay in Hotel must be booked by the First Nation and billed to Chance. Table of Opportunities by date. Purpose of participation will be to observe fieldwork and gain first hand understanding of the research. Deadline for Vegetation Survey # 1 is June 19th.
E00271	June 17, 2019	Email	In	Gwich'in Tribal Council Tetlit Gwich'in Council (DGO)	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	Working on firming up meeting dates around July 10th. Will confirm as soon as possible.
E00272	June 17, 2019	Email	Out	Gwich'in Tribal Council Tetlit Gwich'in Council (DGO)	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	Thank you. Will awai[redacted] e-mail
E00273	June 18, 2019	Email	In	Gwich'in Tribal Council Tetlit Gwich'in Council (DGO)	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	In Yellowknife. Gwich'in presently engaged in Self-Government negotiations with Canada and NWT. Team has meetings with DGO Councils with Indian Act Band Councils for the period of July 8th - July 14th. Asking for other date possibilities. Suggests July 3-5 or around July 15th.
E00274	June 18, 2019	Email	Out	Gwich'in Tribal Council Tetlit Gwich'in Council (DGO)	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	Will canvas Chance/Hemmera to see what availability is. Fieldwork scheduled for July, ending about July 25/26. Maybe July 29,30,31, Aug 1, or after the VG GA perhaps between Aug 12-16 or Aug 19-23. Will advise of other conflicts once hearing back from others.
E00264	June 19, 2019	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Information Sharing	Link to shape files for Chance's project area as discussed in Inuvik.
E00408	June 19, 2019	Email	In	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Engagement	I assume this should be 2019 rather than 2018?
E00479	June 19, 2019	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Engagement	Yes, sorry for the mistakes. All dates are summer 2019
E00481	June 20, 2019	Email	Out	Gwich'in Tribal Council Tetlit Gwich'in Council (DGO)	[redacted]	[redacted]	[redacted]	Engagement Information Sharing Engagement/Consultation	Attached Meeting Summary of June 7th meeting between Gwich'in Partners and Chance
E00255	June 24, 2019	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Fish Information Sharing	Attached notice letter regarding DFO licence application for Environmental Dynamics Inc's fish studies
E00347	June 27, 2019	Email	In	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	Confirming that the window will work for arranging meetings with the Gwich'in Presidents and Councils will be Aug 19-23 week. At present I have confirmed a meeting with the Gwichya Gwich'in Council in Tsiigehtchic for 17:00 Aug 19 and with Ehdiitat Gwich'in Council in Aklavik 17:00 Aug 21. I'll try to build the Fort McPherson and Inuvik meetings around these foundation dates
E00397	June 27, 2019	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	Thank you for making arrangements. I'm copying my colleagues so they are in the loop for planning purposes.
E00315	June 27, 2019	Email	Out	Gwich'in Tribal Council Tetlit Gwich'in Council (DGO)	[redacted]	[redacted]	[redacted]	Fish Information Sharing	Revisions from EDI for their DFO Application, see Attached
E00398	June 28, 2019	Email	In	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Engagement/Consultation Meeting Coordination/Planning	Here is the schedule, with Nihtat Gwich'in Council in Inuvik to be worked in yet. Aug 19, 5pm - Gwichya Gwich'in Council in Tsiigehtchic, Aug 21, 6pm - Ehdiitat Gwich'in Council in Aklavik, Aug 22, 6pm - Tetlit Gwich'in Council in Fort McPherson. Timing for the meeting with EGC in Aklavik has been pushed back an hour at the request of the EGC President and Council. This will allow us to have a dinner meeting. We can arrange to travel over to Aklavik in the afternoon of August 21 and stay over in Aklavik that night following the dinner meeting and then return to Inuvik the next morning on the 22nd. At that time we will need to journey directly to Fort McPherson for the meeting that we have scheduled there for 18:00 on Thursday, August 22 with the TGC President [redacted] and his Council members.
E00399	June 28, 2019	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	Thank you. We will do our best to make it work. We may need some help with logistics so arrangements can be made.

Reference	Date	Contact Type	In / Out	Organization	Author	Proponent/Proponent Rep	External Organization Names	Topic/Regarding	Meeting/Correspondence Summary
E00400	June 28, 2019	Email	In	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	We will be able to provide the logistics help needed to make it all work out.
E00401	July 9, 2019	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Engagement Meeting Coordination/Planning	Regarding the four meetings with the DGOs, do you think it would be possible to schedule a community open house/ short information session in combination with these meetings? I know how much work goes into coordinating the meetings and travel, and it would be beneficial to do as much as possible in each community. I think we could either host an open house in the hour or two prior to the meetings with the presidents and board members or perhaps invite community members to the meetings. Please advise on what you think may be appropriate and possible given our short time in each community.
E00402	July 9, 2019	Email	In	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Engagement Meeting Coordination/Planning	DGO's would be open to making the meetings open to community members. We discussed that with them last week. Id suggest we go that route.
E00403	July 9, 2019	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Engagement Meeting Coordination/Planning	Thank you for helping to make arrangements. Are you able to confirm the meeting with the NGC during that week as well?
E00404	July 9, 2019	Email	In	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Engagement Meeting Coordination/Planning	NGC has confirmed 6 pm August 20. That meeting will be here at the GTC Boardroom. [redacted] (Manager of Regional Coordination and Capacity) and [redacted] (Nation Building and Governance Advisor) will be working with us on the arrangements for these meetings and at least one will be in attendance at each DGO meeting.
E00405	July 9, 2019	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Engagement Meeting Coordination/Planning	Thanks. How is it best to advertise to community members? We can prepare posters and then have someone in the community post them either online or around the community
E00406	July 9, 2019	Email	In	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Engagement Meeting Coordination/Planning	If you can prepare the posters and send us an electronic version as well, we can coordinate the dissemination.
E00484	July 9, 2019	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Site Visit/Field Work	Have you had any interest for participation in the Chance field surveys? Below I've highlighted the surveys there's still time to participate in.
E00409	July 12, 2019	Email	In	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	Further to our phone conversation, boat transport option from Inuvik to Aklavik ad back will work according to the proprietor [redacted] who is a member of the EGC. [redacted] advises if the meeting were extended until 9pm, return would be no problem. . The advantage of doing the round trip in the same day is that the team could all return to the hotel in Inuvik and would have some clear time to rest and caucus during the following day in advance of departing for Fort McPherson. Please let me know what you diced for transportation, so we can reserve [redacted] vessel.
E00410	July 12, 2019	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	Thanks. I will get back to you early next week on the decision. How do we pay for the boat?
E00411	July 12, 2019	Email	In	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	For payment, we would do a purchase order for the service and then rebill you later.
E00412	July 15, 2019	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Engagement Meeting Coordination/Planning	Please proceed with booking the boat for our meeting in Aklavik. I have copied my travelling colleagues and [redacted] who will handle the preparation of the PO and processing of the invoice. Please let us know if [redacted] should continue to deal with you for the PO or if there is another person that is better to receive it. For ground transport to Tsiigehtchic and Ft McPherson, we will be a group of 5 and will have posters and other handout material. Should, we plan to rent our own vehicle, or can we catch a lift with your group? We intend on returning to Inuvik from Tsiigehtchic and Ft McPherson following the meetings. We are not going to charter flights as previously suggested. I will have limited e-mail access until July 22, so please respond to everyone so some processes can be handled in my absence.
E00413	July 16, 2019	Email	In	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Engagement Meeting Coordination/Planning	[redacted]
E00328	July 16, 2019	Email	Out	Gwich'in Tribal Council Tetlit Gwich'in Council (DGO)	[redacted]	[redacted]	[redacted]	Engagement Reports/OIC Requirements	Hemmera has prepared draft reports on the Implementation of the Communications and Engagement Plan for both Gwich'in Partners and Chance to review. This report summarizes meeting we have had since completing the plan. Please make any desired revisions to the document in tracked changes and send back to me to finalize. Once I have incorporated the changes, I will send final versions to both parties to sign. Please have revisions in by July 26, then I will finalize, get them signed and submit to Yukon Government for July 31.
E00329	July 24, 2019	Email	Out	Gwich'in Tribal Council Tetlit Gwich'in Council (DGO)	[redacted]	[redacted]	[redacted]	Engagement Reports/OIC Requirements	Following up to see if GTC is planning to provide feedback on the draft reports on the Implementation of the Communication and Engagement Plan. Looking for feedback by Friday. Please let me know if you are providing feedback or have any questions.
E00330	July 25, 2019	Email	In	Gwich'in Tribal Council Tetlit Gwich'in Council (DGO)	[redacted]	[redacted]	[redacted]	Engagement Reports/OIC Requirements	Yes, we will be providing feedback, but it will not be available to you on Friday, but rather likely by end of day Monday
E00492	July 25, 2019	Email	Out	Gwich'in Tribal Council Tetlit Gwich'in Council (DGO)	[redacted]	[redacted]	[redacted]	Engagement Reports/OIC Requirements	Thank you. End of day on Monday works for me.
E00499	July 25, 2019	Email	Out	Gwich'in Tribal Council Tetlit Gwich'in Council (DGO)	[redacted]	[redacted]	[redacted]	Engagement Reports/OIC Requirements	Attached are Chance's edits to the Draft Plan Implementation report
E00534	July 30, 2019	Email	In	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Engagement Reports/OIC Requirements	Thanks for the revised Implementation Summary. I've asked [redacted] to review it before I sign it. She may not have it for me until tomorrow.
E00535	July 30, 2019	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Engagement Reports/OIC Requirements	Thanks for letting me know. Tomorrow before noon works well.

Reference	Date	Contact Type	In / Out	Organization	Author	Proponent/Proponent Rep	External Organization Names	Topic/Regarding	Meeting/Correspondence Summary
E00529	July 30, 2019	Email	In	Gwich'in Tribal Council Tetlit Gwich'in Council (DGO)	[redacted]	[redacted]	[redacted]	Engagement Reports/OIC Requirements	I've reviewed the draft Implementation Summary I've reviewed the draft Implementation Summary and agree that it well reflects the implementation of the GTC-Chance Communications and Consultation Plan over the past year. I do have a few minor change suggestions that I would suggest be made to the text of the Summary, after which I'd be pleased to sign it on behalf of the Gwich'in Partners. 1.Where references are made to "staff" or to "technical staff," it would be more accurate in my view to change this reference to "senior officials." This would be consistent to the protocol used by the GNWT in the context of the NWT Intergovernmental Council when distinguishing "senior officials" from "political leaders." The senior officials are not providing technical advice on project details. They provide substantive and strategic advice to their respective political leaders in accordance with their role as permanent officials of their respective governments; 2.On page 2, please add a bullet reference to "business and employment and training opportunities for Gwich'in businesses and Gwich'in Comprehensive Land Claim Agreement (GCLCA) Participants." This has and will continue to be an important and priority topic for discussion as we move in the future towards negotiating a "Cooperation Agreement"; 3.On page 6, Re Chance following through on the Gwich'in Partners' new consultation protocol you could note that the GTC has worked with Chance to schedule meetings in each Gwich'in community to discuss the project for the week of August 19, 2019. You could also note that the Gwich'in Partners have expressed appreciation to Chance for Chance's embracing this consultation protocol that the Gwich'in Partners have developed.
E00530	July 30, 2019	Email	Out	Gwich'in Tribal Council Tetlit Gwich'in Council (DGO)	[redacted]	[redacted]	[redacted]	Engagement Reports/OIC Requirements	I have incorporated your suggested changes and removed the draft watermarks in the attached version. This version is ready for you to sign. Once I have your signed version, I will have Chance sign the report and include you in the submission to YG.
E00537	July 31, 2019	Email	In	Gwich'in Tribal Council Tetlit Gwich'in Council (DGO)	[redacted]	[redacted]	[redacted]	Engagement Reports/OIC Requirements	I've discussed with Carolyn and there are a few further items that we would like revised, then we can sign it. Page 2 – RE Gwich'in Partners, GTC Grand Chief and President [redacted] should be added to the list of Gwich'in Partners members; Page 3, para 2 – please revise the text of this sentence as follows: "…also discussed the Chance proposal for a Confidentiality Agreement." Page 3 – Nov 15 Meeting – please change "Government Building" to Chief Jim Koe Building. Page 5 – June 7 Meeting – same thing, change "Government Building" to Chief Jim Koe Building. Page 7 – Signature Line – Please change out my name and title and put: [redacted]
E00538	July 31, 2019	Email	Out	Gwich'in Tribal Council Tetlit Gwich'in Council (DGO)	[redacted]	[redacted]	[redacted]	Engagement Reports/OIC Requirements	Thank you. I have made the changes in the attached version. Please let me know if there are more changes, or consider it the final version for signing
E00539	July 31, 2019	Email	In	Gwich'in Tribal Council Tetlit Gwich'in Council (DGO)	[redacted]	[redacted]	[redacted]	Engagement Reports/OIC Requirements	The document is now with [redacted] who will sign it before the end of the day. I did a proofread and made a couple of small changes: 1)Page 6, para 2 – I changed the reference to "TGC Primary and Secondary Use Lands" to "Tetlit Gwich'in…". 2)Also page 6, I corrected the wording in the first bullet under 4.0 to align the word with the proper tense.
E00540	July 31, 2019	Email	Out	Gwich'in Tribal Council Tetlit Gwich'in Council (DGO)	[redacted]	[redacted]	[redacted]	Engagement Reports/OIC Requirements	Thanks for catching those two additional changes. Cindy from Chance is coming to our office at 3:20, to sign reports on behalf of Chance. Do you think that you could send the final version by then?
E00541	July 31, 2019	Email	In	Gwich'in Tribal Council Tetlit Gwich'in Council (DGO)	[redacted]	[redacted]	[redacted]	Engagement Reports/OIC Requirements	Here is the signed copy
E00542	July 31, 2019	Email	Out	Gwich'in Tribal Council Tetlit Gwich'in Council (DGO)	[redacted]	[redacted]	[redacted]	Engagement Reports/OIC Requirements	Thank you
E00558	August 18, 2019	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Engagement/Consultation Meeting Coordination/Planning	Attached Draft Working Agenda for Chance and GTC meeting August 20. Please let me know of any revisions
E00441	August 21, 2019	Email	In	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	Trip to Aklavik is a go. There is no funeral today in Aklavik, see you at 13:40.
E00442	August 26, 2019	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Engagement/Consultation	Here are the sign in sheets from last week.
E00443	August 26, 2019	Email	In	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Engagement/Consultation	Thanks
E00447	September 3, 2019	Email	Out	Gwich'in Tribal Council Tetlit Gwich'in Council (DGO)	[redacted]	[redacted]	[redacted]	Engagement/Consultation Meeting Coordination/Planning	Attached is the draft summary of our meeting August 20, 2019 in Inuvik for review. Please let me know of any revisions.

