  - 22% of these seismic lines have vegetation growing back at a faster rate, and are now larger than nearby vegetation that wasn't disturbed
- All 3D lines were created in the winter of 2014, and showed signs of normal regrowth
  - Line of sight down 3D lines was not expected to offer substantial advantage to hunters and/or predators compared to line of sight through areas that were undisturbed
- Signs of caribou or moose use were observed on all types of linear features
- Other than the Dempster Highway, no human use was observed on linear features in winter.

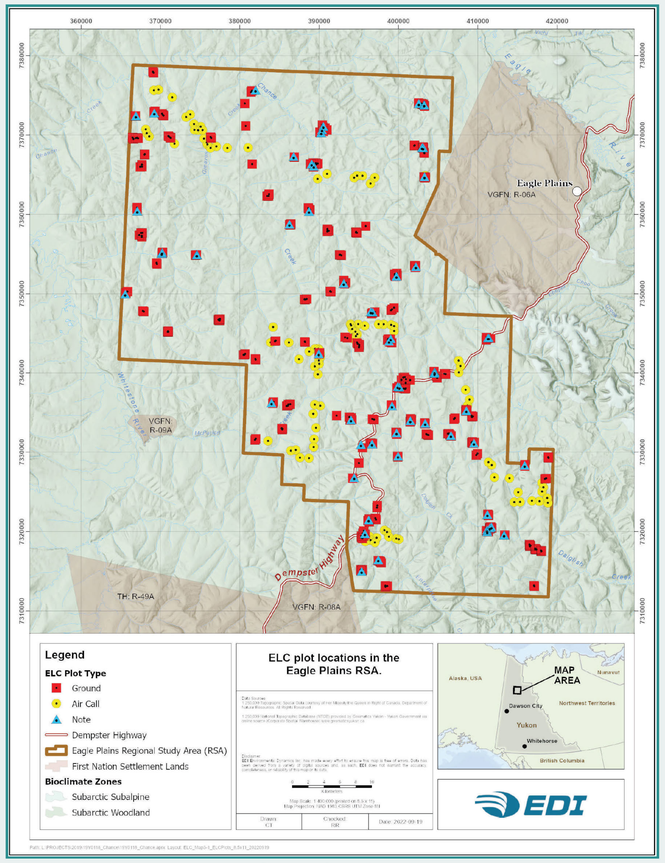
Wildlife and Habitat Mapping

Overview

Chance Oil and Gas Limited (Chance) is committed to protecting wildlife and habitat during the proposed Eagle Plains Exploration Project (Project). Many types of wildlife occur in the Project Area at different times of year. Environmental Dynamics Inc. (EDI) has been gathering information on a number of key species in the Project Area. Field studies, best management practices, working with Indigenous land users and Traditional Knowledge holders, and consultation with communities will help make informed decisions about protecting the environment and wildlife throughout the life of the Project.

Ecological Land Classification - Habitat Mapping

The Yukon Environmental Socio-economic Assessment Board requires that a project proposal have an area-wide ecosystem map. This mapping identifies any rare or sensitive ecosystems in the Project Area and can be used for wildlife habitat mapping. Both ecosystem and habitat mapping can be tools to measure potential Project-related impacts and disturbances to habitat types. They can also be used to reduce potential Project-related effects. EDI completed ecosystem mapping across the Project Area following Yukon standards for Ecological Landscape Classification.



Ecological Landscape Classification Plot Locations

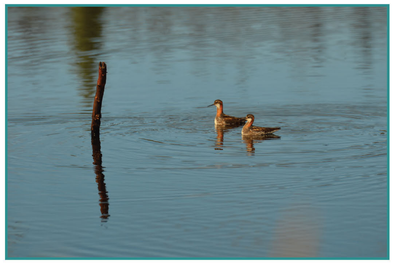
Birds

Due to the remote location of the Project Area, existing knowledge on bird presence was limited. EDI conducted point count surveys and wetland bird surveys in the Project Area in June 2019. A total of 52 species of birds were detected, including four species at risk: Red-necked Phalarope, Common Nighthawk, Olive-sided Flycatcher, and Rusty Blackbird. The number of species and total bird abundance were both well-distributed across the habitats of the Project Area. Most birds are expected to be absent from the Project Area during winter months.

Lincolns Sparrow

Rock Ptarmigan

Spotted Sandpiper



Red-necked Phalarope

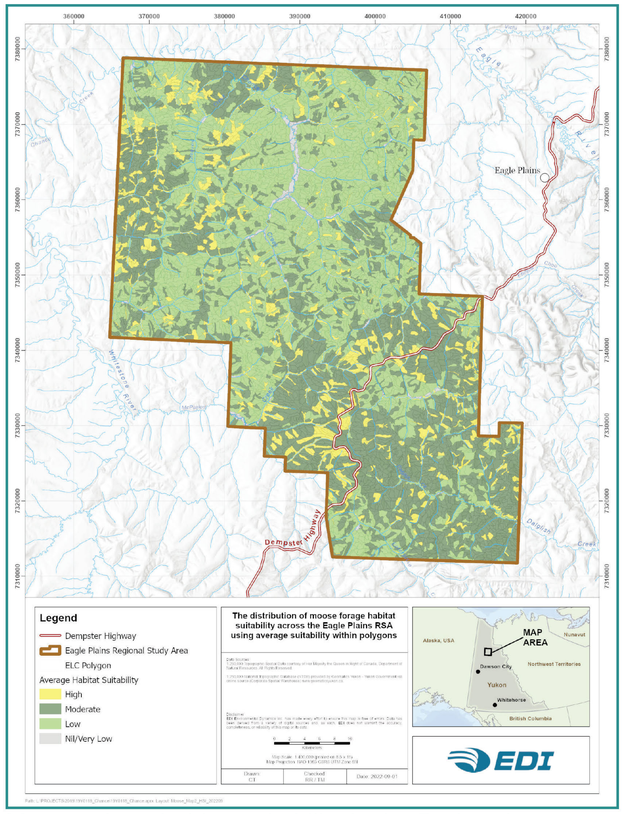
American Marten

Marten is an indicator species for mature and old forest values and is important to local communities as a furbearer. EDI developed a habitat model to understand the amount, quality, and distribution of habitat for this species. The majority (60%) of the Project Area is made up of low-quality habitat. High-quality habitat, found in 16% of the Project Area, is associated with mesic, spruce-dominant ecosites in mature to old forests.

Moose

Formal population surveys of moose have not been conducted in the Project Area but local knowledge suggests that, while moose densities in Eagle Plains are relatively low compared to areas in southern Yukon, they are relatively high compared to other areas in northern Yukon. Winter is the most limiting season for moose due to reduced food availability and greater energy demands from cold temperatures and the extra effort to travel through snow. EDI developed a habitat model to understand winter moose habitat amount, quality, and distribution in the Project Area. The model identified widespread moderate- and low-quality habitat, with only a small amount of high-quality habitat present.

Willow shrubs browsed by moose in the Project Area



Moose winter habitat suitability in the Project Area

Fisheries and Water

Fish and Aquatic Studies

Overview

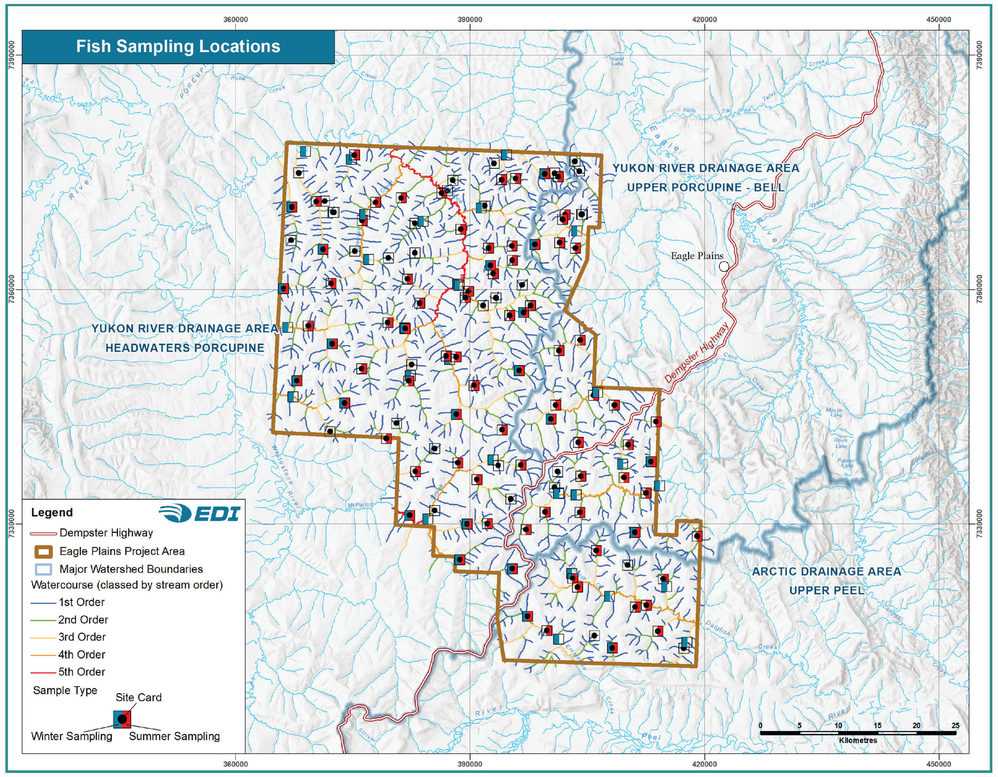
There is very little information available on fish populations in the Eagle Plains Area. In order to gain a better understanding of where and when fish are there, EDI conducted studies in 2019 and 2020. These studies included compiling historic info, assembling available spatial data on streams, conducting field studies in 2019-2020, and developing a model that could be used to tell the chances of fish being present in streams in the Project Area. Field studies occurred in July/August 2019, when the presence of fish was expected to be its highest, and again in March 2020, when the availability of overwintering fish habitat was expected to be at its lowest.

Key Findings

- Six species of fish were observed within or immediately next to the Project Area. This included Arctic grayling, slimy sculpin, longnose sucker, burbot, round whitefish, and lake whitefish. All of these species, with the exception of lake whitefish, were observed during the summer 2019 fish surveys.
  - During the summer, Arctic grayling were around the most. They were the only species found in all types of streams.
- Larger streams generally had better habitat for fish such as higher water volume and better water quality (e.g., dissolved oxygen levels). EDI found that the bigger the stream, the more likely the fish were there.
- During winter, fish habitat becomes very limited due to reduced water flow and reduced water quality. Smaller streams had no water in the winter. In bigger streams, water was limited to deeper pools and dissolved oxygen levels were too low to support overwintering fish.

Arctic Grayling caught during fish sampling

Electrofishing sampling during summer 2019



The 'order' is the type of stream, 1 is the smallest and 5 is the biggest. Clear sitecards mean that no sampling was done in 2019/2020, but there is historic information that was used in the study.

Water Quality and Hydrology

Overview

The project area contains 1,467 streams, many of which are smaller headwater streams. During summer 2019 and winter 2020, EDI collected water samples from five locations within the Project Area and five locations downstream. Eight of these sites match regional sites previously sampled by Yukon Government Water Resources Branch. EDI then combined the water quality data they collected with historic data available from Environment and Climate Change Canada, Yukon Government Water Resources Branch, and Water Survey of Canada.

Example of brown-stained water that is common in streams within the Project Area

Example of a stream in the Project Area

Key Information and Findings

- Surface water quality was similar across the Project Area. Surface water was generally neutral to slightly acidic, typical for boggy northern landscapes. Turbidity (concentration of suspended sediments) changed from stream to stream, likely as a result of melting permafrost causing slumping of stream banks.
- Some metal concentrations, including aluminum, cadmium, copper, iron, and manganese, were present throughout the Project Area at levels higher than Environment Guidelines. Select metals like arsenic and selenium also exceeded guidelines in isolated samples. Given the lack of development near sampling locations, these high levels of metals are likely naturally occurring.
- Dissolved oxygen is consistently low in all streams surveyed in the Project Area during the winter. It is suspected that most fish migrate out of the Project Area in the winter, to areas where the water conditions better support their survival.

Information about Chance, Jobs, and Training

Chance's Company Profile

Chance Oil and Gas Ltd. (Chance) is a Canadian-owned private company incorporated in the Yukon. Chance's head office is located in Calgary, but its team members are based in both Calgary and Whitehorse.

Key Members of Chance's Team:

- Mike Chernoff, Chairman and CEO
- Richard Wyman, President
- Greg Charlie, VP Government and Community Relations
- Cindy Dickson, Regulatory, Environmental and Community Relations Director
- Lynn O'Neil, Corporate Secretary

Chance's Exploration Objectives

The business plan of the company is to explore for, and in the future potentially develop, oil and natural gas resources in Eagle Plains to help meet the energy needs of the Yukon and/or other markets.

Chance's exploration objectives includes:

- Drill up to 30 wells to evaluate resource potential
- Undertake the exploration program on a small scale over a long period of time (i.e., up to 10 years) in order to minimize environmental and social impacts
- Operate as continuously as possible to provide steady employment, to become more efficient over time, and to reduce costs and disruptions associated with starting up and shutting down
- Involve local and regional businesses
- Discover sufficient oil and natural gas resources to support future development of oil and gas.

Worker at camp

Operator

Annual inspection of bottom suspended wells

Some Examples of Jobs

Drilling Program

- Wellsite Supervisor
- Service Rig
- Security
- Wireline Crew
- Slickline Crew
- Truck drivers/operators (Water Tank, Vacuum Truck, Picker / Bed Truck, Fuel Truck)
- Flow Test Crews
- Tool hand
- Cementing Crew
- Wildlife Monitor
- Heritage Monitor
- Road/Trail Construction and Maintenance

Seismic Program

- Line Preparation Supervisor
- Equipment Operators
- Survey Coordinator
- Surveyor
- Source Preparation Supervisor
- Equipment Helpers
- Cruisers
- Slashers
- Packers
- Water Truck Driver
- Line Crew
- Wildlife Monitor
- Heritage Monitor
- Road/Trail Construction and Maintenance

General Camp Operations

- Nurse Practitioner/Medic
- Camp Cooks
- Office Staff
- Camp attendants
- Maintenance and Cleaning Staff

Project Workforce

Chance's workforce is limited by the size of its camp. The Chance Camp can hold a maximum of 75 - 80 people. It's also possible that additional workers could stay at Eagle Plains Hotel.

Chance will work with First Nations to maximize their involvement. One of Chance's main objectives is to provide as much work and contracts to First Nation / Yukon partners as possible.

Training Requirements

Basic training required by all project workers:

- Workplace Hazardous Materials Information System (WHMIS)
- Hydrogen Sulphide Alive
- Wildlife Awareness
- Emergency First Aid/Wilderness First Aid Training
- Common Safety Orientation

Additional and advanced training (varies by job position):

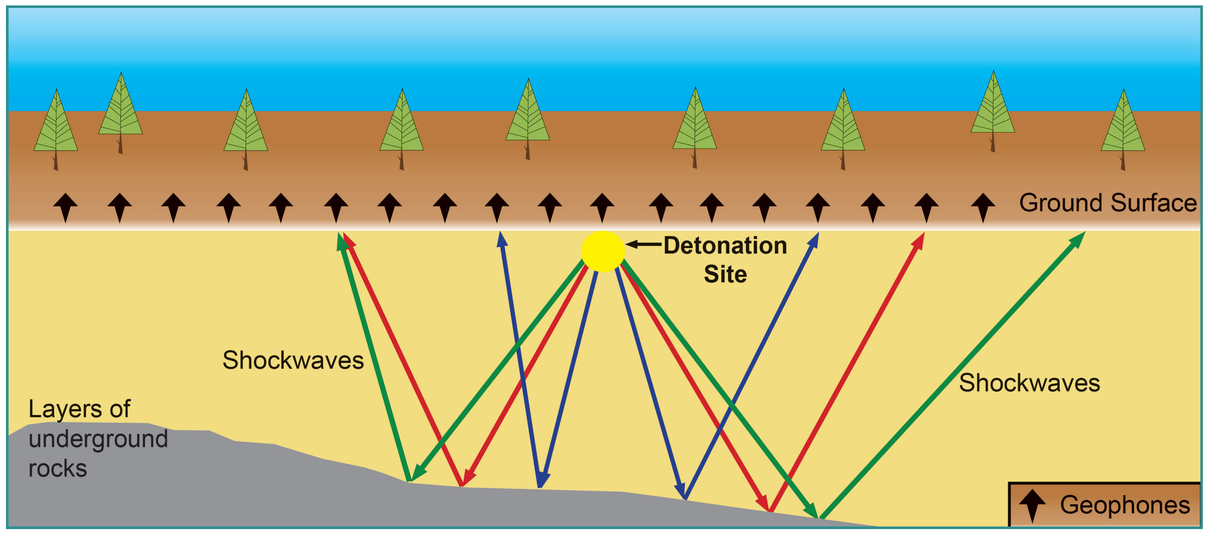
- Food Safe
- ATV
- Chainsaw (Level 1)
- Transportation of Dangerous Goods
- Wildlife/Environmental monitoring training
- Driving licenses (Class 1 and 3)
- Well Service Blowout Prevention
- Confined Space Entry and Monitor
- Fall Protection from Rig Work
- Oilfield Driver Awareness

Annual inspection of bottom suspended wells

Chance's Seismic Exploration Program

What is Seismic?

Seismic technology is used to record and study the earth's layers. Explosives are put in a hole underground (approximately 6m deep) and then that hole is sealed. When the explosives go off, the only sound heard above ground is a dull thud. That sound is similar to that of a passing diesel truck and only lasts about one second. The explosion sends shocks waves down into the ground. Those shock waves bounce back in a variety of different ways off the layers of underground rock. They are then recorded on the surface using equipment called geophones. Information recorded by geophones allows experts to create images of the layers of rock underground and find areas in the earth that may have oil or gas.



How seismic technology works. In this example it is 2D seismic because it is a single line.

Seismic Programs

Chance's seismic programs will help identify the general depths and locations of oil and gas reserves below the surface. Having this information will help decide the best locations for wells and help reduce the number of wells needed for exploration. The seismic programs propose up to 1500 km² of 3D seismic and 2000km of 2D seismic. The programs will take up to 5 to 10 years.

What is the difference between 2D and 3D?

2D seismic data is gathered by putting the geophones and shooting holes with dynamite in one line. 2D seismic is less expensive and needs less lines. They are measured by certain lengths (e.g., 2000 km of 2D seismic).

3D seismic data is gathered by spreading out the geophones in a grid pattern. The source lines (where dynamite is used) will run north/south direction while the receiver lines (geophones) will run east/west director. This is why 3D seismic is measured in area (e.g., 1500 km^2). 3D seismic provides a 3D understanding of the earth's layers. This provides better information on where the oil and gas are located.

2D lines and 3D lines can overlap each other and take place in the same area.

Reducing Disturbances

In order to reduce the impact of the seismic lines on the environment, Chance will:

- Use old lines, previously burnt areas, and natural open areas, instead of clearing vegetation
- Prepare lines in winter to protect ground cover and vegetation.
- Use zigzags and curves in the lines to make them harder to see and reduce predator line-of-sight.
- Using rough mulching, which only takes off branches of trees. The trunk and roots are left intact to preserve the forest.
- Doglegs will be used where lines meet roads so they can't easily be seen by drivers.
- Remote detonate in summer to avoid times when caribou are present and to maximize hours worked.

IL AND GAS LIMITED

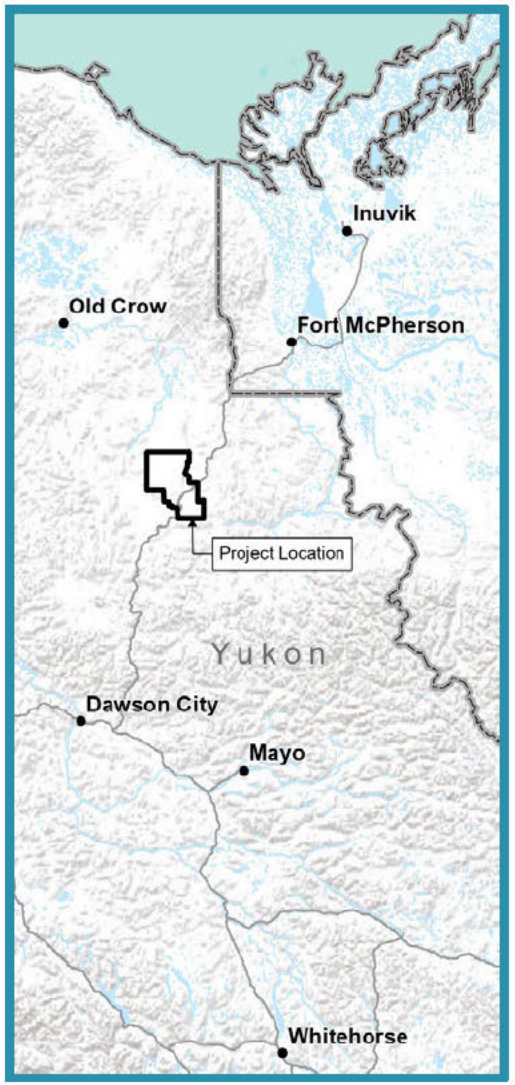
CHANCE OIL AND GAS LIMITED OVERVIEW

Background Information

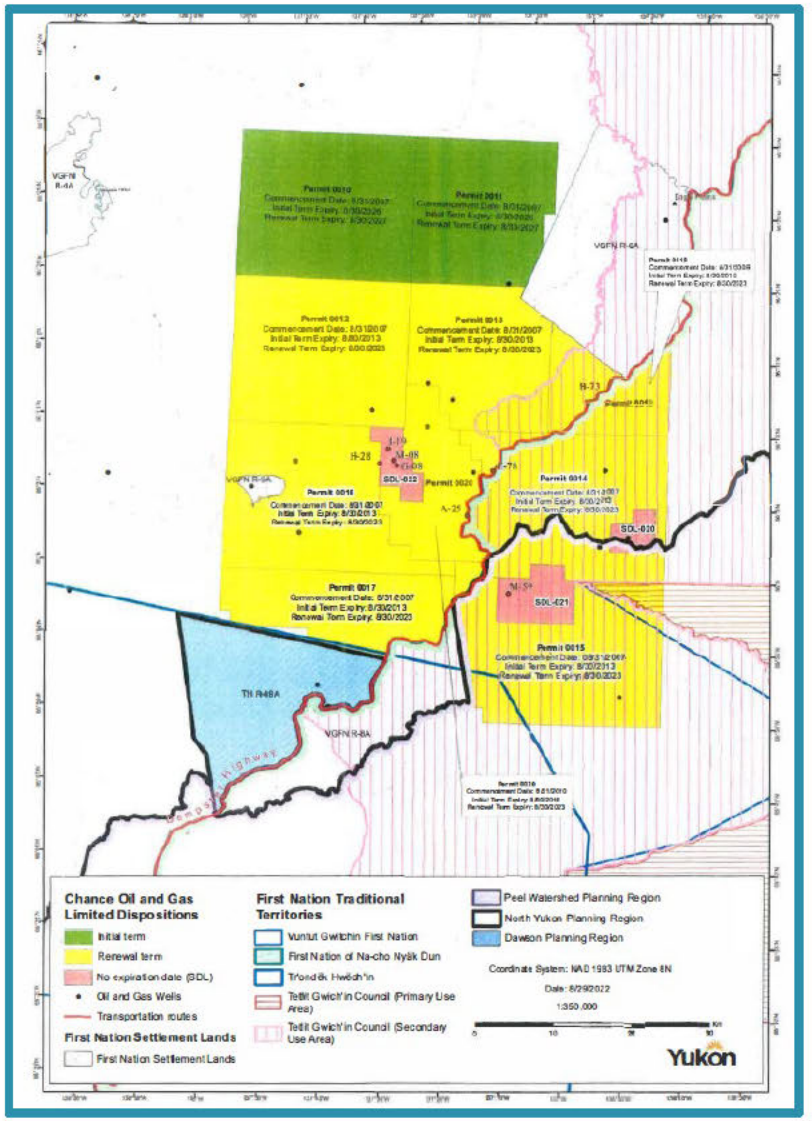
- Incorporated on September 19, 1994
- Offices in Whitehorse and Calgary
- Exploration company focused on assessing oil and natural gas potential in Yukon



PROJECT OVERVIEW

Where is the proposed Eagle Plains Exploration Project ("Project")?

- The proposed Project is located in the territories of:
  - First Nation of Na-Cho Nyäk Dun
  - Gwich'in Tribal Council
  - Tr'ondek Hwech'in
  - Vuntut Gwitchin First Nation



hance
IL AND GAS LIMITED

PROJECT OVERVIEW

What is it the proposed Project?

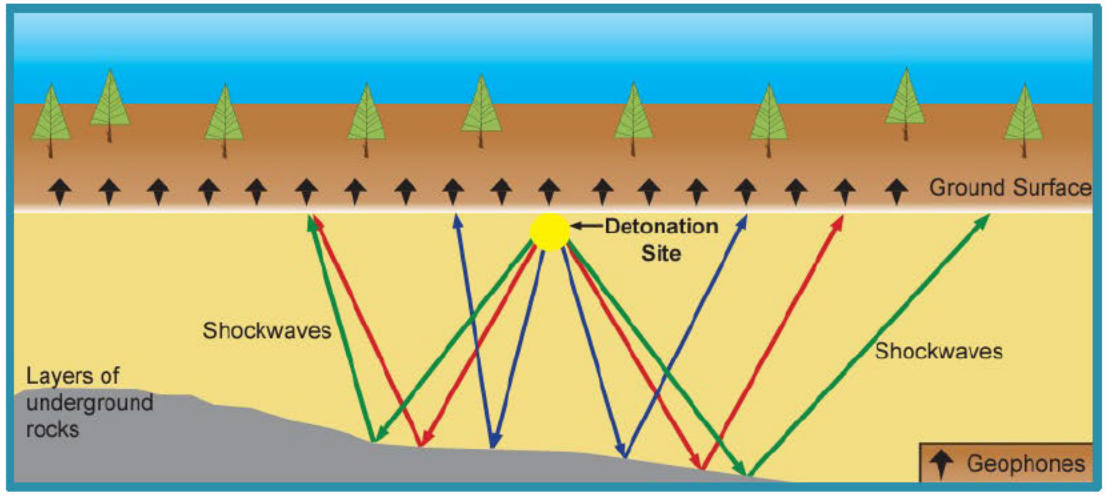
- Drilling and seismic exploration project to better understand oil and natural gas resources in the Eagle Plain Basin
    - If sufficient oil and/or natural gas resources are discovered, Chance will propose to conduct a future extraction project
    - Any future project will undergo additional assessment, consultation, and engagement

hance
IL AND GAS LIMITED

PROJECT OVERVIEW

How is Chance proposing to evaluate oil and natural gas resources in the Eagle Plain Basin?

- Seismic programs will help identify the general depths and locations of oil and gas reserves below the surface. Chance will use this information to:
  - Decide the best locations for wells
  - Reduce the number of wells needed for exploration
- The seismic programs include:
  - 1,500 sq kms of new 3D seismic to be undertaken over the course of several programs
  - 2,000 kms of 2D seismic could be integrated into one or more of the 3D seismic programs



Seismic technology *is used to record and study the earth's layers. Explosives are put in a hole underground (approximately 6m deep) and then that hole is sealed. When the explosives go off, the only sound heard above ground is a dull thud. The explosion sends shocks waves down into the ground. Those shock waves bounce back in a variety of different ways off the layers of underground rock. They are then recorded on the surface using equipment called geophones. Information recorded by geophones allows experts to create images of the layers of rock underground and find areas in the earth that may have oil or gas.*

hance
IL AND GAS LIMITED

PROJECT OVERVIEW

How is Chance proposing to evaluate oil and natural gas resources in the Eagle Plain Basin?

- Drill up to 30 wells to evaluate presence oil and natural gas resources
    - Drilling to be conducted during the winter
    - Drilling approx. 5–8 wells / year
- Conduct extended flow testing on up to 20 wells to understand how much oil and/or natural gas each well can produce over time
    - This information will help Chance understand if it is economical to propose a new project focused on extracting available oil and natural gas resources in the Project area

hance
IL AND GAS LIMITED

PROJECT OVERVIEW

What other Project activities are required to support the proposed drilling program?

- Use of existing Chance camp
  - Capacity: 75 – 80 people
- Use of an existing airstrip
- Construction of winter access roads
- Construction of a winter airstrip

hance
IL AND GAS LIMITED

PROJECT OVERVIEW

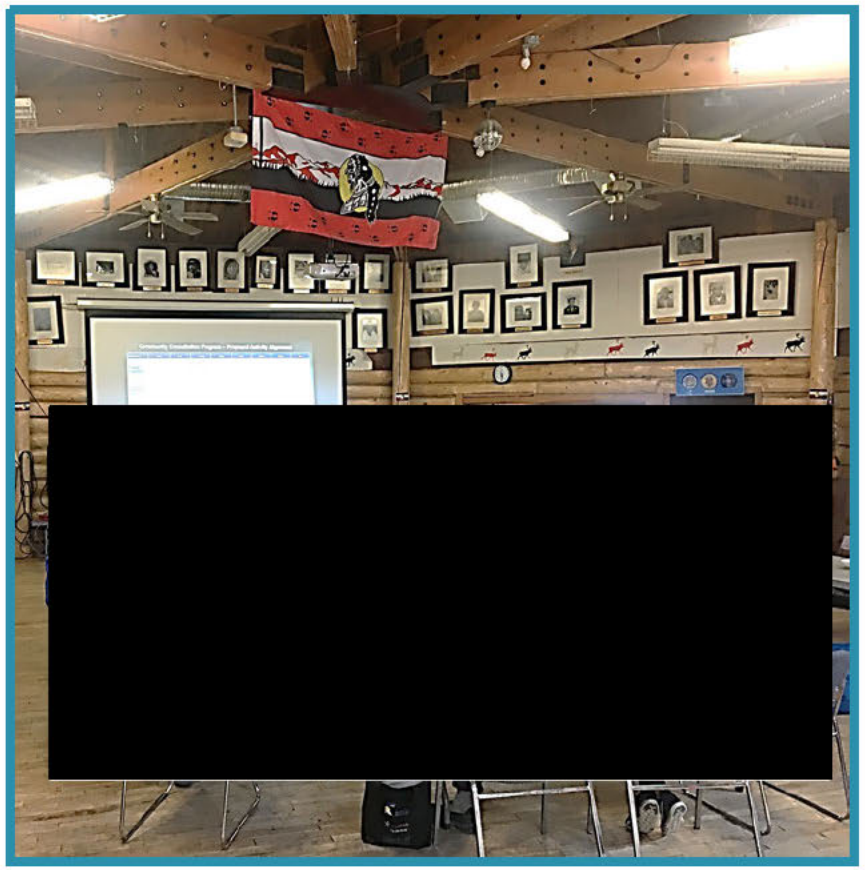
What is the purpose of the Project?

- Provide less carbon intensive oil and natural gas supply to Yukon, parts of Canada, and other regions across the world
- Reduce local and regional reliance on oil and natural gas resources from other areas in Canada and across the world
- Improve local and regional energy security
- Offset the use of carbon-intensive diesel in Yukon using natural gas for power generation
- Create employment and procurement opportunities for First Nations and local/regional businesses

PROJECT OVERVIEW

What regulatory process does the proposed Project fall under?