E00487	September 9, 2019	Email	Out	Gwich'in Tribal Council Tetlit Gwich'in Council (DGO)	[redacted]	[redacted]	[redacted]	Cooperation Agreement	An action from the August 20 meeting was to re-send a memo and draft cooperation agreement template created last Decembers. No changes have been made to the document since it was originally shared with GTC. Some items may be outdated given conversations that have taken place between GTC and Chance.
E00561	September 10, 2019	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Traditional Knowledge and Use Education and Training Interviews	Have been working with David on community engagement and consultation for a proponent project's environmental assessment. We are now moving into the interview stage in communities and doing a Traditional Knowledge and Traditional Land Use workshop. David suggested I get in touch with you to discuss the research licences and agreements. Are you available this week to discuss our approach to the research and applications as an initial conversation. I will explain more about the project and Hemmera's role.
E00567	September 10, 2019	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Information Sharing	Are you able to provide a current list of Ehdiitat Gwich'in Council's president and board members? You provided us a list of names for other DGO's, but not for EGC.
E00562	September 11, 2019	Email	In	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Traditional Knowledge and Use Education and Training Interviews	I suggest we meet tomorrow. Let me know what time you are available
E00563	September 11, 2019	Email	In	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Traditional Knowledge and Use Education and Training Interviews	Please let me know how the conversation goes
E00564	September 11, 2019	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Traditional Knowledge and Use Education and Training Interviews	I've sent a meeting invite for 11:30 your time tomorrow. Please let me know if this works or suggest an alternate time.
E00585	September 11, 2019	Email	In	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	Is it ok if I send the telephone information to call in to Kristi Benson?
E00565	September 18, 2019	Email	In	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Traditional Knowledge and Use Education and Training Interviews	I'm attaching a letter that GSCI drafted to YESAB that I mentioned in our telephone conference Set 12.
E00566	September 19, 2019	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Traditional Knowledge and Use Education and Training Interviews	Thank you for sharing the GSCI letter with us. Apologies for missing it in our review of the YESAB documents
E00586	November 14, 2019	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Information Sharing	Since speaking in September, [redacted] and I have been working on our application to Aurora College Research Ethics Committee for the Chance Oil and Gas Environmental Assessment Research Program. We are planning to submit our application on November 26th. Do you think it would be beneficial to have another meeting to discuss our final application? [redacted] and I could briefly present our proposed research plan for discussion and feedback to increase your familiarity with the proposed plan and also to provide us with the opportunity to make changes before it is reviewed by the REC. Perhaps November 21/22 you would like to have phone meeting?
E00587	November 19, 2019	Email	In	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Information Sharing	Can we set up a meeting for Friday November 22nd, at 1:15 pm?
E00588	November 22, 2019	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Information Sharing	Please see attached Project Summary. During our meeting this afternoon, we are hoping to go over these details and discuss next steps with you.
E00589	November 22, 2019	Email	In	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Information Sharing	I would like to request that [redacted] be part of the call also
E00590	November 22, 2019	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Information Sharing	[redacted] s welcome. Please share the Skype information below with her.
E00842	January 12, 2020	Email	Out	Gwich'in Tribal Council Tetlit Gwich'in Council (DGO)	[redacted]	[redacted]	[redacted]	Engagement/Consultation Information Sharing	My apologies for the delay in sharing this draft meeting summary. Let me know if you have any revisions you'd like me to make. Then I can combine those revisions and share an updated version of the summary. I have also attached some documents that were referred to during the meeting: •the Communications and Consultation Plan between Gwich'in Partners and Chance •Chance's draft project description for the Eagle Plains Exploration Program (project for Executive Committee screening level).
E00603	January 28, 2020	Email	Out	Gwich'in Tribal Council Tetlit Gwich'in Council (DGO)	[redacted]	[redacted]	[redacted]	Project Description/Activities Regulatory Process	Chance will be applying to the Yukon Government very shortly to extend the tenure of Exploration Permit 20. Application will be for maximum allowable under the Oil and Gas Act of 5 years. This permit has one suspended well at McParlon A-25 which we hope to use for fluid disposal of any produced water associated with the proposed exploration project. We are at an intermediate stage of discussions with the Manager of Oil and Gas Operations with Yukon to extend the suspended well status on the suspended wells at Eagle Plain. Manager has indicated hat Chance will need to do some physical assessments of the legacy wells to confirm the integrity of the wells before granting an extension. Assessments will require access to 3 suspended wells at SDL M-08, G-08, and J-19 and well as M-59 in order to do the work. A service rig, cement pumping equipment, and wireline services are expected to be used to conduct the assessments. Anticipate taking temperature measurements in wells to evaluate permafrost depth. The program is expended to take 1-2 months. This is a winter operation and will be done during the winter of 2020-2021 and may require Designated Office screening b y YESAB. We will provide more information as soon as we can.

Reference	Date	Contact Type	In / Out	Organization	Author	Proponent/Proponent Rep	External Organization Names	Topic/Regarding	Meeting/Correspondence Summary
E00645	March 23, 2020	Email	Out	Gwich'in Tribal Council Tetlit Gwich'in Council (DGO)	[redacted]	[redacted]	[redacted]	Information Sharing	Chance Oil and Gas (COG) has several initiatives on the go, some of which are time sensitive and all require engagement with the affected First Nations. The following is a summary of these initiatives: 1.Application to the Yukon Government to get tenure extension on Exploration Permit 0020 which is set to expire on August 30, unless extended. This permit is located mostly in the Traditional Territory of the Vuntut Gwichin, but a portion is in the Secondary Use Area of the Tetlit Gwich'in and in the overlap area with the Na-cho Nyak Dun Traditional Territory. There is a suspended well in this Permit at McParlon A-25 which has ongoing value to COG. 2.There are several suspended wells at the Chance Significant Discovery License (SDL 022) and one at the Blackie SDL 021 which the Yukon Government requires COG to undertake some maintenance work. This activity will require an impact assessment by the Designated Office (DO) of YESAB in Dawson prior to permissions being granted by Yukon to undertake the work. The plan is to submit to the DO the program in the next month or so with the objective of being able to do the work over approximately a 6 week to two month period in the winter of 2020-2021. This is a regulatory requirement made by the Manager of Oil and Gas Operations with the Yukon Government. Importantly for your knowledge, there is no indication that these suspended wells have any problems, but they are wells that were drilled in the 1960's so the regulator has asked for work to be done in order to be able to continue the suspended status of these wells. 3.Continuing engagement with respect to the multi-well drilling and seismic data acquisition project that has been described to you in the past couple of years. In view of the COVID 19 outbreak, travel and face to face get togethers are not appropriate, if not prohibited, so we will have to make arrangements to exchange information in writing, electronically and by conference call. There is quite a geographic spread for all of us to manage and I look forward to hearing your preferences for engagement. Also, I understand that there have been some changes to a number of staff positions with the GTC and I am not sure exactly who we should be engaging on the COG file. If I have missed anyone on this email, please advise us and forward this email to the appropriate individuals.
E00648	March 26, 2020	Email	In	Gwich'in Tribal Council Tetlit Gwich'in Council (DGO)	[redacted]	[redacted]	[redacted]	Information Sharing	In addition to [redacted], the following are the updated GTC staff contacts: [redacted], Interim Chief Operating Officer [redacted], Director of Lands and Resources godlove.ngeh@gwichintribal.ca [redacted], Intergovernmental Relations, Communications Coordinator

E00687	June 10, 2020	Email	Out	Gwich'in Tribal Council Tetlit Gwich'in Council (DGO)	[redacted]	[redacted]	[redacted]	DO Project Meeting Coordination/Planning	Thank you so much for your response! [redacted] let us know that GTC is currently compiling input and comments. Once we have that feedback, I can coordinate a day and time that works for everyone. A time after 3:45 pm MT shouldn't be a problem.
E00690	June 12, 2020	Email	In	Gwich'in Tribal Council	[redacted]		[redacted]	DO Project Information Sharing	[redacted] please find attached input for this work from GTC's departments of Lands and Resources, Cultural Heritage and Economic Development. We thank you for giving us the opportunity to provide input/comments on this work. Please if you have any questions related to our input, do not hesitate to contact me.
E00695	June 18, 2020	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	DO Project Meeting Coordination/Planning	For ease of planning and coordination - Are you able to determine some dates and times that work for yourself, Leslie Blake, and anyone else that GTC would want to participate? Then I can coordinate Chance and Hemmera participants on my end.
E00694	June 18, 2020	Email	Out	Gwich'in Tribal Council Tetlit Gwich'in Council (DGO)	[redacted]	[redacted]	[redacted]	DO Project Meeting Coordination/Planning	My apologies for the delay in getting back to you. Thank you so much for providing your feedback (attached for everyone's reference). Chance and Hemmera are currently working on providing a response to GTC. My colleague, [redacted] is leading that piece and he hopes to share a draft tomorrow or early next week. If we are able to respond by early next week, we were wondering if it would be possible to arrange a conference call for a time later in the week in order to facilitate further discussion. Perhaps either the afternoon of June 25th (next Thursday) or June 26th (next Friday)?
E00696	June 18, 2020	Email	Out	Gwich'in Tribal Council Tetlit Gwich'in Council (DGO)	[redacted]	[redacted]	[redacted]	DO Project Meeting Coordination/Planning Information Sharing Project Description/Activities	As requested, I've attached the draft Project Description for the well maintenance program. The summary information attached to our initial engagement letter was based on this larger document.
E00787	June 24, 2020	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Engagement/Consultation DO Project	I just wanted to send a quick update. We're a little delayed on drafting a response to GTC's comments, [redacted] is working on the draft and we'll get it to GTC as soon as we can. Then hopefully we can work on scheduling a date/time for a conference call.
E00788	June 24, 2020	Email	In	Gwich'in Tribal Council	[redacted]		[redacted]	Engagement/Consultation DO Project	Thanks and no problem
E00780	July 9, 2020	Email	Out	Gwich'in Tribal Council Tetlit Gwich'in Council (DGO)	[redacted]	[redacted]	[redacted]	Engagement/Consultation DO Project	Attached is a memo prepared by Chance and Hemmera in response to input received from GTC.We would be more than happy to arrange a conference call for further discussion. If that is something GTC and TGC are interested in, perhaps we can schedule a time for mid to late next week?
E00781	July 9, 2020	Email	In	Gwich'in Tribal Council Tetlit Gwich'in Council (DGO)	[redacted]	[redacted]	[redacted]	Engagement/Consultation DO Project	Thank you, please we will review this internally first and contact you early to mid-next week for a possible conference call to discuss this if it works well for you.
E00786	July 9, 2020	Email	Out	Gwich'in Tribal Council Tetlit Gwich'in Council (DGO)	[redacted]	[redacted]	[redacted]	Engagement/Consultation DO Project Meeting Coordination	Thank you, and that definitely works for us.
E00709	July 13, 2020	Email	Out	Gwich'in Tribal Council Tetlit Gwich'in Council (DGO)	[redacted]	[redacted]	[redacted]	Engagement Reports/OIC Requirements	Hemmera has prepared a draft report on implementation of Gwich'in Partners and Chance Engagement and Communication Plan for Gwich'in Partners and Chance to review. This report summarizes meetings/correspondance that have occurred between Gwich'in Partners and Chance since completing the 2019 Annual Report. I have attached the draft as a Word Document, if both Gwich'in Partners and Chance could make revisions to that document in tracked changes, that would assist me in creating a final version. If there are any issues that arise between parties' revistion, we can address them via e-mail or a quick call. Once revisions have been incorporated and the document is considered final by Gwich'in Partners and Chance, I will send the final version to both parties to sign. I have also attached, as a pdf, a draft of Gwich'in Partners and Chance's Engagement Log which functions as Appendix D for the report. Please complete reveiws by Friday, July 24th. Reminder that reports need to be signed and submitted to YG on July 31st.
E00782	July 17, 2020	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Engagement/Consultation DO Project	I hope you had a good week! I wanted to touch base with you and see how things are going?
E00783	July 17, 2020	Email	In	Gwich'in Tribal Council	[redacted]		[redacted]	Engagement/Consultation DO Project	[redacted] we are fine, we are having an internal discussion today in relation to your submission and a call with you and your team next week would be great. Let me know a date to have a call to discuss your reply to our submission.
E00784	July 17, 2020	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Engagement/Consultation DO Project Meeting Coordination	I've checked with [redacted] and we have a few windows we can propose for next week: Tues July 21, Wed July 22. Let me know if any of these dates/times work on your end. If not, I can try to find openings Thursday/Friday. Are you able to coordinate having [redacted] participate?
E00789	July 21, 2020	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Engagement/Consultation DO Project Meeting Coordination	I will be sending out an invite to everyone a little later this morning. However, I was wondering if it would be possible for you provide any information on the topics/themes that GTC would like to discuss? It will help me draft a rough agenda, but it will also help me strategize which of Chance's other consultants I should try to include. For example, we have a consultant from Environmental Dynamics Inc. that could speak to any wildlife topics if that's something GTC would like to focus on.

Reference	Date	Contact Type	In / Out	Organization	Author	Proponent/Proponent Rep	External Organization Names	Topic/Regarding	Meeting/Correspondence Summary
E00761	July 21, 2020	Email	Out	Gwich'in Tribal Council Tetlit Gwich'in Council (DGO)	[redacted]	[redacted]	[redacted]	Engagement/Consultation DO Project	This is a conference call to discuss Chance's proposed Well Maintenance Work. Attached is a draft agenda for our call. If you have any proposed revisions please let me know. I've also attached the memo prepared by Chance in response to theinput received by GTC.
E00785	July 21, 2020	Email	In	Gwich'in Tribal Council Tetlit Gwich'in Council (DGO)	[redacted]		[redacted]	Engagement/Consultation DO Project Meeting Coordination	Please we will do Wednesday 3:30 - 5 pm. And send metting inited to those copied in this e-mail, including myself.
E01189	July 22, 2020	Meeting - Teleconference		Gwich'in Tribal Council		[redacted]	[redacted]	DO Project Engagement/Consultation	The purpose of this meeting is for Chance Oil and Gas (Chance) and Gwich'in Partners to continue their discussion with respect to Chance's proposed Eagle Plain Well Maintenance Project. Chance will also take this opportunity to provide an overview of changes to the project design that have occurred as a result of engagement activities and refinement during proposal development.
E00746	July 24, 2020	Email	Out	Gwich'in Tribal Council Tetlit Gwich'in Council (DGO)	[redacted]	[redacted]	[redacted]	Engagement Reports/OIC Requirements	I wanted to check in and see how your review of the draft engagement report was going? My apologies for not doing this sooner in the week. Despite my typo below, these reports are due to Yukon Government July 31, 2020. Not 2019, there is no time travel involved.
E00765	July 24, 2020	Email	Out	Gwich'in Tribal Council Tetlit Gwich'in Council (DGO)	[redacted]	[redacted]	[redacted]	Engagement/Consultation DO Project	Attached is a draft copy of Chance Oil and Gas (Chance)'s YESAB Project Proposal for the Eagle Plains Well Maintenance Project. In order for Chance to get all its approvals in hand before thw winter season, Chance's application will need to be submitted very shortly after sending this draft to you. At this time, our goal is to submit the Project Proposal middle of next week. I remember from our June phone call that [redacted] had inquired about a Wildlife Management Plan. As it happens, all mitigation measures with respect to wildlife and caribou is located within the body of the proposal. I wanted to flag that for your attention. As this document has not gone through Hemmera's formatting procedure, it is absent of some of the figures and appendices. However, I've attached the the Spill Response Plan which will be Appendix B. Chance continues to be committed to engaging with the Gwich'in Tribal Council. Should you wish to discuss the proposed Project in more detail, please don't hesitate to contact Chance or Hemmera.
E00747	July 29, 2020	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Engagement Reports/OIC Requirements	Will GTC be able to provide comments today or tomorrow? For your information, I've attached the comments I received from [redacted]. He also pointed out that the Engagement Log (Appendix D) didn't include records of the community meetings in Tsiigehtchic, Inuvik, Aklavik and Ft McPherson last year between Aug 19 and 22. So I'm make sure that's fixed as well. my goal is to get the draft notes from last week's meeting to GTC and Chance before the end of the week.
E00748	July 29, 2020	Email	In	Gwich'in Tribal Council	[redacted]		[redacted]	Engagement Reports/OIC Requirements	Thank you, we plan to send our commentts tomorrow.
E00750	July 30, 2020	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Engagement Reports/OIC Requirements	I've received comments back from GTC and Chance. Chance wanted to make sure that Appendix D included line items for each of the community meetings held last August (i.e., community meetings referenced in the report). Those line items are being added to the log and the is log currently being re-formatted for Appendix D. Revisions that GTC provided that were editorial (e.g., mistaken dates, awkward wording), I've gone through an accepted. I've provided some additional text for Chance review that I believe may address GTC's comments. Richard can you review my additions and let me know if they are acceptable? Additionally, can you provide any text for GTC's comment with respect to training and employment? Please leave everything in track changes and put your decisions in comment bubbles. Once [redacted] has finished the task bolded above, the document can be returned to GTC for a another review.
E00751	July 30, 2020	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Engagement Reports/OIC Requirements	Sorry I missed your call (I'm working from home today), but thank you for your message. I appreciate your comments and they helped me with some text I've added. I gave [redacted] a call and was able to tidy up things from his perspective. Would you be able to review the document attached and delete comments you feel have been addressed by either text I've added to the document or my comment in response.
E00752	July 30, 2020	Email	In	Gwich'in Tribal Council	[redacted]		[redacted]	Engagement Reports/OIC Requirements	Thank you please, we are fine with the comments and you can go ahead and have a clean version to meet your submission deadline and send our copy as well.
E00753	July 30, 2020	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Engagement Reports/OIC Requirements	Thanks for the quick turn around. I've attached a PDF of the clean version. [redacted] are you able to print off the signature page and stick handle that piece on your end? Then send a scanned copy to Greg for his signature. By then the formatting should be done for Appendix D and I can compile the complete document. I will send that to the Gwich'in Partners and Chance prior to sending an email to YG.
E00755	July 30, 2020	Email	In	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Engagement Reports/OIC Requirements	I have sent to my COO [redacted] who can even sign electronically if he is around now.
E00749	July 30, 2020	Email	In	Gwich'in Tribal Council Tetlit Gwich'in Council (DGO)	[redacted]		[redacted]	Engagement Reports/OIC Requirements	Please find attached the engagement plan with GTC's comments. Please note that there are additional comments at the end of the document.
E00756	July 31, 2020	Email	In	Gwich'in Tribal Council	[redacted]		[redacted]	Engagement Reports/OIC Requirements	Signed attached.

Reference	Date	Contact Type	In / Out	Organization	Author	Proponent/Proponent Rep	External Organization Names	Topic/Regarding	Meeting/Correspondence Summary
E00757	July 31, 2020	Email	In	Gwich'in Tribal Council	[redacted]		[redacted]	Engagement Reports/OIC Requirements	Thank you [redacted] greatly appreciated please.
E00758	July 31, 2020	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Engagement Reports/OIC Requirements	Thank you very much! I really appreciate your help and efforts getting this report across the finish line. I will be sending it to YG shortly.
E00759	July 31, 2020	Email	Out	Gwich'in Tribal Council Tetlit Gwich'in Council (DGO) YG	[redacted]	[redacted]	[redacted]	Engagement Reports/OIC Requirements	Please see attached for the 2020 Annual Report on the Implementation of the Gwich'in Partners and Chance Oil and Gas Communications and Consultation Plan.
E00760	August 3, 2020	Email	Out	Gwich'in Tribal Council Tetlit Gwich'in Council (DGO)	[redacted]	[redacted]	[redacted]	Engagement/Consultation DO Project	Attached is a draft summary of our call on July 22nd. I had meant to get this out last week, but engagement reports ate up my time. Let me know if you have any revisions and I will do my best to compile them.
E00869	August 28, 2020	Email	In	Gwich'in Tribal Council	[redacted]		[redacted]	DO Project Engagement/Consultation	Email read receipt
E00910	August 28, 2020	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	DO Project Project Description/Activities	Further to Richard's email dated August 7th (attached), Chance Oil and Gas (Chance) has made a few revisions to their Project Description for the Designated Office Evaluation of their proposed Well Maintenance Program. As a result of those changes, Hemmera has also revised the effects assessment sections of the Project Proposal. Below are the reasons for the revision that have been provided to us by Chance and a brief summary of the amendment itself: 1.Ongoing conversations between Chance and Yukon Government, Oil and Gas Branch (YG) have necessitated changes. While Chance was previously of the impression wells could continue to be suspended, YG is now directing Chance to conduct inspection and maintenance activities for all eight suspended wells and then abandon those wells or bring them into active status (i.e., end the period of well suspension). Chance is now proposing to abandon six wells (i.e., M-59, M-08, J-19, G-08, B-73, and H, 28) and to bring the remaining two wells (i.e., A-25 and E-78) into active status as deep-injection wells. Waste fluid produced during the abandonment of the six wells can then be disposed of via injection into the deep-injection wells. No oil or gas is expected to be produced from the two wells proposed to be activated; they would specifically be used for disposal of waste fluid from activities associated with these maintenance activities. (See sections 2.1.4 and 2.1.5 for further description) 2.At this time, Chance cannot confirm whether it will use the Eagle Plains Hotel or the existing Chance Camp for housing workers over the duration of the Project. The decision to utilize the Eagle Plains Hotel or the Chance Camp will be made when the Project schedule is finalized. It will also have to take into consideration the Hotel's ability to accommodate Chance workers over the full duration of the Project as well as COVID-19 related self-isolation requirements at that time. As a result both options are considered in the effects assessment for the housing of the project workforce. (See sections 2.2 and 2.3 for further description) 3.When the Chance field team were at Eagle Plain early August, they observed that the route used to access M-59 would require realignment of the final portion of Blackie Winter Road. The section of the original route that proceeds north for the final kilometer is not ideal for traffic due to steeper terrain. The steeper route would result in a significant risk to the trucks bearing heavy loads, fuel supply, and other fluid handling shipments. Chance is proposing shifting the final portion of Blackie Winter Road east of the original route in order to attain a much gentler gradient. (See section 2.1.1 and Figure 2-1 for further description) Each of the amendments above are described with additional detail within the attached revised Project Proposal. As previously, not all appendices are complete yet but will be
E01034	August 28, 2020	Email	In	Gwich'in Tribal Council	[redacted]		[redacted]	DO Project Engagement/Consultation Project Description/Activities	Thanks please
E01030	September 2, 2020	Email	In	Gwich'in Tribal Council	[redacted]		[redacted]	DO Project Engagement/Consultation Project Description/Activities	Please find attached the document with GTC's final comments based on the meeting we had with Chance oil and Gas in July. I know you circulated another project document with additional information on the Eagle Plain Well maintenance work and we will review it and see if our input is different from what we have provided in this document. And if that will be the case, then we will provide additional input. In addition, I have ben told that one of our Renewable Resources Council members in Fort McPherson (Tetlit Gwich'in) would like to meet with Chance Oil and Gas. Once I get his information, I will send to you so that Chance Oil and Gas can arrange a meeting with him.
E01031	September 3, 2020	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	DO Project Engagement/Consultation Project Description/Activities	Thank you for sending this updated version of your comments. I've forwarded it to Chance and the rest of my Hemmera team. We'll review it, but for now we'll hold off on any follow-up, where/if required. This way your team can have time to review the revised project proposal and collect your feedback. Then we can coordinate a conference call if you'd like. We appreciate you providing any specific contact information for the Renewable Resource Council in Fort McPherson. Once we have that, we'll connect with them to schedule a meeting.
E01032	September 3, 2020	Email	In	Gwich'in Tribal Council	[redacted]		[redacted]	DO Project Meeting Coordination/Planning	Thank you very much
E01033	September 10, 2020	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	DO Project Meeting Coordination/Planning Information Sharing	I was wondering if you would be able to forward the contact information for the Renewable Resource Council members in Fort McPherson? Alternatively, if you'd be able to coordinate a conference call? I'm not sure if you were planning on attending or not? Having GTC and RRC staff members would be perfect. Timing wise, a conference call for sometime next week (Sept 14-18) would be best for Chance staff, but they could accommodate the following week (Sept 21-25) if needed.

Reference	Date	Contact Type	In / Out	Organization	Author	Proponent/Proponent Rep	External Organization Names	Topic/Regarding	Meeting/Correspondence Summary
E01035	September 10, 2020	Email	In	Gwich'in Tribal Council	[redacted]		[redacted]	DO Project Meeting Coordination/Planning Information Sharing	Thank you please, I have not yet gotten any name(s) but would follow up and can coordinate that if they are willing.
E00875	September 10, 2020	Email	In	Tetlit Gwich'in Council (DGO)	[redacted]	[redacted]	[redacted]	DO Project Engagement/Consultation Meeting Coordination/Planning	Accepted meeting for July 22 - Chance Oil and Gas - Proposal for Well Maintenance Work (Engagement with Gwich'in Partners)
E00902	September 15, 2020	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	DO Project Engagement/Consultation Project Description/Activities	Since my email dated August 28th, Hemmera has been in the final stages of concluding the revised DO Project Proposal for Chance's Well Maintenance program. We have appreciated your feedback and worked to include that into the application. As you know, Chance's timeline for completing this work was tied to compliance with regulations, so in an effort to ensure that the maintenance activities could occur this winter Chance needed to submit the application last week. It was submitted late Friday evening and today Hemmera received confirmation that the project was on the YESAB registry. We acknowledge that you may have future comments on the project as it progresses through the YESAB process. We continue to look forward to hearing your views and are happy to hold additional meetings to discuss and answer any questions you may have. Please see the link to the registry here: Project 2020-0151 Eagle Plains Well Maintenance and Winter Activities
E00865	September 16, 2020	Email	In	Gwich'in Tribal Council	[redacted]		[redacted]	DO Project Engagement/Consultation	Email read receipt
E00906	November 2, 2020	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	DO Project Engagement/Consultation	After further consideration of the proposed Project (Eagle Plains Well Maintenance and Winter Activities) activities and the requirements of the Yukon Oil and Gas Act, Chance Oil and Gas Ltd. (Chance) has determined that changes are required to the Project submitted to the Dawson Designated Office on September 11, 2020 (Project #2020-0151). As such, Chance has decided to withdraw its Project proposal and will be informing the Yukon Environment and Socio-Economic Assessment Board today, November 2, 2020. Chance intends to incorporate changes into a revised Project proposal. Once the revised proposal has been drafted, Chance will notify you by sharing a draft and requesting a meeting to discuss the changes further. After Chance has discussed those changes with the Gwich'in Tribal Council and Tetlit Gwich'in Council, the Project proposal will be finalized and resubmitted to the Dawson Designated Office. Chance understands and appreciates that making changes to this Project a second time is requesting additional effort and capacity of the Gwich'in Tribal Council and Tetlit Gwich'in Council. Chance looks forward to continuing to work with the Gwich'in Tribal Council and Tetlit Gwich'in Council, and Chance will do its best to ease this process.
E00851	November 4, 2020	Email	Out	Gwich'in Tribal Council Tetlit Gwich'in Council (DGO)	[redacted]	[redacted]	[redacted]	Engagement/Consultation Meeting Coordination/Planning	I want to congratulate you both for your recent election victories and we look forward to working with you in the future. I think that Chance Oil and Gas has established a good working relationship with the Gwich'in Tribal Council and Designated Gwich'in Organizations and we hope to continue building on this relationship. I understand that you have been in touch with [redacted] already so I thought I would reach out to introduce myself so we can initiate discussions about our plans and proposed activities. Godlove has been engaged with us during the past year so is generally current with our plans so can brief you prior to any conversation that we have with you. We do need to engage again to discuss some changes that we are proposing to a well maintenance project at Eagle Plain. Overall, Chance Oil and Gas is involved in exploration activities in northern Yukon and has plans to expand this effort in the future. A multi-year exploration project in an area of interest within the exploration land that Chance currently holds covers about 2,400 sq kms of area. This project could involve drilling up to 30 exploration wells, shooting up to 1,500 sq kms of 3D seismic and up to 2,000 linear kms of 2D seismic, and undertaking extended flow testing of any discoveries has been proposed and information has been provided to all the affected First Nations including the GTC and the DGO's. When it is convenient, we would like to meet with you, probably virtually by Zoom or Microsoft Teams given the COVID 19 situation.
E00849	November 9, 2020	Email	Out	Gwich'in Tribal Council Tetlit Gwich'in Council (DGO)	[redacted]	[redacted]	[redacted]	Engagement/Consultation Meeting Coordination/Planning	I have feedback from Hemmera and my colleagues. It looks like Monday morning next week works for all of us. How does 9-11 am work for you and your colleagues? I can arrange with [redacted] at Hemmera to save this time, send out meeting invitations and connection details and a draft agenda for you to consider.
E00850	November 9, 2020	Email	In	Gwich'in Tribal Council Tetlit Gwich'in Council (DGO)	[redacted]	[redacted]	[redacted]	Engagement/Consultation Meeting Coordination/Planning	I am available to meet next Monday from 9-11am.
E00852	November 9, 2020	Email	In	Gwich'in Tribal Council Tetlit Gwich'in Council (DGO)	[redacted]	[redacted]	[redacted]	Engagement/Consultation Meeting Coordination/Planning	Mahsi' (thanks) for reaching out and introducing yourself. Yes myself and Greg had a quick discussion in October. I have also copied [redacted] who is our acting COO to make him aware of the request. We may have some time on Monday, November 16th if that works. We look forward to meeting with your team and discussing your proposed activities at Eagle Plain.

Reference	Date	Contact Type	In / Out	Organization	Author	Proponent/Proponent Rep	External Organization Names	Topic/Regarding	Meeting/Correspondence Summary
E00853	November 9, 2020	Email	Out	Gwich'in Tribal Council Tetlit Gwich'in Council (DGO)	[redacted]	[redacted]	[redacted]	Engagement/Consultation Meeting Coordination/Planning	Great to hear from you. Next Monday works for me and my colleagues. I would like to include others who are helping with various processes like YESAB submissions and Communication and Engagement such as consultants at Hemmera in Whitehorse. GTC government staff will already be familiar with the folks at Hemmera. I will check with them on their availability to participate and let you know. Are you able to use Microsoft Teams for a virtual meeting? I suggest that we allow up to two hours to introduce you both to plans we have for work at Eagle Plains. In the near term, we are under an order from the Yukon Government regulator to undertake maintenance of 8 suspended wells operated by Chance. There is no evidence of any problems with these wells, but Yukon law specifies that suspended wells must be put into operation or abandoned after a period of inactivity. Our plan is to preserve for future use five of the suspended wells, but three will likely have to be abandoned. In the longer term we have plans to undertake a small scale, multi-year exploration drilling and seismic data acquisition program in an area of interest within the existing exploration permits held by Chance. Information about both these projects has been provided to your staff over the past couple of years. We are underway with updating the maintenance project to include extended flow testing of three wells to assess the productive capability and hopefully measure the resource size as part of the program. I will confirm the availability of the Hemmera advisors as quickly as I can. January 16 is pretty open for [redacted] and me.
E00877	November 10, 2020	Email	In	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	DO Project Engagement/Consultation Meeting Coordination/Planning	Accepted meeting for November 16 - Gwich'in Tribal Counce and Chance Oil and Gas Meeting

E00880	November 10, 2020	Email	In	Gwich'in Tribal Council	[redacted]		[redacted]	DO Project Engagement/Consultation Meeting Coordination/Planning	Accepted meeting for November 16 - Gwich'in Tribal Counce and Chance Oil and Gas Meeting
E00998	November 10, 2020	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	DO Project Engagement/Consultation Meeting Coordination/Planning	Here is the meeting invite with Teams/call-in details for the Gwich'in Tribal Council and Chane Oil and Gas call next week. Hemmera will draft an agenda and send it out for participants to review.
E00847	November 13, 2020	Email	In	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	DO Project Meeting Coordination/Planning	Please include [redacted] (copied) to your CC list for this project. Thanks!
E00876	November 13, 2020	Email	In	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	DO Project Meeting Coordination/Planning	Accepted meeting for November 16 - Gwich'in Tribal Counce and Chance Oil and Gas Meeting
E00881	November 13, 2020	Email	In	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	DO Project Meeting Coordination/Planning	Accepted meeting for November 16 - Gwich'in Tribal Counce and Chance Oil and Gas Meeting
E00846	November 13, 2020	Email	Out	Gwich'in Tribal Council Tetlit Gwich'in Council (DGO)	[redacted]	[redacted]	[redacted]	Engagement/Consultation Meeting Coordination/Planning DO Project	Attached is a draft agenda for the meeting on Monday (Nov 16th). Please let me know if you have any changes you'd like me to make.
E00843	November 16, 2020	Email	In	Gwich'in Tribal Council	[redacted]		[redacted]	DO Project Meeting Coordination/Planning Information Sharing	Please can you send to me the detailed project Richard just presented to share with my leadership.
E00844	November 16, 2020	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	DO Project Engagement/Consultation Project Description/Activities	I've attached the original email Hemmera sent to GTC back in June 2019. It includes the draft project description for Chance's Eagle Plains Exploration Project and a presentation that Chance gave to the GTC team at that time. This project will go through a YESAB Executive Committee level screening. Since you and your team started this year, Richard may have mentioned the "Executive Committee" project in passing, but Chance (and Hemmera) haven't been actively engaging on it. We've been focused on Chance's Eagle Plains Well Maintenance Project (or subsequently called Eagle Plains Well Maintenance and Winter Activities) which will be going through the YESAB Designated Office in Dawson City. That is the proposal we've been engaging with you on for the past few months. It's this project that has changed a couple times and which Chance withdrew from YESAB a couple weeks ago. As soon as the revised draft (including project description and effects assessment) for this project is completed, Hemmera will get a copy to GTC. As Nathan mentioned on the call, he's hoping for sometime this week. Hopefully my additional comments here aren't too unsolicited. It may end up being repetitive for you, but I will be attaching the draft project description for Chance's Eagle Plains Exploration Project again when I send out the notes from today's meeting. I'll also attach other documents that were referenced during the call, for ease of reference.
E00845	November 16, 2020	Email	In	Gwich'in Tribal Council	[redacted]		[redacted]	DO Project Engagement/Consultation Project Description/Activities	Thank you very much
E00848	November 16, 2020	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	DO Project Project Description/Activities	Will do! Moving forward, regardless of whether emails pertain to Chance's Designated Office project (Well Maintenance and Winter Activities) or its Executive Committee level project (Eagle Plains Exploration), I'll be sure to cc you both!