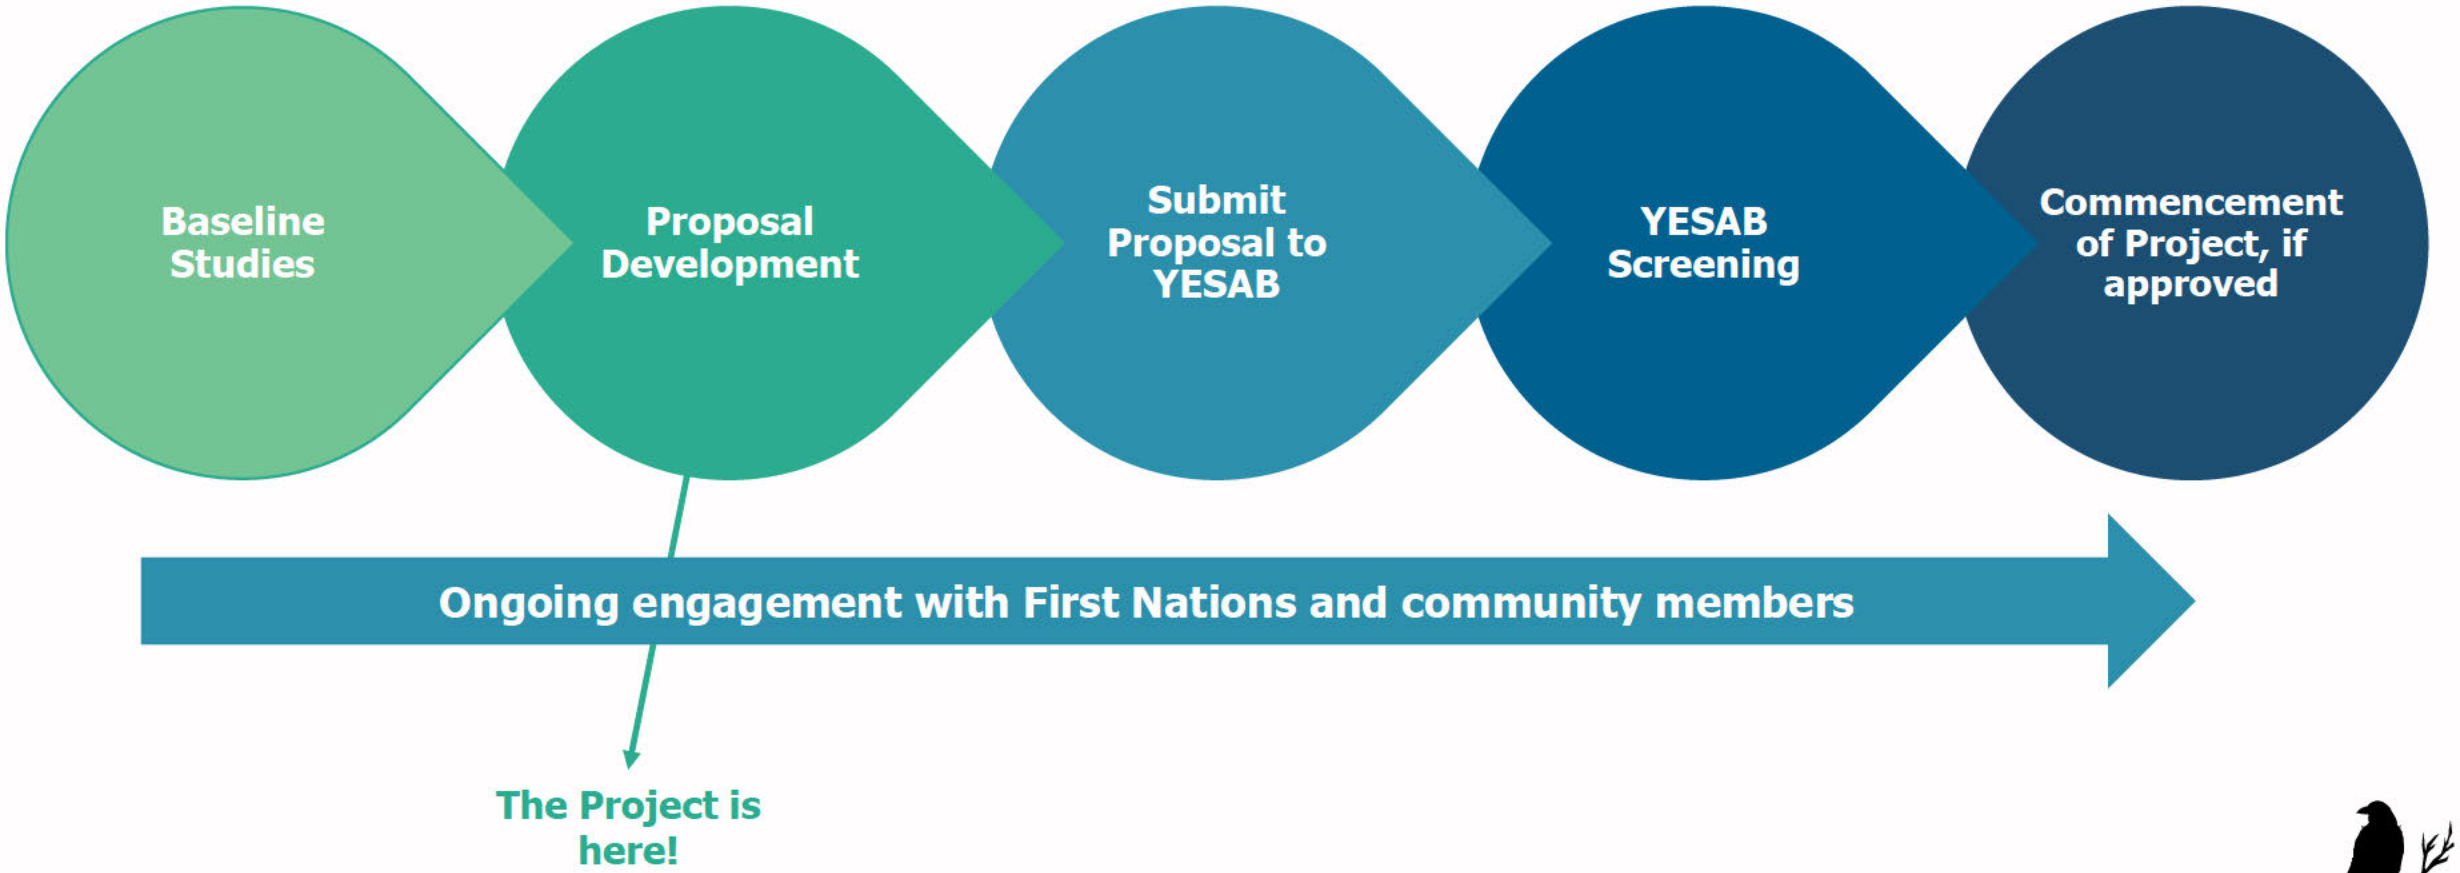
- The proposed Project will be assessed by the Executive Committee of the Yukon Environmental Socioeconomic Assessment Board (YESAB)
- Per the *Yukon Environmental Socioeconomic Assessment Act*, Chance is planning to submit a Project Proposal to YESAB in Q4, 2023
    - This proposal will reflect feedback from First Nations and community members as well as baseline research conducted by Chance between 2019 – 2023
- First Nations and community members will have an opportunity to comment on the proposal in engagement processes and during the YESAB assessment process
- Chance will engage First Nations and community members during all stages of the YESAB assessment process



hance
IL AND GAS LIMITED

PROJECT OVERVIEW

Where in the YESAB process is the proposed Project?

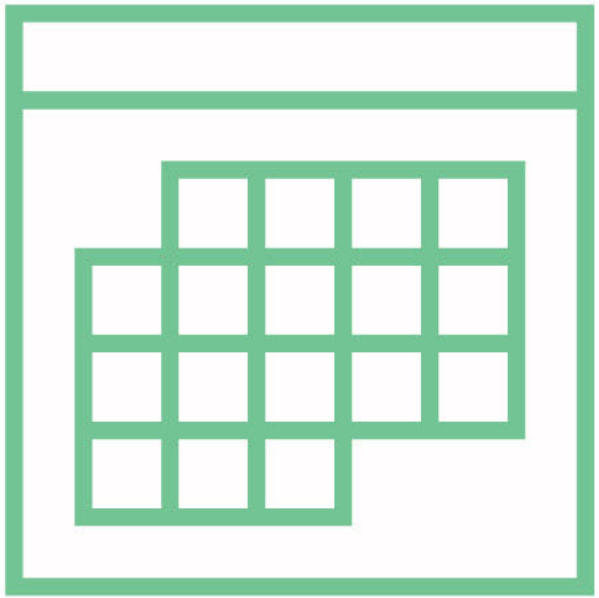


hance
IL AND GAS LIMITED

PROJECT OVERVIEW

If the Project is approved, when will it start and finish?

- The proposed Project is expected to last up to 10 years and is expected to start within 12 months of YESAB approval



PROJECT OVERVIEW

What work has Chance done to understand potential Project-related impacts to the environment and communities?

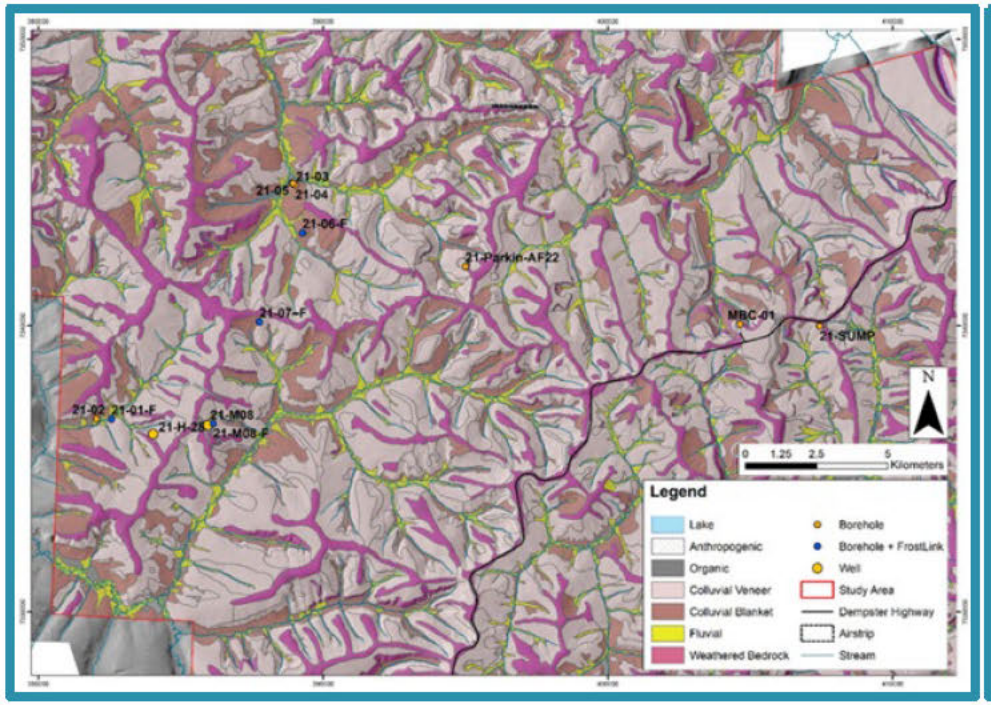
- Chance hired consultants to conduct baseline studies (e.g., wildlife baseline study and socio-economic baseline study) in 2018/19 and updated these studies in 2022/23
    - Chance refined initial Project plans to reflect feedback shared through previous engagement sessions and learned through baseline studies

hance
IL AND GAS LIMITED

PROJECT OVERVIEW

Terrain Baseline Information

- Palmer has mapped surficial geology of the Project Area
  - Mapping using air photos, satellite images, LiDAR data
  - Fieldwork, including shallow drilling
  - Surficial geology maps created



PROJECT OVERVIEW

Permafrost Baseline Information

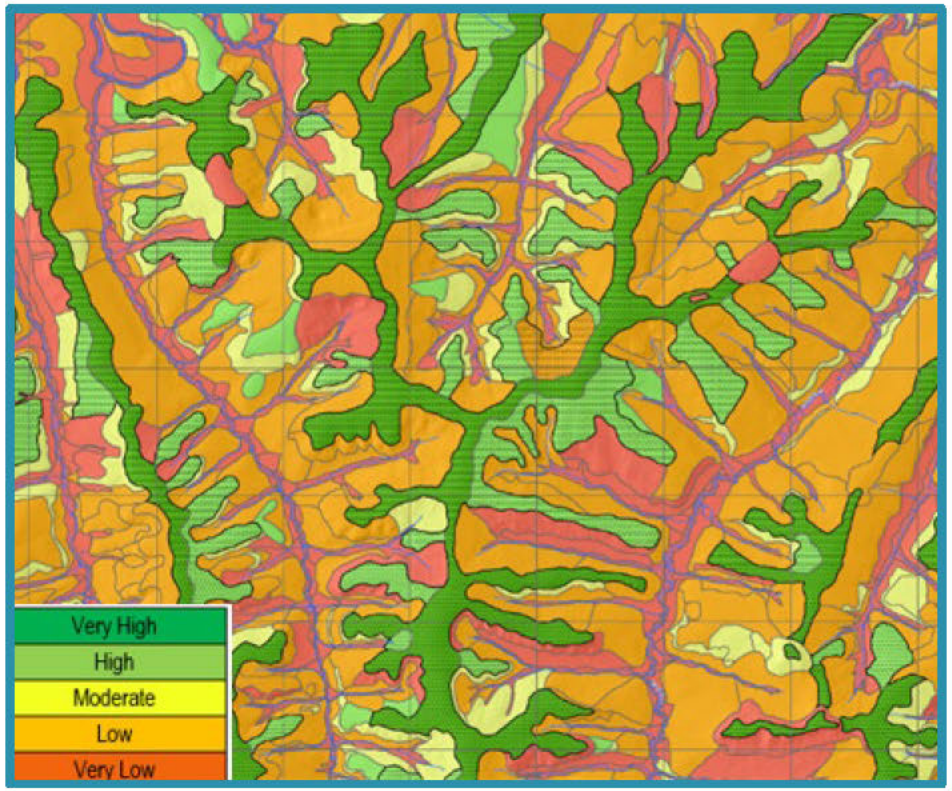
- Permafrost is frozen ground that remains below 0°C for more than 2 years
- Palmer described permafrost in core collected from drilling
- Installed temperature sensors in the ground

hance
IL AND GAS LIMITED

PROJECT OVERVIEW

Permafrost Baseline Information

- Created an exploration suitability map
  - Based on surficial geology
  - Updated with permafrost information
- Depth to the top of permafrost ranges from 0.45 m to more than 1 m
  - Depends mainly on material type, drainage and existing disturbance from forest fire and human activities
- The amount of ice in the soil is variable
  - Depends mainly on grain size
- Permafrost is cold and stable, except where forest fires have occurred
- Colder permafrost is preferred for Project activities



hance
IL AND GAS LIMITED

What We Heard: First Nation Permafrost Feedback

- **Asked about drilling effects on permafrost**

Chance's response:

  - Permafrost is mostly within the bedrock in the drill holes – no effects
  - Above bedrock (top 20 m of ground), drilling fluids could warm permafrost
    - Refrigeration tubing to be installed in drill holes to keep the near surface material frozen while using drilling fluids
    - Once drilling ceases, well remains frozen in place
  - At surface, any disturbance would be localized and limited to only centimetres of thaw settlement
    - To be avoided by:
      - Drilling in winter, when the ground is frozen
      - Insulating ground with at least 10 cm of packed snow
      - Selecting ground with low amounts of ice and bedrock near surface (following exploration suitability map recommendations)

hance
IL AND GAS LIMITED

What We Heard: First Nation Permafrost Feedback

- **Asked about permafrost thaw effects on exploration equipment, such as sinking drills and wells**

Chance's response:

  - Surface thaw settlement will be minimized
  - Wells are drilled into bedrock and are 700 m to >2500 m deep
    - Bedrock cannot move, so drills cannot move or sink
    - None of the earlier wells have moved since drilling (first well installed in 1959)

What We Heard: First Nation Permafrost Feedback

- **Asked if permafrost thaw causes animals and illnesses previously frozen to resurface**

  Chance's response:

  - Permafrost thaw will be minimized
  - Near surface thaw has already occurred naturally due to forest fire in the northwest portion of the Project Area and dangerous microbes have not been a problem

- **Asked if permafrost thaw causes pipes to break**

  Chance's response:

  - There will be no pipes in the ground during oil and gas exploration
  - Permafrost thaw will be minimized

PROJECT OVERVIEW

Next Steps – Permafrost Work

- Install more ground temperature sensors
- Retrieve ground temperature data from all sensors after one year

PROJECT OVERVIEW

Water Quality and Surface Flows Baseline Information

- Compiled historic data and conducted field surveys
- Project area contains 1,467 streams, very few lakes and ponds
- Typical for boggy, northern landscapes and climate
    - High water flows during spring melt
    - Most smaller streams dewater or freeze in winter
    - Neutral to slightly acidic, brown-stained
    - Extensive silt deposits indicate high sediment loads during spring freshet
    - Low nutrient levels on average
    - Many metals present naturally at levels above Canadian Council of Ministers of the Environment's guidelines

hance
IL AND GAS LIMITED

PROJECT OVERVIEW

Fish Baseline Information

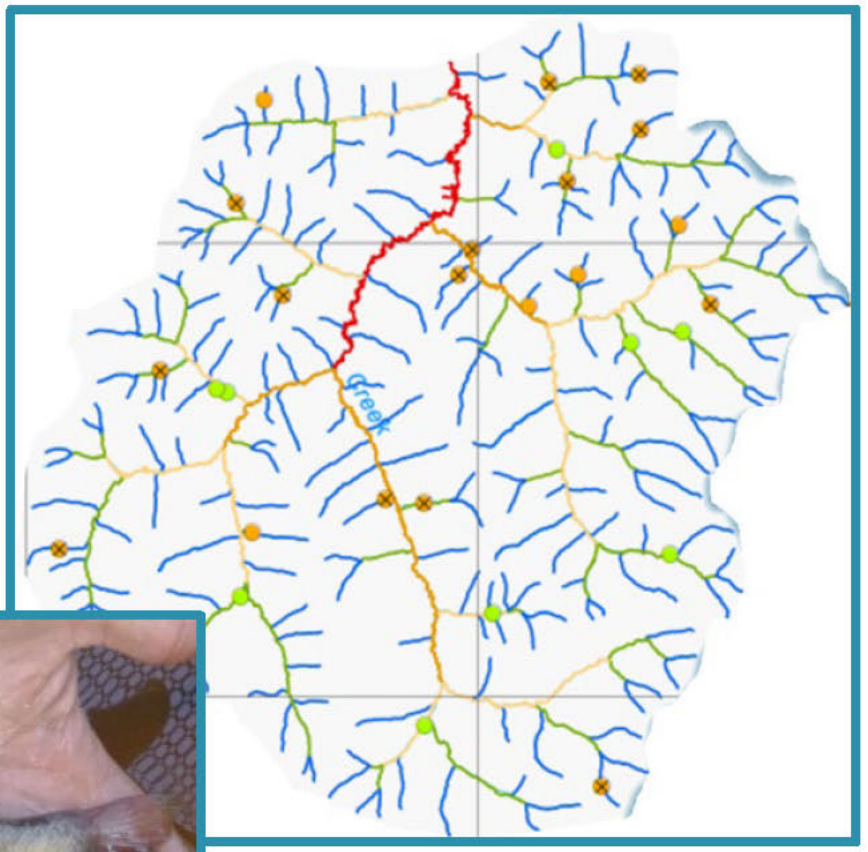
- Conducted electrofishing and minnow trapping surveys in summer, underwater camera surveys in winter
- Used data to model the probability of fish presence in all streams
- Clear patterns of fish distribution and habitat availability in summer and winter
- Most streams in the area are low gradient with silty streambeds
    - Moderate habitat where larval and juvenile fish find food and shelter
    - Poor spawning habitat for most fish species
- Six species of fish observed in or adjacent to the Project area:
    - Arctic grayling were the most abundant and widespread species
    - No salmon were captured or documented in the study area

hance
IL AND GAS LIMITED

PROJECT OVERVIEW

Fish Baseline Information – Summer

- Fish presence in summer was strongly related to stream order (size):
  - 1st order streams (smallest) had very low probability of fish occurrence (<8%)
  - 2nd order streams had about 50% fish occurrence
  - 3rd order and greater had high probability of fish occurrence (>90%)



hance
IL AND GAS LIMITED

PROJECT OVERVIEW

Fish Baseline Information – Winter

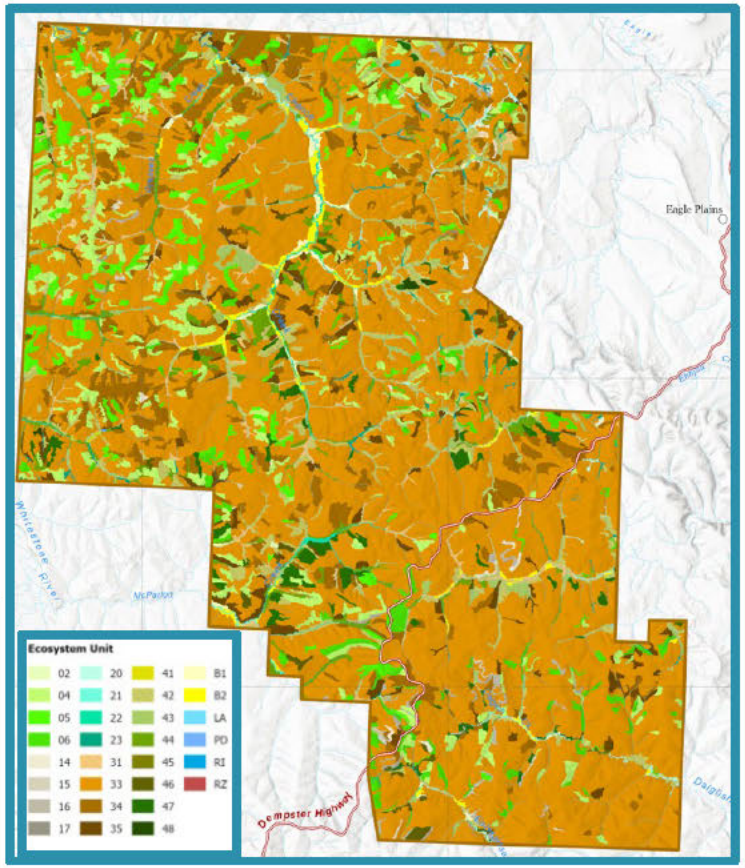
- During winter, fish habitat becomes very limited
  - Most smaller streams had no water in the winter or were frozen
  - In larger streams, water was present in some deeper pools
  - Dissolved oxygen levels were too low to support overwintering fish

- Most fish appear to migrate downstream to overwinter in larger rivers outside of the Project Area

PROJECT OVERVIEW

Vegetation Baseline Information

- Mapped ecological communities across the Project Area
  - Used a combination of satellite imagery and field sampling
- Area is dominated by moist and wet ecosystems
  - Most common ecosystem is moist spruce – Labrador tea
- Majority of Project Area is 'shrub' stage (<8 m [24 ft] tall)
- Only 1% of the Project Area is old forest



hance
IL AND GAS LIMITED

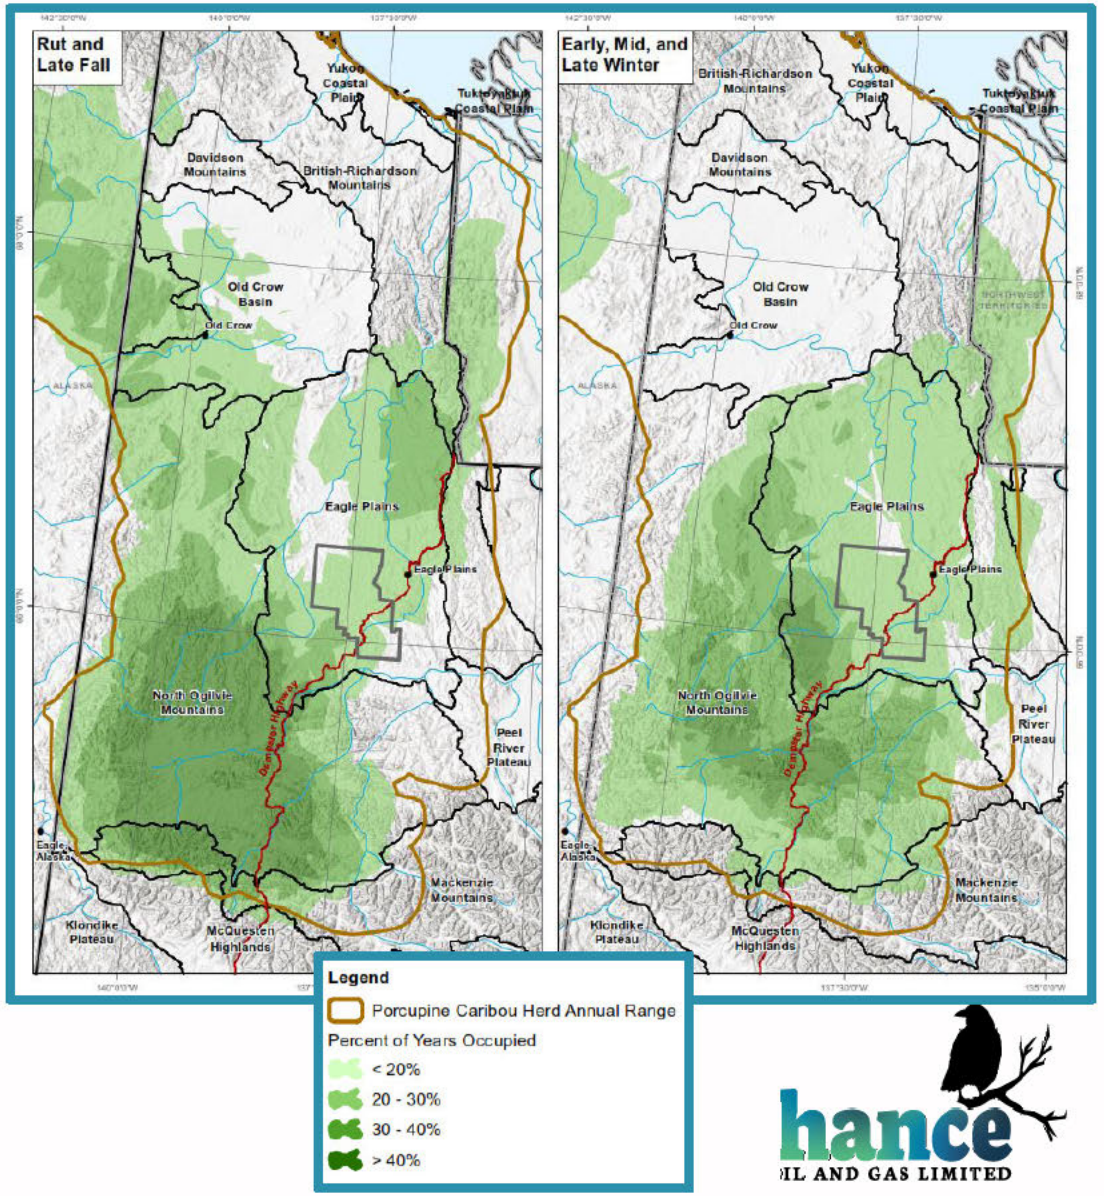
PROJECT OVERVIEW

Wildlife Baseline Information – Porcupine Caribou Herd (PCH)

- Studied habitat selection, movements, and linear features to better understand the herd's use of the Project area

- The Project Area overlaps with a small proportion of the PCH late-fall and winter ranges
  - Rut/Late Fall range (6%)
  - Winter range (7%)

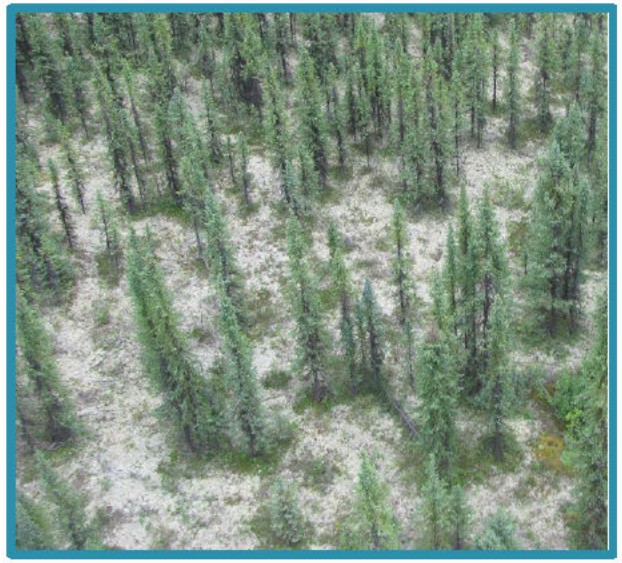
- Rut/Late Fall and Winter Seasons are considered to be the least-sensitive periods for the herd

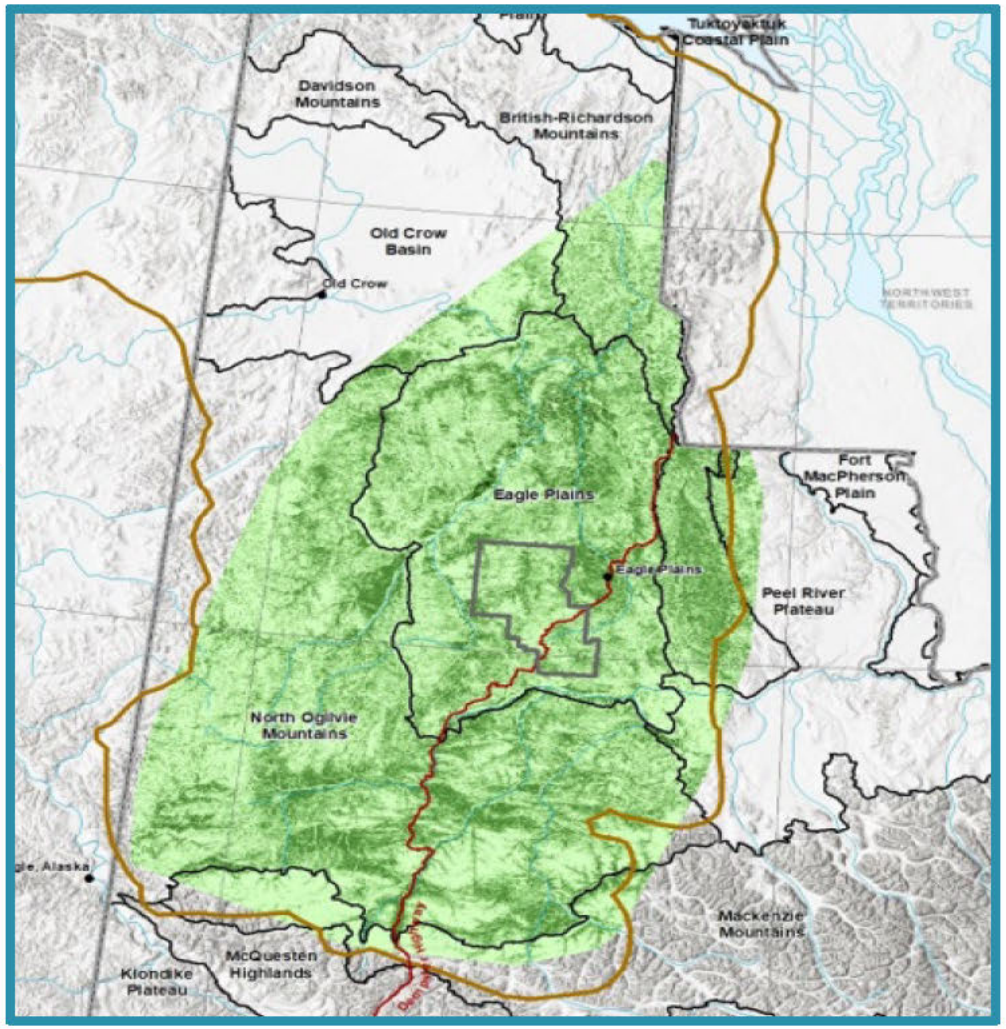


PROJECT OVERVIEW

Wildlife Baseline Information – PCH Habitat Selection

- Habitat selection by the PCH was assessed in Rut/Late Fall and Winter using GPS collar data
- Lichen cover was the primary driver of PCH habitat selection in these seasons





Wildlife Baseline Information – PCH Movements

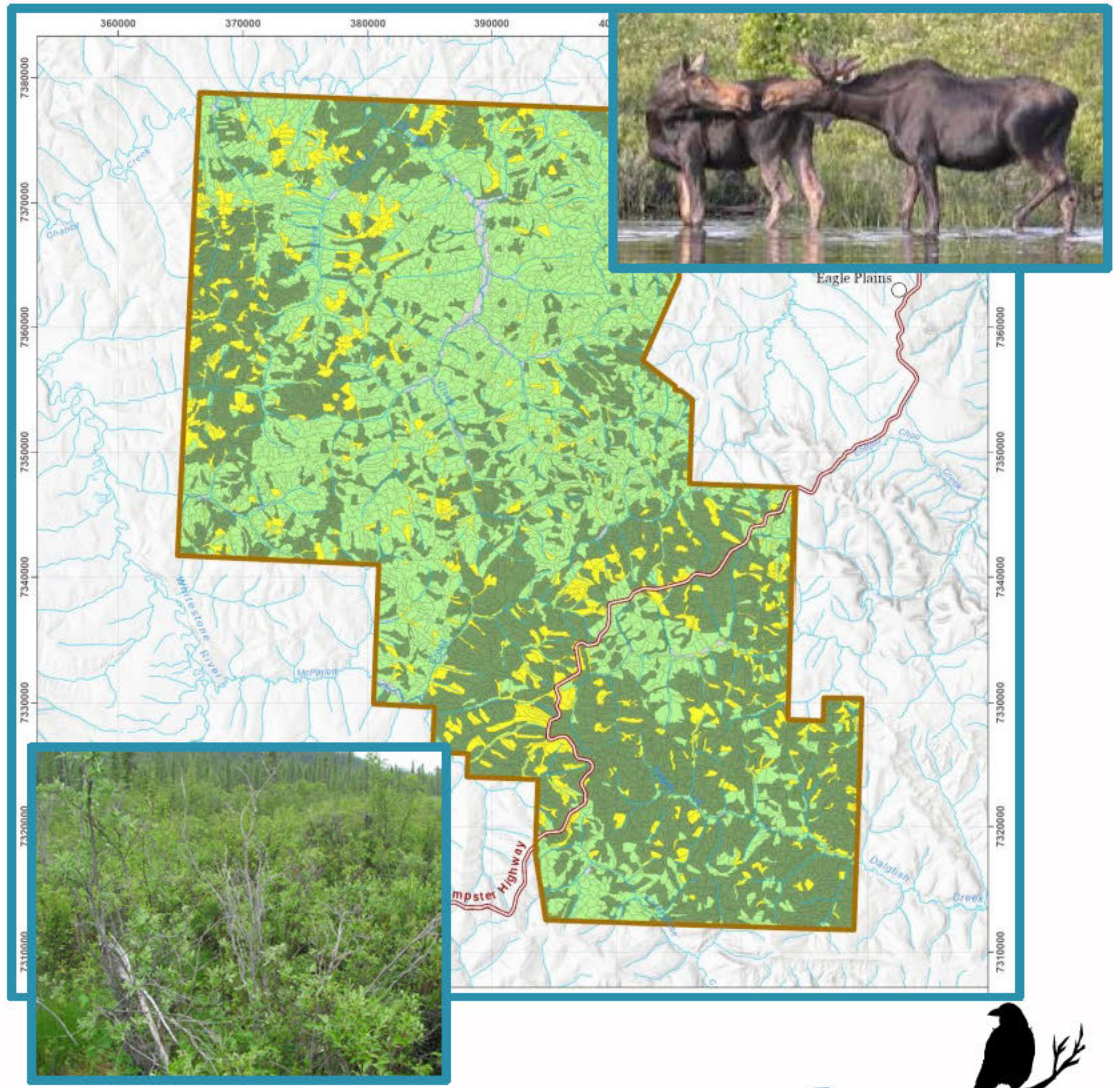
- Caribou rarely stay in one area for more than a couple of days
  - Caribou that used the Project Area spent less than 15% of the season there