Reference	Date	Contact Type	In / Out	Organization	Author	Proponent/Proponent Rep	External Organization Names	Topic/Regarding	Meeting/Correspondence Summary
E01194	November 16, 2020	Meeting - Teleconference		Gwich'in Tribal Council		[redacted]	[redacted]	DO Project Engagement/Consultation Project Description/Activities	The purpose of this meeting was to introduce Chance Oil and Gas and its projects to Gwich'in Tribal Council's (GTC) new leadership.
E00987	November 16, 2020	Email	In	Tetlit Gwich'in Council (DGO)	[redacted]	[redacted]	[redacted]	DO Project Engagement/Consultation	Declined: Gwich'in Tribal Council and Chance Oil and Gas Meeting
E00859	November 19, 2020	Email	In	Gwich'in Tribal Council	[redacted]		[redacted]	DO Project Engagement/Consultation	Email read receipt
E00891	November 19, 2020	Email	Out	Gwich'in Tribal Council Tetlit Gwich'in Council (DGO)	[redacted]	[redacted]	[redacted]	DO Project Engagement/Consultation Project Description/Activities	Further to my email dated November 2nd (attached) and our meeting November 16th with the Gwich'in Tribal Council, Chance Oil and Gas (Chance) has revised its Project Proposal (including updated Project Description and Effects Assessment) for Designated Office Evaluation. Below is the key project component that has changed: •Extended Flow Testing: After maintenance activities are complete and depending on wellbore integrity (as confirmed through maintenance activities), Chance proposes to conduct Extended Flow Testing (EFT) on up to three of the wells which have the highest potential for natural gas reserve. The reason for this change is to allow Chance to gather important information about the nature of the natural gas resource accumulation and its productive capability. a.Wells proposed for EFT are M-59, M-08, and J-19 (see PDF attached for Figure 2-1). Please note, Figure 2-1 is currently being updated to reflect this change. b.Revert up to three wells to suspended status (if the EFT results prove to have sufficient resource). c.Abandon three to six wells (the three remaining wells (G-08, B-73, and H-28) will be abandoned and up to additional three wells may be abandoned if wellbore integrity is not confirmed or if EFT results prove insufficient resources). •Timelines: If work cannot be completed this winter season (due to low snow pack, COVID considerations, or permitting delays), Chance will complete the project during the winter of December 2021 to March 2022. Additional detail is within the attached revised Draft Project Proposal. While revisions were made throughout the document, Section 2.1.3 is the substantive addition with respect to EFT. We've attached both a clean version and a version with tracked changes to facilitate your review. Given the very short time frame for winter work, Chance will be submitting the application to YESAB on Friday, November 20th. Hemmera anticipates the GTC and Tetlit Gwich'in Council requiring additional discussions with Chance to review these changes and look forward to scheduling a meeting where we can discuss these matters further to support your future submissions to the YESAA process.
E00860	November 20, 2020	Email	In	Gwich'in Tribal Council	[redacted]		[redacted]	DO Project Engagement/Consultation	Email read receipt
E01023	November 20, 2020	Email	Out	Gwich'in Tribal Council Tetlit Gwich'in Council (DGO)	[redacted]	[redacted]	[redacted]	DO Project Project Description/Activities Engagement/Consultation	I need to amend my email sent yesterday. While Chance would like to submit as soon as possible, the submission will be delayed until mid next week. If the Gwich'in Tribal Council and/or the Tetlit Gwich'in Council has any immediate concerns, please contact us and we'll make scheduling a meeting a priority.
E00894	November 20, 2020	Email	In	Tetlit Gwich'in Council (DGO)	[redacted]	[redacted]	[redacted]	DO Project Meeting Coordination/Planning Engagement/Consultation	Declined Meeting for November 16 - Gwich'in Tribal Council and Chance Oil and Gas Meeting
E00896	January 19, 2021	Email	Out	Gwich'in Tribal Council Tetlit Gwich'in Council (DGO)	[redacted]	[redacted]	[redacted]	DO Project Engagement/Consultation	A brief update on Chance's proposed Eagle Plains Well Maintenance and Extended Flow Testing project is provided below: •Project was submitted to the Dawson District Office (DO) December 24, 2020. •Adequacy Review started December 29, 2020 and was extended January 11, 2021. oThe Adequacy Review period was extended for 21 days due to the complexity of the Project. •Dawson DO issued an Information Request on January 15, 2021 Chance is currently working on its response to Information Request 1 which you can find here. Additionally, here is the link to the project's page on the YESAB registry: 2020-0197.
E01099	April 7, 2021	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	I will in Ontario that week to deal with the sale of and move out from our place in Muskoka. I am tied up on April 26 all day and between 10:00 am and noon Calgary time on April 27 for a Board meeting. The rest of the week is open for me.

Reference	Date	Contact Type	In / Out	Organization	Author	Proponent/Proponent Rep	External Organization Names	Topic/Regarding	Meeting/Correspondence Summary
E01064	April 7, 2021	Email	Out	Gwich'in Tribal Council Tetlit Gwich'in Council (DGO)	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning Engagement/Consultation	Hemmera is currently resuming work on Chance's Executive Committee project titled Eagle Plains Exploration Program. Seeing as it's been quite some time since Chance and the Gwich'in Tribal Council (GTC) and the Tetlit Gwich'in Council (TGC) have discussed this particular project, Chance was hoping to schedule a meeting. Some items that Chance would like to discuss are: •a refresher of the draft project description •update of events since Chance last engaged on the ExCom project •anticipated timeline for submission to YESAB, and •GTC and TGC's preferences/guidance for engagement with its government and its citizens over the coming months. Do you have any availability the week of April 26th – 30th?
E01100	April 15, 2021	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	I wanted to touch base on the request below and see if you had any availability to meet the week of April 26th – 30th or perhaps the following week. Also, my apologies[redacted]. I did not include you in my original email sent April 7th.
E01053	April 16, 2021	Email	In	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	I am out of office, returning Monday, June 14, 2021. I will be checking my e-mail and do my best to get back to you as soon as I can. *Automatic reply*
E01105	April 20, 2021	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	I just sent a placeholder to you which can be forwarded to others. I'll update and clean up the invite closer to the meeting.
E01101	April 26, 2021	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	I noticed on the GTC website that there have been some changes in staff. Would yourself and [redacted] be the correct people to contact now to discuss the request below (i.e., request for a meeting)?
E01182	April 26, 2021	Voice Message	In	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	Voice message summary [redacted] calling from GTC. I will send you an email. [redacted] if you would like to call me back.
E01102	April 27, 2021	Email	In	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	You are correct. However, I am only in an acting capacity until the new Lands Manger starts, which is May 10th. I would like to request that we meet when the new Lands Manager starts and involve Grand Chief [redacted] and Deputy Grand Chief [redacted] well in the meeting. I've checked with their Executive Assistant and the dates for a meeting would be the afternoons on May 19th-22nd (1-5 pm). I am hoping one of these time slots for you and your team. If not, please advise if that is not possible.
E01103	April 28, 2021	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	I've heard back from the Chance team and we're wondering if we could book a meeting for Friday May 21st at 2:00pm (Mountain time). If that time still works for GTC, I can send a placeholder for everyone's calendars. Closer to the date I can reach out again to make sure the time still works.
E01104	April 28, 2021	Email	In	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	Yes, that time works for us. Looking forward to our discussions.
E01084	April 30, 2021	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	Here is a placeholder for the Chance/GTC meeting in May. Feel free to forward it to anyone that needs to attend on GTC's side. Closer to the date, I will confirm the that the date/time still works for everyone involved, set up the call-in info, and work on an agenda.
E01163	April 30, 2021	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	I just sent a placeholder to you which can be forwarded to others. I'll update and clean up the invite closer to the meeting.
E01106	May 18, 2021	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Engagement/Consultation Meeting Coordination/Planning Project Description/Activities	I wanted to check in and see if meeting this Friday was still possible?
E01164	May 19, 2021	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	As few weeks ago I was working with [redacted] schedule a meeting between Chance and GTC. She mentioned a new Lands and Resources Manager starting. We tentatively booked a meeting for this Friday, but I wanted to confirm that it still works for everyone on your end.
E01157	May 20, 2021	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	Attached is the draft project description that Chance shared with GTC way back in June/July 2019. We presented this to each of the DGOs and Gwich'in communities then as well. I've also attached a draft agenda for the meeting. We can make changes later today once we confirm the date/time and attendees on your end
E01165	May 20, 2021	Email	In	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	Chief and Deputy Grand Chief are out of the office until next week. I spoke to [redacted] and it was suggested that we reschedule for either next week or the week following that. I will try and narrow a meeting date down for you that will work for everyone on our end. Hopefully, I can get a date to you by Friday, if not early next week, when everyone is back in the office.
E01166	May 20, 2021	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	I'll cancel the invite for tomorrow. Would you be able to see if you can find a time that works fo[redacted] as well?
E01176	May 20, 2021	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	Meeting invite: We are going to re-schedule this meeting.
E01177	May 20, 2021	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	Has there been any suggestion about an alternative time?

Reference	Date	Contact Type	In / Out	Organization	Author	Proponent/Proponent Rep	External Organization Names	Topic/Regarding	Meeting/Correspondence Summary
E01178	May 20, 2021	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	[redacted] is going to coordinate on GTC's end and then let us know some dates and times that work. Aiming for next week, maybe the week after.
E01181	May 25, 2021	Voice Message	In	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	Voice message summary: Follow-up on the next meeting, I was able to secure a date for June 3rd from 2-2:30. Would you want to send out the meeting request or if that would come from you with an updated agenda. You can call or email me back if that works for you.
E01155	May 26, 2021	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	Meeting Invite: Chance and GTC to meet and discuss Chance's proposed Eagle Plains Exploration Project. Draft agenda to be sent tomorrow.
E01161	May 26, 2021	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted]	Meeting Coordination/Planning	I was able to connect with Chance and meeting next Thursday June 3rd from 2:00 to 3:30 (Mountain time) works on our end. Just to confirm though, you meant Mountain Time right? I can send out the invite (to you to start with) and then you can forward it to folks on your end. Then I'll follow up the invite with the draft agenda to all attendees
E01156	May 27, 2021	Email	Out	Gwich'in Tribal Council	[redacted]	[redacted]	[redacted],	Meeting Coordination/Planning	Attached is a draft agenda for the Chance/GTC meeting next week. Please let me know if you have any changes you would like me to make.

1. Reintroduction Meeting Details

Table 1 below outlines details of the Reintroduction Meeting.

Table 1: Reintroduction Meeting Details

Topic	Action Description
Date	• January 26, 2023
Time	• 2:00 pm – 5:00 pm
Location	• Fairmont Waterfront, 900 Canada Pl, Vancouver, British Columbia V6C 3L5

Attendees	• Chance Oil and Gas Limited (Chance)
	  • [redacted] (Chairman and CEO)
	  • [redacted] (President)
	  • [redacted] (Regulatory, Environmental and Community Relations Coordinator)
	  • [redacted] (Vice President, joined by telephone)
	• First Nation Na-Cho Nyäk Dun (NND)
	  • Chief [redacted]
	  • [redacted] Implementation & Governance Manager
	• Gwitchin Tribal Council (GTC)
	  • Grand Chief [redacted]
	  • President [redacted], Tetlit Gwitchin Designated Gwitchin Organization
	  • [redacted], External Consultant, Lands and Resources Department, GTC
	  • [redacted]., Gwitchin Development Corporation Chief Executive Officer (CEO)
	  • [redacted], Executive Assistant, GTC
	• Two Worlds Consulting
	  • [redacted] (Facilitator Support)
	  • [redacted] (Facilitator)
	• Vuntut Gwitchin First Nation (VGFN)
	  • Chief [redacted]
	  • [redacted], Intergovernmental Relations Coordinator
	  • [redacted], Executive Director

DRAFT

2. Reintroduction Meeting Discussion

Chief [redacted] led a welcome prayer.

[redacted] provided a safety share and initiated introductions. [redacted] shared that he is based out of Yellowknife and looks forward to learning and listening from everyone during the meeting. Grand Chief [redacted] said he has been in his role for 2.5 years and noted he has been involved in the mining industry for many years. Grand Chief [redacted] shared how his ancestors followed caribou in the Eagle Plains area. He noted the importance of this area to his people today. Grand Chief [redacted] added that he is interested in understanding more about the Eagle Plains Exploration Project (the Project) and Chance Oil and Gas Limited's (Chance) next steps [redacted] was born and raised in Inuvik and often drives through the Eagle Plains area. She noted interest in learning more about the objectives of today's meeting. Richard said he was born in Treaty Seven Territory and is the founding shareholder of Chance (previously known as Northern Cross (Yukon) Limited) [redacted] shared that the name Chance is taken from the Chance sandstone in the Eagle Plain sedimentary basin where oil was first discovered in Yukon in 1959 [redacted] thanked everyone for joining the meeting and said he looked forward to establishing a collaborative, constructive, and respectful relationship with all the participating First Nations. Willard noted he is a Gwitchin citizen born in Tetlit Territory. [redacted] is currently an Advisor for the Lands and Resources Department at Gwitchin Tribal Council (GTC). [redacted] expressed interest in learning more about the Project and shared he had been in his role for 13 months [redacted] said she is a Yukon Gwitchin member who was raised by her grandfather. She has been with Chance for 10 years and is based in Whitehorse, Yukon. [redacted] shared that he is Red River Métis and the Executive Director of the Vuntut Gwitchin First Nation (VGFN). Chief [redacted] was born and raised in Old Crow and noted a background in oil and gas, self-government agreements, land protection and management, and early negotiations. Chief [redacted] said she was previously the Minister of Environment and had extensive experience dealing with oil and gas licensing and permitting. Chief [redacted] also shared that her intention at today's meeting was to listen and create an open dialogue around intentions [redacted] introduced herself and noted she is the Intergovernmental Relations Coordinator for VGFN. Chief [redacted] introduced himself. [redacted] introduced himself and welcomed everyone to the meeting.

[redacted] reviewed the agenda and asked everyone to share proposed changes or suggestions.

[redacted] noted [redacted] from Chance had joined the meeting via speaker phone.

Chief [redacted] said the proposed agenda topics are not where they need to be. Chief [redacted] shared that the Indigenous Nation attendees had intricate technical knowledge of the Project area. Chief [redacted] noted the Indigenous leaders at today's meeting had an internal briefing prior to this meeting. Chief [redacted] asked [redacted] what her role was during the meeting and if Two Worlds Consulting (TWC) was participating in the Project's Impact Benefit Agreement (IBA) process. [redacted] said TWC is not supporting the Project's IBA process and was recently hired to support the Project's engagement scope of work including meeting facilitation and notetaking. [redacted] added that TWC staff were happy to step out at any time if discussions related to the IBA process

were going to take place. Chief [redacted] noted that Grand Chief [redacted] opening comments highlighted the importance of the Project area to all northern Indigenous Nations. She added that the Project's existing IBAs are maturing, and further discussions related to IBAs will be required.

Chief [redacted] shared community concerns for wells that exist on the Project site and the Yukon's definition of employment and income opportunities in the *Yukon Oil and Gas Act*. Other Project-related concerns shared by Chief [redacted] included impacts to the environment, Treaty and Aboriginal Rights, extent of engagement, how Chance plans to engage going forward, permits with First Nation Na-Cho Nyäk Dun (NND), the vision to push north, the removal of 5 northern permits with respect to hydraulic and conventional methodologies, land, water, fish, and caribou protections, and the Executive Committee stage. Chief [redacted] also noted there are outstanding engagement protocols to establish to sustainably build integrity and trust with Elders and communities. She expressed interest in understanding potential request for land use permits to potentially develop or maintain existing lands including and involvement in related discussions. Chief [redacted] noted the importance of re-establishing relationships with all northern Indigenous Nations and acknowledged the history that exists between meeting attendees. Added that the Project area is used by all northern Indigenous Nations and looks forward to having collective conversations going forward to establish new opportunities and protect their inherent rights. Chief Frost [redacted] Chance to clarify their engagement approach going forward (e.g., when do they want to meet, what information is needed etc.). Chief [redacted] said ethical and responsible partnerships that respect people, and the environment are the foundation to how the northern Indigenous Nations govern themselves. They have lived off the land for generations and Chance will need to communicate differently with their people going forward. Acknowledged that trust and integrity is currently lacking at the community-level. Chief [redacted] said her role as Chief is the voice of the people, to deliver messages on behalf of the people to Chance and advance how Chance can move forward in a respectful manner. Chief [redacted] noted Chance had not signed previous agreements with the northern Indigenous Nations. Stated they are not closed for business but are interested in sustainable opportunities rooted in the laws of the land and that is the laws of the people. Chief [redacted] looked forward to identifying priorities to move this process forward.