Season	Daily Travel Rates (km/day)	Residency Time (days)
Rut/Late Fall (30 days)	8.7	4.5
Winter (120 days)	4.4	13.9

PROJECT OVERVIEW

Wildlife Baseline Information – Moose

- Environment Yukon believes the population is high compared to other areas in northern Yukon
- Moose are present in Project Area year-round
- Winter is the most limiting season
  - Limited food availability
  - Elevated energetic costs
- Limited high-quality habitat present in the Project Area:
  - High (yellow) = 12%; riparian shrublands, regen burn (wet)
  - Moderate (dark green) = 43%; regenerating burns (mesic)
  - Low (light green) = 44%; undisturbed spruce stands

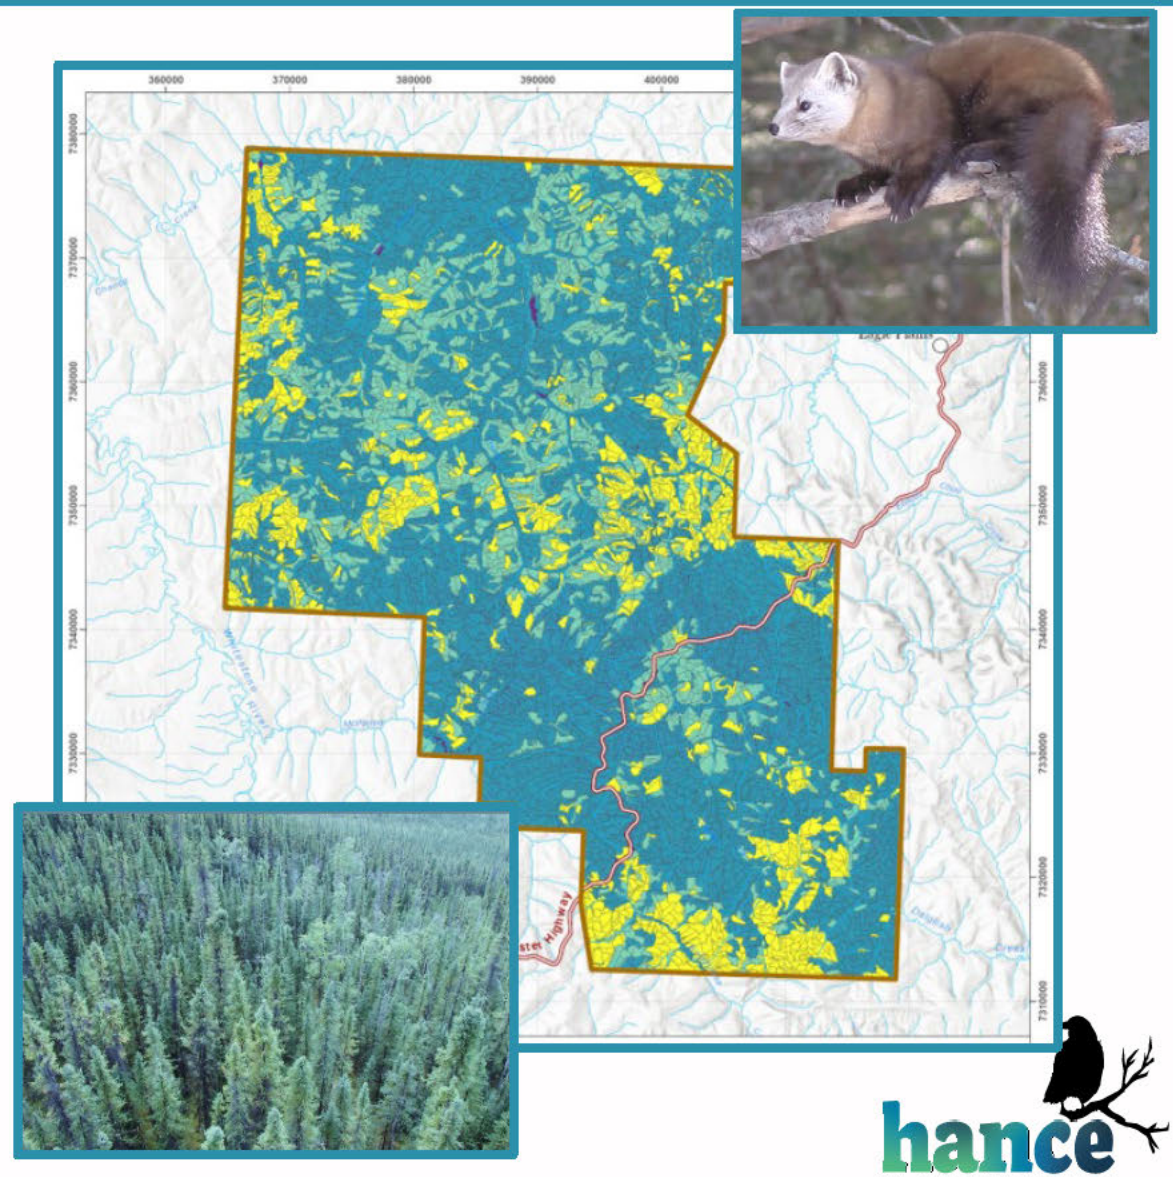


hance
IL AND GAS LIMITED

PROJECT OVERVIEW

Wildlife Baseline Information – American Marten

- Harvest rates suggest a moderate-sized population
- Present in the Project area year-round
- Associated with mature forest structure like large trees, snags, coarse woody debris
- Use vegetation and coarse woody debris to access small mammals under the snow in winter
- The majority of the Project Area is low-quality habitat:
    - High (yellow) = 16%; mesic, mature spruce forest
    - Moderate (light blue) = 23%; wetter and younger forest
    - Low (dark blue) = 60%; regenerating burns, wetlands, and stunted, open, black spruce areas



hance
IL AND GAS LIMITED

PROJECT OVERVIEW

Wildlife Baseline Information – Birds

- 128 bird species have the potential to occur in the Project area based on range and habitat
  - 52 species detected during Project surveys
  - 19 additional species have been detected historically
- Eight species of conservation concern have been observed in the Project Area
  - Horned Grebe
  - Red-necked Phalarope
  - Peregrine Falcon
  - Gyrfalcon
  - Short-eared Owl
  - Common Nighthawk
  - Olive-sided Flycatcher
  - Bank Swallow
  - Rusty Blackbird
- No threats to these species on breeding grounds in the Project Area
- Most birds are absent from the Project Area in the winter months

hance
IL AND GAS LIMITED

WHAT WE HEARD

What We Heard: First Nation Water, Wildlife, and Terrestrial Feedback

- Asked about downstream effects to salmon
- Asked about invasive species along the Dempster Highway
- Asked about seasonal effects to fish and fish habitat
- Asked about Project-related effects to surface water quality
- Recommended a holistic approach to assessing Project-related effects to water
- Noted importance of moose, Porcupine caribou, and wildlife ecosystems
- Asked if wolverines have been studied

hance
IL AND GAS LIMITED

PROJECT OVERVIEW

Heritage Resources Baseline Information

- Types of heritage resource studies:
    - Heritage Resource Overview Assessment (HROA)
        - Desktop study that creates an inventory of known heritage resource sites within a study area and identifies areas of potential (AOPs) for the presence of undocumented heritage resource sites
    - Heritage Resource Impact Assessment (HRIA)
        - Field-based study aimed at ground truthing and testing AOPs that overlap with proposed work areas
    - Systematic Data Recovery (SDR) Excavations
        - Excavations aimed at mitigating impacts to sites that will be impacted by development activities

PROJECT OVERVIEW

Heritage Resources Baseline Information

- Heritage Resource Overview Assessment: Eagle Plains Basin Exploration Project (2022)
    - Review of physical/environmental setting, cultural/historical setting
    - Review of previous heritage resource studies and known archaeological and historical site inventories
    - Development of a heritage resource potential model

PROJECT OVERVIEW

Heritage Resources Baseline Information

- Physical/environmental setting - Looking for well-defined landforms and heritage features such as:
    - Terraces
    - Knolls
    - Ridgelines
    - Cabins
    - Depressions
    - Stone features
- Cultural/historical setting
    - Modern and archaeological indigenous cultures
    - Historic period events, settlements, etc.

PROJECT OVERVIEW

Heritage Resources Baseline Information

- Review of known archaeological and historical site inventories
- Six archaeological sites within exploration area: LlVc-1, LlVd-1, MaVc-4, MaVc-5, MaVc-6, and MaVe-1
    - All stone tool scatters
    - Twenty-six more known archaeological sites within 50 km of exploration area
- One Yukon Historic Sites Inventory (YHSI) site within exploration area: 116I/03/001 - Tth'an Dhidlii Njik Dalgish Creek Resource Area
    - Historically significant cultural landscape
    - Thirteen more known YHSI sites within 50 km of exploration area
- Three palaeontological sites within ~20 km of the exploration area, but none inside the boundary

PROJECT OVERVIEW

PROJECT OVERVIEW

Heritage Resources Baseline Information

- Summer 2022 HRIA Program
  - A 10-day HRIA program was conducted between July 26 - August 2, 2022
  - The HRIA focused on a 625 km2 subsection of the Project Area where a new seismic and drilling program has been proposed
  - Field crew included Ecofor archaeologists and a VGFN participant

PROJECT OVERVIEW

PROJECT OVERVIEW

Heritage Resources Baseline Information

- Summer 2022 HRIA Program
  - HRIA work included:
    - A helicopter survey throughout this area to identify the best areas or heritage resource potential
    - A survey on foot to confirm potential in areas of potential identified from the helicopter
    - Shovel testing at 12 locations

Heritage Resources Baseline Information

- Summer 2022 HRIA Program
    - In total, 228 shovel tests were completed
    - Shovel tests at location E10 led to the recording of archaeological site [redacted]
    - This site has been flagged as a no-work area

PROJECT OVERVIEW

PROJECT OVERVIEW

PROJECT OVERVIEW

Heritage Resources Baseline Information

PROJECT OVERVIEW

Heritage Resources Baseline Information

PROJECT OVERVIEW

Heritage Resources Baseline Information

- Summer 2023 HRIA Program
  - Ecofor and Chance plan to continue developing the Eagle Plains Basin Exploration Project Heritage Resource Management program
  - Additional HRIA fieldwork will be conducted under Yukon Archaeological Sites Regulations Permit 23-03ASR

NEXT STEPS

What is next?

- Chance is planning to engage First Nations and community members on the following topics prior to submission of the Project Proposal in May and June 2023:
    - Valued Components (VCs) such as fish and fish habitat
    - Baseline Results
    - Socio-economics
    - Indigenous Knowledge
    - Effects and Mitigations (e.g., spill prevention measures)
    - Management Plans (e.g., caribou management plan)
- Chance to continue incorporating feedback shared during ongoing engagement with First Nations and community members to the Project Proposal and other plans
- Chance to provide ongoing Project updates with interested Open House attendees (e.g., notification of Project Proposal submission to YESAB)

hance
IL AND GAS LIMITED

NEXT STEPS

What is next? Continued…

- Chance to conduct a survey for heritage resources this summer
- Chance to complete Project effects assessments
- Chance to engage with Yukon Government on the Project

hance
IL AND GAS LIMITED

Questions & Answers

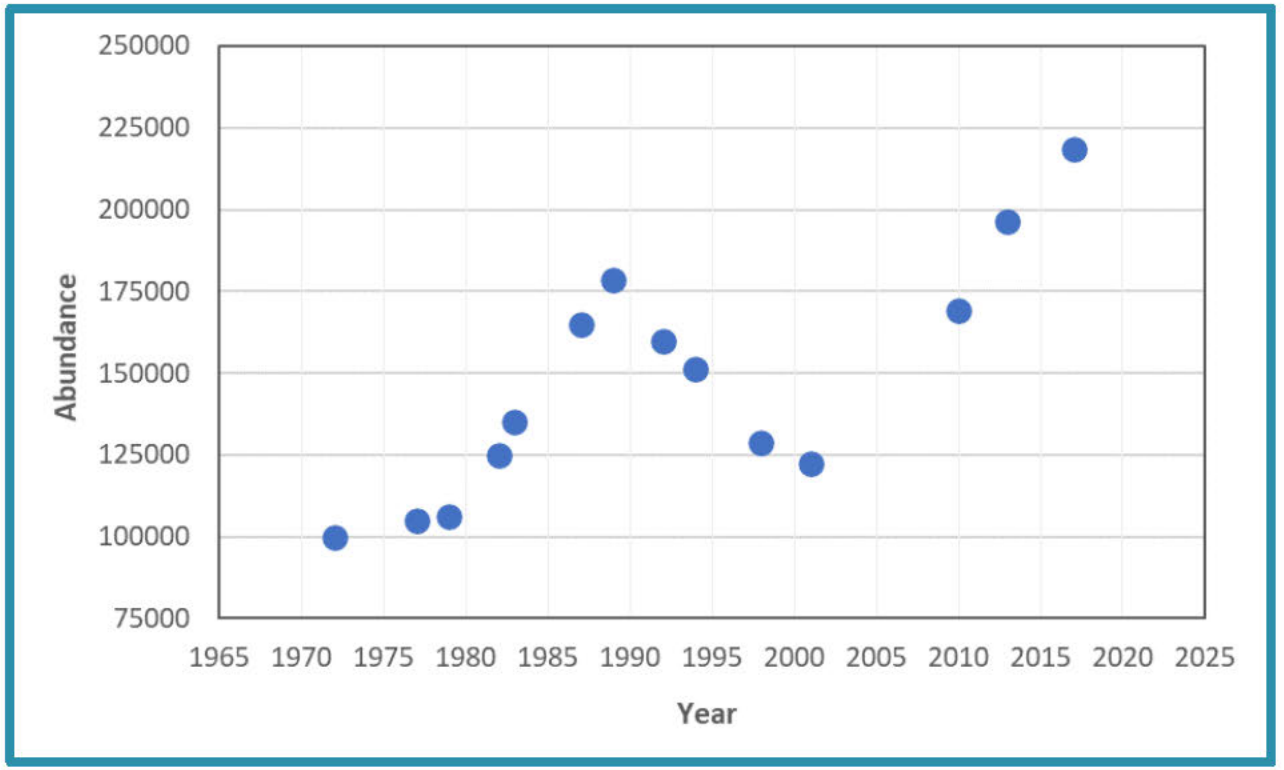
Thank you for your time!

We look forward to continue learning from and working with you to support your involvement in the Project and address/mitigate any concerns you may have about the Project.

ADDITIONAL DETAILS

Porcupine Caribou Herd

- Population has increased over the last two decades
  - Large population fluctuations are a key ecological trait of barren-ground caribou
  - Over 50 years of monitoring the herd has not exhibited population fluctuations as large as other herds

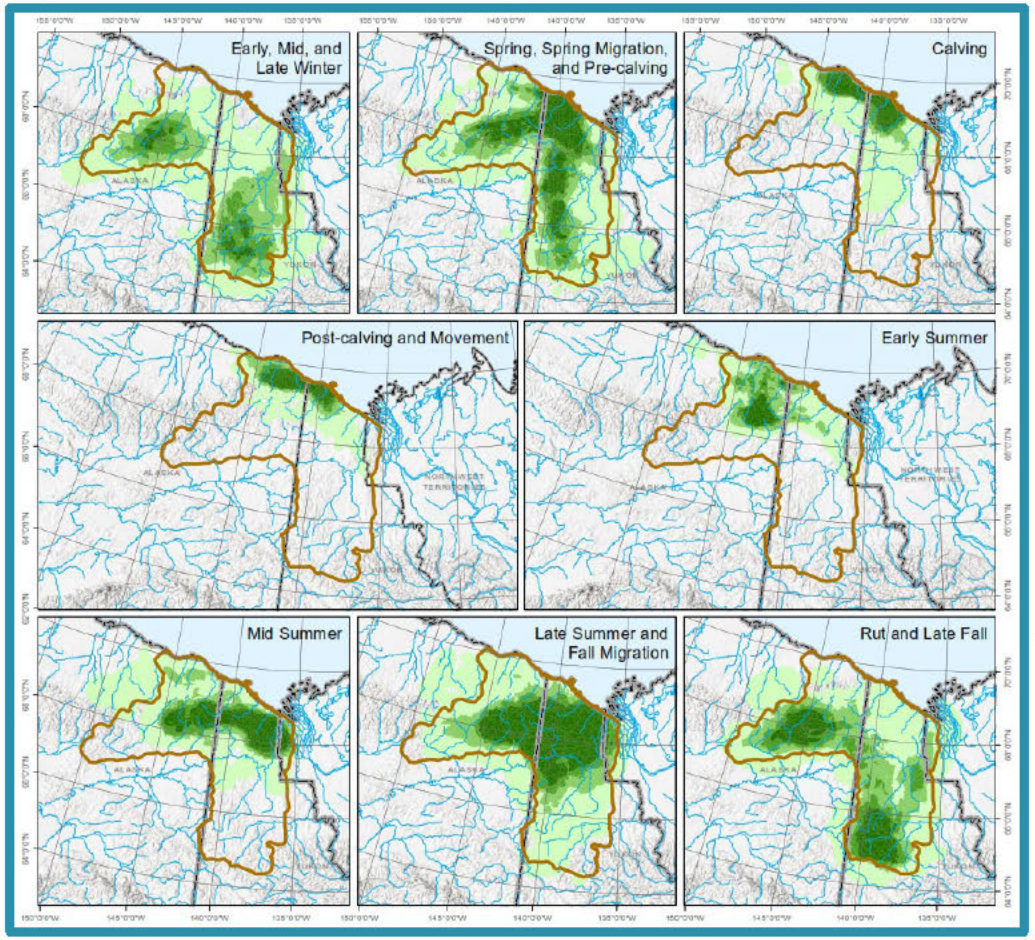


hance
IL AND GAS LIMITED

ADDITIONAL DETAILS

Porcupine Caribou Herd

- Porcupine caribou make long-distance migrations among seasonal ranges



hance
IL AND GAS LIMITED

ADDITIONAL DETAILS

Porcupine Caribou

- Late fall and winter are the least sensitive seasons for the herd
- Relative sensitivity of the Porcupine Caribou Herd during 8 key life cycle seasons:

Season	Dates	Sensitivity*
Early, Mid, and Late Winter	Dec. 1 – Mar. 31	4
Spring, Spring Migration, and Pre-Calving	Apr. 1 – May 31	3
Calving	June 1 – 10	1
Post-Calving and Movement	June 11 – 30	1
Early Summer	July 1–15	2
Mid Summer	July 16 – Aug. 7	2
Late Summer and Fall Migration	Aug. 8 – Oct. 7	3
Rut and Late Fall	Oct 8 – Nov 30	4

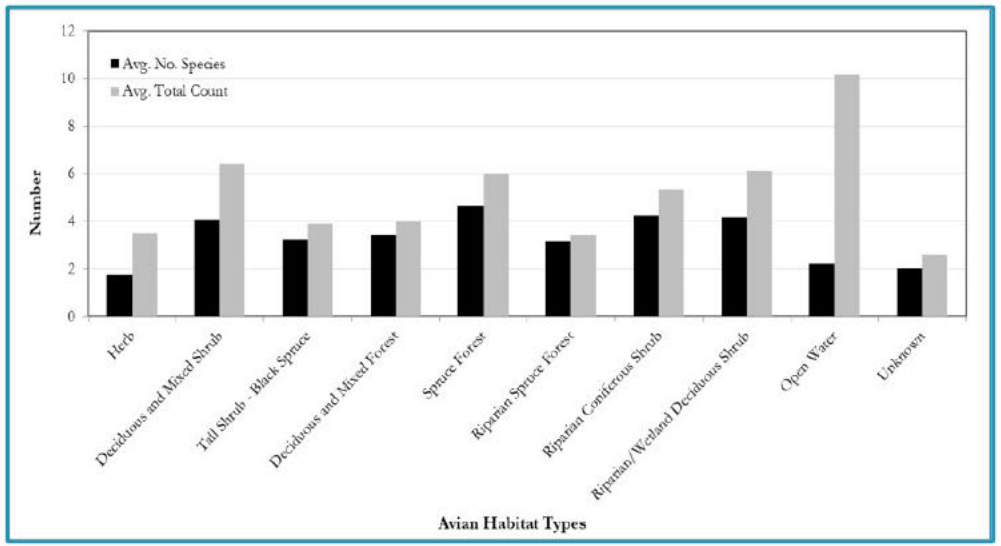
*1 = highest sensitivity, 4 = lowest sensitivity

hance
IL AND GAS LIMITED

ADDITIONAL DETAILS

Birds

- Compiled existing information and conducted field surveys
  - Terrestrial songbird surveys (91 sites)
  - Pond/wetland surveys (19 sites)
  - Cliff-nesting raptor habitat was assessed; none present
- Number of species and total bird abundance were both well-distributed across habitat types



hance
IL AND GAS LIMITED

APPENDIX F

May 16, 2023
Open House Feedback Form

Chance Oil and Gas Limited (Chance) would like to learn about your experience at the Open House. Responses shared in this Open House Feedback Form will be used by Chance to help inform Project decision-making, Project design, and the assessment of potential Project-related effects to community members. Responses will remain anonymous in any Project materials (e.g., reports to the Yukon Environmental Socio-economic Assessment Board). Thanks in advance for taking time to complete the Open House Feedback Form!

1. How did you hear about the Open House? **Please check all that apply.**

Radio	Word of Mouth	Social Media	Signage/Poster	Other:
○	○	○	○	○

If you selected 'Other', please explain below.

2. Overall, how would you rate this Open House on a scale from 1 (Very Unsatisfied) to 5 (Very Satisfied)? **Please check one and explain your response below.**

Very Unsatisfied 1	Unsatisfied 2	Ok 3	Satisfied 4	Very Satisfied 5
○	○	○	○	○

3. Were you able to share your thoughts, ideas, and knowledge during the Open House in a comfortable manner? **Please check one and explain your response below.**

Yes	No	I don't know
○	○	○

4. Did the Open House help you learn more about Chance Oil & Gas and the proposed Eagle Plains Project? **Please check one and explain your response below.**

Yes	No	I don't know
○	○	○

3. What did you like most about the Open House? What could we do better to improve future Open House events? **Please briefly explain your response below.**

4. Please feel free to share any comments or questions that you may have about the Chance Oil & Gas, the Eagle Plains Project, and/or the Open. We value your comments.

Thank you for taking the time to share your experience with us.

We hope to see you at the next Open House!

If you would like to receive Project updates including information on future engagement events, please list your contact details below:

Phone: _____

Email: _____

APPENDIX 2-B-26. May 17, 2023, Meeting Summary

Eagle Plains Exploration Project
May 17, 2023 Meeting Minutes

Session Details	
Event:	Eagle Plains Exploration Project ("Project") Update Meeting
Date / Time:	May 17, 2023 (8:45 am MST – 9:45 am MST)
Participants:	Gwich'in Tribal Council (GTC): • Grand Chief [redacted] • [redacted], Manager Lands & Resources Gwich'in Development Corporation (GDC): • [redacted]., Chief Executive Officer Chance Oil and Gas (Chance): • [redacted], Regulatory, Environmental and Community Relations Coordinator • [redacted], Vice President Government and Community Relations Environmental Dynamics Inc. (EDI): • [redacted], Deputy Chief Executive Officer and Senior Biologist Ecofor: • [redacted], Senior Archaeologist, Permit Holder Palmer: • [redacted], Senior Geoscientist Two Worlds Consulting (TWC): • [redacted], Engagement Specialist • [redacted], Engagement Specialist

Objectives

1. Provide a Project update (timeline, regulatory process, engagement etc.)
2. Understand GCT and GDC's engagement preferences going forward.
3. Provide an overview on the May 16, 2023 Open House in Inuvik.

Discussion

Welcome

- Grand Chief [redacted] welcomed the Chance Project Team and noted GTC had prepared breakfast for all meeting attendees.

Open House Overview

- Grand Chief [redacted] asked about the Open House event Chance held the night prior at the Nihtat Gwich'in Council boardroom.
- [redacted] shared there were a total of six attendees at the Open House and the event included a catered dinner. She noted that the attendees asked a lot of great questions. [redacted] added that Chance gave a presentation on the Project, including engagement next steps, and received feedback from Open House attendees on how to attract a larger turnout for future engagement events.
- Grand Chief [redacted] shared that six attendees was average for engagement events in Inuvik.

Project Updates

Engagement

- [redacted] shared an update on Chance's engagement with Vuntut Gwitchin First Nation. Noted the Project Team had travelled from Old Crow, YT to Inuvik, NT. [redacted] expressed that Chance is hoping to sit down with Vuntut Gwitchin First Nation in Old Crow to develop a formalized schedule for meetings and Project milestones (e.g., Chance's Project Proposal submission to the Yukon Environmental Socio-economic Assessment Board (YESAB).
- [redacted] noted that Chance is looking to submit their Project Proposal to YESAB's Executive Committee by the end of December 2023.
- [redacted] shared that Chance's engagement with First Nations was delayed due to the COVID-19 pandemic.
- [redacted] shared information on Chance's land permit extensions. Noted Chance is requesting a 5-year permit extension for the Project Area. If approved, the permit would be valid between 2023 - 2027.
- [redacted] expressed Chance's interest in engaging GTC members from Aklavik. Proposed supporting members' travel from Aklavik to Inuvik or that Chance's Project Team could travel to Aklavik by charter plane.
- Grand Chief [redacted] noted [redacted] (phonetic spelling) operates a water taxi to Aklavik for same-day travel. He added that engagement in each community is different. Grand Chief [redacted] shared that there is not a lot of engagement in Tsiigehtchic, that approximately 8 – 12 people will attend engagement events in Aklavik, and that typically there is an overflow of attendees in Fort McPherson. Grand Chief [redacted] also noted younger people in the community tend to stay away from politics.

Archaeology and Heritage Resources

- [redacted] shared information on Ecofor's archaeology and heritage work in and around the proposed Project.
- [redacted] noted Ecofor had conducted a 10-day field program including field testing. During this field program, Ecofor identified one new archaeological site. Their assessment concluded this site was probably a short-term occupation site.
- [redacted] said Ecofor would be conducting more fieldwork.
- Grand Chief [redacted] suggested [redacted] reach out to [redacted], GTC Cultural Heritage Director, to include potential members for Indigenous Knowledge gathering purposes.

Discussion

Welcome

- Grand Chief [redacted] asked what protocols are in place in the event a burial site is discovered. [redacted] explained that the Project is required to follow a chance find process to mitigate the site or completely avoid it. Chief [redacted] requested that he be contacted if a burial site is discovered and to ensure the Project creates an opportunity to engage an Elder because they may know of the site and can provide guidance to respectfully protect the site.
- [redacted] confirmed archaeology and heritage mitigation plans would be included in Chance's Project Proposal.
- [redacted] asked if the Project Proposal also includes a contact list if something is found. [redacted] said Chance will include a contact list in the Project Proposal. Noted the First Nations will be part of that list.

Permafrost

- [redacted] provided a permafrost update. She noted that Palmer will install six sensors in summer 2023, in addition to the already installed six sensors.
- [redacted] said the terrain in the Project Area is sensitive. There are ridgetops, valleys, and slopes.
- [redacted] said Palmer has mapped good areas for the proposed exploration activities, as well as areas to be avoided.
- [redacted] explained that directional drilling will stay on high ground.
- [redacted] asked if there are buffers where work activities are adjacent to a sensitive area. [redacted] explained that the Project activities will not be adjacent to high sensitivity areas.
- [redacted] asked how deep the permafrost sensors can test? Shirley confirmed the sensors reach up to a 1 metre depth.
- [redacted] noted areas affected by forest fires are typically low sensitivity (i.e., sandy areas that do not hold water or ice well).
- [redacted] said the permafrost is different in Eagle Plains compared to the Mackenzie Delta.
- [redacted] said Palmer's work will help guide Chance to protect vegetation during the winter.
- [redacted] asked if Chance is still planning to bury drilling materials? [redacted] confirmed Chance is still planning to build Mix Bury and Cover (MBC) sumps (for material that comes out of drilling). Greg added that cuttings will be relatively clean and monitored by regulators. [redacted] said Chance had been monitoring another MBC sump for reference and it's looking good (e.g., vegetation regrowth).
- [redacted] asked if there are any aquifers down there? [redacted] said there is an aquifer, but the water is not drinking water quality. Leigh-Ann followed up and asked roughly how deep it would be. Greg confirmed the aquifer is approximately 1800 metres below the surface. He said the Yukon University studied the water in this area and concluded the water was not fit for future consumption.
- [redacted] asked if the MBC sumps will be part the suitability in the permafrost baseline study? [redacted] confirmed MBC sumps would be included.

Aquatic, Wildlife, and Terrestrial Ecosystems

- [redacted] gave an overview of aquatic, wildlife, and terrestrial ecosystems.
- [redacted] noted Chance is proposed to cut up to 3-metre-wide seismic lines.
- [redacted] said Chance's proposed annual work for the Project is a small area less than 2% of the Porcupine Caribou Herd range.
- Grand Chief [redacted] recommended the Project Team avoid saying that 2% is a small area. He said community members will need to understand the proper context and then once they have the honest truth, they can determine the impacts. Noted language such as "less than a certain percentage" can be misleading.

Discussion

Welcome

- Grand Chief [redacted] asked [redacted] what the information tells us. [redacted] responded that the information gathered to date helps show where access roads should not be built, and it limits where Chance can conduct certain activities.
- Grand Chief [redacted] asked [redacted] if he had worked with the Porcupine Caribou Management Board and [redacted] confirmed that EDI had worked with the Porcupine Caribou Management Board.
- [redacted] noted Project activities will take place in the winter which will avoid impacts to berries and other vegetation.
- [redacted] shared that EDI also conducted bird surveys.

Project Activities

- [redacted] reviewed Project activities and the purpose of the Project. He noted that oil and natural gas discovered in the Project Area is intended to provide energy security in the north.
- [redacted] shared information on the 2D and 3D seismic lines proposed for the Project. Noted it's a grid system with geophones that are detonated section by section over ten years.
- Grand Chief [redacted] asked what is the 1500 sq km of 2D and 3D?
- Grand Chief [redacted] asked how Chance gets data from the seismic activities? Greg explained geophones that are four to six meters below the surface capture the data. He explained that the geophones are wireless and get picked up by helicopter during the summer months.
- Grand Chief [redacted] asked what Chance does for 2D seismic? Greg said 2D seismic functions the same as 3D seismic, but the lines are further apart than 3D.
- [redacted] asked if there are any predator-prey issues with the seismic lines? [redacted] stated that the possibility of linear features facilitating predation is specifically addressed in their baseline study (linear features study), effects assessment, and mitigation (e.g., minimizing line of sight, dog-legging of seismic lines at major access points, winter operations, etc.). Some studies show seismic lines can facilitate predator movement however, modern seismic activities incorporate doglegged (bent) lines at certain locations to reduce predator-prey line of sight. Meandering line construction selects the path of least resistance and avoids timber larger than 20 – 30 cm in diameter (details provided in the draft Project Description). Height of vegetation can also influence travel speed and sight lines. These issues will be addressed in the Project Proposal (impact assessment).
- [redacted] noted seismic lines now are no longer straight through like they used to be. He added that most of the time trees aren't cut down because they can go around them.
- Grand Chief [redacted] noted the Project Area is moose country.
- [redacted] asked what the Project is using for a water source? Greg said the Project will use Glacier Creek for camp use and Eagle River in the winter for sediment etc. He noted the camp will truck no more than one truckload every week because they recycle drilling fluid. [redacted] said the largest water use is for building the ice road.
- [redacted] asked what Chance does with the water? Truck it out or inject it? Chance said recovered formation water (if any) will be disposed of in deep zone injection wells. Formation water will be disposed of by re-injecting it into a compatible and approved geological formation via an existing Eagle Plains well converted to a deep injection well. Existing suspended wells may be converted to deep-injection wells as needed.

Action Items & Next Steps

Discussion

Welcome

- Chance to contact Chief [redacted] if a burial site is discovered and to ensure the Project creates an opportunity to engage an Elder because they may know of the site and can provide guidance to respectfully protect the site.
- Chance to include a contact list for archaeological and heritage resources discoveries in the Project Proposal for YESAB's Executive Committee.

APPENDIX 2-B-27. August 29, 2023, Meeting Summary

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

Meeting Minutes

Subject	Draft Project Overview Meeting
Prepared By	Two Worlds Consulting (TWC)
Groups Involved	Chance Oil and Gas Limited (Chance) Gwich'in Tribal Council (GTC) TWC
Participants	[redacted], VP Government and Community Relations (Chance) [redacted], Transboundary Specialist (GTC) [redacted], Acting Director (GTC) [redacted], Engagement Support (TWC) [redacted], Engagement Support (TWC)
Date/Time	August 29, 2023 10:00 AM – 11:30 AM PST
Copies to	Chance and GTC

Purpose of Meeting

- Chance provided an Eagle Plains Exploration Project (Project) overview to GTC.

Topics Discussed

- Chance overview
- Project overview including information on exploration, design changes, baseline studies, regulatory process, schedule, engagement, proposed next steps

Key Issues Raised / Chance Responses to Issues

- Suggested GTC and Chance develop a Memorandum of Understanding and a Terms of Reference or Cooperation Agreement.
    - Chance agreed.

Actions and Responsible Party

- TWC to send meeting actions and requested information to [redacted] – complete.
- TWC to send invite to reoccurring monthly virtual meeting between Chance and GTC – complete.
- GTC staff to discuss information requests detailed in the email from [redacted] on September 5, 2023 with GTC leadership and share feedback with Chance – in progress.
- GTC and Chance to develop Memorandum of Understanding, Terms of Reference or Cooperation Agreement – in progress; Chance is developing a high-level Collaboration Plan to share with GTC for review and comment per feedback from GTC on October 7, 2023.
- GTC staff to confirm if Grand Chief [redacted] should be copied on all communications between Chance and GTC staff – in progress.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

- Chance to introduce [redacted] to [redacted] (Vuntut Gwitchin First Nation technical advisor) – complete.

Details of Discussion

- Everyone shared introductions.
- [redacted] is interested in producing oil and gas for local consumption. He added that Chance is trying to create economic opportunities within the Yukon and partner with First Nations. [redacted] said he was looking forward to working together with the GTC and asked [redacted] how they wanted to proceed for the rest of the call.
- [redacted] thanked [redacted] for the context and noted they were interested in having a reintroduction meeting because there had been turnover at the GTC office. [redacted] said he is the Acting Director at GTC and hired [redacted] recently to support consultation work. [redacted] explained that [redacted] has a good background in consulting in the north and asked Greg to walk through the presentation.
- [redacted] said Chance has been to Aklavik, Fort McPherson, and Inuvik since the Project started in 2014. [redacted] noted the Project would be assessed by the Executive Committee of the Yukon Environmental Socioeconomic Assessment Board (YESAB).
- [redacted] provided a background on Chance and noted the company started in 1994. He explained Chance is focused on assessing oil and natural gas potential in the Yukon. Greg shared that Chance has offices in Calgary and Whitehorse. Greg shared that Chance has 8 active natural gas and oil wells in the Eagle Plains.
- [redacted] said the Project also overlaps with part of GTC's secondary use area. [redacted] explained that the Project area overlaps with the North Yukon Planning Region (NYPR) and Peel Watershed Planning Region (PWPR). He noted Chance is looking at the guidelines for both planning regions.
- [redacted] shared that the Project proposes more seismic activities in the Eagle Plains area. He added that if the results from the proposed Project deem the oil and natural gas resources economical, then a future extraction project would be proposed. The extraction project would undergo its own assessment under YESAB.
- [redacted] said Chance is proposing to conduct 1500 square kilometers of 3D and 2000 square kilometers of 2D seismic. He added that Chance is proposing to drill up to 30 wells in total, and approximately, 5-7 wells per year. [redacted] said all operations will be in the winter and that ice roads will be built to minimize impacts to wildlife and permafrost. He explained that extended flow testing will also be conducted.
- [redacted] shared information on Chance's existing camp located at kilometer 324 on the Dempster Highway. He said it has a capacity of 75 people. Chance will use the existing airstrip for the Project and will construct winter access roads as well as a fly in camp to accommodate approximately 25 people. [redacted] said Chance may also build a winter airstrip to support bringing crews in from Inuvik, Old Crow, and other interested communities.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

- [redacted] explained the permafrost in the Project area is quite thick and that Chance will utilize sumps to prevent significant melt. He added that the sumps have been working well to date.
- [redacted] shared that Chance will abandon the exploration wells and reclaim the Project area. They are currently working on reclaiming past wells and will be abandoning a few more this year. Other wells will be suspended to get them ready for potential future production.
- [redacted] explained that Chance initially submitted a Project Proposal to the Dawson City Designated Office of YESAB and they deferred the Project to the Executive Committee of YESAB. She explained that the current Project design and activities reflects feedback shared during previous engagement. For example, drilling activities will only take place in winter versus year-round drilling, Chance is utilizing the existing Project footprint, Project activities will be spread over 10 years to support longer-term employment and procurement opportunities, and Chance will utilize low impact seismic technologies. [redacted] said seismic lines are much narrower today than seismic lines created in the 1970s. As a result, Chance is expecting less linear features impacts.
- [redacted] presented baseline studies completed for the Project. She added that Chance conducted additional baseline studies in 2018/2019 and 2023 based on feedback they had received from First Nations and the Dawson City Designated Office. [redacted] offered to share available baseline studies with GTC.
- [redacted] said GTC would appreciate receiving copies of the available baseline studies and today's presentation.
- [redacted] shared she would share a video illustrating proposed Project activities. She noted the video is helpful for people with limited oil and gas experience.
- [redacted] explained that the Project is now at step six of YESAB's Pre-Submission Engagement Process. She said the Project is at step six because it was referred by the Dawson City Designated Office to the Executive Committee. Step six requires Chance to submit a Project Proposal to the Executive Committee. Chance is aiming to submit their Project Proposal in mid-December 2023 and recognized this is an ambitious timeline.
- [redacted] provided an update on engagement activities in 2023. She noted Chance conducted an open house event in Inuvik in May and heard a lot of great feedback from attendees at that event. Eliza explained a planned open house in Fort McPherson the following day was cancelled due to flash flooding. [redacted] shared that Chance is hoping to conduct more open house events in the fall.
- [redacted] asked GTC to share any feedback on engagement preferences or if there are any GTC specific community-based research protocols to follow before conducting socioeconomic baseline interviews. [redacted] explained data available through Statistics Canada is not disaggregated enough to reflect socioeconomic conditions in smaller northern communities. [redacted] asked GTC to confirm if there are people or businesses that Chance should interview.
- [redacted] said Chance has prepared a draft Table of Contents for the Project Proposal.
- [redacted] asked Chance to include questions asked of GTC during this meeting when they send over materials that were discussed. [redacted] said a lot of work still needs to be done and commended Chance for work that had been completed. He said today's meeting was good

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

and that they will get back with answers to the questions asked. [redacted] suggested they set up monthly meetings to stay connected.

- [redacted] thanked [redacted] for his comments and said if GTC has specific biophysical Valued Environmental and Socioeconomic Components related questions, that Chance can bring the discipline leads from Environmental Dynamics Inc. and the other consulting companies to the monthly meetings. She reiterated that Chance is happy to focus the monthly meetings to topics GTC is most interested in.
- Greg suggested he introduce [redacted] to [redacted] (technical advisor for Vuntut Gwitchin First Nation). He added Chance would be happy to set up technical meetings with all potentially affected First Nations, if interested. He said Chance wants to engage First Nations on the VESECs (e.g., Porcupine Caribou Herd and permafrost).
- [redacted] explained the logistical challenges of in-person engagement (e.g., finding flights and accommodation for the Project Team and travelling when the ice roads freeze). He expressed interest in more frequent virtual meetings. [redacted] acknowledged that COVID-19 delayed engagement with First Nations. He said that time was used to continue collecting baseline data.
- [redacted] said they recognize that Chance has been doing this for a long time and suggested they develop a Terms of Reference or Cooperation Agreement.
- Greg thanked [redacted] for their time.
- [redacted] requested Chance send information and questions discussed and work on collaboratively developing a Memorandum of Understanding, Terms of Reference, or Cooperation Agreement.

APPENDIX 2-B-28. September 27, 2023, Meeting Summary

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

Meeting Minutes

Subject	Monthly Chance-GTC Meeting
Prepared By	Two Worlds Consulting
Groups Involved	Chance Oil and Gas Limited (Chance) Environmental Dynamics Inc. (EDI) Gwich'in Tribal Council (GTC) Two Worlds Consulting (TWC)
Participants	Chance Oil and Gas Limited • [redacted], VP Government and Community Relations • [redacted], Community Engagement and Permitting Environmental Dynamics Inc. • [redacted], Regulatory Specialist and Biologist Gwich'in Tribal Council • [redacted], Lands and Resources Coordinator • [redacted], Transboundary Specialist • [redacted], Acting Director Two Worlds Consulting • [redacted], Engagement Specialist • [redacted], Engagement Support • [redacted], Project Manager
Date/Time	September 27, 2023 1:30 – 2:15 pm PST
Copies to	Chance and GTC

Purpose of Meeting

- The purpose of the meeting was to follow up on action items identified during the August 29, 2023 meeting between Chance and GTC Staff.

Topics Discussed

- Project Proposal review and schedule
- Consultation and engagement activities
- Chance-GTC Collaboration Plan

Key Issues Raised / Chance Responses to Issues

- GTC shared they have ongoing capacity challenges and do not have a lot of technical experts inhouse.
- Chance shared [redacted] (Vuntut Gwitchin First Nation's technical advisor) contact information with GTC [redacted] was in the process of setting up a meeting with all potentially affected First Nations, Chance, Yukon Government, and the Yukon Socioeconomic Assessment Board to discuss capacity funding on October 13, 2023.
- GTC shared the importance of putting things into plain language and summarizing where possible.
    - Chance offered to bring Project Team members to discuss areas of interest to GTC at future monthly meetings (e.g., [redacted] from EDI to discuss the Porcupine Caribou Herd).

Actions and Responsible Party

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

- Chance to develop a draft Collaboration Plan for GTC's review and comment – in progress
- Chance to send Eagle Plains Exploration Project (Project) information to [redacted] at GTC – complete
- Chance to send chapters of Project Proposal to Gwich'in Tribal Council as they become available – in progress
- GTC to confirm if Grand Chief[redacted] should be copied on all ongoing communications – in progress

Details of Discussion

Everyone introduced themselves.

[redacted] asked if anyone had any feedback on the meeting agenda before beginning.

[redacted] and [redacted] said there were no additional agenda items.

[redacted] shared the GTC Annual General Assembly (AGA) was happening October 3 – 5, 2023 after being postponed in August 2023 due to the wildfires. He said the AGA location had changed to Inuvik. GTC had no Project updates. [redacted] introduced [redacted] as the GTC lead on the Project and said there are many new staff at GTC. He added that it had been great collaborating with Chance and appreciates the support from TWC. Peter said GTC is looking forward to continuing to work together.

[redacted] asked if there would be any briefing on the Project at the AGA.

[redacted] said GTC Staff will discuss the Project with Grand Chief[redacted]. He added the Project will not be discussed in a lot of detail.

[redacted] asked GTC Staff to confirm if there are any materials that Chance could share to support that discussion.

[redacted] asked if Chance will be able to conduct community-level consultation and engagement activities. He noted Chance were told to cancel a planned community open house event in Fort McPherson in August 2023.

[redacted] said he would mention this to Grand Chief[redacted] at the AGA and noted GTC was holding off consultation and engagement activities until after the AGA.

Greg said the last two weeks of October is a difficult time to travel due to changing environmental conditions. He added it takes time to coordinate the logistics for the Chance Project Team to travel to the Northwest Territories.

[redacted] asked if there was a time in the fall that would work best for Chance to conduct consultation and engagement activities.

[redacted] said Chance will share proposed consultation and engagement dates with GTC. She added that Chance will offer taxi chit money to support the attendance of folks from Aklavik and Tsiigehtchic at events in Fort McPherson and Inuvik.

Greg said Chance wants to get proper feedback from people in the communities including Designated Gwich'in Office representatives, Elders, and youth.

[redacted] asked if Chance would cover expenses for the community members and staff.

[redacted] confirmed that Chance would cover travel expenses including honorarium and fuel to support folks from Aklavik and Tsiigehtchic attend events in Inuvik or Fort McPherson.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

[redacted] aid there are two steps required prior to consultation and engagement activities. He said GTC needs to provide approval for Chance to go into communities and approval on how Chance plans to conduct consultation and engagement activities. Peter requested Chance prepare a high-level Collaboration Plan outlining proposed consultation and engagement activities.

[redacted] said Chance has been and will continue to provide dinner at community open house events. [redacted] noted Chance is looking for GTC to confirm preferences around leadership-specific consultation and engagement activities. She asked GTC Staff to confirm if Grand Chief would like to join the monthly meeting between GTC and Chance.

[redacted] said that virtual consultation and engagement may be possible and asked Chance to include proposed location and format of activities in the Collaboration Plan.

[redacted] said it is helpful to know that virtual is an option.

[redacted] said Chance is interested in a Cooperation Agreement to support the flow of funding to GTC for their involvement in consultation and engagement activities.

[redacted] said GTC wants to set out their intentions to work together. He noted he has experience working on collaboration plans and that this medium allows GTC and Chance can get creative.

[redacted] said Chance is aiming to submit their Project Proposal in February 2024. She added that Chance is looking for feedback on the Project Proposal details from GTC and their technical team. [redacted] asked if GTC would be comfortable receiving documents as they become available or if there is preference to receive the Project Proposal as a bundled-up package.

[redacted] said either way would be okay. She also asked how long the documents are.

[redacted] said that the documents are long and exact page numbers for each chapter are not yet available. Eliza added that the documents could range into the hundreds of pages depending on the topics.

[redacted] confirmed receiving the Project Proposal chapters as they become available would be best.

[redacted] asked if GTC has a preferred technology such as Dropbox or a folder structure to share Project information.

[redacted] said she will work with [redacted], and the EDI Information Technology Team to see what would be the easiest for GTC.

[redacted] said GTC had no preferences around file sharing methods.

[redacted] said they can test out options and see which would work best.

[redacted] said Chance is trying to share information on topics of interest at community open house events. He said Chance will do their best to summarize important topics for the communities and is happy to support the First Nations coordinating their reviews together to help prioritize what information is needed for review and what individual experts are needed at the next session.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

[redacted] said that all sounds great. GTC stated they have ongoing capacity challenges and do not have a lot of technical experts inhouse. Peter shared the importance of putting things into plain language and summarizing where possible.

[redacted] welcomed GTC Staff to forward the monthly meeting invite to anyone else that should be involved.

[redacted] asked the GTC Staff if they had questions on the materials shared so far or if there are any topics of interests to discuss at the next meeting. She added Chance would coordinate to bring the right experts to the table as needed.

[redacted] said that sounded good.

[redacted] asked if there are any GTC-specific community-based research protocols that Chance should be aware of and/or individuals that Chance should interview as part of their socioeconomic assessment in the Project Proposal.

[redacted] said GTC will investigate and get back to Chance. Alicia added that she is feeling very new and is unsure if there are any emails that she is missing.

[redacted] said she will forward the email to [redacted] from the first meeting on baseline studies, links to a Dropbox site with the Project video, and other Project-related information. [redacted] said if anything is unclear, to let Chance know so they can help GTC to understand the proposed Project.

APPENDIX 2-B-29. October 13, 2023, Meeting Summary

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

Meeting Minutes

Subject	Consultation and Capacity
Prepared By	Two Worlds Consulting (TWC)
Groups Involved	Chance Oil & Gas (Chance) TWC The Yukon Government (YG) Canadian Northern Economic Development Agency (CanNor) Crown-Indigenous Relations and Northern Affairs Canada (CIRNAC) First Nation of Na-Cho Nyak Dun (FNNND) Tr'ondëk Hwëch'in First Nation (TH) Gwich'in Tribal Council (GTC) Vuntut Gwitchin Government (VGG) Yukon Environmental and Socio-economic Assessment Board (YESAB)
Participants	• [redacted] Executive Committee Manager (YESAB) • [redacted] Aboriginal Relations (YG) • [redacted] Major Projects Director (YG) • [redacted] Major Projects Manager (YG) • [redacted] Geothermal & Petroleum Resources Manager (YG) • [redacted] Regional Environment Manager (CIRNAC) • [redacted] Manager (CIRNAC) • [redacted] Project Officer (CanNor) • [redacted] Project Manager (CanNor) • [redacted], Resources & Governance Consultant (FNNND and TH) • [redacted], Lands & resources coordinator (GTC) • [redacted], Technical Advisor (VGG) • [redacted], Caribou Coordinator (VGG) • [redacted] (Chance) • [redacted] (Chance) • [redacted], Regulatory Lead (Chance) • [redacted], Transboundary Specialist (GTC) • [redacted], [redacted], and [redacted] (TWC)
Date/Time	October 13, 2023 from 10:30am – 12:00pm PST
Copies to	[redacted]

Purpose of Meeting

- Discuss Consultation and Capacity

Topics Discussed

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

- YESAB Screening Process
- Consultation Plan
- Transboundary Territory

Key Issues Raised / Chance Responses to Issues

- Inquired about international transboundary lands and if there is a plan to address that.
    - Chance stated they are following the YESAB regulations and there is nothing explicitly about international transboundary consultation requirements.
- Noted the need for Nations to receive capacity funding prior to the submission of proposals.
    - CIRNAC stated that NPFP is flexible and can be arranged to support this

Actions and Responsible Party

- VGG to set up all Nations meeting.
- YG to set up meeting with VGG, TH, FNNND, GTC to discuss Consultation Plan after all Nations meeting.
- VGG, TH, FNNND, GTC to follow up with CIRNAC about capacity funding.
- CIRNAC to follow up about Transboundary with US consultation protocol

Details of Discussion

- [redacted] talked about Chance's project proposal. [redacted] discussed Engagement with Chance and the somewhat revised project description. He clarified that this meeting is about the process moving forward and not the project details, as well as to better understand the Nations feelings. John introduced the idea of making a joint consultation plan process to ultimately look at capacity funding for all Nations to meaningfully participate in further engagement. [redacted] clarified that this meeting is to hear the party's perspectives on consultation and capacity and not to talk about the project or project details.
- [redacted] reiterated that this meeting is for consultation discussions. [redacted] described the screening process for YESAB. He stated that YESAB through the screening process checks to see if the proponent has fulfilled consultation duties with communities and First Nations using the four-point test. He clarified YESAB doesn't need consultation records during the screening period, as this is separate from the records of past consultation leading up to the screening period. [redacted] said he is here to answer any further questions about the screening process as the meeting progresses.
- [redacted] asked for clarification about the project history and new regulatory screening process since the project went from Dawson City Designated Office to the Executive Committee. [redacted] continued that with the newer consultation under the Executive Committee how will this change the screening process since the project is referred from the DO?
- [redacted] clarified this is a referred project and now must update under new regulation. He stated Chance is not submitting a new project rather a revised proposal and consultation record to meet new standards.
- [redacted] asked whose regime Chance was under before compared to now and how that has changed the process.
- [redacted] added that Nations are dealing with a proposal that has not been submitted yet and the consultation record only covers what has happened during the DO days.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

- [redacted] stated that First Nations are providing comments but asked [redacted] if Nations should expect face to face discussions to provide input moving forward.
- [redacted] answered yes, this is a possibility. He said YESAB could include Nations in the screening process if needed and desired.
- [redacted] redirected the conversation onto Aboriginal Relations with Yukon Governments
- [redacted] proposed adding to the meeting agenda more discussions regarding the Yukon government. He stated the Yukon Government is a regulator on this project and decision maker on this project and will make recommendation based on the Department of Economic Developments input. [redacted] further explained that the Yukon will lead a consultation under major projects Yukon, with affected Nations and YG will be relying on the screening process which means Nations need to participate in the screening process to inform how treaty rights are affected and how YESAB are taking those impacts and converting to values ultimately to inform decision making. [redacted] continued that the YESAB approach is to engage early in addition to the ongoing screening. He said this meeting is a good time to understand what the consultation process looks like moving forward. He informed that YESAB will be leaning on the Aboriginal Relations to inform and set up that consultation approach. He clarified the assessment itself will be informed by regulators providing technical expertise.
- [redacted] agreed with [redacted] and explained the process further.
- [redacted] explained that YESAB has a less defined consultation process to let it be led more by participants. She explained that YG has been working on multiyear consultation efforts. She invited a discussion of the components that need to be improved in the engagement process. [redacted] stated that she looks forwards to using consultation tools to better inform a process moving forward.
- [redacted] asked if YG is aware of the transboundary areas and how consultation works with Alaskan transboundary lands. He also asked how YG feels about transboundary lands with America.
- [redacted] answered that YG takes transboundary issues seriously but can't confirm if there is a case to reference where an organized Indigenous group in America had transboundary lands with Canada. [redacted] explained that YG has dealt with transboundary within Canada and Provinces more frequently than National transboundary lands.
- [redacted] asked to hear from other Federal representatives on International transboundary protocol.
- [redacted] answered speaking to the federal approach to consultation and the federal participation in these major projects. [redacted] stated that this project may not require federal decision bodies. She clarified that Canada's engagement and duty to consult relies on what is determined through the YESAB screening process.
- [redacted] stated that the Northern Participant Funding Program (NPFP) is designed to assist First Nations in participating in big projects but is limited to 150,000 dollars per fiscal year. He further explained that NPFP is limited to projects that are for sure to go through the assessment process.
- [redacted] asked [redacted] if Nations can't trigger NPFP funding until the proposal is submitted how can Nations get ready for the assessment, as Nations don't want to be left behind. [redacted] asked, if there was a possibility for capacity funding about 2 months before the proposal is submitted.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

- [redacted] answered that CIRNAC tries to be very flexible with this and are open to discussions before submission if things are moving quickly. Shane continued that CIRNAC is looking to maximize participation and readiness.
- [redacted] asked [redacted] if he would be open to assisting in creating a consultation plan
- [redacted] answered that he would be very open to help with a consultation plan. He clarified that Provincial limiting doesn't limit federal funding.
- [redacted] asked If Canada is not a decision body how are transboundary lands addressed with the US for Federal consultation.
- [redacted] asked, for the federal money that is available, is there any documents on the responsibility of proponents to provide capacity funding or is there federal linkage to proponent obligation.
- [redacted] answered, no, federal funding is not linked to proponent responsibility, rather federal funding is supplementary.
- [redacted] asked what Transboundary lands are in question.
- [redacted] clarified that Gwich'in territory extends into Alaskan transboundary lands. [redacted] asked if there is a plan around addressing this.
- [redacted] asked if this is referencing Porcupine Caribou Herd. [redacted] continued that Chance follows YEASB regulations and is concerned over the international regulations being brought into the equation as Chance is following all required regulations that are known.
- [redacted] answered that there are international transboundary Porcupine Caribou Herd relations that he wants clarification on about if there is existing federal protocol for but he just wanted to raise question not to raise concern.
- [redacted] echoed [redacted] and thanked John for clarifying on importance of concern raised.
- [redacted] reiterated that there is no question about FNNND desire to be very involved but the form that will take on how that participation will look he is not sure on. He stated that FNNND is overlapping with TG and that both First Nations want to be involved but have to sort out the details.
- [redacted] stated that Chance has been working with FNNND for a while now and Chance needs to know what level of consultation is required as previous meetings have been postponed and there is not a clear understanding of what FNNND wants consultation wise. [redacted] wanted to get confirmation about level of consultation desired by FNNND. He stated porcupine caribou is common priority amongst all Nations involved and that is known. [redacted] said that Chance would like to schedule meetings with FNNND and asked if [redacted] could help Chance in a timely matter to get some direction on how and when to consult with FNNND as it has been hard in the past. [redacted] recognized that the type and degree of consultation needs to be sorted out on direction that further consultation will take.
- [redacted] answered that there has been some difficulty lately with new governments in both Nations and all new staff causing delays. [redacted] stated that he is working on trying to facilitate more understanding on needs.
- [redacted] stated that he had a few meetings with Chance regarding the proposal and GTC and Chance have a good working relationship, but this relationship doesn't replace the federal duty to consult, and GTC looks forward to discussing that further when the time comes.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

- [redacted] talked about the how the Old Crow meetings back in May discussing the revised project description were delayed due to floods but the but the Mid September meetings in Old Crow were very productive. [redacted] thought it was a good session. [redacted] shared that the VGG perspective is to get ahead of this and have regular meetings with Greg, to keep in touch. John shared that VGG are in support about the proposal being submitted. [redacted] shared that VGG would like to know what the consultation process looks like so VGG can prepare. [redacted] proposed that VGG works together with the other Nations to be more efficient and share resources and to be coordinated in the consultation process. John asked for a First Nations reps only meeting to get organized and so Nations can be active and not passive in the consultation process.
- [redacted] asked if the current project proposal is the final version of the proposal. [redacted] said that the last timeline heard was mid December for probable submission to YESAB. [redacted] asked if FNNND and TH are currently being consulted on the final or work in progress proposal.
- [redacted] answered that Chance has a description of the project in draft from. [redacted] said that the Nations consultation on the project so far has not just been about ticking off a box about rather what people think about the project. [redacted] said that all Nations are going to see the final proposal when it is submitted. [redacted] stated that Chance is looking at a submission in January and said [redacted] can talk to that more.
- [redacted] said that Nations are currently dealing with the draft proposal currently, but the final will be the one that is focused on moving forward.
- [redacted] asked if it can be confirmed that the proposal can be adjusted.
- [redacted] answered that the proposal can be adjusted until submission.
- [redacted] Presented Chance project updates: [redacted] showed slides. [redacted] thanked everyone for attending. He stated Chance is working to meet all four points under YESAB screening. [redacted] stated nothing has really changed from 2014 to the new project. He continued that minor changes were made to First Nations engagement, like seasonal road. [redacted] informed that between now and January 2024 the goal is to submit proposal early to mid February. He stated Chance is happy to do virtual meetings. [redacted] said Chance doesn't want to be throwing big packages at you, Chance wants to make sure that it can be a meaningful conversation. He stated Chance will be doing a document review and that Two Worlds Consulting was hired to support in this endeavour. He finished by saying the meeting held with YESAB about traditional knowledge was critical and Chance wants to capture that Knowledge and use it to influence the submission.
- [redacted] closed the meeting by discussing possible next steps like an all Nation only meeting and a consultation plan with help of YG. [redacted] stated that it was good to hear about support for consultation and about capacity funding as needs are there. He finished by sharing that it might be a good idea to collapse all nations together to save money.

APPENDIX 2-B-30. November 1, 2023, Meeting Summary

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

Meeting Minutes

Subject	Monthly Eagle Plains Exploration Project Meeting
Prepared By	Two Worlds Consulting
Groups Involved	Chance Oil and Gas Limited (Chance) Environmental Dynamics Inc. (EDI) Gwich'in Tribal Council (GTC) Two Worlds Consulting (TWC)
Participants	Chance • [redacted], Community Engagement and Permitting • [redacted] VP Government and Community Relations EDI • [redacted], Regulatory Specialist and Biologist GTC • [redacted], Lands and Resources Coordinator • [redacted], Transboundary Specialist TWC • [redacted], Engagement Specialist • [redacted] Socioeconomic Specialist • [redacted] Engagement Support • [redacted] Project Manager
Date/Time	November 1, 2023 2:30 – 3:20 pm MDT
Copies to	Chance and GTC

Purpose of Meeting

- To discuss GTC's involvement in the Eagle Plains Exploration Project (Project) regulatory process.

Topics Discussed

- Project Proposal updates and schedule.
- Consultation and engagement activities.

Key Issues Raised / Chance Responses to Issues

- GTC shared that they are experiencing ongoing capacity challenges.
- GTC shared that any development within the Peel Watershed could trigger a requirement for the Yukon Government to notify the Northwest Territories Government.
- GTC shared concern about cumulative effects in the Peel Watershed and cumulative effects of greenhouse gas emissions.

Actions and Responsible Party

- Chance to share updated open house dates with GTC staff via email.
- Chance to maximize the use of visuals in open house materials.
- Chance to provide the open house advertisement with GTC, once the open house date is confirmed.
- GTC to review and provide comment on the *Draft Collaboration Plan*.
- GTC to confirm if Chance should proceed with conducting an open house in Fort McPherson on December 7, 2023.
- GTC to confirm the best way to advertise the proposed open house in Fort McPherson.
- GTC to confirm if the PDF open house advertisement should be in another file format.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

- GTC to confirm interest in having a more focused discussion on heritage resources with Ecofor (heritage resources consultant for the Project).
- GTC to send [redacted] contact information to Chance.
- GTC to confirm with Chance if there are any communication protocols to follow (i.e., who should be included on emails from Chance).

Details of Discussion

[redacted] welcomed GTC to share Project updates.

[redacted] shared GTC staff plan to meet regularly with GTC leadership about the Project and other items.

[redacted] said that GTC was still in the process of reviewing the *Draft Collaboration Plan* prepared by Chance. GTC will get back to Chance with any comments, questions, and/or feedback very soon.

[redacted] said the proposed open house dates have shifted due to Project team and airline availabilities. She said that Chance is hoping to get confirmation from GTC on these dates. She added that Chance would like to fly into Inuvik on the morning of December 7, 2023. She explained that Chance is hoping to meet with GTC that morning and then take a charter plane to Fort McPherson to conduct an open house event that evening. [redacted] said Chance would leave Inuvik on December 8, 2023 to fly south to Whitehorse.

[redacted] said he had breakfast with GTC Grand Chief that morning. [redacted] said Grand Chief understood the importance for Chance to consult GTC Participants and residents in Fort McPherson. Grand Chief suggested to [redacted] that Chance host an early dinner with a presentation from each specialty group, such as fish and wildlife, engineering, seismic, and permafrost. [redacted] confirmed Chance will reimburse GTC for their time to support hybrid meeting logistics for the proposed open house. [redacted] also shared that Grand Chief recommended Chance bring representatives from Aklavik, Tsiigehtchic, and Fort McPherson to Inuvik in early 2024. [redacted] said Chance would help pay for the travel and accommodation of these representatives.

[redacted] asked for clarification on the proposed December open house date in Fort McPherson.

[redacted] clarified Chance is proposing to conduct an open house in Fort McPherson the evening of December 7, 2023. She added that there would also be space to bring GTC staff on the charter plane to Fort McPherson and return to Inuvik. [redacted] stated that Chance would fly to Whitehorse on December 8.

[redacted] said Chance hopes to conduct a hybrid event on December 7, 2023. He noted if that doesn't work out, then the Project team would travel back to the Northwest Territories in January 2024 for additional in-person consultation and engagement.

[redacted] said the Chance Project Team would like to provide sufficient time to advertise the event to GTC Prticipants and support Chance to plan accordingly. She said that Chance would normally like to provide 2 to 3 weeks of notice of open house events. [redacted] said Chance would provide an advertisement to GTC once the open house date was confirmed.

[redacted] asked if GTC prefers the term 'participants', 'citizens', or 'members'. Noted she had seen variety of terms online and wanted to make sure Chance prepared materials that respected GTC's preferences.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

[redacted] said that 'Gwich'in Participant' is the proper term. He shared that presentations with visuals are appreciated by Gwich'in Participants. He recommended less technical presentations and the use of maps and figures that Gwich'in Participants can ask questions about and provide feedback on.

[redacted] said Chance has a Project video as well. She said that if it's too long to show, Chance can focus on parts of the video most important to GTC. [redacted] thanked [redacted] for the feedback and asked if there is anything else that anyone would like to add. She said if not, she will introduce Daryl to the group.

[redacted] ared that there is a community radio station in Fort McPherson and recommended Chance advertise the open house via the radio. He added that Facebook is a good way to advertise too. He said that he can reach out to the GTC enrollment office, and that they can send the information directly to Gwich'in Participants' emails, pending approval from GTC leadership.

[redacted] said that sounded great. She said that Chance will wait to hear back from GTC for confirmation on the proposed open house date. She said she can send an email confirming the December dates in writing.

[redacted] asked if there will be a Microsoft Teams link for folks to join the open house event that are not located in Fort McPherson.

[redacted] said Chance is happy to support a hybrid event. [redacted] added that Chance is looking for advice from the GTC technical team to support the logistics of a hybrid event.

[redacted] asked if Chance has considered travelling with Starlink. He said his Starlink works very well.

[redacted] asked GTC to confirm if the open house invitation should be shared in a format other than PDF.

[redacted] said he would confirm with the preferred invitation format with one of his communication colleagues.

[redacted] said that if there are any questions regarding the socio-economic process for the Collaboration Plan, [redacted] is here to help.

[redacted] introduced himself. He said that he is leading the socio-economic assessment of the Project Proposal. He said that Chance is assessing the Project's potential impact to land use, transportation and infrastructure, employment and economy, and community health and wellbeing. [redacted] noted Chance is interested in engaging Gwich'in Participants on these topics. He acknowledged Gwich'in Participants travel down the Dempster highway for cultural and traditional use activities. He added that Chance wants to understand the location and seasonality of these activities to understand potential Project-related impacts and possible mitigation measures. He said that there is an opportunity to connect with representatives from GTC to confirm any information that Chance has heard and to fill in gaps where necessary.

[redacted] thanked [redacted] and said it is good to see that Chance is planning to engage with Gwich'in Participants. He said that in the past, GTC has included the cultural and heritage department. He said he will chat with the leadership and bring [redacted] on board to participate. He asked if [redacted] is doing the cultural heritage assessment.

[redacted] said that Ecofor is responsible for the cultural heritage assessment. She said to let Chance know if GTC wants a more focused discussion on heritage with Ecofor.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

[redacted] said he will mention it to the leadership.

[redacted] asked [redacted] to share [redacted] contact information with Chance to coordinate a socio-economic interview with her. He added that Chance can send over consent forms, questions, and themes prior to conducting socio-economic interviews to make the best use of everyone's time.