[redacted] thanked Chief [redacted] for her comments and said Chance is exploring for natural gas and oil resources in the Project area using permits that have already been awarded. He said Chance is looking to understand how each northern Indigenous Nation wishes to be engaged and the best way to share information. [redacted] said Chance is open to economic and environmental stewardship partnerships. He shared that Chance is proposing to conduct smaller-scale exploration activities over a longer period of time to minimize potential environmental impacts and maximize potential Project-related benefits. [redacted] shared that Yukon Government has mandated Chance to conduct further investigations of existing suspended wells dating back to the 1950s/1960s. He said hydrocarbons have been discovered in some suspended wells. Richard noted Chance hired consultants such as EDI, Palmer, and Ausenco (previously Hemmera) to assess potential Project-related effects to the Eagle Plains Basin and support Chance's Environmental Assessment Application to the Yukon Environmental Socio-economic Assessment Board (YESAB). Richard noted Chance has a lot of information to share with the northern Indigenous Nations and would like to further engage each Indigenous Nation to better understand issues that should be addressed through mitigation and/or prevention measures. He added there are up to 30 new exploration wells to be drilled, up to 1,500 square kilometres of

new 3-D seismic data acquisition and up to 2,000 kms of new 2-D seismic data acquisition. Drilling results will determine long-term natural gas/oil extraction within the existing exploration permit areas. [redacted] added that the exploration activities would take place during the winter seasons over an 8–10-year period depending on results as the program unfolds. The exact drilling locations have not yet been determined. [redacted] noted that no hydraulic fracking would take place because the anticipated drilling will evaluate resource potential in geological formations that are not expected to need hydraulic fracturing. He said the camp is located at KM 325 on Dempster Highway and can accommodate around 75 people [redacted] added that the drilling program will occur sequentially rather than all at once. He also shared that natural gas/oil resources from the Project would support local energy security, economic independence, economic diversification, and a reduction of cumulative greenhouse gas (GHG) emissions by transporting fuel over shorter distances.

[redacted] added he had been involved in the Eagle Plains since 1959 and noted the landscape is unique compared to other northern landscapes because there are no lakes, the terrain supports exploration/extraction equipment, and it will be easier to build roads without significantly damaging the environment.

Grand Chief [redacted] noted that he was recording the meeting for GTC's internal minute keeping and requested permission from all meeting attendees. All meeting attendees agreed to the recording. Grand Chief [redacted] said he struggled with the open-ended agenda and thought it was paternalistic. Expressed interest in more structured agendas to avoid wasting anyone's time and to supporting things moving forward. Grand Chief [redacted] said meetings were had with Chance during the COVID-19 pandemic. He suggested a certain level of transparency, respect, and integrity was required to move forward. Grand Chief [redacted] noted he expects transparency, respect, and integrity from anyone working within their Traditional Territory and said there is water under the bridge in terms of this Project.

[redacted] asked Grand Chief [redacted] if the agenda felt vague. Grand Chief [redacted] responded that the agenda felt a bit vague and shared that GTC agendas included an opening prayer, introduction, meeting content, action items, and next steps. Noted members will quickly share if too much was included in the meeting agenda. Grand Chief [redacted] said he had previously heard what [redacted] shared and preferred meetings with a presentation / opportunity to review maps/leases to understand what is being discussed. Grand Chief [redacted] noted GTC represents four Gwitchin councils, and Chance maps reference one of these councils. Grand Chief [redacted] added that the GTC expects Chance to engage all Gwitchin communities/Indian Band Act councils. Noted GTC will support bringing together the right group of people and expressed interest in visiting the Project's camp. Grand Chief [redacted] shared that the Project is in an area where Gwitchin people harvest caribou. Noted compensation should be the last topic of discussion, and instead discussions should be focused on the management of the land, water, resources, environment, and air. Grand Chief [redacted] suggested Chance simplify future meeting agendas and appreciated the effort to move forward together.

[redacted] said she heard there is an interest in building trust and integrity as well as understanding of historic use in and around the Project. She summarized that historic wells and current and future permitting, involving Elders, inherent rights, employment and economic opportunities, respectful and collaborative relationships, community level engagement timelines, and the

protection of land, water, and air resources are important topics to be discussed at future meetings. Erin asked meeting attendees if she heard them correctly. Grand Chief [redacted] added that the key values mentioned were respect, transparency, accountability, and integrity.

Chief [redacted] shared that it is unfortunate how things have gotten to this point and acknowledged the historical relationship between Chance and northern Indigenous Nations. He noted that he was one of four NND Chiefs to go through this process and felt like little had been accomplished to date. He suggested the northern Indigenous Nations wanted to get to work for their children and future generations. Noted the importance of getting right down to the basic facts. Chief [redacted] added that they need to keep a sharp eye on the issue from a political point of view and bring in politicians as needed and move quickly back to the technical folks. He said it is time to put the politics to the side. Shared the politicians are like the star at the top of a Christmas tree and will let information filter down. Chief [redacted] noted the discussions with Chance had been ongoing over the past 12 years. Emphasized the importance of straightening the politics and focusing on arrangements. Chief [redacted] suggested everyone move forward without going back over the past 12 years of deliberations. Noted NND has not had a large role in the Project to date and that the northern Indigenous Nations will charge hell with a snowball together. Thanked everyone for the opportunity to speak.

[redacted] asked if there was anything else that anyone wanted to add to the discussion. Chief [redacted] reflected on the process and the Project. Noted [redacted] had been involved in the region for a long time. Chief [redacted] said her people are fighting for refuge and noted pristine areas and it's significant to use as the refuges. Chief [redacted] said the previous Project application triggered an Executive Committee review and could not determine if there were any adverse effects to the Porcupine caribou herd because of proposed development in the region. She shared the importance of being more confident in numbers and determinations in the YESAB consultation and engagement process. Chief [redacted] expressed concern for the YESAB process. Specifically, caribou, environment, climate change, assessment planning, monitoring and evaluation, triggers for stopping and advancing work, inherent rights, and the full scope/development of the Project. Expressed interest in a broader agreement with Chance to set the bar higher than the *Yukon Oil and Gas Act* and influence Project triggers and remedies to consider environmental vulnerabilities (e.g., halting project operations). Chief [redacted] acknowledged how fragile the environment is currently, especially around climate change and the pressure of resource development. Added that the northern Indigenous Nations want to participate collaboratively in the Project to ensure it is well managed and not going to create long-term environmental degradation. Suggested this approach will create a degree of control for the Gwitchin people which is important for quantifying significant adverse impacts. Noted the significance of assessment, data, management, and planning work. Chief [redacted] said the northern Indigenous Nations will share their interests/concerns with Chance and will stop the process from advancing if it does consider local Indigenous Knowledge. Noted the importance of listening to Elders and their teachings to inform Project management, planning, and decision-making. Chief [redacted] added the importance of upholding sustainability objectives and expects Chance to work more responsibly.

[redacted] shared interest in having a full dialogue on issues, concerns, and values with the northern Indigenous Nations. Noted the Project's intention is to minimize impacts and hopefully create benefits too. Acknowledged that this exchange is required. [redacted] said he felt like Chance was previously delivering information in a one-way direction and hopes to have more of

[redacted] TWC kindly requests Chief [redacted] review and clarify this sentence to make sure it adequately captures what was being shared.

an exchange. Noted Chance is unable to react without feedback and looks forward to doing whatever it takes to address the concerns identified by the northern Indigenous Nations.

Grand Chief [redacted] acknowledged Gwitchin Treaty rights to harvest, including the rights to access to support their harvesting. Noted these rights come with the responsibility to legally and spiritually be stewards of their Traditional Territory. Shared a story about the late Elder [redacted], who travelled by dogsled in the 1960s in and around the Peel River area. Grand Chief [redacted] said the late Elder [redacted] saw smoke and assumed it was a camp. As he approached the smoke, he realized it was a drill rig. This was a troubling experience because late Elder [redacted] did not know who these people were or what they were doing on the land. This experience laid the groundwork for Gwitchin people to form the Gwitchin Comprehensive Land Claim Agreement (GCLCA) to prevent future incidents like this in their Traditional Territory. Grand Chief [redacted] explained the GCLCA was signed in 1991 and this agreement set a principle that non-Indigenous people, businesses, government, or elected agencies were not able to do anything in our Traditional Territory without speaking with the original inhabitants of the land. Noted this includes having the right to say no and share standards around what they are willing to allow. Grand Chief [redacted] shared porcupine caribou is the main concern for GTC as well as impacts to water, air, and the overall ecosystem (which is very fragile). Grand Chief [redacted] said he was not a fan of the term 'traditional knowledge' because it refers to the past, and Gwitchin Knowledge is current. He noted Gwitchin Knowledge Studies help Gwitchin people develop a record of their knowledge for community use purposes and stated the importance of respecting the intellectual property of such information. Expressed interest in advancing discussions around historic and current use of the land and impacts to Treaty rights and access. Grand Chief [redacted] shared that the Gwitchin standard is high for a good a reason.

[redacted] asked Chief [redacted] what collaboration looks like to her community. Chief [redacted] responded that she is at today's meeting to share the perspectives of her community and the standards they are trying to uphold. Noted these standards were established through their laws and agreements. Chief [redacted] said Chance had heard community feedback for over 20 years. Noted the northern Indigenous Nations are not interested in discussing only monetary compensation or relationships. They want to protect the land, water, air, and caribou. Chief [redacted] said there are outstanding questions to be answered around water, hydrology, and the assessment of oil and gas. These conversations will also include the Yukon Government. Chief [redacted] confirmed she had shared how her community would like to see this process move forward and preferred not to speak to her personal feelings. Chief [redacted] asked [redacted] to clarify what he meant by one-way conversation and lacking information. She said this comment was unclear because there is an established process through YESAB to obtain information. Requested further clarification from Chance. [redacted] said Chance has hired consultants to support their assessment and the Project has an interest from learning from the First Nations. [redacted] said he hears about Section 35 rights and mentioned he is looking to understand what those rights are and how the Project could potentially infringe on those rights. [redacted] added that the Chance had conducted baseline studies and offered to provide this information with the First Nations. Expressed interest in receiving First Nation feedback on what Chance has learned to help guide how they develop and manage the Project until conclusion. [redacted] said Chance is trying to develop a pathway to support conversations that will take place under a cooperation agreement including a terms-of-reference. He noted that previously this process did not go far and explained Chance is following this process because it was how mining companies in the Yukon

had moved forward their proposed projects. [redacted] asked the group to confirm if there is a different way of doing it.

Grand Chief [redacted] said he was surprised by the comment [redacted] made about not understanding legal rights. He said the courts look at collaborative agreements and IBAs to clarify the muddy waters. Grand Chief [redacted] said their rights have evolved over the last 30 years. Stated each Indigenous Nation has the inherent right to self-government in their Traditional Territories. Grand Chief [redacted] said if they seem sensitive it is because Chance is looking to occupy a part of their Traditional Territory and as a sovereign nation, they must review that. Noted it would take another 20 years to get an idea of rights. Grand Chief [redacted] expressed interest in clearly understanding timelines to convey this information back to the community level. Noted the Chiefs are spokespeople that have a responsibility to explain to their people what is being proposed. He said the support of Gwitchin will not be possible if he is unable to explain the Project to his people. Grand Chief [redacted] said he used to this type of back-and-forth dialogue. Noted there is often a desire to hold your cards close to your chest for fear of liability. He suggested Chance create frank and open discussions because that is what matters to the Gwitchin people. Shared that some people in the community may be upset around work being conducted in this area. Grand Chief [redacted] asked Chance if they will stop operations if the caribou migrate to the Project area. He explained that is the baseline of what Gwitchin people will expect and the community will also be interested in understanding what Chance is doing in the area to protect caribou and other species. Grand Chief [redacted] acknowledged some effort had been made to protect caribou. As a leader, Grand Chief [redacted] said he needs to be able to answer these questions from the community.

[redacted] said Chance loves feedback and had information to share. Noted Chance is looking to better understand how the northern Indigenous Nations would like to be engaged and how Chance should proceed after today.

Meeting attendees took a break between 3:50 pm – 4:05 pm.

[redacted] said Chief [redacted] wants the whole life cycle of Eagle Plains examined, and it is difficult for Chance because the Project is currently exploratory and does not go beyond that. Shared that the Project will determine if there is anything worth pursuing. If there something worth pursuing is found, then that is a better time to establish economic partnerships since the nature of the resource to be developed will be better understood [redacted] noted that Chief [redacted] understands this process because of the Victoria Gold project. [redacted] reiterated that the proposed Project is the first stage involving 30 wells to get an idea around what resources are available in the Eagle Plains for everyone. He added that pipelines and other works required after exploration will be considered later. [redacted] said Chance is willing to risk their money and assume that it might not work out, but they really hope that it will. Suggested the northern Indigenous Nations may regret getting into something now if it turns out differently because at this stage there is not enough information to move on. [redacted] said the northern Indigenous Nations can evaluate how the Project goes including how the terrain is treated and improvements needed to protect the environment better. [redacted] said Chance is focused on this first stage (exploration). He said that is hoping the northern Indigenous Nations will help Chance with that. Noted exploration is high risk in terms of very uncertain outcomes related to resource determination and they will not want to participate in that. Suggested involvement beyond exploration will be different, including a payoff for all the northern Indigenous Nations.

[redacted] said the exploration phase will create opportunities for businesses and these opportunities will continue even expand into development if the project proceeds beyond exploration.

Grand Chief [redacted] respectfully said they are not interested in any kind of payoff and said that [redacted] comment about payoff was offensive. [redacted] responded that he meant there would be an opportunity to be a full partner in the Project. Grand Chief [redacted] said they have different expectations and are interested in being full partners now. Expressed interest in understanding the nature of the operation and how and understood the long period of time between initial investment. Grand Chief [redacted] shared GTC experienced the false prospect of the Mackenzie Valley Pipeline. Shared that he felt the discussion was not getting anywhere productive and suggested Yukon Government attend the next meeting. Grand Chief [redacted] requested the meeting conclude. Chief [redacted] and Chief [redacted] agreed with Grand Chief [redacted] request to stop the meeting. Chief [redacted] added that they had addressed the major points and want further deliberation with Yukon Government present. Chief [redacted] added that the northern Indigenous Nations have an obligation to the Yukon Environmental and Socioeconomic Assessment Board (YESAB) as well and will take this time to reflect. Noted the importance of fully understanding what is involved in exploration, including the end product. Chief [redacted] said they want to know they did everything possible to protect the environment. Stated the Charter is intrinsic to everything they do. It is founded on Gwitchin ways. Chief [redacted] thanked everyone for making space for this conversation to happen and shared her appreciation.

[redacted] thanked everyone and said Chance would work on pulling together a summary of engagement topics and associated timelines. Noted the clock is ticking on land tenures. Chief [redacted] confirmed their awareness of the clock ticking and suggested the northern Indigenous Nations will get back to Chance with their perspectives [redacted] added that [redacted] booked accommodation in Old Crow in March at Porcupine Camp. Expressed that finding accommodation in Old Crow is a challenge.

DRAFT

3. Reintroduction Meeting Action Items & Next Steps

Table 2 below details action items and next steps identified during the Reintroduction Meeting.

Table 2: Reintroduction Meeting Action Items & Next Steps

Topic	Action Description	Responsible	Estimated Date
Meeting Minutes	• Review and provide comment on Draft Reintroduction Meeting Minutes with Two Worlds Consulting.	All	February 20, 2023
Meeting Minutes	• Incorporate meeting attendees' feedback on the Draft Reintroduction Meeting Minutes and share a finalized version of the minutes with all attendees for their records.	Two Worlds Consulting	March 1, 2023 (or approximately 2 weeks after receiving feedback from meeting participants)
Meeting Agendas	• Create simplified agendas for future meetings.	Chance	Ongoing
Meeting Format	• Utilize visual aids such as presentation slides and maps during future meetings.	Chance	Ongoing
Next Steps	• Share perspectives with Chance.	GTC, NND, VGFN	TBC

APPENDIX 2-B-25. May 16, 2023, Open House Summary Report

GWICH'IN TRIBAL COUNCIL AND CHANCE OIL AND GAS LIMITED:
INUVIK COMMUNITY OPEN HOUSE SUMMARY REPORT (MAY 16, 2023)

Figure 1: Inuvik (May 2023).

Introduction

Chance Oil and Gas Limited (Chance) is proposing the Eagle Plains Exploration Project (Project) to gain a deeper understanding of the economic viability of oil and natural gas reserves within the Eagle Plains Basin. Proposed project activities are scheduled to take place over for up to 10 years. These activities include:

- Constructing approximately up to 1,500 square kilometers of new 3D seismic lines.
- Constructing approximately up to 2,000 square kilometers of 2D seismic lines.
- Drilling up to 30 wells (5-8 wells per year) during the winter to evaluate the presence of oil and natural gas resources.

Chance is currently preparing its Project Proposal for submission to the Yukon Environmental Socio-economic Assessment Board's (YESAB) Executive Committee in February 2024.

Chance invited Gwich'in Tribal Council (GTC) Participants (Gwich'in Participants) and residents of Inuvik to a Project Overview Open House (Open House) in Inuvik on Tuesday, May 16, 2023. The objectives of the Open House were to:

- Strengthen the relationship and enhance communications between Gwich'in Participants, residents of Inuvik, and Chance.
- Share Project information to support Gwich'in Participants and residents of Inuvik prepare and present views on information shared.

This report summarizes the Open House event including the location, invitation, details, and feedback.

Event Location

The Open House was hosted at the Nihtat Gwich'in Council Board Room in Inuvik, Northwest Territories.

Open House Invitation

On May 11, 2023, Chance sent an event invitation poster to GTC staff to post in Inuvik facilities. This invitation was targeted to Gwich'in Participants and residents of Inuvik (Appendix A). Chance shared the Open House invitation via a rolling advertisement with a local radio station. The invitation provided key information such as event purpose, event location and time, and Chance contact information to share questions and/or feedback about the Open House or the Project.

Figure 2: Open House advertisement at the Nihtat Gwich'in Government building in Inuvik.

Open House Participation

Open house participants included:

- Chance Project Team[1]:
  - Chance.
  - Environmental Dynamics Inc. (EDI).
  - Ecofor; and
  - Two Worlds Consulting (TWC).
- Gwich'in Participants.
- GTC Staff; and
- Residents of Inuvik.

Open House Details

The Open House was held on May 16, 2023, from 4:00 pm to 8:00 pm MDT. Open House attendees[2] were asked to sign-in upon arrival and were given a Project handout (Appendix B). The Project handout included a Project overview, information on the Project assessment process, and proposed Project consultation and engagement activities. Open House attendees who signed in were added to a draw for an opportunity to win door prizes (see page 5 for more information on draw prizes). In total, there were 6 Open House attendees.

Chance posted Photo Permission Posters (Appendix C) around the Nihtat Gwich'in Council Board Room. These posters indicated that Chance would be taking photos at the Open House and that the photos would be used by Chance in public-facing materials. The posters also welcomed Open House attendees to advise facilitators from TWC if they preferred that they and/or their children not be photographed. No Open House attendees requested not to be photographed.

Chance set up posterboards (Appendix D) around the Nihtat Gwich'in Council Board Room to share Project information with Open House attendees. Chance representatives were available to respond to comments and questions while Open House attendees reviewed the posterboards. Posterboards included:

- Eagle Plains Exploration Project
  - This poster included a high-level project description, project benefits to the Yukon, a project map (also showing First Nations' Traditional Territories and Settlement Lands, permit zones, Peel Watershed Planning Region, North Yukon

[1] The Chance Project Team wore name tags to identify their names and the organization they represented.
[2] Open house attendees refers to Gwich'in Participants, GTC Staff, and residents of Inuvik.

Planning Region, and Dawson Planning Region), and a summary of the YESAB Executive Committee assessment process.

- Heritage Resource Management Program
    - This poster included a description of the Project's Heritage Resource Overview Assessment, Heritage Resource Impact Assessment, Systematic Data Recovery Excavation, and current heritage resources management work within the Project area.
- Permafrost and Terrain Mapping
    - This poster included background information on permafrost in the Project area, how terrain and permafrost information inform the project design, surficial geology mapping, and next steps for permafrost data gathering.
- Porcupine Caribou Herd
    - This poster included information on habitat mapping, seasonal ranges based on historic use of the area, caribou distribution and movement, key existing information, and the Project's *Linear Features Study*.
- Wildlife and Habitat Mapping
    - This poster included an ecological land classification plot location map, and information on species such as birds, moose, and American marten in the project area.
- Fisheries and Water
    - This poster identified key findings from fish and aquatic studies, and information on fish sampling locations, water quality, and hydrology.
- Information about Chance, Jobs, and Training.
    - This poster included a Chance company profile, examples of project-related jobs, and related training requirements.
- Chance's Seismic Exploration Program
    - This poster included information on seismic technology, seismic programs, the difference between 2D and 3D seismic, and how Chance is planning to reduce potential seismic-related impacts.

Chance contracted a resident of Inuvik to prepare dinner for Open House attendees. Dinner was served at 5:30 pm MDT. Chance began the Open House by providing a Project Overview Presentation (Appendix E). Open House attendees were encouraged to ask questions about and share comments on the Project during and after the presentation. Chance staff drew prize winners[3] throughout the Open House. Door prizes included:

[3] Open House prize winners had to be present at the time their name was drawn. If an individual was not present at the time their name was drawn, a new name was drawn.

- Two Air North gift cards (eligible for freight and flight).

All Open House attendees were offered Ecofor lanyards and pens.

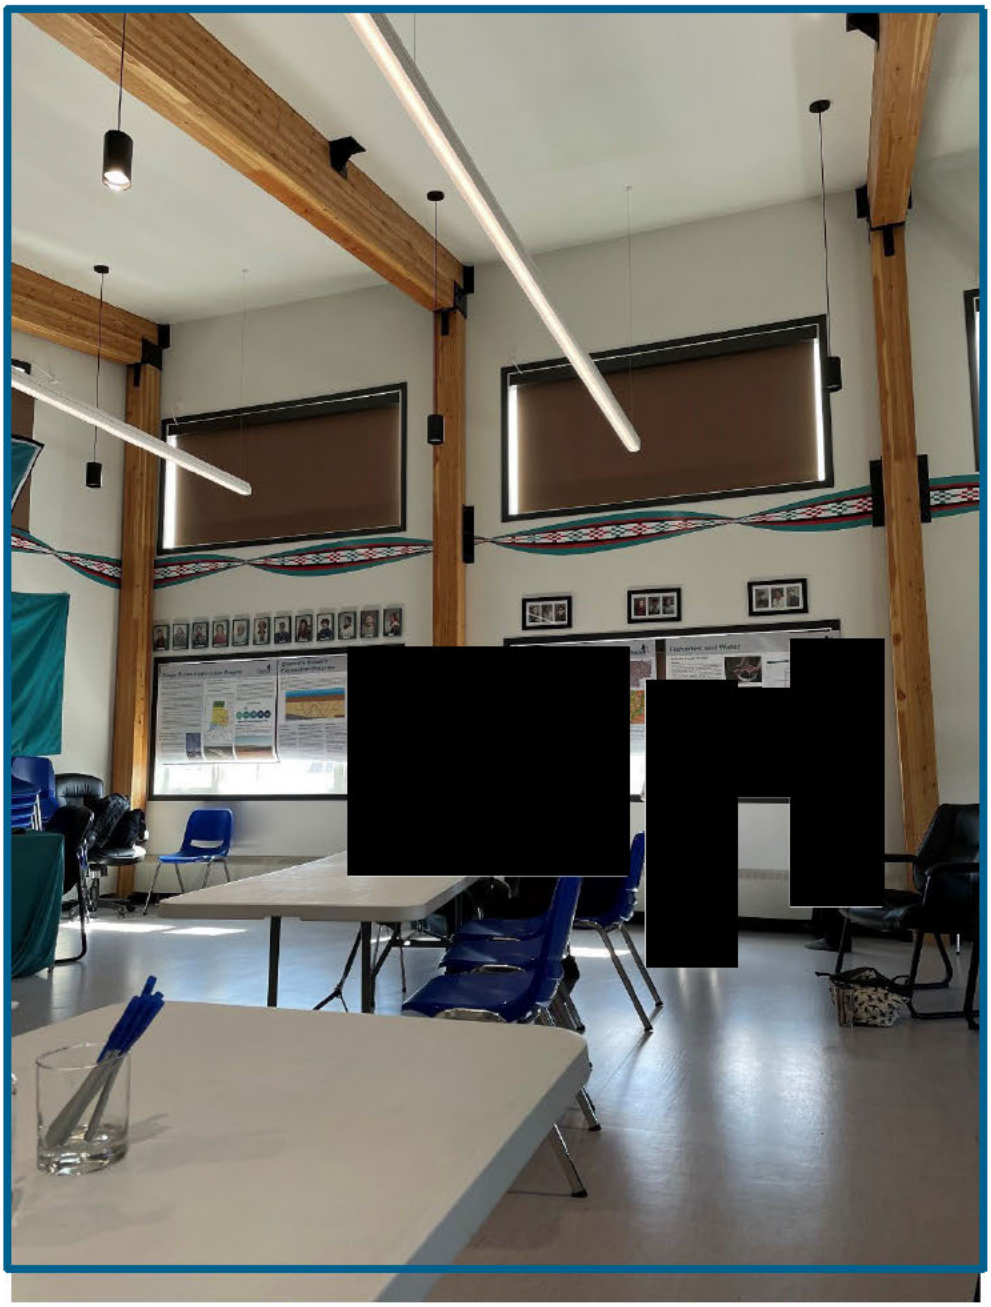

Figure 3: Chance Project Team discussing posterboard information at the Open House with event attendees.

Chance asked Open House attendees to complete the Open House Feedback Form (Appendix F) prior to leaving the event. This form asked attendees:

- How they heard about the Open House.
- How they would rate the Open House.
- If they were able to share their thoughts, ideas, and knowledge during the Open House in a comfortable manner.
- If the Open House helped them learn more about Chance and the Project.
- What they liked most about the Open House and what could be improved upon at future Open House events.
- If they had any additional comments or questions about Chance, the Project, and/or the Open House.
- If they wanted to receive project updates including information on future engagement events.

Open House Feedback Form results are summarized in the Open House Feedback section of this report. Four feedback forms were submitted at the Open House.

Open House Feedback

Table 1 summarizes feedback shared at the Open House by Gwich'in Participants and residents of Inuvik.

Table 1: Open House Feedback

Feedback Topic	Feedback Shared	Chance's Response to Feedback Shared
Wildlife	Asked if the Project considered potential effects to frogs.	Project activities are primarily in winter when frogs will be dispersed and hibernating below the soil surface. Due to primary winter activities and minimal soil disturbance, Project interactions with frogs are expected to be negligible and were not evaluated further.
	Asked if the Project considered potential effects to invertebrates including water insects.	Due to primary winter activities and minimal soil disturbance, Project interactions with invertebrates are expected to be negligible and were not evaluated further.
	Asked if the Project researched how to avoid high quality moose habitat.	The Chance Project Team confirmed that moose habitat had been studied. Added that potential Project-related effects to moose habitat, and mitigation measures to address those effects, would be described in the Project Proposal.
	Suggested Chance monitor wildlife after any damages to permafrost.	The Chance Project Team acknowledged the comment and confirmed there would be ongoing wildlife monitoring throughout the Project.
	Suggested Chance monitor where caribou are standing, as they are always moving.	The Chance Project Team shared they have been working with Porcupine Caribou Herd collar data from the Porcupine Caribou Technical Committee to better understand potential Project-related effects to the Porcupine Caribou Herd.
	Noted that Porcupine Caribou Herd will stick around for a two-week period.	
	Asked if Chance is planning to put collars on moose.	The Chance Project Team confirmed they are not planning to put collars on moose.
	Noted Project activities are not when birds are there, but chickadees may be there.	The Chance Project Team acknowledged the comment and that there may be some overwintering birds in the RSA.

	Noted that the Project area is not good for grizzlies and asked about protection measures for black bears.	Due to primary winter activities and minimal soil disturbance, Project interactions with black bears are expected to be negligible. The Chance Project Team said the Project will avoid active den sites if any are identified.
Vegetation	Asked if there are any berries in the Project area.	The Chance Project Team acknowledged there are berries in the Project area.
	Asked what the difference is between old growth forests and new forests.	The Chance Project Team confirmed that old growth forests are considered areas with trees over 100 years old and newer forests have trees less than 100 years old.
Project Design	Asked about mercury and fire effects on well heads.	The Chance Project Team said no mercury or fire effects are expected.
	Asked Chance to clarify what dog legged means.	The Chance Project Team clarified that the term dog legged referred to crocked or bent. This term was used in reference to the proposed seismic activities for the Project versus more traditional grid seismic lines from the 1990s. A dog-legged method is proposed to reduce potential Project-related effects to predator-prey relationships.
	Asked where Project sewage will go (e.g., river, lake, or land).	The Chance Project Team said all wastewater and sewage will be collected in tanks approved by the Canadian Standards Association and transported offsite for disposal at an approved facility in Fort McPherson.
	Asked about the end users of oil and gas products from the Project.	The Chance Project Team confirmed end users of a potential future extraction project are expected to be folks and businesses from Yukon and Northwest Territories. Confirmed any future extraction Project would undergo an environmental assessment. Confirmed this Project has no end-use product and focuses on exploration.

	Asked how Chance collects seismic data.	The Chance Project Team confirmed seismic data is collected by technology called geophones. Added that geophones are placed in the ground and then picked up by helicopter and taken to a lab for data analysis.
	Asked if Chance is only drilling in the winter.	The Chance Project Team confirmed that Project drilling activities will occur only in the winter.
	Asked how many wells there are so far.	The Chance Project Team confirmed there are six existing wells in the Eagle Plains area. Added that Chance is proposing to drill up to 30 wells over a 10-year period.
	Asked how Chance reclaims well sites.	The Chance Project Team said progressive reclamation will be ongoing throughout the Project. Added that wells will be plugged and covered to support natural revegetation.
Employment	Asked if the Project will be good for young people looking for work.	The Chance Project Team acknowledged the comment and expressed interest to share potential Project-related employment and training opportunities with youth, when available.
	Suggested Chance discuss job opportunities at the high school.	
Community Wellbeing	Asked about potential Project-related effects to Inuvik and mentioned increased community investments could influence their decision-making around extending their existing work contract in Inuvik.	The Chance Project Team confirmed they hired Two Worlds Consulting to assess potential Project-related effects to communities. Added that this assessment is still underway and will be described in the Project Proposal.
	Noted Inuvik needs more community amenities such as Tim Hortons.	The Chance Project Team acknowledged the comment.
	Shared difficulty access fresh produce in the spring after the ice road closes.	The Chance Project Team acknowledged the comment.
Water Quality	Asked if water is monitored for residue.	The Chance Project Team said that water quality will be characterized for the effects assessment.

Heritage Resources	Mentioned the importance of protecting archaeological, historical, and paleontological sites	The Chance Project Team responded that any archaeological and heritage resource discoveries in the Project area will be protected from Project related impacts.
	Someone said the Borden number is a coordinate and known archaeological site that is not to be disturbed.	The Chance Project Team acknowledged the comment. Confirmed potentially affected First Nations would be contacted if archaeological and heritage resources are discovered to follow appropriate protection protocols.
Permafrost and Surficial Geology	Asked how much closer the drill got in areas where permafrost was burned from fire.	The Chance Project Team responded that vegetation affected by wildfire will grow back in 100 to 200 years. Shared that drilling occurs only in the winter and the ground will be frozen. The surface hole may encounter an interval of up to 20 meters that is not bedrock but unconsolidated water saturated soil and ice that is solid only because it is frozen during the winter. Confirmed sensitive permafrost areas will be avoided.
Consultation and Engagement	Suggested Chance advertise future community engagement events in Inuvik at the post office, churches, and the grocery store.	The Chance Project Team acknowledged the comment.
	Asked if Chance is talking to Elders. Added that it is important to listen and follow what Elders say as they have wisdom and know what they are talking about. Noted Elders are not on Facebook. Mentioned the importance of knowing both sides of the story to the best decision is made.	The Chance Project Team acknowledged the comment.

Open House Closing

Chance appreciated the opportunity to host the Open House in Inuvik and learn more about Project-related interests, concerns, and feedback from Gwich'in Participants and residents of Inuvik.