[redacted] introduced herself as the regulatory lead for the Project. She said that EDI can bring experts as needed to answer any questions around physical and biophysical components of the Project.

[redacted] said that GTC is so busy right now. He said that GTC will take a closer look at the Collaboration Plan soon and provide further feedback.

[redacted] asked if the Project overlaps with the Peel Watershed.

[redacted] confirmed the Project overlaps with the Peel Watershed.

[redacted] noted this that may trigger requirement for Yukon Government to notify the Northwest Territories of the Project, which may affect Chance's current Project timeline.

[redacted] said Chance is prepared to assist the Nations review the Project information in detail. He recognized that the Porcupine Caribou Herd, water drainage system, fish, wildlife, and land and resource use activities such as trapping are priorities for the First Nations. [redacted] added that Chance will still be available after submission of the Project Proposal to discuss and respond to Project-related issues/gaps identified by the First Nations.

[redacted] said that [redacted] is working with all the First Nations and that there is already a meeting scheduled to discuss northern participant funding. He said the meeting will be about how each Nation can benefit from that and increase capacity in the Project's regulatory process. He said that GTC's leadership team knows about this meeting. [redacted] raised that cumulative effects to the watershed are a very important consideration as well. He asked what the total carbon footprint of the Project is. He noted that this is something that GTC would like to investigate as well.

[redacted] thanked [redacted] for his comments.

[redacted] asked if GTC has any communication protocols and if Kanda and Alicia should be copied on all correspondence.

[redacted] said he will let Chance know if GTC has any communication protocols to be followed.

APPENDIX 2-B-31. December 4, 2023, Meeting Summary

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

Meeting Minutes

Subject	Monthly Eagle Plains Exploration Project Meeting
Prepared By	Two Worlds Consulting
Groups Involved	Chance Oil and Gas Limited (Chance) Environmental Dynamics Inc. (EDI) Gwich'in Tribal Council (GTC) Two Worlds Consulting (TWC)
Participants	Chance • [redacted], Community Engagement and Permitting • [redacted], VP Government and Community Relations EDI • [redacted], Regulatory Specialist and Biologist GTC • [redacted], Lands and Resources Coordinator • [redacted], Transboundary Specialist TWC • [redacted], Engagement Specialist • [redacted], Engagement Support • [redacted], Project Manager
Date/Time	December 4, 2023 9:30 – 9:55 AM MST
Copies to	Chance and GTC

Purpose of Meeting

- Project updates

Topics Discussed

- Fort McPherson engagement activities
- Socioeconomic research interviews
- Porcupine Caribou Herd Technical Working Group

Key Issues Raised / Chance Responses to Issues

- GTC noted that didn't have a record of anything related to cultural or heritage baseline data in the draft Project Description, but it says that cultural impact studies will be considered.
    - Chance to resend the heritage baseline studies to GTC – complete.

Actions and Responsible Party

- Chance to prepare a slide about Project-related job opportunities for the community engagement events – complete.
- Chance to forward email regarding socioeconomic interviews with GTC – complete.
- Chance to copy [redacted] on all future GTC correspondences – ongoing.
- Chance to send the December 20th meeting recording to GTC – in progress; Chance to share a copy of the Porcupine Caribou Herd Technical Working Group meeting minutes to GTC – in progress.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

- GTC to send Chance personal cell number for Fort McPherson engagement activities – complete.

Details of Discussion

[redacted] requested confirmation from the GTC team if there was anyone else from GTC that wanted to travel with the Chance Project Team to Fort McPherson via charter plane on December 7th. [redacted] asked if TWC should pick [redacted] up in a taxi to the airport with the Project Team.

[redacted] added that the charter is scheduled to leave between 2:00 and 2:30 pm MST. He said that the Project Team will be leaving from the main hangar.

[redacted] said that it sounds like the Project Team will be leaving for the airport after checking in at Capital Suites in Inuvik. She said the Project Team will be waiting for the rest of the team to arrive from Calgary at the Inuvik airport. [redacted] asked if [redacted] would like an email, text, or phone call when the Project Team will be heading to the airport.

[redacted] confirmed that a text or phone call would work. She added that she could drive herself to the airport.

[redacted] said meeting the Project Team at the Inuvik airport at 2:00 pm MST would work. He noted that the Project Team will be leaving Inuvik around 2:30 pm MST. [redacted] added that the flight will take 30minutes and that Chance has arranged rides to and from the Fort McPherson airport to the Hamlet Community Center. [redacted] said the Project Team would be dropped off at the Fort McPherson airport around 8:00 and 8:30 pm MST.

[redacted] stated that it will be just her from GTC. She added that [redacted] and [redacted] are not available.

[redacted] noted that [redacted] is not expected to set up the open house event. She added that the Project Team will be setting up posters around the room, have a sign in sheet upon entry, and a Project handout to give to attendees. She noted that if there are any questions, the Project Team will be there to help. She shared dinner would be provided and stated that while people are eating, the Project Team will play the Project Overview video. She added that after that, there will be a presentation with a question-and-answer period. [redacted] noted that a feedback form will be available for attendees to complete at the end of the event. She also shared Chance draw door prizes at the end of the event.

[redacted] asked if there is anything that will be expected of her and what she should be prepared for.

[redacted] said that questions might be asked about the role that GTC plays with Chance. He added that attendees may want to know how GTC is connected to Chance. He noted that GTC could say that Chance works with GTC so that Gwich'in Participants are aware that Chance is following proper consultation protocols and practices.

[redacted] said that community members may ask about Project-related job opportunities. He requested that the Project Team prepare a slide to let the attendees know what type of opportunities will be available.

[redacted] confirmed Chance would prepare a slide on Project-related job opportunities and mentioned that the Project Team had already gotten requests for information on this topic. He added that the *Indian Act* chief and council will come say hello too. He noted that Chance will have seismic and drilling experts who will be able to answer any technical questions about the Project and job and contract opportunities for the well maintenance program next winter.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

[redacted] thanked GTC and noted the socioeconomic team will conduct interviews with GTC staff while in Inuvik and Fort McPherson. She added that the socioeconomic team is conducting interviews to help fill data gaps for the socioeconomic assessment that is part of the Project Proposal. She said that [redacted] suggested a group interview via email. [redacted] confirmed that the socioeconomic interview program did not include interviewing Gwich'in Participants but is looking for input from GTC staff to support the socioeconomic assessment.

[redacted] asked what day the email was sent out on.

[redacted] said that she will reforward the email to Alicia and Kanda again. She said that the email was sent out last Tuesday (November 28, 2023).

[redacted] asked if [redacted] would like to be copied on everything from the Project Team.

[redacted] onfirmed yes.

[redacted] said that he hasn't seen anything related to First Nations heritage or cultural in the baseline data that's been provided to GTC. He noted that draft Project Description says that cultural impact studies will be considered. He stated that he didn't see any cultural or heritage baseline data.

[redacted] said that Chance has conducted heritage baseline studies. She noted that she could resend the heritage baseline studies to [redacted] by email.

[redacted] said that the Project Proposal that Chance will be submitting to Yukon Environmental Socio-economic Assessment Board will include information on these topics. He noted that the socioeconomic assessment will incorporate publicly available secondary sources of cultural/Traditional knowledge.

[redacted] noted that it is important to include both cultural and heritage information in anything related to GTC. He added that is why he inquired about the baseline data.

[redacted] shared that the Project Team is working with EDI to conduct a fish and wildlife hybrid technical working group meeting on December 20, 2023, with specific focus on the Porcupine Caribou Herd. He added that Vuntut Gwitchin Government requested this meeting. Greg said someone from the Project Team will send an invite shortly. Greg said the meeting would be held in Whitehorse and a virtual attendance option would be provided. He stated that the Project Team hopes GTC can join the meeting He acknowledged the importance of Porcupine Caribou Herd and fur bearing animals to Gwich'in Participants.

[redacted] said the GTC office will be closed as of December 15th and staff will be unavailable to attend the December 20th meeting. Kanda requested that the Project Team record the meeting for GTC.

[redacted] said that Chance can record the meeting and send it to GTC. She asked what day the GTC office opens in January 2024.

[redacted] said he will check.

[redacted] said she is going to resend the socioeconomic assessment email outlining identified secondary sources containing Gwich'in Traditional Knowledge. She requested that GTC give confirmation that the sources can be used in the socioeconomic assessment and Project Proposal. She noted that some are linked to online sources; and some need to be downloaded as a PDF.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

[redacted] said that if it was sent in October, GTC would have missed it.

[redacted] said she will reforward the email to GTC.

[redacted] thanked [redacted]. He noted that Porcupine Caribou Herd is in the Peel Watershed. He stated that GTC is looking to develop a baseline document about the Porcupine Caribou Herd in the Peel Watershed.

[redacted]stated that she will send her personal cell number to get a hold of her.

Chance thanked GTC for their time and expressed excitement for their trip to Fort McPherson.

APPENDIX 2-B-32. December 7, 2023, Open House Summary Report

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

Meeting Minutes

Subject	Monthly Eagle Plains Exploration Project Meeting
Prepared By	Two Worlds Consulting
Groups Involved	Chance Oil and Gas Limited (Chance) Environmental Dynamics Inc. (EDI) Gwich'in Tribal Council (GTC) Two Worlds Consulting (TWC)
Participants	Chance • [redacted], Community Engagement and Permitting • [redacted], VP Government and Community Relations EDI • [redacted], Regulatory Specialist and Biologist GTC • [redacted], Lands and Resources Coordinator • [redacted], Transboundary Specialist TWC • [redacted], Engagement Specialist • [redacted], Engagement Support • [redacted], Project Manager
Date/Time	December 4, 2023 9:30 – 9:55 AM MST
Copies to	Chance and GTC

Purpose of Meeting

- Project updates

Topics Discussed

- Fort McPherson engagement activities
- Socioeconomic research interviews
- Porcupine Caribou Herd Technical Working Group

Key Issues Raised / Chance Responses to Issues

- GTC noted that didn't have a record of anything related to cultural or heritage baseline data in the draft Project Description, but it says that cultural impact studies will be considered.
    - Chance to resend the heritage baseline studies to GTC – complete.

Actions and Responsible Party

- Chance to prepare a slide about Project-related job opportunities for the community engagement events – complete.
- Chance to forward email regarding socioeconomic interviews with GTC – complete.
- Chance to copy [redacted] on all future GTC correspondences – ongoing.
- Chance to send the December 20th meeting recording to GTC – in progress; Chance to share a copy of the Porcupine Caribou Herd Technical Working Group meeting minutes to GTC – in progress.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

- GTC to send Chance personal cell number for Fort McPherson engagement activities – complete.

Details of Discussion

[redacted] requested confirmation from the GTC team if there was anyone else from GTC that wanted to travel with the Chance Project Team to Fort McPherson via charter plane on December 7th. [redacted] asked if TWC should pick [redacted] up in a taxi to the airport with the Project Team.

[redacted] added that the charter is scheduled to leave between 2:00 and 2:30 pm MST. He said that the Project Team will be leaving from the main hangar.

[redacted] said that it sounds like the Project Team will be leaving for the airport after checking in at Capital Suites in Inuvik. She said the Project Team will be waiting for the rest of the team to arrive from Calgary at the Inuvik airport. [redacted] asked if [redacted] would like an email, text, or phone call when the Project Team will be heading to the airport.

[redacted] confirmed that a text or phone call would work. She added that she could drive herself to the airport.

[redacted] said meeting the Project Team at the Inuvik airport at 2:00 pm MST would work. He noted that the Project Team will be leaving Inuvik around 2:30 pm MST. [redacted] added that the flight will take 30minutes and that Chance has arranged rides to and from the Fort McPherson airport to the Hamlet Community Center. [redacted] said the Project Team would be dropped off at the Fort McPherson airport around 8:00 and 8:30 pm MST.

[redacted] stated that it will be just her from GTC. She added that [redacted] and [redacted] are not available.

[redacted] noted that [redacted] is not expected to set up the open house event. She added that the Project Team will be setting up posters around the room, have a sign in sheet upon entry, and a Project handout to give to attendees. She noted that if there are any questions, the Project Team will be there to help. She shared dinner would be provided and stated that while people are eating, the Project Team will play the Project Overview video. She added that after that, there will be a presentation with a question-and-answer period. [redacted] noted that a feedback form will be available for attendees to complete at the end of the event. She also shared Chance draw door prizes at the end of the event.

[redacted] asked if there is anything that will be expected of her and what she should be prepared for.

[redacted] said that questions might be asked about the role that GTC plays with Chance. He added that attendees may want to know how GTC is connected to Chance. He noted that GTC could say that Chance works with GTC so that Gwich'in Participants are aware that Chance is following proper consultation protocols and practices.

[redacted] said that community members may ask about Project-related job opportunities. He requested that the Project Team prepare a slide to let the attendees know what type of opportunities will be available.

[redacted] confirmed Chance would prepare a slide on Project-related job opportunities and mentioned that the Project Team had already gotten requests for information on this topic. He added that the *Indian Act* chief and council will come say hello too. He noted that Chance will have seismic and drilling experts who will be able to answer any technical questions about the Project and job and contract opportunities for the well maintenance program next winter.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

[redacted] thanked GTC and noted the socioeconomic team will conduct interviews with GTC staff while in Inuvik and Fort McPherson. She added that the socioeconomic team is conducting interviews to help fill data gaps for the socioeconomic assessment that is part of the Project Proposal. She said that [redacted] suggested a group interview via email. [redacted] confirmed that the socioeconomic interview program did not include interviewing Gwich'in Participants but is looking for input from GTC staff to support the socioeconomic assessment.

[redacted] asked what day the email was sent out on.

[redacted] said that she will reforward the email to Alicia and Kanda again. She said that the email was sent out last Tuesday (November 28, 2023).

[redacted] asked if [redacted] would like to be copied on everything from the Project Team.

[redacted] onfirmed yes.

[redacted] said that he hasn't seen anything related to First Nations heritage or cultural in the baseline data that's been provided to GTC. He noted that draft Project Description says that cultural impact studies will be considered. He stated that he didn't see any cultural or heritage baseline data.

[redacted] said that Chance has conducted heritage baseline studies. She noted that she could resend the heritage baseline studies to [redacted] by email.

[redacted] said that the Project Proposal that Chance will be submitting to Yukon Environmental Socio-economic Assessment Board will include information on these topics. He noted that the socioeconomic assessment will incorporate publicly available secondary sources of cultural/Traditional knowledge.

[redacted] noted that it is important to include both cultural and heritage information in anything related to GTC. He added that is why he inquired about the baseline data.

[redacted] shared that the Project Team is working with EDI to conduct a fish and wildlife hybrid technical working group meeting on December 20, 2023, with specific focus on the Porcupine Caribou Herd. He added that Vuntut Gwitchin Government requested this meeting. Greg said someone from the Project Team will send an invite shortly. Greg said the meeting would be held in Whitehorse and a virtual attendance option would be provided. He stated that the Project Team hopes GTC can join the meeting He acknowledged the importance of Porcupine Caribou Herd and fur bearing animals to Gwich'in Participants.

[redacted] said the GTC office will be closed as of December 15th and staff will be unavailable to attend the December 20th meeting. Kanda requested that the Project Team record the meeting for GTC.

[redacted] said that Chance can record the meeting and send it to GTC. She asked what day the GTC office opens in January 2024.

[redacted] said he will check.

[redacted] said she is going to resend the socioeconomic assessment email outlining identified secondary sources containing Gwich'in Traditional Knowledge. She requested that GTC give confirmation that the sources can be used in the socioeconomic assessment and Project Proposal. She noted that some are linked to online sources; and some need to be downloaded as a PDF.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

[redacted] said that if it was sent in October, GTC would have missed it.

[redacted] said she will reforward the email to GTC.

[redacted] thanked [redacted]. He noted that Porcupine Caribou Herd is in the Peel Watershed. He stated that GTC is looking to develop a baseline document about the Porcupine Caribou Herd in the Peel Watershed.

[redacted]stated that she will send her personal cell number to get a hold of her.

Chance thanked GTC for their time and expressed excitement for their trip to Fort McPherson.

APPENDIX 2-B-33. December 20, 2023, Meeting Summary

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

Draft Meeting Minutes

Subject	Technical Working Group – Fish and Wildlife
Prepared By	Two Worlds Consulting
Groups Involved	Chance Oil and Gas (Chance) Environmental Dynamics Inc. (EDI) First Nation of Na-cho Nyäk Dun (NND) Porcupine Caribou Management Board (PCMB) Tr'ondëk Hwëch'in (TH) Two Worlds Consulting (TWC) Vuntut Gwitchin First Nation (VGFN) Yukon Government (YG)
Participants	**Chance Oil and Gas (Chance)** • [redacted], Community Engagement and Permitting • [redacted], Vice President Government and Community Relations **Environmental Dynamics Inc. (EDI)** • [redacted], Senior Biologist • [redacted], Senior Biologist • [redacted], Quantitative Ecologist **First Nation of Na-cho Nyäk Dun (NND)** • [redacted], Advisor **Porcupine Caribou Management Board (PCMB)** • [redacted], Executive Director • [redacted], Chair • [redacted], Minute Taker **Tr'ondëk Hwëch'in (TH)** • [redacted], Advisor **Two Worlds Consulting (TWC)** • [redacted], Engagement Facilitator • [redacted], Engagement Support **Vuntut Gwitchin First Nation (VGFN)** • [redacted] Technical Advisor **Yukon Government (YG)** • [redacted], Caribou Specialist
Date/Time	December 20, 2023, 8:00 to 12:00 am MST
Copies to	All groups involved

Purpose of Meeting

- To provide a Project summary and updates; and share results of Environmental Baseline Studies including preliminary potential effects and mitigation to Fish, Wildlife, Porcupine Caribou Herd, Linear Features, and North Yukon Land Use Planning Conformity.
- A question and answer period followed the information sharing.

Topics Discussed

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

- Project summary and updates
- Baseline Studies
- Effects Assessments
- Fish and Fish Habitat
- Wildlife and Wildlife Habitat
- Porcupine Caribou Herd

Key Issues Raised / Chance Responses to Issues

- Participants would like more detail about the Project Proposal and requested Chance to include all activities in the Project proposal. / Chance to review.
- Participant inquired about meandering seismic lines and how operators are informed about the design. / Chance confirmed that there is a design in place and that scouting will occur prior to the work, to understand the density of the forest and to optimize line locations.
- Asked if the Project videos are online. / Chance is developing a webpage.
- Requested more information on Chance's interpretation of disturbance. / Chance responded that key disturbance factors include noise, smells, and human movement/presence, and consider how far away caribou are from the well sites. Chance stated that disturbance is dependent on how the caribou are responding. Studies on Zone of influence are mixed, with various analytical methods, and depending on interpretation can range from no avoidance up to 40 kilometres of avoidance. There are many issues with analytical approaches that are scale dependent, and not often considered by those authors.
- The priority is to not disturb the caribou, but further work is needed to determine what is too much disturbance. Participants inquired about mitigations and if there is anything other than seasonality. / Chance responded that there will be mitigations in place, and there will be direct and indirect effects.
- A participant cautioned about using a 1-kilometrer Zone of Influence (ZOI), and believes the literature will reflect larger zones. Shared that he thinks Chance will have a difficulty finding that in the literature. / Chance responded that the primary reason for the buffer was because of sensory disturbance and that in larger ZOI assessments there is not a clear mechanism that is associated with the level of disturbance. Chance is focused on addressing local scale sensory disturbance within the work area, and that linear avoidance is assumed within the literature on ZOI's. The assessment applies a uniform 75% reduction across the 1-kilometre zone, which is a conservative (i.e., likely over-estimate) of the effect throughout the zone.
- PCTC (Porcupine Caribou Technical Committee) advised against doing the ZOI analysis based on low sample size (few caribou interacting with 3D seismic across the range). / Chance said that they could not ignore existing data and conducted the analysis regardless, and in the end did not rely on a 3D ZOI analysis as it was not conclusive.
- Participants expressed concerns about the ability of the Land Use Planning Council to review the Project for a conformity check, compared to the capacity of the North Yukon Commission. / Chance said that there are knowledgeable people on the council who have been there for a while. Shared that the North Yukon Commission no longer exists.
- Inquired about how Chance will be able to privatize a road. / Chance responded that the Chief Operating Officer can make it a private road. Said that that it is more of a safety concern, and that people are not interested in hunting around the drilling area. The company could grant access to subsistence harvesters, but this may create a safety concern for staff on site.
- Expressed concerns about the lack of communication between Chance and the Executive Committee. These conversations are important.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

- A participant shared concerns that their experience on drill projects, drill sites needed a 24-hour supply of water, which was trucked into the site. Unless technology has changed, that is one example of essential road traffic even if there are caribou in the area. Participant asked if the reduction would be sufficient or not. / Chance does not have the details on what is considered essential road traffic right now, but will include that in the Project Description.
- Participant requested an end of season report, to understand if caribou mitigation efforts worked and is concerned that this is not being considered. / Chance is interested in learning how the caribou are impacted, and that Chance will learn over the project lifecycle (10-year program).
- Participants encouraged ongoing in-person discussion outside of the YESAB review, which, through written format, can become hostile.

Actions and Responsible Party

- No actions.

Details of Discussion

[redacted] (Chance) gave a brief Project summary and added that [redacted] (EDI) would lead the presentation. [redacted] emphasized that the Project is a proposed exploration program and reiterated that the proposed submission of their Project Proposal is February 2024. Chance has been conducting virtual and in person engagement meetings. He mentioned First Nation of Na-Cho Nyäk Dun leadership currently does not want to participate in community engagement. Chance will continue to provide Project information and that engagement will continue with the First Nations and residents of communities. Chance will also share technical reports with First Nations. Chance is proposing a 10-year program.

The group shared a round of introductions.

[redacted] (EDI) stated the exploration area is around 2400 square kilometres, with clearing occurring during the winter and that it will be approximately 1500 square kilometres total of 3D seismic spread over 10 years. He added that there will be 2000 square kilometres of 2D seismic. [redacted] (EDI) noted that the Project is looking at up to 5 wells per year, equivalent to 2 hectares, and a maximum of 30 wells total. He stated that winter operations will last about 1 to 3 years in each area. He added that there will be three Project work areas and winter access roads will be created. He noted that there will be spring and summer seismic activities with helicopter support and extended flow testing. He stated that the seismic work is different than what was done in the 1950s.

[redacted] (Chance) added that extended flow testing occurs during the winter months and a well of interest will be flowed for natural gas and oil to a service rig. He shared that Chance will be abandoning 3 or up to 5 wells next winter.

[redacted] (PCMB) asked if the seismic testing will include installing and retrieving geophones, which was done previously.

[redacted] (Chance) said that it is new to Chance and that they use the same equipment from the seismic program in 2013.

[redacted] (PCMB) mentioned that he knew Chance was working on site.

[redacted] (Chance) stated that the geophones will be flown out when the snow and wildlife are gone in the spring. He added that if the caribou are hanging out, they can employ mitigation measures and hold off detonation and data collection until the caribou migrate north.

[redacted] (NND/TH) asked if this includes surface drilling.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

[redacted] (Chance) said that it would involves drilling a 3-to-5-meter hole, and the charge will be put down and repacked.

[redacted] (NND/TH) inquired if it was helicopter access and if Chance would be setting up a portable drill.

[redacted] (Chance) mentioned that the site is accessible by vehicle and that Chance would transport the drilling equipment. He added that Chance can hold off until late spring to detonate and take samples.

[redacted] (NND/TH) inquired if it was restricted access.

[redacted] (Chance) confirmed that it will be restricted access.

[redacted] (PCMB) stated that in 2013 there were caribou around. If caribou are around when Chance conducts work, will they hold off on the seismic activity?

[redacted] Chance) said Chance would hold off on detonation activities, but this needs to be discussed further. Chance will make these decisions as they occur and depending on how many caribou are in the area. [redacted] does not understand what the criteria is for this. In the baseline data being gathered for the technical review, there is the understanding that the caribou will migrate. He noted that Chance will go back to that location after the caribou move through. He stated that it depends on the number of caribou that are migrating in the winter range. Chance won't know until they do the field work and determine caribou movement through wildlife monitoring.

[redacted] PCMB) said that if there are caribou moving through the area, it won't be just one hundred in the Eagle Plains Basin. It will be a lot more caribou than that. This is what the collared data suggests.

[redacted] (EDI) noted that the Project team wants to have a good understanding of caribou movement. He added that protecting the lichen protects the herd. He noted that this is why activities are occurring in the winter to minimize the impacts. Seismic lines don't have to be straight anymore, and it is not the Project that was proposed in the past. This is a different seismic operation and that the key thing is that it will be spread out over 10 years.

[redacted] (EDI) presented the Baseline Studies Completed slide.

[redacted] (EDI) shared that the Project was bumped up to Executive Committee screening, which required Chance to do several studies.

[redacted] (PCMB) inquired about information on the Executive Committee.

[redacted] (EDI) said that it is a higher level of consultation and requirements. The Executive Committee reviews the Project.

[redacted] (Chance) said that they require additional data and baseline studies. The original Project went to the Yukon Environmental and Socioeconomic Assessment Board (YESAB) Dawson office and four out of six concerns came from it. These concerns put the Chance Project into a higher level of screening.

[redacted] (EDI) stated that field studies from 2019 to 2021 included: ecological mapping, linear features, fish, water, birds, and desktop studies that includes Porcupine Caribou Herd (PCH), moose, and martens. Chance wanted to do a linear features study to feed into the Land Use Plan (LUP) conformity check. He noted that the PCH are in the desktop studies because there is so much information available on them. He added that there were concerns about grizzly bears, but Chance doesn't have information on them.

[redacted] (EDI) presented the Effects Assessment Approach slide.

[redacted] (EDI) said there will be an impact on caribou, and we are assessing the significance of the effects. He added that Chance put the Environmental Assessment in the context of the LUP. He noted that there is more disturbance which is included in the Linear Features Study. The constraint maps help to develop scenarios to figure out future impacts. He noted that the spatial

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

scale is relevant to the species. He said that exploration programs typically do not trigger an Executive Committee review. He added that this Project is going through the same review as the Casino mine project. He said that there is enough concern that it triggered an Executive Committee screening. There are always questions about the Project. He stated that Chance can't do an impact assessment without confirmed sites, which is why the Project team is using scenarios.

[redacted] (Chance) stated that Chance is taking an ecological perspective. Chance is trying to do the Project in a sustainable way by using constraints mapping and studies. Chance knows where the Project would like to drill. Chance needs to design winter access that considers constraints and previous disturbances. The Project team has described this to the Executive Committee and to communities to understand that Chance is listening and modifying the Project Proposal. They are not drilling year-round, and Chance's approach is unique and hasn't been done in the Arctic.

[redacted] (PCMB) asked for clarification whether the Project team was talking about next steps in the permitting process and if they had stopped talking about drilling.

[redacted] (EDI) said seismic comes first to identify the drill targets.

[redacted] (PCMB) said drilling is part of the exploration program, but we are talking about seismic right now.

[redacted] (Chance) said that Chance will still have to drill but initially they must get the targets and do the seismic. He added that this is what will help us understand what kind of resources are out there.

[redacted] (PCMB) inquired as to whether seismic would give Chance that information.

[redacted] (Chance) responded that no, it won't. He added that once it is put in a controlled environment, seismic will be used to understand of the layers of rock formation, depth of it, and any anomalies. He noted that drill site locations will be determined in the seismic studies.

[redacted] (PCMB) questioned whether Greg believed seismic and drilling to be one and the same. [redacted] (Chance) stated they are indeed different, and that identifying drill targets requires the seismic work.

[redacted] (PCMB) said [redacted] (EDI) said the drill on the slide was unconventional.

[redacted] (VGFN) asked if the last step in the process is flow testing.

[redacted] (Chance) said that that is correct. Geologists have said there is a 10 to 20% success rate, which means that 3 of 30 wells or 6 of 30 wells may be successful. Currently they do not know how successful they will be, but that there is opportunity. He noted that the business plan is focused on local consumption and that the Yukon needs additional energy. He said that Chance needs to understand what kind of gas there is and flow it. He noted that the flow time is up to six weeks. Chance would like to understand what kind of gas there is.

[redacted]NND/TH) mentioned that even if heating oil is locally sourced, it would need to be refined down south and then shipped back up. To be a local supplier, Chance would still have to ship oil south.

[redacted] (Chance) said that oil would need to be shipped south during the flow tests, but that there is technology to be refined at the site, but that's not a part of this Project.

[redacted] (YG) said that natural gas flow testing would occur for 6 weeks to prove the resource and asked Greg how long it would be with oil.

[redacted] (Chance) said it would require two years for flow testing and that Chance would be awaiting recommendations from YESAB. He added that it is longer for oil than gas. He noted that when the pressure comes up, the oil is a heavier liquid. He said that it takes time to understand it.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

[redacted] (YG) inquired about how long it would need to flow for.

[redacted] (Chance) said that the Project is not able to flow test summer months as Chance does not have all season roads. If there are successful wells, then Chance will need to seek a permit for an all-season road.

[redacted]YG) said that he's trying to understand the level of disturbance and if Chance would have to turn off the tap and begin flow tests in the following year.

[redacted](EDI) stated that that is something that Chance will have to include in the Project description.

[redacted](Chance) said that winter activities will only be 4 to 5 months.

[redacted] (VGG) asked if flaring would occur during flow testing.

[redacted](Chance) said that yes that is why flow testing is shorter because it would include a minimum of 3 weeks of flaring.

[redacted] (YG) expressed concern about how the trucks would be staged up to get the oil.

[redacted](Chance) said that Chance could get him the information. There will be heated storage, and will include 400-barrel trucks to keep the crude oil in. He said that the oil will come into a station area and before it gets taken away, there will be separators. He stated that Chance will probably have to reinject produced water back down into the wells.

[redacted] (VGG) stated that there needs to be more details about the Project Proposal and what activities Chance is proposing. For example, what are the activities associated with flow testing so that it can be evaluated. He noted that if the detail is in the Project Proposal to start with it saves everyone time. Chance will review.

[redacted] (EDI) presented the Land Use Plan Context slide.

[redacted] (EDI) said there are differences between how it works. There is the Integrated Management Area Zone 4 and that this is where it is expected that development will occur in the area. This zone has a higher level of protection than other areas. Even though Chance is looking at development in this area, Chance is looking at a high level of environmental protection. He added that it is likely one of the highest levels of protection with protection covering 37% of late winter and 31% of the fall range.

[redacted] (EDI) presented the Low Impact Seismic slide.

[redacted] (EDI) said Chance will use meandering lines to avoid large trees and to make the lines of sight to be less than 70 meters. There will be small narrow mulchers used for the seismic lines (2.5 m), which will help to protect vegetation. There is low ground pressure equipment over at least 20 cm of packed snow/ice. The vegetation will be pushed over, not cut, which means a faster recovery.

[redacted] (YG) asked if that is 20 centimetres of snowpack.

[redacted] (EDI) confirmed that it is 20 centimetres of snowpack.

[redacted] (Chance) Chance wants 20 centimeters of snowpack for winter roads, and in Chance's mitigation section, it says Chance will strive to get 20 centimeters.

[redacted] (VGG) asked if there is a design in place for meandering seismic lines and how Chance will communicate this to the operator.

[redacted] (EDI) said that that is an excellent question and [redacted] is the expert.

[redacted](Chance) said that scouting will be done in advance to understand the density of the forest, determine the location, and design it based on that information. If there are dense trees on the south side, Chance will design it to go around.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

[redacted] (VGG) asked if Chance would design it.

[redacted] (Chance) responded yes, they go out and walk it before they design it. There was helicopter support in the past to scout areas, to avoid mulching and to decide where to mulch. He noted that Chance will get more information about the criteria.

[redacted]. (YG) said they are trying to avoid site lines from certain lengths.

[redacted](VGG) said that it is up to Chance to design meandering seismic lines.

[redacted] (EDI) said that is how it works operationally.

[redacted](YG) said aerial photos could be helpful.

[redacted] (EDI) noted that Chance does not have any high-definition photos.

[redacted] (YG) said that the Yukon Government has some photos.

[redacted] (EDI) presented the Linear Feature Disturbance slide.

[redacted] (EDI) said that there are indicator levels of linear disturbance. He added that cautionary is 0.75 kilometres/square kilometer and the Regional Study Area (RSA) is 1.79 kilometres/square kilometre (unadjusted), and 0.52 kilometres/square kilometres(adjusted). He said that if the 3D lines are removed, it could be down to 0.48 square kilometers. He added that the background isn't presented too much in the LUP. He noted that Chance is utilizing the cautionary level.

[redacted](YG) said this is all the discussion from the LUP process.

[redacted] (EDI) said that there is a lot of theory around it, and that is why Chance did a linear effects study.

[redacted](YG) said that the numbers came from the caribou work. He said that he was not at the table but talked to people, such as [redacted], after the plan was done.

[redacted] EDI) said that information came out of Alberta, for example, different land uses and species in the area such as wolves preying on moose rather than caribou.

[redacted] (YG) asked what Chance meant by vegetation recovery.

[redacted] (EDI) said that they used the tall shrub stage, which was 2 metres instead of 1.5 metres from the LUP.

[redacted] (EDI) added that the old seismic approach was to cut the vegetation down.

[redacted] (EDI) presented the Environmental Constraints Mapping slide.

[redacted] (EDI) said Chance intends to avoid heritage sites, permafrost/terrain sensitive areas, riparian management areas, priority ELC units, caribou habitat, and moose habitat. He added that directional drilling is good to avoid high quality habitat, another mitigation measure.