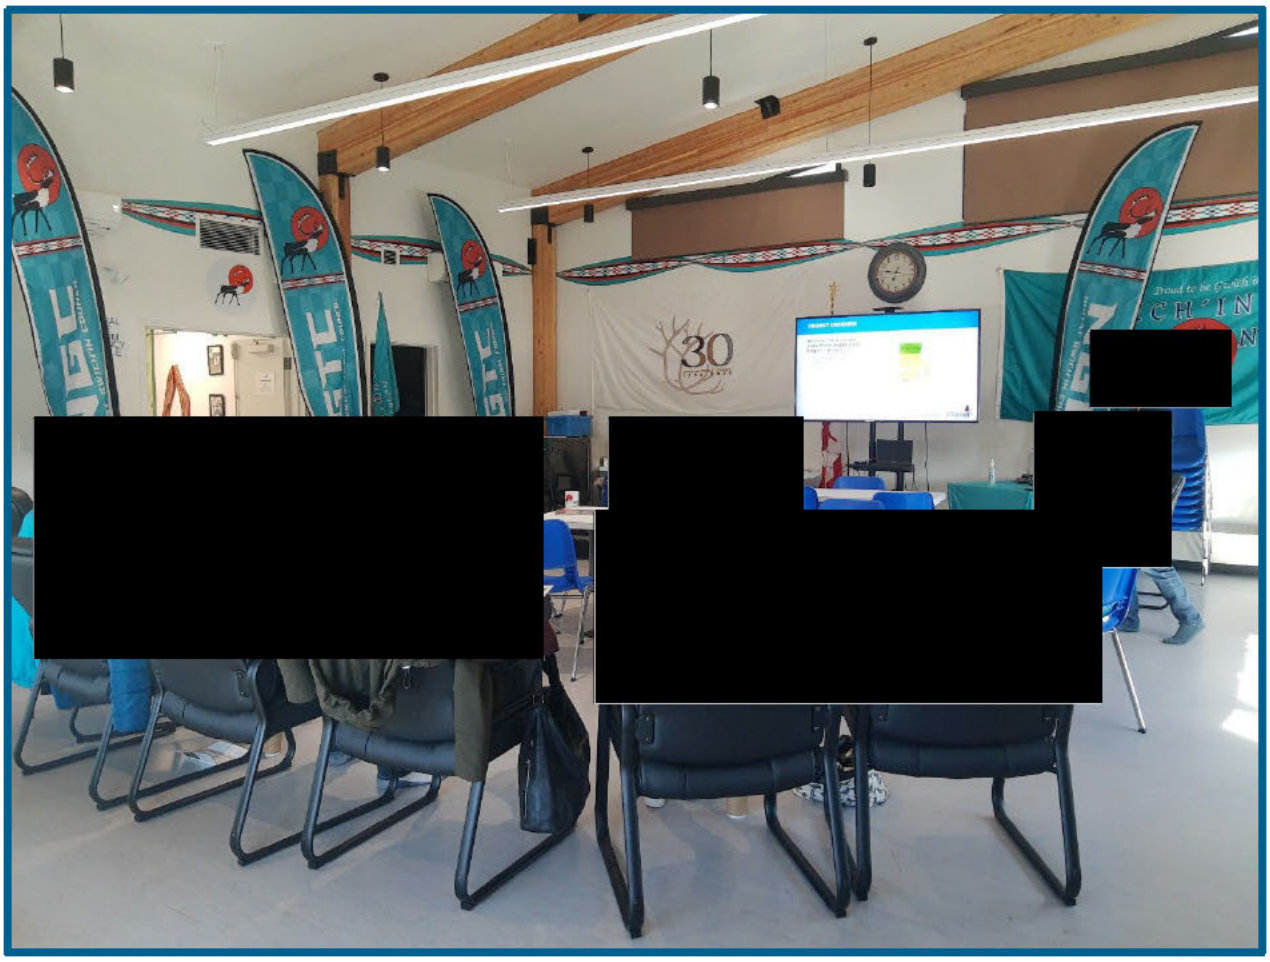

Figure 4: Chance presenting at the Open House.

APPENDIX A

Chance
OIL AND GAS LIMITED

OPEN HOUSE

TUESDAY, MAY 16, 2023

Come learn about Chance Oil and Gas Ltd.'s proposed Eagle Plains Exploration Project! There will be a presentation and opportunities to provide feedback & get involved!

DOORS OPEN FROM 4:00 PM – 8:00 PM

NIHTAT GWICH'IN COUNCIL BOARD ROOM

DOOR PRIZES | FOOD | FREE ENTRANCE

For more information, please contact:
Greg Charlie (e: gcharlie@chanceyukon.ca, p: 867.456.7805) or Cindy Dickson (e: cdickson@chanceyukon.ca, p: 867.456.7805).

APPENDIX B

Eagle Plains Exploration
Project Update - May 2023

Chance
OIL AND GAS LIMITED

Eagle Plains Exploration Project Location

Who is Chance?
What Do We Plan to Do?

- Exploration company focused on assessing Yukon's oil and natural gas potential
- Hoping for government and community support to explore in the Eagle Plains area
- If approved, investigation would include drilling more wells and carrying out seismic surveys for up to 10 years
- Small scale, to provide steadier long-term jobs and contracts to local residents and businesses
- Once investigations are complete, we would know how much oil vs. how much gas, and whether it's economical to proceed to development
- No fracking anticipated, now or later

What We've Been Working On in 2022/2023

- Refining our plans for how to address concerns related to sensitive environmental factors including caribou
- Preparing to start the regulatory process
- Understanding what information regulators and communities want and need
- Collecting scientific data to understand effects and create options for how to manage effects
- Preparing to show communities our plans before entering the regulatory process in 2023

Where and How We Hope to Engage

- Old Crow, Dawson, Mayo, Inuvik, and Whitehorse
- Respect community preferences on timing, approach
- Share our draft plans, get feedback, adjust/amend plans

What Do Our Plans Look Like for Restarting the Regulatory Process?

Relationship-building, Information-sharing

Engagement 1
What is the Project

Engagement 2
What are Project effects, and how could we mitigate them?

Regulatory process begins

When:
May 15 – 18, 2023

Where:
Old Crow, Fort McPherson, Inuvik

With whom:
Vuntut Gwitchin First Nation (VGFN), Gwich'in Tribal Council, and members of the communities of Old Crow, Inuvik, Fort McPherson

What we hope to discuss:
- Who is Chance, what do we stand for?
- What is exploration?
- What is Chance's plan?
- How do communities wish to engage with Chance?
- Methods of engagement:
  - Meetings with leadership
  - Community open houses

When:
June 12 – 15, 2023

Where:
Old Crow, Mayo, Dawson, Inuvik, Whitehorse

With whom:
Vuntut Gwitchin First Nation (VGFN), First Nation Na-cho Nyak Dun (FN NND), Tr'ondëk Hwëch'in (TH), Gwich'in Tribal Council, and members and businesses of the communities of Old Crow, Mayo, Dawson, Inuvik

What we hope to discuss:
- What are the potential positive and negative effects of exploration?
- What are community concerns?
- How could Chance address these concerns?
- Methods of engagement:
  - Meetings with leadership
  - Community open houses
  - Socio-economic interviews

Yukon Environmental and Socioeconomic Assessment Board (YESAB) begins

- The Project will be assessed under YESAB's Executive Committee process
- YESAB will see how Chance has reflected the results of Engagement 1 and Engagement 2 in its submission documents
- Under *Yukon Environmental and Socioeconomic Assessment Act (YESAA 2003)*, YESAB may engage First Nations and communities as needed. Typically, YESAB hosts multiple public comment periods
- Chance will work with YESAB to support their efforts to engage First Nations and communities on the Project
- Chance will be available to share information, listen and learn

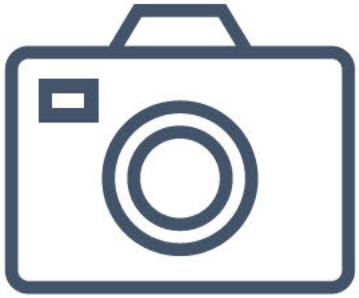
OIL AND GAS LIMITED

Photo Consent



Photos will be taken at today's event. These images will be used by Chance Oil and Gas Limited in public-facing materials.

If you prefer for you or your child not to be photographed, please speak to the Open House facilitators from Two Worlds Consulting.

APPENDIX D

Eagle Plains Exploration Project

Chance Oil and Gas Limited Overview

Chance Oil and Gas Limited (Chance) is an exploration company focused on assessing oil and natural gas potential in Yukon. Chance was incorporated on September 19, 1994 and has offices in Whitehorse and Calgary.

What is the proposed Eagle Plains Exploration Project?

Chance is proposing a drilling and seismic exploration project ("Eagle Plains Exploration Project" or "Project") to better understand oil and natural gas resources in the Eagle Plain Basin. Chance will conduct the following activities over a period of up to 10 years:

- Construct 1,500 square kilometers (km²) of new 3D seismic lines (i.e., pathways created by removing vegetation to support Project activities)
  - Seismic lines will be constructed over multiple programs (i.e., not all at once)
- Construct 2,000 km² of 2D seismic lines
  - Seismic lines to be constructed during one or multiple of the 3D seismic programs
- Drill up to 30 wells to evaluate the presence of oil and natural and gas resources
  - Drilling to be conducted during the winter
  - Drilling approximately 5-8 wells per year
- Conduct extended flow testing on up to 20 wells to understand how much oil and/or natural gas each well can produce over time
  - This information will help Chance understand if it is economical to propose a new project focused on extracting available oil and natural gas resources in the Project area.

What are the benefits of oil and natural gas to the Yukon?

If the Project finds it is economical and feasible to extract, the proposed Project will:

- Provide less carbon intensive oil and natural gas supply to Yukon, parts of Canada, and other regions across the world
- Create employment and procurement opportunities for First Nations and local/regional businesses
- Reduce local and regional reliance on oil and natural gas resources from other areas in Canada and across the world
- Improve local and regional energy security
- Offset the use of carbon-intensive diesel in Yukon using natural gas for power generation.

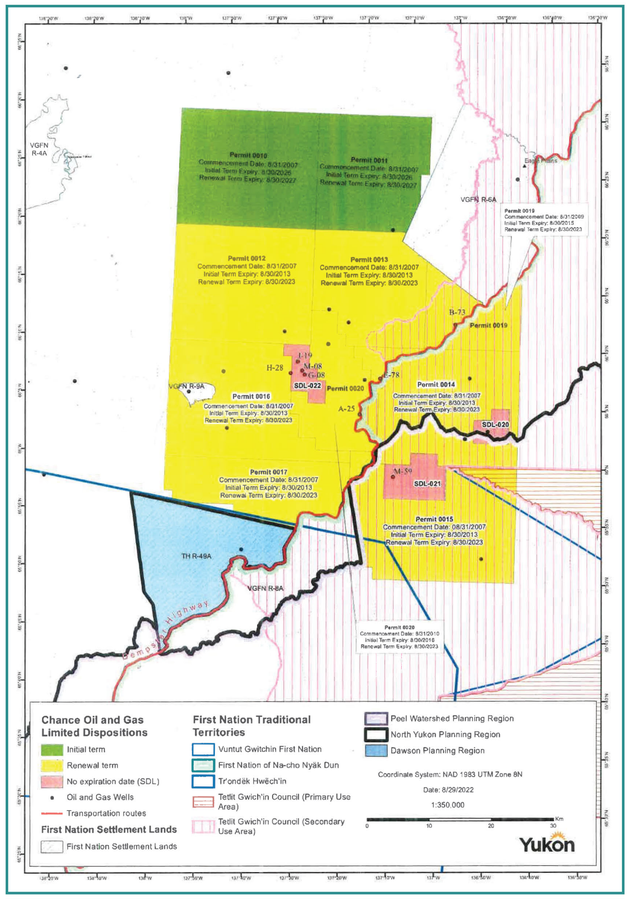
Chance Rig

Where is the Project?

The proposed Project is approximately 2,400 km² located in the territories of:

- First Nation of Na-Cho Nyäk Dun
- Tetlit Gwich'in Council Secondary Use Area
- Vuntut Gwitchin First Nation.

Chance Oil and Gas Limited Dispositions and Wells

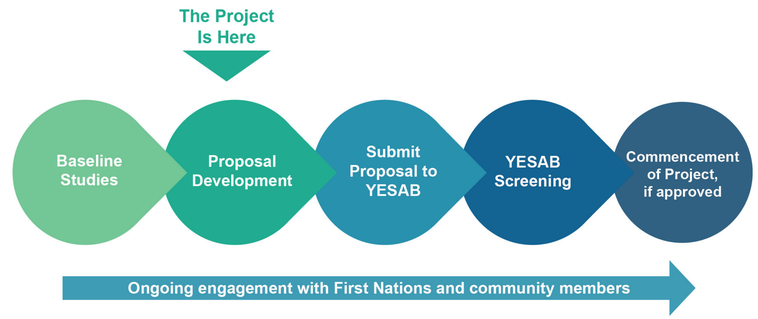


Chance Rig and Camp

What regulatory process does the Project fall under?

The proposed Project will be assessed by the Executive Committee of the Yukon Environmental and Socioeconomic Assessment Board (YESAB), under the *Yukon Environmental and Socioeconomic Assessment Act (YESAA)*. Chance is planning to submit a Project Proposal to YESAB in late 2023. The Project Proposal will reflect feedback from First Nations and community members as well as baseline research conducted by Chance between 2019 – 2023. First Nations and community members will have an opportunity to comment on the Project Proposal in engagement processes and during the YESAB assessment process. Chance will engage First Nations and community members during all stages of the YESAB assessment process.

YESAB Process



First Nation Engagement

Chance appreciates the opportunity to engage and learn from potentially affected First Nations. Chance will incorporate feedback shared during ongoing engagement with First Nations to the Project Proposal and other plans. Chance will provide ongoing Project updates with interested First Nations throughout the life of the Project.

Eagle Plain Basin

Heritage Resource Management Program

Introduction

On behalf of Chance Oil and Gas Ltd. (Chance), Ecofor Consulting Ltd. (Ecofor) has been developing a Heritage Resource Management Program for the Eagle Plains Exploration Project (Project) since 2021. The goals of the Heritage Resource Management Program are to assess the heritage resource potential and sensitivity within the Project Area and make recommendations for the ongoing management of heritage resources. The Heritage Resource Management Program includes three main types of assessments:

1. Heritage Resource Overview Assessment (HROA)

- An HROA involves a desktop review (no fieldwork) including reading through past documents, databases, and maps of the physical/environmental and cultural/historical setting within the Project Area. Information gathered during the desktop review is used to identify known heritage resource sites and predict areas of high potential for undocumented heritage resource sites. The HROA considers landscape features (e.g. mountains, hills, valleys), visible surroundings, closeness to natural resources (e.g. water and food gathering areas), and distance to previously recorded heritage resource sites to determine high potential for undocumented heritage resource sites. Indigenous Knowledge and Traditional Land Use data are also used to enhance the HROA, when available.

2. Heritage Resource Impact Assessment (HRIA)

- An HRIA is the first phase of field study within a Heritage Resource Management Program. It involves visits to any known heritage resource sites that may be affected by exploration activities and the areas of elevated potential identified in the HROA. Specific HRIA tasks include:
  - Pedestrian survey to identify surficial heritage resources and areas with potential for underground heritage resources
  - Shovel testing in areas with confirmed potential for underground heritage resources
  - Documentation of all shovel test locations and heritage resource sites encountered during the HRIA
  - Reporting of all documented heritage resource sites encountered during the HRIA to First Nations, Chance, and the Yukon Government Heritage Resource Unit.

3. Systematic Data Recovery Excavation (SDR)

- An SDR program is used when the Project cannot avoid affecting a heritage resource site. The goal of the SDR program is to mitigate impacts to the site area by collecting detailed site data to develop a strong understanding of the site. Specific SDR tasks include:
  - Shovel testing within the known site area to determine the site boundaries and identify underground heritage resources
  - Excavation of 1 m x 1 m excavation units, arranged as blocks, trenches, or individual units, to recover heritage resource materials
  - Detailed documentation of all heritage resources encountered during the SDR program
  - Reporting of all documented heritage resource sites encountered during the SDR program to First Nations, Chance, and the Yukon Government Heritage Resource Unit.

Heritage Resource Management Program Details

Previous Heritage Resource Management Work Within the Project Area

The Project Area has not been extensively explored for heritage resources, but a few studies have assessed portions of the current footprint. These studies include three permitted HRIAs related to previous oil and gas exploration and one HRIA related to a fibre optic cable project along the Dempster Highway. Three non-permitted studies have also been completed in association with the fibre optic project along the Dempster Highway, including a HROA, an Indigenous Knowledge/Traditional Land Use study, and an update to the original HROA. These studies have identified seven archaeological sites and one Yukon Historic Sites Inventory site.