[redacted] (Chance) said that Chance needs to get surface distance between 1.5 to 2.0 kilometres. He said that the Project team could stay on top of the hill and still drill in the valley.

[redacted] (VGG) asked if the Project videos are online.

[redacted] (Chance) said that Chance is in the process of developing a webpage.

[redacted] (Chance) said that Chance wants to launch the website before the new year and the February 2024 submission.

[redacted] (EDI) presented the Well Site Scenarios slide.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

[redacted] (EDI) said that the well site locations are unknown. He added that Chance develops scenarios within constraints to the range of potential habitat effects. Chance develops scenarios based on Scenario 1 which is developed by the seismic team.

[redacted] EDI) presented the Project Interactions slide.

[redacted] (EDI) said that there will be direct and indirect habitat interactions. Direct being vegetation clearing and indirect such as sensory disturbance. He added that there are areas where the Project team will avoid human activity. He said that there will be an indirect and direct mortality risk, direct being vehicle collisions and indirect will be due to increased predator access. This is what YESAB brought up in the first review. Chance is trying to reach a balance in the assessment.

[redacted] (PCMB) inquired about Chance's interpretation of disturbance.

[redacted] (EDI) responded that key disturbing factors are noise, smells, and human movement/presence. He added that this depends how far away caribou are from the well sites. He noted, based on mixed results in literature using various analytical methods, some possibly erroneously, that disturbances could result in no avoidance and up to ~40 kilometres of avoidance. He said that it is dependent on how the caribou are responding to the disturbance.

[redacted] (NND/TH) asked if there would be something on the ground at whatever distance it is. He asked what mitigation is there. He added that the concern is not to disturb the caribou, but how much is too much disturbance. He asked if there were other mitigations other than seasonality.

[redacted] (EDI) responded that there is a mitigation. He added that Chance calls them direct and indirect effects.

[redacted] (EDI) presented the Porcupine Caribou slide.

[redacted] (EDI) said that the key resource in the LUP is the caribou. He added that the information that Chance presents on the caribou is far more descriptive than in 2013. He noted that it was important to characterize the caribou. He added that Chance must understand the caribou enough to understand interactions with the Project. He said that Chance can't avoid all locations, and that Chance has looked at potential effects on PCH habitat and movement. He said that when looking at mortality it is challenging to quantify. He added that Chance has looked at residual effects, which are effects that are left over after mitigation is applied and that cannot be addressed.

[redacted] (EDI) presented the Porcupine Caribou – Distribution slide.

[redacted] (EDI) identified the PCH-identified life cycle periods or seasons. He added that there are patterns of occurrence from 1970 to 2016, supplied by PCTC. He said that Chance is looking at rut and winter overlap. He added that there is no doubt that Chance will see the caribou and that they will likely show up some time during the 10 year operation, and when they do, they will show up in large numbers.

[redacted] (EDI) shared movement of the PCH after the 2013/2014 seismic program. He said that the PCH moved through the Project area in 2015. He added that there were 13,000 to 14,000 observations through the cameras. He said that it was evident that they had moved through there. He noted that this has not happened ever since. He said that he is unsure where the PCH are now in the winter.

[redacted] (YG) said that the time where it does split, they used winter ranges in Alaska recently. He added that the challenge is that the PCH may go to the same area for two decades and then never go there again. He noted that he has not seen them in the uplands for two decades but that is where they used to be. He said that it is common to see them overlap with the December range.

[redacted] (EDI) said that there could be richer detail to describe. He said that when the PCH do show up it will be a lot.

[redacted] (YG) said that they do not have detailed GPS data prior to 2015. He added that collared data did not start until 2012.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

[redacted] (EDI) added that before, there were different collars.

[redacted] (YG) confirmed that previously, the location was tracked every day versus now, where you can track every minute of their movement. He added that most survey work occurs during the summer periods. He said that they had late winter data to look at distribution.

[redacted] (EDI) presented the Porcupine Caribou – Movement slide.

[redacted] (EDI) stated that in 2015, caribou travelled through a network of 2D seismic lines, winter roads, and a large 3D seismic grid. He said that the PCH will probably show up in abundance based on the work Chance has done.

[redacted] (YG) said this is late winter data. He added that that is when distribution would be done.

[redacted] (EDI) said that this is why the Project went to the Executive Committee. He added that Chance doesn't know enough about the PCH in the winter. He said that in the baseline effects, the Project can compile that data. He shared that a lot of the information was not available to the Chance team. He noted that if Chance misses anything, that this is what Chance is looking for.

[redacted] (EDI) said that caribou occupy the RSA in less than 20% of previous years. He added that rut/late fall and winter seasons are considered the least biologically sensitive periods for the herd. He said that that doesn't mean that the Project team isn't treating them sensitively, caribou are just less sensitive during these times. Winter is the least sensitive period relative to all seasons. He said that protecting calving grounds is key. He added that this herd keeps going back and other caribou herds are quite different. He noted that, the PCH are in good health this time of year and less sensitive than other times of the year. He shared that this information came from the PCTC report.

[redacted] (EDI) said that they are looking at the movement rate of PCH and what will they be exposed to. He said that based on the PCH collared data, it is evident that they move through the area. He added that it is roughly 4 to 5 days in the rut and late fall or 15 to 16 days in the winter.

[redacted] (EDI) said that the analysis consisted of quantifying daily travel times. He added that Chance characterized the seasonal ranges by dividing the seasonal range into around 2500 square kilometres of cells. He said that after that, they compared the different travel rates and residency times. He noted that the Project can say that the RSA is around half in the late fall and there are about ten days less spent in the winter. He shared that overall, caribou are spending less time in the RSA when they are there.

[redacted] (EDI) said that this is why it is important to characterize what the caribou are doing in the area. He added that they seem to be moving through the area quickly.

[redacted] (YG) asked if Chance is characterizing that their residency will be half of when they are going into the area.

[redacted] (EDI) said that we calculated residency times as an average, and that we are making a relative comparison of residency in the RSA versus the broader seasonal ranges using the collar data. He said that when the Project team is making a comparison of residency times, they are seeing this much of a difference.

[redacted] (YG) said that he is unsure if he would base the data on the limited set of examples, but it does give a sense. He added he would be leaning more on to the seasonal range data (SRD). He shared that the residency of SRD is useful. He said that he would be careful saying that about collared data.

[redacted] (EDI) said that there will be a list of uncertainties in the Environmental Assessment.

[redacted] (EDI) said that the standard error is associated with the ranges. He shared that the seasonal range average is not directly comparable to the RSA and that he is not sure if the seasonal range residency time is the best average to use. He said

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

that the composition of the eco ranges is different. He added that they wouldn't expect the same amount of residency time in the RSA.

[redacted] (YG) said that there is a lot of data, around 50 years of movement data for the herd. He added that there is only GPS data for a decade, which isn't that much.

[redacted] (EDI) said that the Project team must move through with some level of confidence. He said that the Project talks about reversibility of effects and if it is reversible.

[redacted] (EDI) presented the Porcupine Caribou – Habitat Selection slide.

[redacted] (EDI) shared a recap of the methods and results for PCH. He said that they used a standard approach to developing these models and used a generalized linear mixed model. He added that it was a 1:10 used-available design. He shared that they are looking at interactions with lichens, and plant functional type layers (e.g., light microlichens, conifer, forbs, deciduous shrubs, graminoids, and evergreen shrubs). He said that it included elevation, slops, aspect, and distance to waterbodies. He added that they did random effects on the caribou year and did a 5-fold cross variation of model predictions. He added that they mapped RSF predictions across seasonal ranges.

[redacted] (EDI) said that they used selection ratios to identify the RSF prediction threshold where the proportion of used locations is greater than available. He added that this corresponds to selected habitat by caribou; these predictions considers the partial effects of all habitat covariates (rather than single covariate coefficients). He shared that they were able to identify four habitat ratings: high, moderate, low, and very low. He said that the selection threshold identified the split between high/moderate and low/very low and that the split between high and moderate was based on midpoint value, the same for low and very low.

A participant asked if this is describing the quality of the habitat or the ratio of use.

[redacted] (EDI) said that it is quantifying selection. He added that when Chance maps that, it has been classified as a habitat with high or moderate rating. He shared that it is selection, not use.

[redacted] (EDI) said that the moderate and high ratings are the areas associated with selected habitat. He shared that that corresponds to caribou using the areas more frequently than what would be expected by random chance. He added that the Project team chose the term 'selected' habitat and didn't want to use 'suitable' habitat because all habitats can potentially be suitable and used by caribou. He said that the habitat ratings are associated with higher macrolichen cover.

[redacted] (YG) asked what the Y-axis on the top graph said.

[redacted] (EDI) responded that it is the proportion of locations. He said that both figures show the same information in a different type of way.

[redacted] (EDI) presented the Caribou / Project Interaction – Review slide.

[redacted] (EDI) shared that the RSA overlaps with the PCH seasonal ranges. He added that the caribou occupy the RSA in less than 20% of years (or approximately 1 in 5 years). He shared that rut/late fall and winter seasons are considered the least sensitive periods for the herd. He added that the exposure period of individual caribou is expected to be 1 to 2 weeks. He said that Chance is looking at the assessment of criteria of seasonal habitats and that they were built into the LUP.

[redacted] (EDI) presented the Potential Habitat Effects slide.

[redacted] (EDI) shared that direct habitat effects refers to areas cleared of vegetation. He said that this affects 2% of selected rut/late fall and winter habitats within the RSA. He added that it affects 0.2% of selected rut/late fall and winter habitats at the Eagle Plains ecoregion scale. He said that the 3D seismic may not create a functional loss if lichen persists. He shared that it should not affect the lichen.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

[redacted] (EDI) shared that the indirect habitat effects refer to sensory disturbance. He added that they did a ZOI study that was applied around all disturbances. He said that they assumed a 75% reduced habitat effectiveness within a 1-kilometer ZOI. He shared that it is hard to quantify the area. He said that it means that there is a 75% chance that caribou are less likely to select the area. He added that annually, about 32% of the RSA experiences sensory disturbance and affects 23% of the selected rut/late fall and winter habitats within the RSA. He said that it affects 5% of selected rut/late fall and winter habitats at the Eagle Plains ecoregion scale. He added that it is a temporary effect which is reversed once activity stops.

[redacted] (YG) asked where 1 kilometre came from.

[redacted] (EDI) said that it is based on the permanent disturbance, which was their own zone of disturbance. He added that they looked to find a balance of something that was reasonable. He said that 1 kilometer seemed like a reasonable measure.

[redacted] (YG) said that activities like helicopter work and safety checks, cause greater disturbance than the mulcher. He added that he cautions using the 1-kilometer buffer. He shared that he thinks Chance will have a hard time supporting that in the literature.

[redacted] (EDI) said that the primary reason was to associate the ZOI with sensory disturbance. He said that in assessments where ZOIs were found to be large, there hasn't been a test or link to a clear mechanism that could lead to such large areas of avoidance. He argues that studies with large ZOIs often capture broad changes in a herd's range distribution rather than local effects of a Project. He added that this assessment is focused on local-scale sensory disturbance which covers the work area. He said that, in the literature, ZOIs are most often quantified as linear avoidance up to the ZOI threshold. This causes the average avoidance effect to be about halfway up the sloped line. He shared that, for this assessment, they applied a uniform 75% reduction across the 1-kilometer buffer.

[redacted] (YG) said there is a potential effect for the whole area. He asked how they could get this into more detail. He said they will be looking at it very closely.

[redacted] (EDI) said that they identified a 2- or 4-kilometre ZOI associated with the 2D seismic lines (including winter roads and trails). However, he stated that they identified attraction (rather than avoidance) to the 3D seismic grid. He added that the 2–4-kilometre ZOIs for historical 2D seismic are small in magnitude. Habitat effectiveness is reduced by 20–40% on the footprint itself, but the average reduction across the ZOI is much smaller.

[redacted] (EDI) asked what the sample size for the 3D seismic sample size analysis was.

[redacted] (EDI) said that he will have to circle back.

[redacted] (YG) said that the PCTC advised against doing that analysis.

[redacted] (EDI) said that Chance did not rely on a 3D ZOI analysis.

[redacted] (YG) said that it was raised. He added that it may or may not be the case, but they don't have the data.

[redacted] (EDI) added that it is not conclusive.

[redacted] (YG) said that's perfect.

[redacted] (EDI) said that Chance expects those comments to come up too and that's why the analysis is there.

[redacted] said that when you talk about all this data, so next year when you are doing the seismic, there is no additional effects to the PCH at that location.

[redacted] (EDI) said that there will be a leftover footprint. He added that there is a linear disturbance that brings in predators.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

A participant said that it seems reasonable for seismic activity, but then there is a well being drilled. They said that the ZOI would be much bigger based on that. They said that there is going to be less of an impact.

[redacted]. (EDI) said that the impact could be up to 1 kilometer, but Chance could revisit that and rethink the details of that too.

[redacted] (EDI) shared that it was 1 kilometer impact for everything sticking to sensory disturbance.

[redacted] (NND/TH) said that if the caribou are discouraged from using the ZOI and activity stops, that they came back through. He added that he doesn't know if there is any information on prolonged activity. He said that they are talking about several winters. He said that if there is a prolonged period of disturbance, he hasn't come across the information. He asked if there is any information on permanent discouragement of using the area, even after the mulching disturbance stops.

[redacted] (EDI) said that he would look at caribou near mine sites and the Central Arctic Herd and how they responded. He said that they looked it on a herd basis, but he is unsure if they respond well. He shared that work has been done on caribou response to roads, and other development. He said he cannot think of whether they responded to any well site. He said thinking about the development in Prudhoe Bay, there was work on the caribou's response to the road and pipeline. He added that they had deemed a 300-meter zone. He said that if it is not fenced off, the caribou will move through.

[redacted] (YG) said Heather did the most recent analysis on that, and their role is to do objective PCTC science. He said it is the calving and post calving information that has not been developed in the last 30 years. He added that it was around 5 or 6 kilometers. He said that it was a tundra environment and oil field, in the summer. He shared that there were many differences.

[redacted] (EDI) said that it is hard to make that comparison of linear disturbance in Alberta to Eagle Plains. He shared that a caribou response to a single well site would need a wealth of data. He said that there are forty well sites out there.

[redacted] YG) said a camera on the well site would be good.

[redacted] (EDI) said that if you look at an oil rig and the caribou herd are going through, there is a clear answer to that.

[redacted] (VGG) asked if the linear thresholds Chance talks about, are based on the proposed linear disturbance.

[redacted] (EDI) said that that is why the planning commission did their own effects strategy.

[redacted](VGG) asked if Chance has talked to anyone at the Yukon Government about cumulative effects or linear features.

[redacted] (YG) said one of the linear things that was discussed was that the threshold is 1.5 meters of wooded vegetation. He added that they just don't know.

[redacted] (Chance) said that the last direction that Chance got was from [redacted] office when she was Deputy Minister and that the challenge is that the environmental groups are challenging the Yukon Government because the proponent is responsible to go to First Nations to work with them to get their permission on conformity checks. He asked if the proponents are responsible for making communities understand the effects.

[redacted] EDI) said that at the community level during our meetings, it has not been a topic of discussion.

[redacted] (VGG) said that it's coming up in another process around cumulative effects. He added that he is curious as it sounds like a lot of that work was based on studies from Alberta. He asked what the underpinning of the analysis is and if there is other information that is new to him.

[redacted] (EDI) said that Chance looked at the line of sight, travel speeds, visibility, and different levels of regeneration. He added that the Project team wanted to inform the planning commission.

[redacted](Chance) said that when Chance made the original submission, their understanding was that the Land Use Planning Council was working with them. He stated that they were told that Chance must figure that out and convince any other affected

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

parties. He asked how Chance does that work. Chance completed what it was required to do based on what was agreed to. He said that it is basically an EMR (Energy, Mines, and Resources) office that is just trying to figure it out. He shared that Chance is confused on who will oversee the old studies and disturbance that didn't occur from Chance/Northern Cross.

[redacted] (EDI) added that Chance did their own studies of effects. He added that that is how Chance came up with adjusted numbers.

[redacted] (NND/TH) said that he's come across concerns about the Land Use Planning Council not having the background that the commission has. He added that this is a compounding factor. He said that the council doesn't have a knowledge of history that the commission developed under the treaty, and that the council doesn't have the background to consider a project. He said that there are concerns about the council being capable of having a reliable opinion.

[redacted] (Chance) said that Sam is at the council and has a lot of knowledge and has been there for a while. He shared that there is no North Yukon Commission now.

[redacted] (YG) said that he is interested in talking about mitigations. By focusing on if the herd is coming through, it minimizes the issue. What happens when they do come through. It may be important to get information from the PCTC or Mike Suitor from the Yukon Government. If you hear caribou are coming your way and will be there in 3 days, what will the response be to that data.

[redacted] (EDI) said that they will get into that. He added that the monitoring part is an important part of the assessment.

[redacted] (EDI) presented the Potential Movement Effects slide.

[redacted] (EDI) said that there will be local movement effects such as reduced crossing if there is traffic on roads and seismic lines. Effects to seasonal movements or migrations are unlikely. Long distance movements will mostly be in fall and do not overlap with the bulk of Project activities. Short residency times and fast movement rates through the RSA and caribou travel through network of linear features in the RSA.

[redacted] (YG) said that pertaining to the effect of harvesting activities, there are areas where similar work has been done. A similar migrating effect can be seen and that it is possible that it may change a migration pattern. He said that he doesn't want to discount it.

[redacted] (Chance) asked what the probability is of that occurring.

[redacted] (YG) said that he is unsure exactly. He added that in 2015 it almost happened.

[redacted] (Chance) said that it is easy to tell that they go along the Dempster Highway.

[redacted] (YG) said that humans are travelling the same way the PCH like to because it is the easier travel. He added that it is a scenario that could occur, and it shouldn't be discounted.

[redacted] (PCMB) said that if looking at the probability, what's going to be in place with the PCTC, the people, and what is the plan to respond.

[redacted] (EDI) said that Chance will note it. He asked if it is going to stop them from entering the work area. He stated that Chance is assuming a 75% probability. He said that he is not trying to downplay the potential effects, but it is only an exploration project.

[redacted] (YG) said that YG has programs that shut down for 2 to 3 weeks when the herd hits.

[redacted] (EDI) said that that will certainly happen. He said that the Project team can't operate with thousand caribou around us. He added that it will affect their localized movement.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

[redacted] (EDI) presented the Potential Mortality Effects slide.

[redacted] (EDI) said that direct effects are vehicle collisions, but this is low risk on access roads and seismic lines. He said that by restricting the road, it won't be public access. He stated that the indirect effects are predation and hunting. He added that linear features might give more access to humans.

[redacted] (NND/TH) said that the resource road regulation on the Territorial Roads Land Act should give Chance permission to make the road private. He asked how Chance can use it as a private road. He asked if under the Oil and Gas Act they would be able to say it is a private road. He asked if Chance has had that discussion.

[redacted] (Chance) said that the Chief Operating Officer (COO) can make it a private road. He said that it is more of a safety concern, and no one wants to hunt around the drilling area. He added that it is one thing to give the access to an Indigenous harvester, from a safety point of view there is an issue around the work area buffer.

[redacted] (NND/TH) asked if the COO has the capability to give Chance a private road.

[redacted] Chance) confirmed yes and that they have had a COO do it before.

[redacted] (EDI) said that any predator wants easier access. He shared that it would have a temporary effect, limited to annual work areas where activities pack the snow on linear feature. He added that there aren't resident caribou in the Project area compared to other herds. He said that it is hard to conceptualize.

[redacted] (YG) said that he has seen people using the seismic lines. He said that there is no real monitoring of it. He stated that on predation, it is a different scenario. He shared that it is complicated because there are migratory wolves. He added that the question is if the herd has a major decline. He said that it is being anticipated sooner or later but they don't know.

[redacted] (EDI) said that there is uncertainty around mortality effects. He shared that it is more around Indigenous access, but Chance doesn't know how to move around that.

[redacted] (YG) said that the affected harvest on ZOI basically has a double effect.

[redacted] (EDI) said that as soon as the Project increases predation risk, there will be an increased effect. He added that it is important to increase local awareness there.

[redacted] (YG) said that this can be dealt with in the Project Effects Assessment.

[redacted]. (EDI) said that there is no harvest policy other than the Indigenous Rights to Harvest.

[redacted]. (EDI) presented the General Protection Measures slide.

[redacted] (EDI) said there is environmental constraints mapping to reduce habitat loss. Chance will stay out of this area when caribou are coming. There will be a limited annual footprint, reducing sensory disturbance. There will be access management to reduce mortality risk. People will probably use the winter access. He shared that he doubts that individuals will use the 3D seismic access.

[redacted] (YG) agreed that people likely won't use it as well.

[redacted] (EDI) shared that low impact seismic will help to reduce habitat loss and has been developed over the years. He added that there will be a maximum width of 2.5 meters that will retain ground vegetation. There will be speed limits in place to reduce mortality risk. He emphasized the importance of worker awareness, including reporting any sightings. There will be a caribou interaction response plan. He asked if there is an information database that Chance can use to understand weekly migration patterns.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

[redacted] (YG) said that the YG is trying to get a database in place. He shared that the PCTC updates their website and YG does the updates as they can. He said that the YG has a regulatory meeting that often changes things.

[redacted] (EDI) asked if YG will tell them when the caribou are coming.

[redacted] (YG) said that some companies are required to contact YG on a schedule. The other more likely scenario is just paying attention to the herd. He said the Chief of Mine and Land Use provides emails and the YG provides weekly updates after that. He shared that YG has been doing it for 5 years and it is working well.

[redacted] (EDI) said that there is flexibility with the seismic operation and that it will be Chance's bad luck. He added that Chance can't move the seismic and once a drill is spinning, the Project team can't stop.

[redacted] (NND/TH) said that it is possible to stop the drill.

[redacted] Chance) said that when driving, risks of potential impacts are increased. He added that there are speed controls, traffic controls, and the only traffic would be wildlife monitors.

[redacted] (EDI) said anything that is necessary.

[redacted] (NND/TH) said there was a constant of bringing water in with big trucks when he worked at the mine sites.

[redacted] (EDI) said that once the drill is going, it is not stopping.

[redacted] (PCMB) said that a caribou action response plan has potential, and he knows PCMB would be interested. He said it would be great if Chance could get their caribou information from PCMB and PCTC. He added that it would be good to see something established. If Chance is responding to caribou interactions, it would be nice to have a plan established. It would make sense if there was official communication linkage to be notified. These communications could establish a cooperative protocol. He added that this could help PCMB study the herd.

[redacted] (EDI) said that he wouldn't be able to develop that independently.

[redacted] (Chance) said that he agrees with getting the real data.

[redacted] (YG) said there will always be redundancy on this, and YG is trying to figure that out. He added that there are ways to do it. He said that the challenge for using satellites to track is that there could be several thousand caribou that don't have collars.

[redacted] (EDI) said that he agrees that it is only a small portion.

[redacted] (YG) said that there are 110 collars on the caribou.

[redacted] (EDI) said there is a level of warning from local monitors. He added that there will be a balance of reported observations, onsite. He shared that Chance would have to do aerial surveys.

[redacted] (YG) said there is no need for aerial surveys. He added that it can give you a sense of what you are dealing with and that they did that in 2013.

[redacted] (PCMB) said that it makes her think about how PCMB could help. If there are wildlife monitors around, it would be great to get regular updates on what they are observing. She added that if there is a situation where several caribou are coming to the Project area, the PCMB has connections to the Porcupine Caribou communities to get the word out. PCMB can help communicate things to bring show that we are engaged and that communities can be confident that Chance and PMCB are working together and sharing accurate information. PCMB wants the communities to be comfortable with what is happening. She added that there is the opportunity to look at the PCMB and Chance engagement as a very positive thing.

Chance Oil and Gas Ltd.
Suite 1000, 340–12th Avenue SW
Calgary, AB T2R 1L5

[redacted] (EDI) said that this could be something to work on. He said that he agrees on collaboration and that aerial surveys during operation will be good. He shared that he thinks that the project can operate safely. He said that a lot of this relies on the observers being there.

[redacted] (NND/TH) said that with an existing drill site, and caribou in the area, Chance won't be able to shut down the drill. He said that the idea being that traffic could be reduced. He doesn't know where the water is coming from for the drill. He said that in past projects, there was a 24-hour supply of water from the water source to the drill site. He said that unless technology has changed, that is one example of traffic that can't be stopped if there are caribou in the area. He asked if the reduction would be sufficient or not.

[redacted] (EDI) shared that Chance doesn't have the details on what is considered essential road traffic right now. He shared that 5 vehicles a day sounds manageable.

[redacted] (YG) said that his issue is that there are no communications occurring with the Executive Committee. He said that it is important to have these conversations. These conversations will greatly increase Indigenous relations.

[redacted] (PCMB) said that the PCMB represents PCMB from the PCMB Agreement parties. She said that the PCMB isn't a decision-making board, but they can provide input to regulatory processes and review processes. She added that the PCMB knows trust is important with communities and when working with groups that are willing to go over and above what is specified in regulatory decisions. When the PCMB knows that there is an interest in building that trust, if anyone is looking at building positive relationships, it must be a collaborative process. There needs to be transparency and a willingness to work together no matter what the information may be. It is important for PCMB to do that and that the PCMB wants to work together. It is reasonable to say Chance can't shut down a well in production if there is a conversation ahead of time. If they know about these concerns in advance, there could be something in place that incorporates Traditional Knowledge that would address the communities' concerns. She shared that when caribou come and you can't shut down the well, the PCMB knows that that is reasonable, and they can support that. The PCMB can help with mitigation around that. She said not to underestimate the trust with PCMB and that the PCMB wants to work with Chance to do a good job of this. She shared that what happens with the Project will last in people's minds.

[redacted] (NND/TH) said that even if the PCMB aren't a decision maker, they are important.

[redacted] (EDI) said that the next step is mitigation. He said that he has seen a change in the approach by Chance. It comes down to the communication aspect and the seismic program is flexible.

[redacted] (YG) said regarding the effects monitoring piece, that looking at developing a couple of well-focused designs would be helpful. He said that if the exploration project is successful, Chance will get towards a development stage and there won't be any data.

[redacted] (EDI) said that to determine if mitigation is successful, Chance will have to do an experimental approach.

[redacted] (NND/TH) said that they do a report at the end of the season, to understand if it worked. He is amazed that this is not being considered.

[redacted] (EDI) said that this is a 10-year program, and it is Chance's opportunity to learn. He added that Chance wants to understand what the caribou do.

[redacted] (YG) said that the collared data is one scale.

[redacted] (EDI) said that it makes sense to put in effects monitoring.

[redacted] (YG) said that he is happy to work with Chance and discuss with PCTC to provide input. It is going to have to be a collaborative approach somehow.

N/A	N/A
GTC0054	20-Jul-18	Email	In	Gwich'in Tribal Council	Stephen Charlie (Gwich'in Tribal Council)	Cindy Dickson (Chance), Greg Charlie (Chance), Richard Wyman (Chance)	Shena Shaw (Hemmera), Carolyn Lennie (Gwich'in Tribal Council), Leigh-Ann Williams-Jones (Gwich'in Tribal Council), Kelly Constable (Hemmera)	Communications and Engagement Plans	Gwich'in Tribal Council sent an email to Chance saying that had reviewed the Communications and Engagement Plan and were submitting their draft Communications and Consultation Plan for consideration. Gwich'in Tribal Council expressed their willingness to move forward on this file with Chance.	N/A	N/A
GTC0055	20-Jul-18	Email	Out	Gwich'in Tribal Council	Emily Mann (Hemmera)	Cindy Dickson (Chance), Greg Charlie (Chance), Richard Wyman (Chance)	Shena Shaw (Hemmera), Kelly Constable (Hemmera), Stephen Charlie (Gwich'in Tribal Council), Carolyn Lennie (Gwich'in Tribal Council), Leigh-Ann Williams-Jones (Gwich'in Tribal Council)	Communications and Engagement Plans	Chance sent Gwich'in Tribal Council an email saying they had received the draft Communications and Consultation Plan and that they would review the plan and be in touch with changes. Chance asked Gwich'in Tribal Council when they would be available to meet via teleconference.	N/A	N/A
GTC0056	23-Jul-18	Email	Out	Gwich'in Tribal Council	Emily Mann (Hemmera)	N/A	Stephen Charlie (Gwich'in Tribal Council), Leigh-Ann Williams-Jones (Gwich'in Tribal Council), Carolyn Lennie (Gwich'in Tribal Council), Emily Mann (Hemmera)	Meeting	Chance sent Gwich'in Tribal Council a meeting invitation with a draft Agenda.	N/A	N/A
GTC0057	23-Jul-18	Email	Out	Gwich'in Tribal Council	Richard Wyman (Chance)	Cindy Dickson (Chance), Greg Charlie (Chance)	Shena Shaw (Hemmera), Carolyn Lennie (Gwich'in Tribal Council), Leigh-Ann Williams-Jones (Gwich'in Tribal Council), Kelly Constable (Hemmera), Emily Mann (Hemmera)	Communications and Engagement Plans	Chance sent Gwich'in Tribal Council an email with comments on the Communications and Consultation Plan. Chance communicated that the draft Plan looks fine and asked about section 4.0 and whether there should be a representative from the Tetl'it Gwich'in Council identified as well.	N/A	N/A
GTC0058	27-Jul-18	Teleconference	Out	Gwich'in Tribal Council	Richard Wyman (Chance)	Cindy Dickson (Chance), Greg Charlie (Chance), Richard Wyman (Chance)	Shena Shaw (Hemmera), Kelly Constable (Hemmera), Stephen Charlie (Gwich'in Tribal Council), Leigh-Ann Williams-Jones (Gwich'in Tribal Council), Carolyn Lennie (Gwich'in Tribal Council), David MacMartin (Gwich'in Tribal Council), Leslie Blake (Gwich'in Tribal Council)	Communications and Consultation Plan	The purpose of this meeting was to review the Communications and Consultation Plan and to discuss finalizing the Plan in light of the August 1, 2018 deadline with Yukon Government. Meeting Objectives included: • Review the Plan sent via email to Chance and • Agree to next steps to finalize and submit the Plan by the August 1 deadline.	N/A	N/A
GTC0059	30-Jul-18	Email	Out	Gwich'in Tribal Council	Emily Mann (Hemmera)	N/A	Shena Shaw (Hemmera), Kelly Constable (Hemmera), Stephen Charlie (Gwich'in Tribal Council), Carolyn Lennie (Gwich'in Tribal Council), Leigh-Ann Williams-Jones (Gwich'in Tribal Council), David MacMartin (Gwich'in Tribal Council), Leslie Blake (Gwich'in Tribal Council)	Communications and Consultation Plan	Chance sent Gwich'in Tribal Council a follow-up email regarding section 8 of the Communications and Consultation Plan. Chance suggested some revisions for Gwich'in Tribal Council to review and suggested that Gwich'in Tribal Council and chance have a call to discuss the changes on August 31 at 3:30PM MST.	N/A	N/A

GTC0060	30-Jul-18	Email	Out	Gwich'in Tribal Council	Emily Mann (Hemmera)	N/A	Shena Shaw (Hemmera), Kelly Constable (Hemmera), Stephen Charlie (Gwich'in Tribal Council), Carolyn Lennie (Gwich'in Tribal Council), Leigh-Ann Williams-Jones (Gwich'in Tribal Council), David MacMartin (Gwich'in Tribal Council), Leslie Blake (Gwich'in Tribal Council), Emily Mann (Hemmera)	Communications and Consultation Plan	Chance sent Gwich'in Tribal Council an email of the Communications and Consultation Plan with the changes that were discussed in the , July 27th teleconference. Chance said they would follow-up on Comments regarding Section 8 of the Plan.	N/A	N/A
GTC0061	31-Jul-18	Teleconference	Out	Gwich'in Tribal Council	Richard Wyman (Chance)	Cindy Dickson (Chance), Greg Charlie (Chance), Richard Wyman (Chance)	Shena Shaw (Hemmera), Kelly Constable (Hemmera), Stephen Charlie (Gwich'in Tribal Council), David MacMartin (Gwich'in Tribal Council)	Communications and Consultation Plan	This time was used to review edits to the Gwich'in Tribal Council Chance Communications and Consultation Plan that we sent to Gwich'in Tribal Council by Chance on the afternoon of the July 30, 2018.	N/A	N/A
GTC0062	1-Aug-18	Email	In	Gwich'in Tribal Council	Stephen Charlie (Gwich'in Tribal Council)	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance)	Carolyn Lennie (Gwich'in Tribal Council), David MacMartin (Gwich'in Tribal Council), Stephen Charlie (Gwich'in Tribal Council), Shena Shaw (Hemmera), Emily Mann (Hemmera)	Communications and Consultation Plan	Gwich'in Tribal Council sent Chance their final edits to the Communications and Consultation Plan and asked to be forwarded a clean copy.	N/A	N/A
GTC0063	1-Aug-18	Email	Out	Gwich'in Tribal Council	Kelly Constable (Hemmera)	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance)	Carolyn Lennie (Gwich'in Tribal Council), David MacMartin (Gwich'in Tribal Council), Stephen Charlie (Gwich'in Tribal Council), Shena Shaw (Hemmera), Kelly Constable (Hemmera), Emily Mann (Hemmera)	Communications and Consultation Plan	Chance sent Gwich'in Tribal Council a clean copy of the Communications and Consultation Plan as a pdf and as a word document. It was indicated that the Chance team should send an email that they are satisfied with the final version.	N/A	N/A
GTC0064	1-Aug-18	Email	Out	Gwich'in Tribal Council	Richard Wyman (Chance)	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance)	Carolyn Lennie (Gwich'in Tribal Council), David MacMartin (Gwich'in Tribal Council), Stephen Charlie (Gwich'in Tribal Council), Shena Shaw (Hemmera), Emily Mann (Hemmera)	Communications and Consultation Plan	Chance indicated in writing that they were fine with the final version of the Draft plan and that it should be sent to Minister Pillai.	N/A	N/A
GTC0065	1-Aug-18	Email	Out	Gwich'in Tribal Council	Kelly Constable (Hemmera)	Cindy Dickson (Chance), Greg Charlie (Chance), Richard Wyman (Chance)	Shena Shaw (Hemmera), Stephen Charlie (Gwich'in Tribal Council), David MacMartin (Gwich'in Tribal Council), Kelly Constable (Hemmera), Emily Mann (Hemmera)	Communications and Consultation Plan	Chance sent Gwich'in Tribal Council an updated version 3 of the Plan with suggested wording from Chance. This version of the Plan was meant to be edited by Gwich'in Tribal Council as per the August 1, 2018 discussion. The update version was to be sent back to Chance via email.	N/A	N/A
GTC0066	1-Aug-18	Teleconference	Out	Gwich'in Tribal Council	Richard Wyman (Chance)	Cindy Dickson (Chance), Greg Charlie (Chance), Richard Wyman (Chance)	Shena Shaw (Hemmera), Stephen Charlie (Gwich'in Tribal Council), David MacMartin (Gwich'in Tribal Council), Emily Mann (Hemmera)	Communications and Consultation Plan	Chance and Gwich'in Tribal Council had a teleconference to discuss final edits to the Communications and Consultation Plan, mail Section 8: Cost and Economic Opportunity. Wording proposed by Gwich'in Tribal Council was agreed to by Chance. The process for submission was also agreed to, Chance would respond formally to the wording of section 8 asking Gwich'in Tribal Council to add the final agreed to text and asking Hemmera to submit the Plan to Yukon Government. It was agreed that nothing needed to be signed. Gwich'in Tribal Council said there was a Chief and Council general meeting in mid-August in which cabinet committee processes are discussed and more information may be requested at this time.	N/A	need to note it
GTC0067	2-Aug-18	Email	In	Gwich'in Tribal Council	N/A	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance)	Carolyn Lennie (Gwich'in Tribal Council), David MacMartin (Gwich'in Tribal Council), Shena Shaw (Hemmera), Stephen Charlie (Gwich'in Tribal Council), Emily Mann (Hemmera)	Communications and Consultation Plan	Gwich'in Tribal Council communicated to chance that they were satisfied with the latest version of the Plan moving forward.	N/A	N/A

GTC0068	8-Aug-18	Email	Out	Gwich'in Tribal Council	Emily Mann (Hemmera)	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance)	Shena Shaw (Hemmera), Grand Chief Bobbie Jo Greenland Morgan (Gwich'in Tribal Council), Carolyn Lennie (Gwich'in Tribal Council), Leslie Blake (Gwich'in Tribal Council), Leigh-Ann Williams-Jones (Gwich'in Tribal Council), Stephen Charlie (Gwich'in Tribal Council), David MacMartin (Gwich'in Tribal Council), Emily Mann (Hemmera)	Meeting	Chance sent Meeting Outcomes and Action Items to Gwich'in Tribal Council for review from the July 27, July 31, and August 1, 2018 teleconferences. These notes were done in the format established by the Communications and Consultation Plan and feedback from Gwich'in Tribal Council was requested on content and format because this was the first time the groups shared notes in this manner.	N/A	N/A
GTC0069	21-Sep-18	Email	Out	Gwich'in Tribal Council	Richard Wyman (Chance)	Greg Charlie (Chance), Cindy Dickson (Chance), Richard Wyman (Chance)	Shena Shaw (Hemmera), Mike Chernoff (Chance) (Chance), Grand Chief Bobbie Jo Greenland Morgan (Gwich'in Tribal Council) , Leslie Blake (Gwich'in Tribal Council), Carolyn Lennie (Gwich'in Tribal Council), Emily Mann (Hemmera)	Terms of Reference	Chance emailed Gwich'in Tribal Council in the interest of maintaining a positive momentum created by the creation of the Communications and Consultation Plan. Chance acknowledged that the Plan calls for the creation of a Chance-Gwich'in Communications and Consultation Management Committee that is to be formed within 60 days of completing the Plan, and as a first step, the Committee is to develop a Terms of Reference. Chance asked for Gwich'in Tribal Council's availability to begin discussions on the Committee and suggested a conference call on or before October 1, 2018 to confirm members of the Committee and to begin discussing the Terms of Reference for the Committee. Chance indicated they would like to keep using the services of Hemmera. Chance also enclosed an updated map of disposition in Eagle Plains.	N/A	N/A
GTC0070	21-Sep-18	Email	Out	Gwich'in Tribal Council	Richard Wyman (Chance)	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance)	Shena Shaw (Hemmera), Grand Chief Bobbie Jo Greenland Morgan (Gwich'in Tribal Council), Carolyn Lennie (Gwich'in Tribal Council), Leslie Blake (Gwich'in Tribal Council), Leigh-Ann Williams-Jones (Gwich'in Tribal Council), Stephen Charlie (Gwich'in Tribal Council), David MacMartin (Gwich'in Tribal Council), Emily Mann (Hemmera)	Meeting	Chance made a correction to a previous email in which there was a typo, specifically indicating a correction to the land tenure extension. The Exploration Permits 0012-0017 were extended to 2023, not 2013 as indicated incorrectly in the previous email.	N/A	N/A
GTC0071	10-Oct-18	Email	Out	Gwich'in Tribal Council	Richard Wyman (Chance)	Greg Charlie (Chance), Cindy Dickson (Chance)	Grand Chief Bobbie Jo Greenland Morgan (Gwich'in Tribal Council) , Shena Shaw (Hemmera), Carolyn Lennie (Gwich'in Tribal Council)	Terms of Reference	Chance informed Gwich'in Tribal Council that the first meeting to implement the Engagement and Communications Plan is probably mostly to establish the Management Committee, begin the discussion about the Terms of Reference of the Management Committee, and begin the discussion about the Secretariat that will be supporting the Management Committee including preliminary budget items. Chance attached a copy of the plan for convenience. Chance suggested that the first meeting to kick off implementation should be a conference call. Chance asked Gwich'in Tribal Council to let them know a few options that would work for them and their colleagues at the Gwich'in Tribal Council. Chance stated that once a date was confirmed they could circulate a draft agenda for Gwich'in Tribal Council's review and input.	N/A	N/A
GTC0072	11-Oct-18	Email	In	Gwich'in Tribal Council	Carolyn Lennie (Gwich'in Tribal Council)	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance)	Grand Chief Bobbie Jo Greenland Morgan (Gwich'in Tribal Council) , Shena Shaw (Hemmera), Carolyn Lennie (Gwich'in Tribal Council), Emily Mann (Hemmera)	Meeting	Gwich'in Tribal Council let Chance know that they were available to meet next week anytime. Gwich'in Tribal Council asked Chance to let them know a time to schedule the meeting.	N/A	N/A
GTC0073	15-Oct-18	Email	Out	Gwich'in Tribal Council	Emily Mann (Hemmera)	N/A	Grand Chief Bobbie Jo Greenland Morgan (Gwich'in Tribal Council), Leslie Blake (Gwich'in Tribal Council), Carolyn Lennie (Gwich'in Tribal Council), Emily Mann (Hemmera)	Terms of Reference	Chance sent Gwich'in Tribal Council two documents for the meeting on October 17, 2018 a draft agenda for review and comment, and a draft Terms of Reference for the Gwich'in-Chance Communications and Consultation Management Committee for discussion during the meeting.	N/A	N/A
GTC0074	17-Oct-18	Teleconference	N/A	Gwich'in Tribal Council		Richard Wyman (Chance)	Grand Chief Bobbie Jo Greenland Morgan (Gwich'in Tribal Council)	Communications and Consultation Plan	Chance and Gwich'in Partners met via teleconference to discuss the implementation of the Communications and Consultation Plan	N/A	need to note it
GTC0075	17-Oct-18	Meeting	N/A	Gwich'in Tribal Council	Richard Wyman (Chance)	Richard Wyman (Chance)	Grand Chief Bobbie Jo Greenland Morgan (Gwich'in Tribal Council)	Communications and Consultation Plan	Chance communicated to Gwich'in Tribal Council that it was agreed that an All-Party Meeting would be beneficial after each of the First Nations that have met with Chance.	N/A	N/A

GTC0076	17-Oct-18	Meeting	N/A	Gwich'in Tribal Council	Richard Wyman (Chance)	Richard Wyman (Chance)	Grand Chief Bobbie Jo Greenland Morgan (Gwich'in Tribal Council)	Communications and Consultation Management Committee	Chance and Gwich'in Partners identified members of the Communications and Consultation Management Committee. The Gwich'in Partners members consisted of the following: • Leslie Blake (Gwich'in Tribal Council) • Stephen Charlie (Gwich'in Tribal Council) • David MacMartin (Gwich'in Tribal Council) The Chance members consisted of the following: • Richard Wyman (Chance) • Greg Charlie (Chance) • Cindy Dickson (Chance) If required, it was stated in the Terms of Reference that additional members can be invited to the Management Committee meetings when additional subject matter expertise is needed.	N/A	N/A
GTC0077	24-Oct-18	Email	Out	Gwich'in Tribal Council	Richard Wyman (Chance)	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance)	Shena Shaw (Hemmera), Grand Chief Bobbie Jo Greenland Morgan (Gwich'in Tribal Council), Carolyn Lennie (Gwich'in Tribal Council), David MacMartin (Gwich'in Tribal Council), Stephen Charlie (Gwich'in Tribal Council), Leslie Blake (Gwich'in Tribal Council), Emily Mann (Hemmera)	Confidentiality Agreement	A representative from Chance sent a draft Confidentiality Agreement for Gwich'in Partners to review and provide feedback. This form of agreement was being shared with the other First Nation Governments who Chance had Engagement and Communications/Consultation Plans with. Since there were at least four and possibly five First Nations who are or could be party to this agreement, it would be great if Gwich'in Partners could accept this form as the common one subject to any specific elements needed by the Gwich'in Tribal Council/TGC to be reflected in this agreement. This draft was prepared by counsel to Chance in Calgary and Chance had inserted one correction and a few Notes to Draft (NTD's) in various sections of the draft agreement to help focus the feedback. Likewise, there were several sections with "•" for each of the parties to complete as applicable. Chance stated that notwithstanding that the Engagement and Consultation Plan serves both the Gwich'in Tribal Council and the TGC, to please advise if a similar approach can be used for this Confidentiality Agreement or if separate agreements need to be in place for each of the Gwich'in Tribal Council and the TGC. Chance asked this because each of the parties would be sharing information, some of which may have to be disclosed to agencies such as YESAB, the Yukon Water Board and other regulatory agencies. Chance said it may therefore be appropriate for "owners" of this shared information to be party to this agreement so any reporting obligations are covered in a satisfactory manner.	N/A	N/A
GTC0078	25-Oct-18	Email	Out	Gwich'in Tribal Council	Emily Mann (Hemmera)	N/A	Stephen Charlie (Gwich'in Tribal Council), David MacMartin (Gwich'in Tribal Council), Emily Mann (Hemmera)	Meeting	Hemmera let Gwich'in Tribal Council know that they had already booked their flights to attend the meeting and wanted to know as soon as possible if Gwich'in Tribal Council could be available for a meeting on November 14 or 15.	N/A	N/A
GTC0079	25-Oct-18	Email	Out	Gwich'in Tribal Council	Emily Mann (Hemmera)	N/A	Stephen Charlie (Gwich'in Tribal Council), David MacMartin (Gwich'in Tribal Council), Emily Mann (Hemmera)	Meeting	Hememra asked Gwich'in Tribal Council if they would be able to meet on the morning of November 15. Chance said that they booked their flights and there would be a fee to change our travel plans so it would be preferable for Chance if Gwich'in Tribal Council could make a meeting on morning of November 15, 2018 work. Chance's scheduled flight was set to depart at 1:45pm, so they could meet until 11:45am or noon on November 15. Chance noted that this time appeared to work for some members of Gwich'in Tribal Council as they had accepted the tentative meeting invite. Chance asked Gwich'in Tribal Council to let them know if this could work for them.	N/A	N/A
GTC0080	25-Oct-18	Email	In	Gwich'in Tribal Council	David MacMartin (Gwich'in Tribal Council)	N/A	David MacMartin (Gwich'in Tribal Council), Stephen Charlie (Gwich'in Tribal Council), Emily Mann (Hemmera)	Meeting	Gwich'in Tribal Council noted that a conflict had arisen for the November 14, 2018 date for them. David (Gwich'in Tribal Council) stated they'd be away on duty travel, and that Stephen (Gwich'in Tribal Council) and themself would need to propose some alternative dates. Gwich'in Tribal Council noted it may be more convenient to hold the first meeting in Whitehorse due to the fact Stephen and that they had two occasions coming up where they needed to travel to Whitehorse. David said they'd confer further on this with Stephen and that Gwich'in Tribal Council would get back to Hemmera shortly.	N/A	N/A
GTC0081	29-Oct-18	Email	In	Gwich'in Tribal Council	Emily Mann (Hemmera)	N/A	Stephen Charlie (Gwich'in Tribal Council), David MacMartin (Gwich'in Tribal Council), Emily Mann (Hemmera)	Meeting	Gwich'in Tribal Council told Hemmera that they would get back to Chance on the matter of the meeting on November 15, 2018 the afternoon of October 29, 2018.	N/A	N/A
GTC0082	29-Oct-18	Email	Out	Gwich'in Tribal Council	Emily Mann (Hemmera)	N/A	Stephen Charlie (Gwich'in Tribal Council), David MacMartin (Gwich'in Tribal Council), Emily Mann (Hemmera)	Meeting	Hemmera followed up on the meetings scheduled for November 14 and 15, 2018. Recognizing that some members of Gwich'in Tribal Council would be unavailable on the 14, Hemmera asked if they would be able to meet on the morning of the 15th. The Chance team had already scheduled flights and there was a fee to change them if Chance and Gwich'in Tribal Council cannot make the 15th work. Hemmera asked to let them know as soon as Gwich'in Tribal Council can about meeting on the 15th.	N/A	N/A
GTC0083	31-Oct-18	Email	Out	Gwich'in Tribal Council	Emily Mann (Hemmera)	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance)	Carolyn Lennie (Gwich'in Tribal Council), Stephen Charlie (Gwich'in Tribal Council), David MacMartin (Gwich'in Tribal Council)	Meeting	Hemmera followed up on a phone conversation. Hemmera stated that Chance would prefer to meet on the morning of November 15, if members of Gwich'in Tribal Council are able to meet that day. Chance would like to know as soon as possible if that day can work, if not, we can discuss a meeting later in the month. Hemmera would be in touch later in the week to try and finalize the date.	N/A	N/A
GTC0084	1-Nov-18	Email	Out	Gwich'in Tribal Council	Emily Mann (Hemmera)	N/A	Leslie P. Blake (Gwich'in Tribal Council), Grand Chief Bobbie Jo Greenland Morgan (Gwich'in Tribal Council), Carolyn Lennie (Gwich'in Tribal Council), Stephen Charlie (Gwich'in Tribal Council), Diane Baxter (Gwich'in Tribal Council), Emily Mann (Hemmera)	Meeting	Hemmera thanked Gwich'in Tribal Council for confirming availability for the November 15, 2018 meeting and decided to go ahead with the meeting as scheduled. Hemmera stated they would confirm the meeting scheduler and send out an agenda. Hemmera also CC'd the president of the Tetlit Gwichin Council and the Chief of Gwich'in Tribal Council and asked the Gwich'in Tribal Council representative if they would be joining.	N/A	N/A
GTC0085	1-Nov-18	Email	Out	Gwich'in Tribal Council	Richard Wyman (Chance)	Richard Wyman (Chance), Greg Charlie (Chance)	Carolyn Lennie (Gwich'in Tribal Council)	Meeting	A representative of Chance said they had a commitment in Whitehorse the afternoon of November 15 so would not be able to travel to Inuvik. Instead they would be able to participate by telephone and would need a number to call to join in.	N/A	N/A
GTC0086	1-Nov-18	Email	In	Gwich'in Tribal Council	Carolyn Lennie (Gwich'in Tribal Council)	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance)	Stephen Charlie (Gwich'in Tribal Council), Diane Baxter (Gwich'in Tribal Council), Emily Mann (Hemmera)	Meeting	A Gwich'in Partners representative informed Chance that members of Gwich'in Partners were available to meet on November 15.	N/A	N/A

GTC0106	15-Nov-18	In-Person Meeting	N/A	Gwich'in Tribal Council	Richard Wyman (Chance)	Richard Wyman (Chance)	Grand Chief Bobbie Jo Greenland Morgan (Gwich'in Tribal Council), Diane, Baxter, Stephen Charlie (Gwich'in Tribal Council),	Communications and Consultation Plan	The purpose of this meeting was to further discuss the implementation of the Communications and Consultation Plan and next steps between Gwich'in Partners and Chance. Specifically, the following items were discussed: •Chance's short-term exploration project plans •Chance-Gwich'in Communications and Consultation Management Committee (Committee) Terms of Reference •Confidentiality Agreement •Cooperation Agreement Objectives •Annual reporting to Yukon Government •All-Party Meeting Meeting Objectives were the following: • Confirm the roles and responsibilities of the Management Committee and review the draft Terms of Reference • Review the Confidentiality Agreement • Discuss each party's objectives for the Cooperation Agreement • Discuss Chance's reporting obligations to Yukon Government on the implementation of the Communications and Consultation Plan • Discuss an All-Party Meeting in early 2019	N/A	N/A
GTC0107	21-Nov-18	Email	Out	Gwich'in Tribal Council	Emily Mann (Hemmera)	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance)	Bobbie Jo Greenland Morgan, Carolyn Lennie (Gwich'in Tribal Council), Leslie Blake (Gwich'in Tribal Council), David MacMartin (Gwich'in Tribal Council), Stephen Charlie (Gwich'in Tribal Council), Diane Baxter (Gwich'in Tribal Council), Shena Shaw (Hemmera), Emily Mann (Hemmera)	Terms of Reference, Consultation Plan	To follow-up on action items from the last Gwich'in Tribal Council-Chance meeting, Chance attached two items. 1. The Communications and Consultation Plan with the addition of a signature section, and, in a footer on each page, the date the Plan was created and page numbers. 2. The Draft Terms of Reference with a new table outlining Committee members' titles, and current contacts, a line saying Order Designates are to attend meetings if committee members are unavailable, and references to sections of the Plan. Chance stated that if Gwich'in Tribal Council was happy with the Plan's signature page, to please feel free to sign it and scan it back to Chance. For the Terms of Reference, if Gwich'in Tribal Council was ok with the latest round of changes and did not have any further changes, they could add in the Gwich'in Partner's logo and remove the draft watermark to finalize this document as well. Chance stated they were also in the process of developing the Draft Cooperation Agreement with sections to be filled in and they'd have this to Gwich'in Tribal Council shortly.	N/A	N/A
GTC0108	23-Nov-18	Email	Out	Gwich'in Tribal Council	Emily Mann (Hemmera)	N/A	Grand Chief Bobbie Jo Greenland Morgan (Gwich'in Tribal Council), Stephen Charlie (Gwich'in Tribal Council), Emily Mann (Hemmera)	Meeting	Hemmera followed up on items Chance and Gwich'in Partners discussed in the meeting the previous week, where Chance was interested in planning an All-Party Meeting for February 1st, 2019, and would like to invite Gwich'in Partners. Hemmera noted that the event was still tentatively scheduled, however, they wanted to provide more information as we have looked into the details further. An All-Party Meeting is meant to bring together Gwich'in Tribal Council, Tetlit Gwich'in Council, VGFN, NND, TH, and Yukon Government to discuss matters related to Chance's upcoming exploration project. The following topics are being proposed for the agenda: • An overview of the First Nations' and Chance's work with the Engagement Plans over the past year; • North Yukon Regional Land Use Plan; • Yukon Oil and Gas Act; • In-camera First Nations session to discuss collaboration and leadership; and • Chance's exploration project plans and expected YESAB application process. We would like to host the meeting in Vancouver on February 1st, 2019, the day after AME Roundup (BC's Annual Mining Conference). We are hoping that scheduling this meeting immediately after this widely attended conference will allow for maximum participation. Chance will fund three members from each First Nation for travel to and from Vancouver, and for accommodation for two nights. Chance is anticipating that the First Nations representatives who attend the meeting will be: • The Chief; • The staff member managing the Chance file; and • The Director of Lands and Resources, or another staff member who has been working closely with Chance. Hemmera stated that they were still in the early stages of planning this event, but wanted to let you know in advance so that the date could be reserved. They said they were happy to have further conversations regarding your attendance and meeting logistics. Representatives who were interested to attend the meeting could contact Emily at Hemmera via call or email at any time if there were questions. Emily's contact information was included.	N/A	N/A
GTC0109	26-Nov-18	Email	In	Gwich'in Tribal Council	Stephen Charlie (Gwich'in Tribal Council)	N/A	Stephen Charlie (Gwich'in Tribal Council), Emily Mann (Hemmera)	Meeting notes	A Gwich'in Tribal Council representative asked Chance to forward a copy of the notes from the last two meetings.	N/A	N/A
GTC0110	27-Nov-18	Email	Out	Gwich'in Tribal Council	Emily Mann (Hemmera)	Richard Wyman (Chance), Cindy Dickson (Chance), Greg Charlie (Chance)	Shena Shaw (Hemmera), Calista Morrison (Hemmera), Stephen Charlie (Gwich'in Tribal Council), Grand Chief Bobbie Jo Greenland Morgan (Gwich'in Tribal Council), Diane, Baxter, David MacMartin (Gwich'in Tribal Council), Leslie Blake (Gwich'in Tribal Council), Emily Mann (Hemmera)	Meeting	Hemmera sent the Meeting Outcomes and Action Items for the last two Chance and Gwich'in Tribal Council meetings, as well as the revised Terms of Reference, and revised Communications and Consultation Plan. Hemmera stated for recipients to use the revised Terms of Reference with that day's date as they had updated some contact information in the Membership Table. Hemmera said that once both parties had approved the new "Signature of the Parties" section of Communications and Consultation Plan as well as the addition of the date and page numbers, to let them know so they could facilitate the scanning and signing of the document. Hemmera was also working on the Draft Cooperation Agreement that contained section headings and suggested draft content and was aiming to send that our shortly.	N/A	N/A

GTC0111	29-Nov-18	Email	Out	Gwich'in Tribal Council	Richard Wyman (Chance)	Richard Wyman (Chance), Cindy Dickson (Chance), Greg Charlie (Chance)	Shena Shaw (Hemmera), Emily Mann (Hemmera), Calista Morrison (Hemmera), Grand Chief Bobbie Jo Greenland Morgan (Gwich'in Tribal Council) , Leslie Blake (Gwich'in Tribal Council), Carolyn Lennie (Gwich'in Tribal Council), Diane Baxter (Gwich'in Tribal Council), David MacMartin (Gwich'in Tribal Council), Stephen Charlie (Gwich'in Tribal Council)	Meeting	Chance forwarded a description of the exploration objectives that they have for their exploration permits in Eagle Plain and also provided a couple of scenarios to undertake the work for Gwich'in Partners review and consideration. Chance asked that Gwich'in Tribal Council please pass this on to anybody else who was working on this file. Chance also asked that in case they were not using the correct email addresses for Leslie Blake (Gwich'in Tribal Council), to please forward this to their correct email and to let Chance know what email address was the best one for us to use going forward. Chance said that if Gwich'in Tribal Council had any questions or comments, to please let Chance know.	N/A	N/A
GTC0112	4-Dec-18	Email	In	Gwich'in Tribal Council	Grand Chief Bobbie Jo Greenland Morgan (Gwich'in Tribal Council)	Richard Wyman (Chance)	Emily Mann (Hemmera), Carolyn Lennie (Gwich'in Tribal Council), David MacMartin (Gwich'in Tribal Council), Bobbie Jo Greenland Morgan	Meeting	A Gwich'in Tribal Council representative forwarded the preferred email address of President of the Tetlit Gwitchin Council, Lesley Blake. The email address was appydad2003@yahoo.ca.	N/A	N/A
GTC0113	12-Dec-18	Email	Out	Gwich'in Tribal Council	Emily Mann (Hemmera)	Richard Wyman (Chance), Cindy Dickson (Chance), Greg Charlie (Chance)	Grand Chief Bobbie Jo Greenland Morgan (Gwich'in Tribal Council), Stephen Charlie (Gwich'in Tribal Council), David MacMartin (Gwich'in Tribal Council), Carolyn Lennie (Gwich'in Tribal Council), Leslie Blake (Gwich'in Tribal Council), Emily Mann (Hemmera)	Meeting	To prepare for the December 14 meeting, Hemmera sent Gwich'in Tribal Council a brainstorming document for the Cooperation Agreement to start the discussion. That document contained thoughts expressed in the last meeting as well as a draft template for the Cooperation Agreement. Also attached was a draft working agenda.	N/A	N/A
GTC0114	14-Dec-18	Meeting	N/A	Gwich'in Tribal Council	N/A	N/A	N/A	N/A	Parties to sign Communications and Consultation Plan	N/A	N/A
GTC0115	14-Dec-18	Meeting	N/A	Gwich'in Tribal Council	N/A	N/A	N/A	N/A	Final edits to the Engagement Plan were reviewed and approved by Gwich'in Tribal Council and Chance. Hemmera inquired as to whether the Plan should include a signatory line for the President of Tetlit Gwich'in Council. Following a side bar, Gwich'in Tribal Council decided against including an additional signatory line for the President of Tetlit Gwich'in Council. Complete final changes to the Communications and Consultation Plan as they were discussed in the meeting: •Fix page numbers •Remove dates from signatory line •Remove Tetlit signatory line	N/A	N/A

August 19, 5pm - Gwichya Gwich'in Council in Tsiigehtchic (Arctic Red River), August 21, 6pm - Ehdiitat Gwich'in Council in Aklavik, August 22, 6pm - Tetl'it Gwich'in Councilin Teetl'it Zheh (Fort McPherson). Timing for the meeting with EGC in Aklavik has been pushed back an hour at the request of the EGC President and Council. This will allow us to have a dinner meeting. We can arrange to travel over to Aklavik in the afternoon of August 21 and stay over in Aklavik that night following the dinner Meeting and then return to Inuvik the next morning on the 22nd. At that time we will need to journey directly to Teetl'it Zheh (Fort McPherson) for the meeting that we have scheduled there for 18:00 on , August 22 with the Tetl'it Gwich'in CouncilPresident Les Blake and his Council members.	N/A	E00398_RE_ Meeting with Gwich'in Councils_7

E00529	30-Jul-19	Email	In	Tetl'it Gwich'in Council, Gwich'in Tribal Council	David MacMartin (Gwich'in Tribal Council)	Hemmera Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance)	David MacMartin (Gwich'in Tribal Council), Leslie Blake (Gwich'in Tribal Council), Amber Keegan (Gwich'in Tribal Council), Dwayne Semple, Erika Tizya-Tramm (Gwich'in Tribal Council), Carolyn Lennie (Gwich'in Tribal Council)	Engagement Reports/OIC Requirements	I've reviewed the draft Implementation summary I've reviewed the draft Implementation summary and agree that it well reflects the implementation of the Gwich'in Tribal Council-Chance Communications and Consultation Plan over the past year. I do have a few minor change suggestions that I would suggest be made to the text of the summary, after which I'd be pleased to sign it on behalf of the Gwich'in Partners. 1.Where references are made to "staff" or to "technical staff," it would be more accurate in my view to change this reference to "senior officials." This would be consistent to the protocol used by the GNWT in the context of the NWT Intergovernmental Council when distinguishing "senior officials" from "political leaders." The senior officials are not providing technical advice on Project details. They provide substantive and strategic advice to their respective political leaders in accordance with their role as permanent officials of their respective governments; 2.On page 2, please add a bullet reference to "business and employment and training opportunities for Gwich'in businesses and Gwich'in Comprehensive Land Claim Agreement (GCLCA) Participants." This has and will continue to be an important and priority topic for discussion as we move in the future towards negotiating a "Cooperation Agreement"; 3.On page 6, Re Chance following through on the Gwich'in Partners' new consultation protocol you could note that the Gwich'in Tribal Council has worked with Chance to schedule Meetings in each Gwich'in community to discuss the Project for the week of August 19, 2019. You could also note that the Gwich'in Partners have expressed appreciation to Chance for Chance's embracing this consultation protocol that the Gwich'in Partners have developed. E00603	28-Jan-20	Email	Out	Tetl'it Gwich'in Council, Gwich'in Tribal Council	Richard Wyman (Chance)	Richard Wyman (Chance) Greg Charlie (Chance), Cindy Dickson (Chance)	David MacMartin (Gwich'in Tribal Council), Bobby Jo Greeland-Morgan, Leslie Blake (Gwich'in Tribal Council), Carolyn Lennie (Gwich'in Tribal Council)	Tenures/Dispositions/Permits DO Project Engagement/Consultation	Chance will be applying to the Yukon Government very shortly to extend the tenure of Exploration Permit 20. Application will be for maximum allowable under the Oil and Gas Act of 5 years. This permit has one suspended well at McParlon A-25 which we hope to use for fluid disposal of any produced water associated with the proposed exploration Project. We are at an intermediate stage of discussions with the Manager of Oil and Gas Operations with Yukon to extend the suspended well status on the suspended wells at Eagle Plain. Manager has indicated hat Chance will need to do some physical assessments of the legacy wells to confirm the integrity of the wells before granting an extension. Assessments will require access to 3 suspended wells at SDL M-08, G 08, and J-19 and well as M-59 in order to do the work. A service rig, cement pumping equipment, and wireline services are expected to be used to conduct the assessments. Anticipate taking temperature measurements in wells to evaluate permafrost depth. The program is expended to take 1-2 months. This is a winter operation and will be done during the winter of 2020-2021 and may require Designated Office screening by YESAB. We will provide more information as soon as we can.	N/A	E00603_FW_ Suspended wells and Exploration Permit 20_2
E00645	23-Mar-20	Email	Out	Tetl'it Gwich'in Council, Gwich'in Tribal Council	Richard Wyman (Chance)	Richard Wyman (Chance) Greg Charlie (Chance), Cindy Dickson (Chance), Hemmera	Grand Chief Bobbie Jo Greenland Morgan (Gwich'in Tribal Council) , James Thorbourne (Gwich'in Tribal Council), Leslie P. Blake (Gwich'in Tribal Council), Amber Keegan (Gwich'in Tribal Council)	Information Sharing	Chance (COG) has several initiatives on the go, some of which are time sensitive and all require engagement with the affected First Nations. The following is a summary of these initiatives: 1.Application to the Yukon Government to get tenure extension on Exploration Permit 0020 which is set to expire on August 30, unless extended. This permit is located mostly in the Traditional Territory of the Vuntut Gwichin, but a portion is in the Secondary Use Area of the Tetlit Gwich'in and in the overlap area with the Na-cho Nyak Dun Traditional Territory. There is a suspended well in this Permit at McParlon A-25 which has ongoing value to COG. 2. There are several suspended wells at the Chance Significant Discovery License (SDL 022) and one at the Blackie SDL 021 which the Yukon Government requires COG to undertake some maintenance work. This activity will require an impact assessment by the Designated Office (DO) of YESAB in Dawson prior to permissions being granted by Yukon to undertake the work. The plan is to submit to the DO the program in the next month or so with the objective of being able to do the work over approximately a 6 week to two month period in the winter of 2020-2021. This is a regulatory requirement made by the Manager of Oil and Gas Operations with the Yukon Government. Importantly for your knowledge, there is no indication that these suspended wells have any problems, but they are wells that were drilled in the 1960's so the regulator has asked for work to be done in order to be able to continue the suspended status of these wells. 3. Continuing engagement with respect to the multi-well drilling and seismic data acquisition Project that has been described to you in the past couple of years. In view of the COVID 19 outbreak, travel and face to face get togethers are not appropriate, if not prohibited, so we will have to make arrangements to exchange information in writing, electronically and by conference call. There is quite a geographic spread for all of us to manage and I look forward to hearing your preferences for engagement. Also, I understand that there have been some changes to a number of staff positions with the Gwich'in Tribal Council and I am not sure exactly who we should be engaging on the COG file. If I have missed anyone on this email, please advise us and forward this email to the appropriate individuals. E00709	13-Jul-20	Email	Out	Tetl'it Gwich'in Council, Gwich'in Tribal Council	Hemmera	Hemmera, Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance)	Godlove Suh Ngeh (Gwich'in Tribal Council), James Thorbourne (Gwich'in Tribal Council), Morgan Greenland, Leslie Blake (Gwich'in Tribal Council)	Engagement Reports/OIC Requirements	Hemmera has prepared a draft report on implementation of Gwich'in Partners and Chance Engagement and Communication Plan for Gwich'in Partners and Chance to review. This report summarizes Meetings/correspondence that have occurred between Gwich'in Partners and Chance since completing the 2019 Annual Report. I have attached the draft as a Word Document, if both Gwich'in Partners and Chance could make revisions to that document in tracked changes, that would assist me in creating a final version. If there are any issues that arise between parties' revision, we can address them via email or a quick call. Once revisions have been incorporated and the document is considered final by Gwich'in Partners and Chance, I will send the final version to both parties to sign. I have also attached, as a pdf, a draft of Gwich'in Partners and Chance's Engagement Log which functions as Appendix D for the report. Please complete reviews by , July 24th. Reminder that reports need to be signed and submitted to Yukon Government on July 31st. E00869	28-Aug-20	Email	In	Gwich'in Tribal Council	Godlove Suh Ngeh (Gwich'in Tribal Council)	Hemmera	Godlove Suh Ngeh (Gwich'in Tribal Council)	DO Project Engagement/Consultation	Email read receipt	N/A	E00869_Read_ Chance Eagle Plains Well Maintenance - Draft YESAB Project Proposal REVISED (71)
E00910	28-Aug-20	Email	Out	Gwich'in Tribal Council	Hemmera	Hemmera Richard Wyman (Chance), Cindy Dickson (Chance), Greg Charlie (Chance)	Godlove Suh Ngeh (Gwich'in Tribal Council), Jame Thorbourne, Leslie Blake (Gwich'in Tribal Council)	DO Project Project Description/Activities	Further to Richard's email dated August 7th (attached), Chance made revisions to their Project Description for the Designated Office Evaluation of their proposed Well Maintenance Program. As a result of those changes, Hemmera has also revised the effects assessment sections of the Project Proposal. Below are the reasons for the revision that have been provided to us by Chance and a brief summary of the amendment itself: Ongoing conversations between Chance and Yukon Government, Oil and Gas Branch (Yukon Government) have necessitated changes. While Chance was previously of the impression wells could continue to be suspended, Yukon Government is now directing Chance to conduct inspection and maintenance activities for all eight suspended wells and then abandon those wells or bring them into active status (i.e., end the period of well suspension). Chance is now proposing to abandon six wells and to bring the remaining two wells into active status as deep-injection wells. Waste fluid produced during the abandonment of the six wells can then be disposed of via injection into the deep-injection wells. No oil or gas is expected to be produced from the two wells proposed to be activated; they would specifically be used for disposal of waste fluid from activities associated with these maintenance activities. 2) At this time, Chance cannot confirm whether it will use the Eagle Plains Hotel or the existing Chance Camp for housing workers over the duration of the Project. The decision to utilize the Eagle Plains Hotel or the Chance Camp will be made when the Project schedule is finalized. It will also have to take into consideration the Hotel's ability to accommodate Chance workers over the full duration of the Project as well as COVID-19 related self-isolation requirements at that time. As a result both options are considered in the effects assessment for the housing of the Project workforce. 3) When the Chance field team were at Eagle Plain early Augustus, they observed that the route used to access M-59 would require realignment of the final portion of Blackie Winter Road. The section of the original route that proceeds north for the final kilometer is not ideal for traffic due to steeper terrain. The steeper route would result in a significant risk to the trucks bearing heavy loads, fuel supply, and other fluid handling shipments. Chance is proposing shifting the final portion of Blackie Winter Road east of the original route in order to attain a much gentler gradient. (Chance) has determined that changes are required to the Project submitted to the Dawson Designated Office on September 11, 2020 (Project #2020-0151). As such, Chance has decided to withdraw its Project Proposal and will be informing the YESAB today, November 2, 2020. Chance intends to incorporate changes into a revised Project Proposal. Once the revised proposal has been drafted, Chance will notify you by sharing a draft and requesting a Meeting to discuss the changes further. After Chance has discussed those changes with the Gwich'in Tribal Council and Tetlit Gwich'in Council, the Project Proposal will be finalized and resubmitted to the Dawson Designated Office. Chance understands and appreciates that making changes to this Project a second time is requesting additional effort and capacity of the Gwich'in Tribal Council and Tetlit Gwich'in Council. Chance looks forward to continuing to work with the Gwich'in Tribal Council and Tetlit Gwich'in Council, and Chance will do its best to ease this process.	N/A	E00906_Chance DO Proposal Withdrawal - Gwich'in Tribal Council and Tetlit Gwich'in Council Notification