[redacted]

Current Heritage Resource Management Work Within the Project Area

The Project's Heritage Resource Management Program work began in 2021. An HROA was completed in early 2022. This review identified several thousand areas of high potential for surface and underground heritage resource sites within the 2,400 km^2 area Ecofor archaeologists studied.

In 2022, Ecofor conducted an HRIA program within a 625 km^2 subsection of the Project Area where a new seismic and drilling program has been proposed. A Vuntut Gwitchin First Nation member participated in this HRIA. Work included a helicopter survey throughout this area, a survey on foot, and shovel testing at 12 locations. In total, 228 shovel tests were completed. Shovel tests at location E10 led to the recording of archaeological site [redacted] This site has been flagged as a no-work area. If future phases of the Project are unable to avoid the site area, an SDR program may be considered. No heritage resources were discovered at the other shovel test locations.

Chance and Ecofor will continue to develop the Heritage Resource Management Program. Further HRIA studies are planned for summer 2023. This work will help inform heritage resources management needs of proposed Project activities.

Heritage Resource Management Program

Introduction

On behalf of Chance Oil and Gas Ltd. (Chance), Ecofor Consulting Ltd. (Ecofor) has been developing a Heritage Resource Management Program for the Eagle Plains Exploration Project (Project) since 2021. The goals of the Heritage Resource Management Program are to assess the heritage resource potential and sensitivity within the Project Area and make recommendations for the ongoing management of heritage resources. The Heritage Resource Management Program includes three main types of assessments:

1. Heritage Resource Overview Assessment (HROA)

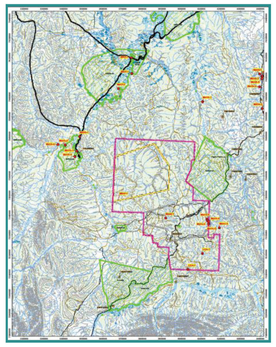
- An HROA involves a desktop review (no fieldwork) including reading through past documents, databases, and maps of the physical/environmental and cultural/historical setting within the Project Area. Information gathered during the desktop review is used to identify known heritage resource sites and predict areas of high potential for undocumented heritage resource sites. The HROA considers landscape features (e.g. mountains, hills, valleys), visible surroundings, closeness to natural resources (e.g. water and food gathering areas), and distance to previously recorded heritage resource sites to determine high potential for undocumented heritage resource sites. Indigenous Knowledge and Traditional Land Use data are also used to enhance the HROA, when available.

2. Heritage Resource Impact Assessment (HRIA)

- An HRIA is the first phase of field study within a Heritage Resource Management Program. It involves visits to any known heritage resource sites that may be affected by exploration activities and the areas of elevated potential identified in the HROA. Specific HRIA tasks include:
  - Pedestrian survey to identify surficial heritage resources and areas with potential for underground heritage resources
  - Shovel testing in areas with confirmed potential for underground heritage resources
  - Documentation of all shovel test locations and heritage resource sites encountered during the HRIA
  - Reporting of all documented heritage resource sites encountered during the HRIA to First Nations, Chance, and the Yukon Government Heritage Resource Unit.

3. Systematic Data Recovery Excavation (SDR)

- An SDR program is used when the Project cannot avoid affecting a heritage resource site. The goal of the SDR program is to mitigate impacts to the site area by collecting detailed site data to develop a strong understanding of the site. Specific SDR tasks include:
  - Shovel testing within the known site area to determine the site boundaries and identify underground heritage resources
  - Excavation of 1 m x 1 m excavation units, arranged as blocks, trenches, or individual units, to recover heritage resource materials
  - Detailed documentation of all heritage resources encountered during the SDR program
  - Reporting of all documented heritage resource sites encountered during the SDR program to First Nations, Chance, and the Yukon Government Heritage Resource Unit.



Eagle Plains Overview Map

Heritage Resource Management Program Details

Previous Heritage Resource Management Work Within the Project Area

The Project Area has not been extensively explored for heritage resources, but a few studies have assessed portions of the current footprint. These studies include three permitted HRIAs related to previous oil and gas exploration and one HRIA related to a fibre optic cable project along the Dempster Highway. Three non-permitted studies have also been completed in association with the fibre optic project along the Dempster Highway, including a HROA, an Indigenous Knowledge/Traditional Land Use study, and an update to the original HROA. These studies have identified seven archaeological sites and one Yukon Historic Sites Inventory site.

Current Heritage Resource Management Work Within the Project Area

The Project's Heritage Resource Management Program work began in 2021. An HROA was completed in early 2022. This review identified several thousand areas of high potential for surface and underground heritage resource sites within the 2,400 km^2 area Ecofor archaeologists studied.

In 2022, Ecofor conducted an HRIA program within a 625 km^2 subsection of the Project Area where a new seismic and drilling program has been proposed. A Vuntut Gwitchin First Nation member participated in this HRIA. Work included a helicopter survey throughout this area, a survey on foot, and shovel testing at 12 locations. In total, 228 shovel tests were completed. Shovel tests at location E10 led to the recording of archaeological site [redacted]. This site has been flagged as a no-work area. If future phases of the Project are unable to avoid the site area, an SDR program may be considered. No heritage resources were discovered at the other shovel test locations.

Chance and Ecofor will continue to develop the Heritage Resource Management Program. Further HRIA studies are planned for summer 2023. This work will help inform heritage resources management needs of proposed Project activities.

Permafrost and Terrain Mapping

Background Information on Permafrost

Continuous permafrost is frozen ground that remains below 0°C for more than 2 years. Chance Oil and Gas Ltd's (Chance) proposed Eagle Plains Exploration Project (Project) is entirely within a zone of continuous permafrost. The depth of permafrost below the ground surface varies across the Eagle Plains landscape and throughout the year. Permafrost can be more or less sensitive to disturbances (e.g., drilling), depending on a number of factors, such as ground temperature, ice content, and soil type. Permafrost warmer than -2°C is more likely to thaw as a result of local, minor disturbances to the ground surface, whereas cooler permafrost will likely not thaw from minor disturbances.

Chance needs to understand the terrain and permafrost conditions of the Project Area to design the Project. This information is key for identifying the best areas for the Project's access roads and well pads, for locating gravel for road construction, and for the in-ground placement of drill cuttings. Palmer has mapped the geology of the top layer of ground (what is above the bedrock, also called the surficial geology), determined the state of permafrost throughout the Project Area, and created maps identifying suitable locations for Chance's proposed oil and natural gas exploration activities.

Palmer installed sensors, using a drill that can be carried in a helicopter, to measure ground temperature and frozen/thawed state in the top 1 m of the ground in suitable locations.

Helicopter slinging drill

Drilling with lightweight Talon drill

How Terrain and Permafrost Information Informs the Project

The active layer is the part of the ground that thaws in the summer and refreezes in the winter. Palmer's drilling work shows that the active layer is 0.45 to 0.9 m thick in fine-grained soils, below wetlands, and in valley bottoms. In coarse-grained soils, it is more than 0.9 m thick. Areas recently burned by wildfire have active layers that are more than 1 m thick, possibly much more.

Field Testpit

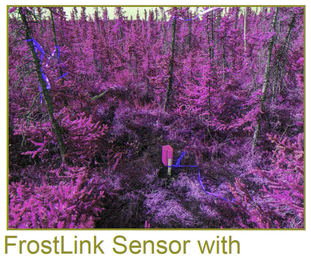
Ice content information is important, as ground containing lots of ice is more sensitive to disturbances (e.g., drilling) and recovers less quickly than ground containing less ice. Areas with high to moderate amounts of ice were found within wetlands and fine-grained soils. The ice content in these areas makes up more than 20% of the soil, but ice amounts vary a lot and are not the same throughout the soil. Ground with low amounts of ice, (less than 10% of the soil) were found within weathered sandstone bedrock near the surface and within coarse-grained layers of material that can be found alongside fine-grained layers of material containing more ice. Palmer concludes that ground ice content in the Project Area is highly variable (i.e., the amount of ice underground is not the same everywhere). Palmer upgraded the oil and natural gas exploration suitability maps to account for different permafrost conditions.

Palmer first collected data from the ground temperature sensors in summer 2022. Cold, stable permafrost was identified in areas with lots of ice on the valley bottom and in a few other areas. One site on a northeast slope within the Project Area has a ground temperature of 3.8°C at 1 m depth, and temperatures are likely similar at locations on similar slopes. Palmer was unable to measure the ground temperatures at 1 m depths at two locations because the equipment malfunctioned.

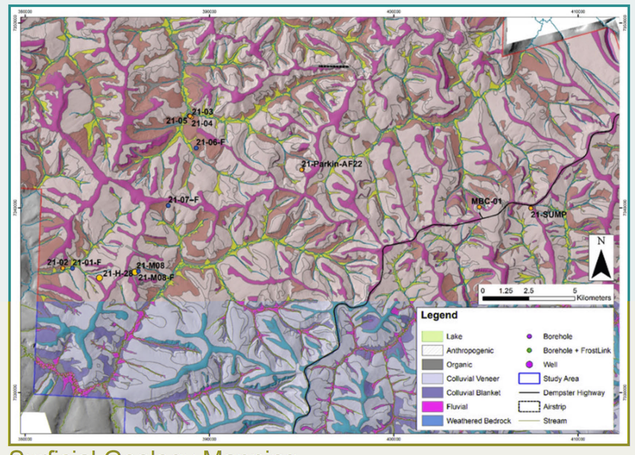
In places where the shrubs and trees were burned by wildfire 18 years ago, the active layer is more than 1 m thick (and may have thawed down to bedrock) and the 1 m ground temperature is -0.2°C. Permafrost is unlikely to return to its former possible shallower depths due to the site conditions (a lack of vegetation), so permafrost is considered to be naturally disappearing at this site.

Cold, stable permafrost is preferred for proposed Project activities. Areas with large amounts of ice can either be avoided or protected through appropriate actions. Areas where permafrost is naturally becoming deeper because trees and brush were lost to wildfire should be left to naturally recover (i.e., allow permafrost to slowly re-establish itself) or actions can be taken to help keep the ground cold (e.g., adding an insulating cover to perform the same function as vegetation or installing a thermal management device). Such mitigation would likely result in faster permafrost recovery of these areas.

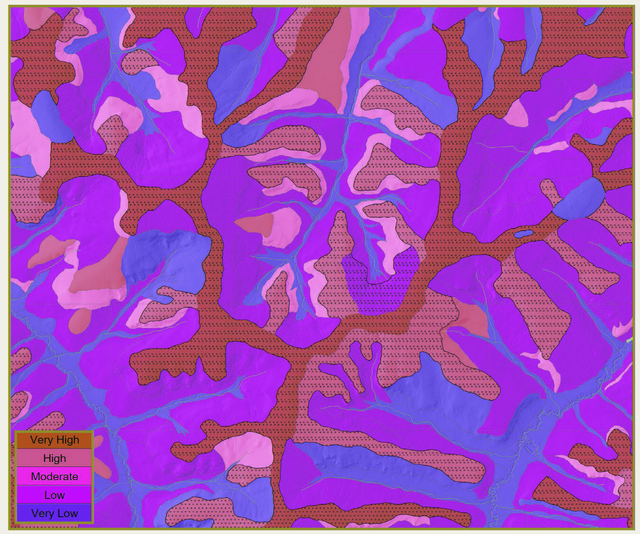
FrostLink Sensor with Plastic Housing



FrostLink Sensor with Steel Housing



Surficial Geology Mapping



Road and Wellpad Suitability for Exploration

Suitability is determined based on surficial geology, permafrost conditions, and drainage. Very high and high suitability are favourable for establishing access roads and wellpads, low and very low suitability are unfavourable for establishing access roads and wellpads. The exploration suitability map assumes no mitigation. Exploration activity that needs to cross less suitable areas can be done responsibly through appropriate mitigation.

Next Steps

Next steps include gathering data from two sensors installed in 2022, replacement of malfunctioning sensors, and installation of six new sensors in summer 2023. The new sensor design is more durable and waterproof and is expected to perform better in the harsh climate.

Porcupine Caribou Herd

Overview

The Porcupine Caribou Herd's annual range extends over large portions of northern Yukon and northeast Alaska. Environmental Dynamics Inc. (EDI) conducted habitat, movement, and linear features studies to:

- Better understand the Eagle Plains Exploration Project (Project) Area with regards to Porcupine Caribou
- Support the assessment of potential Project-related effects to Porcupine Caribou
- Identify ways for the Project to reduce potential Project-related effects to Porcupine Caribou.

Key Existing Information

- The Project overlaps a small proportion of the Porcupine Caribou Herd's late fall and winter ranges
- Based on the past 30 years of data collected from collars placed on caribou to track their movement using GPS, less than 3% of the Porcupine Caribou Herd typically occurs within the Project Area
- Late-fall and winter are less-sensitive periods for Porcupine Caribou
  - During these seasons, Porcupine Caribou are typically in good body condition and are free of insects and other stressors
  - Late-fall and winter are not associated with critical life stages, such as breeding or calving.

Example caribou habitat in Eagle Plains with lots of terrestrial lichen

Habitat Mapping

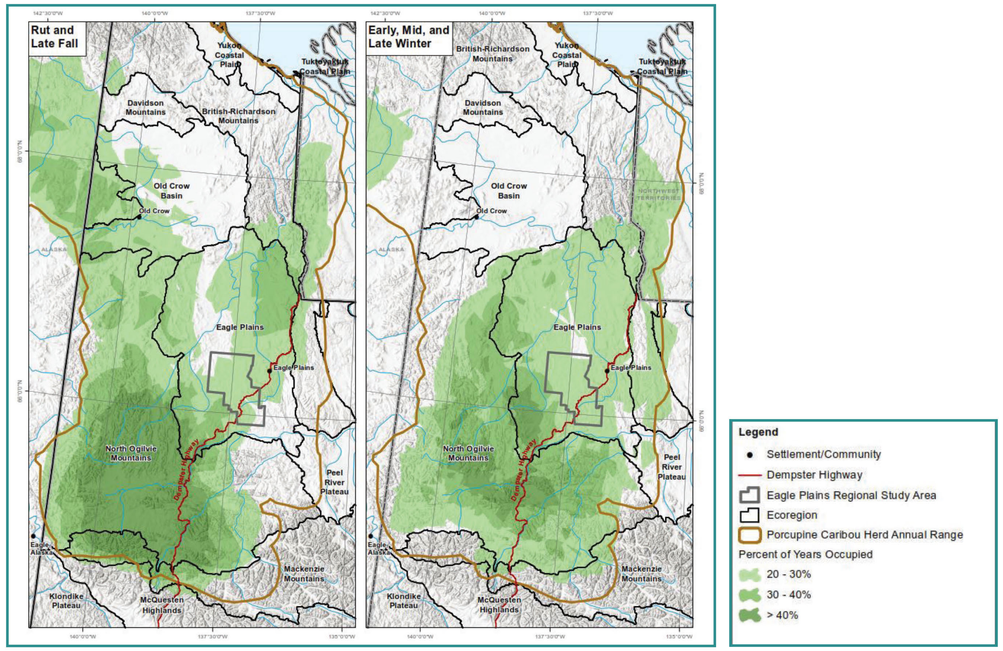
EDI modeled Porcupine Caribou habitat using collar data from the Porcupine Caribou Management Board and vegetation mapping. These models describe the amount, quality, and distribution of important late-fall and winter Porcupine Caribou habitat across the Project Area. Lichen cover was the primary driver of habitat selection by caribou.

Caribou Distribution and Movement

EDI used collar data and studies conducted by the Porcupine Caribou Technical Committee to better understand how much of the Project Area overlaps with the late-fall and winter ranges and movement routes of the Porcupine Caribou Herd.

- Caribou tend to move an average of 8.7 km per day in late-fall and 4.4 km per day in the winter.
- Porcupine Caribou spent half as much time in the Project Area during the late-fall and winter than other parts of their late-fall and winter ranges.

Seasonal Ranges Based on Historic Use



Linear Features Study

Linear features (e.g., roads, powerlines, and trails) can affect how people and wildlife move across the landscape as well as predator-prey relationships. EDI studied existing linear features in the Project Area to evaluate vegetation recovery on linear features and how those lines are used by people and wildlife.

- There are three main types of linear features associated with past oil and gas exploration activities in the Eagle Plains: winter roads, 2D seismic lines (i.e., pathways created by removing vegetation to support oil and gas exploration activities) (5-8 m wide), and 3D seismic lines (1.5-3 m wide)
- Most 2D seismic lines are from oil and gas exploration activities that took place between the 1950s to 1990s
  - 75% of these seismic lines have vegetation growing back with similar species and densities as the nearby vegetation that wasn't disturbed