E00851	4-Nov-20	Email	Out	Tetl'it Gwich'in Council, Gwich'in Tribal Council	Richard Wyman (Chance)	Richard Wyman (Chance) Greg Charlie (Chance), Cindy Dickson (Chance)	Ken Smith (Gwich'in Tribal Council), Kristine McLeod (Gwich'in Tribal Council), Leslie Blake (Gwich'in Tribal Council)	Engagement/Consultation Meeting Coordination/Planning	I want to congratulate you both for your recent election victories and we look forward to working with you in the future. I think that Chance has established a good working relationship with the Gwich'in Tribal Council and Designated Gwich'in Organizations and we hope to continue building on this relationship. I understand that you have been in touch with Greg already so I thought I would reach out to introduce myself so we can initiate discussions about our plans and proposed activities. Godlove has been engaged with us during the past year so is generally current with our plans so can brief you prior to any conversation that we have with you. We do need to engage again to discuss some changes that we are proposing to a well maintenance Project at Eagle Plain. Overall, Chance is involved in exploration activities in northern Yukon and has plans to expand this effort in the future. A multi-year exploration Project in an area of interest within the exploration land that Chance currently holds covers about 2,400 sq kms of area. This Project could involve drilling up to 30 exploration wells, shooting up to 1,500 sq kms of 3D seismic and up to 2,000 linear kms of 2D seismic, and undertaking extended flow testing of any discoveries has been proposed and information has been provided to all the affected First Nations including the Gwich'in Tribal Council and the DGO's. When it is convenient, we would like to meet with you, probably virtually by Zoom or Microsoft Teams given the COVID 19 situation.	N/A	E00851_FW_ Congratulations and Introduction (3)
E00849	9-Nov-20	Email	Out	Tetl'it Gwich'in Council, Gwich'in Tribal Council	Richard Wyman (Chance)	Richard Wyman (Chance) Greg Charlie (Chance), Cindy Dickson (Chance), Hemmera	Ken Smith (Gwich'in Tribal Council), Kristine McLeod (Gwich'in Tribal Council), James Thorbourne (Gwich'in Tribal Council), Leslie Blake (Gwich'in Tribal Council)	Engagement/Consultation Meeting Coordination/Planning	I have feedback from Hemmera and my colleagues. It looks like morning next week works for all of us. How does 9-11 am work for you and your colleagues? I can arrange with Calista at Hemmera to save this time, send out Meeting invitations and connection details and a draft agenda for you to consider.	N/A	E00849_Virtual Meeting November 16
E00850	9-Nov-20	Email	In	Tetl'it Gwich'in Council, Gwich'in Tribal Council	Kristine McLeod (Gwich'in Tribal Council)	Richard Wyman (Chance) Greg Charlie (Chance), Cindy Dickson (Chance), Hemmera	Ken Smith (Gwich'in Tribal Council), Kristine McLeod (Gwich'in Tribal Council), James Thorbourne (Gwich'in Tribal Council), Leslie Blake (Gwich'in Tribal Council)	Engagement/Consultation Meeting Coordination/Planning	I am available to meet next from 9-11am.	N/A	E00850_RE_ Virtual Meeting November 16
E00852	9-Nov-20	Email	In	Tetl'it Gwich'in Council, Gwich'in Tribal Council	Ken Smith (Gwich'in Tribal Council)	Richard Wyman (Chance) Greg Charlie (Chance), Cindy Dickson (Chance)	Ken Smith (Gwich'in Tribal Council), Kristine McLeod (Gwich'in Tribal Council), Leslie Blake (Gwich'in Tribal Council), James Thorbourne (Gwich'in Tribal Council)	Engagement/Consultation Meeting Coordination/Planning	Mahsi' (thanks) for reaching out and introducing yourself. Yes myself and Greg had a quick discussion in October. I have also copied James Thorbourne (Gwich'in Tribal Council) who is our acting COO to make him aware of the request. We may have some time on , November 16th if that works. We look forward to Meeting with your team and discussing your proposed activities at Eagle Plain.	N/A	E00852_FW_ Congratulations and Introduction (2)
E00853	9-Nov-20	Email	Out	Tetl'it Gwich'in Council, Gwich'in Tribal Council	Richard Wyman (Chance)	Richard Wyman (Chance) Greg Charlie (Chance), Cindy Dickson (Chance)	Ken Smith (Gwich'in Tribal Council), Kristine McLeod (Gwich'in Tribal Council), Leslie Blake (Gwich'in Tribal Council), James Thorbourne (Gwich'in Tribal Council)	Engagement/Consultation Meeting Coordination/Planning	Great to hear from you. Next works for me and my colleagues. I would like to include others who are helping with various processes like YESAB submissions and Communication and Engagement such as consultants at Hemmera in Whitehorse. Gwich'in Tribal Council government staff will already be familiar with the folks at Hemmera. I will check with them on their availability to participate and let you know. Are you able to use Microsoft Teams for a virtual Meeting? I suggest that we allow up to two hours to introduce you both to plans we have for work at Eagle Plains. In the near term, we are under an order from the Yukon Government regulator to undertake maintenance of 8 suspended wells operated by Chance. There is no evidence of any problems with these wells, but Yukon law specifies that suspended wells must be put into operation or abandoned after a period of inactivity. Our plan is to preserve for future use five of the suspended wells, but three will likely have to be abandoned. In the longer term we have plans to undertake a small scale, multi-year exploration drilling and seismic data acquisition program in an area of interest within the existing exploration permits held by Chance. Information about both these Projects has been provided to your staff over the past couple of years. We are underway with updating the maintenance Project to include extended flow testing of three wells to assess the productive capability and hopefully measure the resource size as part of the program. I will confirm the availability of the Hemmera advisors as quickly as I can. January 16 is pretty open for Greg, Cindy and me.	N/A	E00853_FW_ Congratulations and Introduction

E00844	16-Nov-20	Email	Out	Gwich'in Tribal Council	Hemmera	Hemmera	Godlove Suh Ngeh (Gwich'in Tribal Council)	DO Project Engagement/Consultation Project Description/Activities	I've attached the original email Hemmera sent to Gwich'in Tribal Council back in June 2019. It includes the draft Project description for Chance's Eagle Plains Exploration Project and a presentation that Chance gave to the Gwich'in Tribal Council team at that time. This Project will go through a YESAB Executive Committee level screening. Since you and your team started this year, Richard may have mentioned the "Executive Committee" Project in passing, but Chance (and Hemmera) haven't been actively engaging on it. We've been focused on Chance's Eagle Plains Well Maintenance Project (or subsequently called Eagle Plains Well Maintenance and Winter Activities) which will be going through the YESAB Designated Office in Dawson City. That is the proposal we've been engaging with you on for the past few months. It's this Project that has changed a couple times and which Chance withdrew from YESAB a couple weeks ago. As soon as the revised draft (including Project description and effects assessment) for this Project is completed, Hemmera will get a copy to Gwich'in Tribal Council. As Nathan mentioned on the call, he's hoping for sometime this week. Hopefully my additional comments here aren't too unsolicited. It may end up being repetitive for you, but I will be attaching the draft Project description for Chance's Eagle Plains Exploration Project again when I send out the notes from today's Meeting. I'll also attach other documents that were referenced during the call, for ease of reference. E00891	19-Nov-20	Email	Out	Tetl'it Gwich'in Council, Gwich'in Tribal Council	Hemmera	Hemmera Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance)	Godlove Suh Ngeh (Gwich'in Tribal Council), James Thorbourne (Gwich'in Tribal Council), Leslie Blake (Gwich'in Tribal Council)	DO Project Engagement/Consultation Project Description/Activities	Further to my email dated November 2nd (attached) and our Meeting November 16th with the Gwich'in Tribal Council, Chance (Chance) has revised its Project Proposal (including updated Project Description and Effects Assessment) for Designated Office Evaluation. Below is the key Project component that has changed: •Extended Flow Testing: After maintenance activities are complete and depending on wellbore integrity (as confirmed through maintenance activities), Chance proposes to conduct Extended Flow Testing (EFT) on up to three of the wells which have the highest potential for natural gas reserve. The reason for this change is to allow Chance to gather important information about the nature of the natural gas resource accumulation and its productive capability. a.Wells proposed for EFT are M-59, M-08, and J-19 (see PDF attached for Figure 2-1). Please note, Figure 2-1 is currently being updated to reflect this change. b.Revert up to three wells to suspended status (if the EFT results prove to have sufficient resource). c.Abandon three to six wells (the three remaining wells (G-08, B-73, and H-28) will be abandoned and up to additional three wells may be abandoned if wellbore integrity is not confirmed or if EFT results prove insufficient resources). •Timelines: If work cannot be completed this winter season (due to low snow pack, COVID considerations, or permitting delays), Chance will complete the Project during the winter of December 2021 to March 2022. Additional detail is within the attached revised Draft Project Proposal. While revisions were made throughout the document, Section 2.1.3 is the substantive addition with respect to EFT. We've attached both a clean version and a version with tracked changes to facilitate your review. Given the very short time frame for winter work, Chance will be submitting the application to YESAB on , November 20th. Hemmera anticipates the Gwich'in Tribal Council and Tetlit Gwich'in Council requiring additional discussions with Chance to review these changes and look forward to scheduling a Meeting where we can discuss these matters further to support your future submissions to the YESAA process. E01205	30-Jun-21	Email	Out	Gwich'in Tribal Council	Hemmera	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance), Hemmera	Leigh-Ann Williams-Jones (Gwich'in Tribal Council)	Project Description/Activities Information Sharing	At our last meeting, Chance mentioned sharing baseline information from Palmer (i.e., Palmer's report and mapping on permafrost, terrain, and suitability mapping). I've attached the main memo/report from Palmer. However, to say the appendices are big, is a massive understatement (like 250MB)! Each appendix contains 14 maps and is nearly impossible to open and view because of its size. So I've had our formatting folks break everything down so that there is only one map per pdf. It makes for a lot of documents to share, but this way you'll actually be able to open them and move around in them. I'm going to have my co-worker send the maps separately using Hemmera's file sharing site. You should receive a notification email for that later today or tomorrow. If you think this will be an issue on your end (with your internet, etc.), please let me know. Because we can put the information on USB drive and mail them to you.	Palmer_RPT_Eagle Plains Terrain Permafrost_DRAFT_25January2021.pdf	E01205_Chance Eagle Plains Exploration Project - Baseline information on terrain_ permafrost_ and suitability maps.msg

E01228	30-Jun-21	Email	Out	Gwich'in Tribal Council	Hemmera	Greg Charlie (Chance), Richard Wyman (Chance), Hemmera	Leigh-Ann Williams-Jones (Gwich'in Tribal Council)	Information Sharing	Here is the Chance information from Palmer (permafrost, terrain, and suitability mapping). They are very large files so let me know if you have any troubles opening them. They should have also sent directly to your email from our file sharing account. Appendix B Suitability Map. Appendix A Surficial Geology.	Included links to file share site	E01228_Palmer Permafrost Files.msg
E01214	16-Jul-21	Email	Out	Gwich'in Tribal Council	Hemmera	Hemmera, Greg Charlie (Chance), Cindy Dickson (Chance), Richard Wyman (Chance)	Leigh-Ann Williams-Jones (Gwich'in Tribal Council), Grand Chief Grand Chief Ken Kyikavichik (Gwich'in Tribal Council) (Gwich'in Tribal Council) Leslie P. Blake (Gwich'in Tribal Council)	Engagement Reports/OIC Requirements	Hemmera has prepared a draft report on the implementation of the Gwich'in Partners and Chance Communications and Consultation Plan for Gwich'in Tribal Council (Gwich'in Tribal Council), Tetlit Gwich'in Council (Tetlit Gwich'in Council), and Chance to review. This report summarizes meetings/correspondence that have occurred between Gwich'in Tribal Council, Tetlit Gwich'in Council, and Chance since completing the 2020 Annual Report. I have attached the draft as a word document. If parties could make revisions to that document in tracked changes, that would assist me in creating a final version. If there are any issues that arise between the parties' revisions, we can address them via email and/or a quick call. Once revisions have been incorporated and the document is considered final by the parties, I will send the final version to both parties to sign. Either later today, or , I will send a follow-up email with a draft of Gwich'in Tribal Council, Tetlit Gwich'in Council, and Chance's Engagement Log which will serve as Appendix D. Please note, for Section 4.0 Plans for Ongoing Engagement and Next Steps, I carried forward outstanding items from last year's engagement report. If you would like me to proceed differently, just let me know. E01377	28-Jul-21	Email	Out	Gwich'in Tribal Council	Hemmera	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance),	Grand Chief Grand Chief Ken Kyikavichik (Gwich'in Tribal Council) (Gwich'in Tribal Council) Leigh-Ann Williams-Jones (Gwich'in Tribal Council), Kanda Gnama (Gwich'in Tribal Council)	Engagement Reports/OIC Requirements	I thought I would check-in. Has Gwich'in Tribal Council/Tetl'it Gwich'in Council been able to review the engagement report? I'm hoping that we can have it reviewed, and hopefully signed by a Gwich'in Tribal Council/Tetl'it Gwich'in Council representative, by the end of the week. Usually the reports are due July 31st, however Yukon Government has allowed us to submit on , August 3rd. Greg and Richard are actually up in Eagle Plains this week, but I've asked Greg to set aside some time next to sign/finalize the report. Let me know if there is anything I can do to help and/or if you think this timeline might not work. We can work on some alternative plans/ideas.	N/A	E01377_RE_ DRAFT 2021 Annual Report of Gwich'in Partners and Chance Engagement Activities - For Review (7).msg
E01378	2-Aug-21	Email	Out	Gwich'in Tribal Council	Hemmera	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance),	Grand Chief Grand Chief Ken Kyikavichik (Gwich'in Tribal Council) (Gwich'in Tribal Council) Leigh-Ann Williams-Jones (Gwich'in Tribal Council), Kanda Gnama (Gwich'in Tribal Council)	Engagement Reports/OIC Requirements	I just left you a voicemail Leigh-Anne. Sorry I keep missing you! In my voicemail I mentioned a Plan B, if we're not able to connect. As Chance must submit their engagement reports to Yukon Government today, I can submit the report to Yukon Government as a DRAFT. I can remove the signing page, keep DRAFT in the title, and keep the DRAFT watermark on the report. Additionally, in my email to Yukon Government, which will cc Gwich'in Tribal Council, I can indicate that the DRAFT report does not incorporate possible revisions from Gwich'in Tribal Council. If I don't hear from Gwich'in Tribal Council before 2:00 pm (Yukon Time), I'll proceed as outlined above.	E01378_210714_ChanceCommunicationLog_v7Gwich'in Tribal Council.pdf E01378_210716_EngagementPlan_2021AnnualReport_Gwich'inPartners_v0.3.docx	E01378_RE_ DRAFT 2021 Annual Report of Gwich'in Partners and Chance Engagement Activities - For Review (6).msg
E01379	3-Aug-21	Email	In	Gwich'in Tribal Council	Leigh-Ann Williams-Jones (Gwich'in Tribal Council)	N/A	Grand Chief Grand Chief Ken Kyikavichik (Gwich'in Tribal Council) (Gwich'in Tribal Council) Leigh-Ann Williams-Jones (Gwich'in Tribal Council), Kanda Gnama (Gwich'in Tribal Council), Hemmera	Engagement Reports/OIC Requirements	I am currently away from the office. I apologize for not getting back to you before leaving. I can provide Gwich'in Tribal Council feedback and signature on (August 9) if that works. I agree with the DRAFT option until I can provide you with Gwich'in Tribal Council's official feedback. Just as a side note, in the recommendations of the report regarding revising the communication plan, Chance suggests a revision to include Teetl'it Zheh (Fort McPherson) Band. As per the reasons highlighted in a meeting with Chance, back in 2018 when we first drafted the communication protocol, Gwich'in Tribal Council will continue to only include Gwich'in Tribal Council and the Tetlit Council and not the band office in our communication protocol. I will send you the meeting minutes from that 2018 Meeting, as soon as I'm back in the office. I apologize for the inconvenience. Based on the Report submitted in September, there are no engagement plans for the Well Maintenance and Extended Flow Testing Project. However, there appears to be a list of upcoming engagement activities for the Eagle Plains Exploration Project. Can you please give us an update on the status on these Projects? When is YESAB expected to complete its review for the Well Maintenance and Extended Flow Testing Project? When is Chance expecting to submit the Eagle Plains Exploration Project Proposal to YESAB?	N/A	E01386_RE_ 2021 Annual Report of Gwich'in Partners and Chance Engagement Activities - For Finalization.msg

E01387	15-Dec-21	Email	Out	Gwich'in Tribal Council	Hemmera	Richard Wyman (Chance), Greg Charlie (Chance), Cindy Dickson (Chance)	Leigh-Ann Williams-Jones (Gwich'in Tribal Council), Kanda Gnama (Gwich'in Tribal Council)	Regulatory Process Information Sharing	Hemmera responded to Gwich'in Tribal Council's December 6, 2023 questions: •Work on the Eagle Plains Exploration Project is ongoing. Chance is currently focusing its efforts on revising/updating the Project Description (i.e., previous version was dated 2019 and shared with Gwich'in Tribal Council). This process is being greatly informed by the current YESAB process for the Well Maintenance and Extended Flow Testing Project. •For the Eagle Plains Exploration Project, Chance's consultants are working on finalizing baseline reports for wildlife, fish, etc. Once those are complete, Chance will share copies. •For the Eagle Plains Exploration Project, Chance will likely be entering YESAB's Pre-Submission Engagement (PSE) process. PSE comes into effect March 1, 2022. Some additional information about that process can be found here. Chance is working with Hemmera and its other consultants to build out a revised schedule for the ultimate Project Proposal submission to YESAB. •For the Well Maintenance and Extended Flow Testing Project, the Public Comment period has ended and Chance/Hemmera is preparing the response to Information Request #4. This should be submitted to YESAB before Christmas.	N/A	E01386_RE_ 2021 Annual Report of Gwich'in Partners and Chance Engagement Activities - For Finalization.msg

(Environmental Dynamics Inc.), Tim Bennett (Ecofor), Roberta Adams (Palmer), Clive Mountford, Daryl Robbins, Alicia McRae, Gwich'in Participants	Community Open House Event	Chance held a community Open House event in Fort McPherson at the Tetlit' Zheh Fort McPherson Hamlet Chamber from 4:00PM to 8:00PM MST. Open House attendees were asked to sign in upon arrival and to complete a feedback form before leaving. Chance shared Project information on posterboards and a 1-page handout. Chance provided a catered dinner and presented Project information to the Open House attendees. The Open House event had door prizes that were drawn throughout the event which included 2 Air North gift cards, 2 Co-op grocery gift cards, and Ecofor packages. Representatives at the Open House from the Project Team included Eliza (Two Worlds Consulting), Rebecca (Two Worlds Consulting), Jorge Soler-Cruz (Two Worlds Consulting) (Two Worlds Consulting), Haylee Dlouhy (Two Worlds Consulting) (Two Worlds Consulting), Mike Setterington (Environmental Dynamics Inc.) (Environmental Dynamics Inc.) (Environmental Dynamics Inc.), Tim Bennett (Ecofor) (Ecofor), Roberta Adams (Palmer) (Palmer), Clive Mountford (Mountford Consulting), Daryl Robbins (Peer Solutions), and Cindy Dickson (Chance) (Chance). Alicia (Gwich'in Tribal Council) also joined the Project Team at the Open House event.	N/A	N/A
GTC0217	8-Dec-23	Email	Incoming	Gwich'in Tribal Council	Sharon Snowshoe (Gwich'in Tribal Council)	N/A	Sharon Snowshoe (Gwich'in Tribal Council), Kirsti Benson, Eliza Bethune (Two Worlds Consulting), Rebecca DeLorey (Two Worlds Consulting), Daryl Harrison (Two Worlds Consulting), Jorge Soler-Cruz (Two Worlds Consulting)	Traditional Knowledge and Engagement Process	Sharon (Gwich'in Tribal Council) emailed Jorge (Two Worlds Consulting) and Kristi (Gwich'in Tribal Council) and cc'd Eliza (Two Worlds Consulting), Daryl (Two Worlds Consulting), and Rebecca (Two Worlds Consulting) providing information on the process of gathering and using Gwich'in Knowledge for an assessment. The process includes the developer signing a research agreement, conducting primary and secondary research as needed, and interviews with land users. Sharon (Gwich'in Tribal Council) stated that engagement with the Department of Culture and Heritage did not constitute gathering Gwich'in Traditional Knowledge and land use information.	Kristi B. to review and sign consent form.	20231215-GTC0219A
GTC0218	15-Dec-23	Email	Outgoing	Gwich'in Tribal Council	Kevin Simpson (Two Worlds Consulting)	Greg Charlie (Chance), Richard Wyman (Chance), Cindy Dickson (Chance)	Alicia McRae, Kanda Gnama (Gwich'in Tribal Council), Peter Csisai, Kevin Simpson (Two Worlds Consulting), Eliza Bethune (Two Worlds Consulting), Jorge Soler-Cruz (Two Worlds Consulting)	Secondary Traditional Knowledge Source Review Request	Kevin (Two Worlds Consulting) emailed Alicia (Gwich'in Tribal Council) and Kanda (Gwich'in Tribal Council) and cc'd Peter (Gwich'in Tribal Council), Greg (Chance), Cindy (Chance), Eliza (Two Worlds Consulting), and Jorge (Two Worlds Consulting), asking if either Alicia (Gwich'in Tribal Council) or Kanda (Gwich'in Tribal Council) had reviewed the list of publicly available Traditional Knowledge sources for Gwich'in Tribal Council, and noted that Gwich'in Tribal Council would have the opportunity to make sure the information is characterized once the Project Proposal was drafted.	N/A	20240104-GTC0221A 20240104-GTC0221B 20240104-GTC0221C 20240104-GTC0221D
GTC0219	15-Dec-23	Email	Outgoing	Gwich'in Tribal Council	Jorge Soler-Cruz (Two Worlds Consulting)	N/A	Sharon Snowshoe (Gwich'in Tribal Council), Kirsti Benson, Alicia McRae, Kanda Gnama (Gwich'in Tribal Council), Jorge Soler-Cruz (Two Worlds Consulting), Eliza Bethune (Two Worlds Consulting), Rebecca DeLorey (Two Worlds Consulting), Daryl Harrison (Two Worlds Consulting), Kevin Simpson (Two Worlds Consulting)	Traditional Knowledge and Engagement Process	Jorge (Two Worlds Consulting) emailed Sharon (Gwich'in Tribal Council) and Kristi (Gwich'in Tribal Council) and cc'd Alicia (Gwich'in Tribal Council), Kanda (Gwich'in Tribal Council), Daryl (Two Worlds Consulting), Eliza (Two Worlds Consulting), Rebecca (Two Worlds Consulting), and Kevin (Two Worlds Consulting) stating that Two Worlds Consulting was not collecting information for a Traditional Knowledge or Traditional Land Use study, but instead was confirming publicly available information on current socio-economic conditions in the Eagle Plains area, including current land and resource use activities of Gwich'in Participants which will be submitted to the YESAB. Jorge stated that Two Worlds Consulting was meeting monthly with staff from Gwich'in Tribal Council Land and Resource Use Department to discuss the Project, who recommended that Two Worlds Consulting contact Sharon to discuss the questions in the socio-economic information collection program, and that anyone from the Gwich'in Tribal Council Heritage Team could remove consent for use of any information once Two Worlds Consulting provides a summary of the interviews for review. Jorge stated that Two Worlds Consulting previously requested review and approval from Gwich'in Tribal Council of publicly available secondary Traditional Knowledge sources, which would be used to inform existing socio-economic conditions, potential Project-related effects, and possible mitigation or enhancement measures. Jorge asked Kristi (Gwich'in Tribal Council) to sign the consent form.	N/A	N/A

1.0 INTRODUCTION

Chance Oil and Gas Limited (Chance) is proposing to conduct routine maintenance on eight of its suspended wells near Eagle Plains, Yukon (the "Project"). Government of Yukon, Oil and Gas Branch (the "Regulator"), has notified Chance that well maintenance is required in order to maintain the suspended well status on four of the wells: NCY McParlon A-25, NCY Ehnjuu Choo B-73, NCY East Chance E-78 and NCY West Chance H-28. Wells Canoe River Chance J-19, Socony Mobil WM Blackie No 1 M-59, Socony Mobil WM Chance YT No 1 YT G-08, and Western Minerals Chance YT No 1 M-08 will also undergo maintenance work. A suspended well is considered a well that is not producing and has been safely secured. With a well in suspension, there is potential to restart production later. This differs from well abandonment where the well is permanently shut down, plugged, the well head is removed and is considered safe and secure by regulators (CAPP, 2019). Well maintenance activities, also known as well workovers, include the following activities:

- Pressure testing to confirm integrity of the casing and well head valves;
- Removal of equipment in the well bores such as tubing and plugs;
- Wireline investigations to measure temperatures and cement integrity and to convey any perforating equipment; and
- Remedial work such as cement squeezes and possible well abandonment.

To facilitate movement of maintenance equipment and crews to the well sites, the project will require re-establishment of the Chance and Blackie winter roads.

The proposal is being submitted to the Yukon Environmental and Socio-economic Assessment Board (YESAB) for an assessment under the *Yukon Environmental and Socio-economic Act* (YESAA). This is required in order to obtain the necessary permits and authorizations to perform the work.

1.1 Proponent Contact Information

The Project proponent for the assessment under the *Yukon Environmental and Socio-economic Assessment Act* (YESAA) is Chance Oil and Gas Ltd. The Proponent has retained Hemmera to prepare and submit the Project Proposal to the DO office in Dawson.

The Proponent contact information is:

Greg Charlie, Vice President
Chance Oil and Gas Ltd.
Suite 202, 208 Main Street
Whitehorse, Yukon, Y1A 2A9
Email: gcharlie@chanceyukon.ca

The Agent contact information is:

Hemmera Envirochem Inc.
Andrew MacPhail, Project Manager
230 - 2237 2nd Avenue

Whitehorse, Y1A 0K7 Yukon
Email: andrew.macphail@hemmera.com

The preferred method of communication for the Proponent and Agent is via email. The Agent authorization form has been submitted to the Designated Office as part of the Project Proposal documents.

1.2 Location

The Project is located 30 to 70 km south of Eagle Plains Hotel, in northeast Yukon (**Figure 1.1**). The exploration wells requiring maintenance are detailed in **Table 2.1** and **Figure 1.2**.

Seven of the wells are located in the upper reaches of the Porcupine River watershed on the west side of the Dempster Highway and one is located in the upper reaches of the Peel River watershed on the east side of the Dempster Highway. The nearest watercourse of the wells located in the Porcupine watershed are McParlon Creek which has two tributaries framing the south and western sides of the Chance Significant Discovery License and Ehnjuu Choo Creek. The watercourse nearest the Blackie M-59 well is Dalgleish Creek which flows into the Ogilvie River. There are no water bodies (i.e., lakes or ponds) in the area of proposed activity.

The Dempster Highway transects the area of proposed activity and provides the all season access to the Blackie winter road, the Chance winter road, and the suspended wells at McParlon A-25 and Ehnjuu Choo B-73 which are located immediately adjacent to the Dempster Highway. The nearest outpost is the Eagle Plains Hotel and Highway Maintenance Base which is located approximately 30 to 70 km north of the locations where the workovers are planned to occur. (**Figure 1.2**)

The latitude and longitude coordinates for the proposed Project are:

NW:	66.20808719	(lat/northing)	-137.6280058	(long/easting)
NE:	66.21832565	(lat/northing)	-136.9320243	(long/easting)
SW:	65.96218433	(lat/northing)	-137.6037058	(long/easting)
SE:	65.97269282	(lat/northing)	-136.9164459	(long/easting)

1.2.1 First Nations

The proposed Project is located in the following First Nations and Indigenous groups' traditional territories (**Figure**):

- First Nation of Na-Cho Nyäk Dun (FNNND)
- Gwich'in Gwich'in Tribal Council (GTC)
- Vuntut Gwitchin First Nation (VGFN)

The proposed Project area is north of the Tr'ondëk Hwëch'in First Nation Traditional Territory and Settlement Land. The Traditional Territories and Settlement Land blocks in the vicinity of the Project are detailed on **Figure 1.1**.

1.2.2 Yukon Environmental and Socio-Economic Assessment Act (YESAA) Triggers

The proposed Project requires an evaluation by a Yukon Environmental and Socio-economic Assessment Board (YESAB) Designated Office (DO) because:

1. The project location is in the Yukon;
2. Schedule 1, Part 3, Oil and Natural Gas, Item 2:
    a. *On other than an Indian reserve, drilling, operation, modification, decommissioning or abandonment of, or other activity in relation to, an oil or natural gas well or seismic shot hole, but not including a hole drilled to obtain geological information.*
3. Schedule 1, Part 13, Miscellaneous, Item 13:
    a. On Crown land or settlement land, levelling, grading, clearing cutting or snow ploughing of a route that provides access to land for the purposes of a geophysical, geological or engineering survey.

The Project is located near Eagle Plains, Yukon and it is understood that the Dawson Designated Office will carry out the evaluation.

1.3 Permits and Licenses / Regulatory Requirements

Over the past several years Chance has operated in Eagle Plains, Yukon. The site is authorized under a suite of project approvals including:

- Type B Water Licence (MN12-061-1);
- Land Use Permits (LUP 2012-F507, LUP2012-F510);
- Oil and Gas Dispositions (0008 to 0017, 0019 and 0020, SDL-020, SDL-021, and SDL-022);
- Dempster Highway Development Authorization;
- Air Emissions Permit (60-035);
- Waste Management Permit (81-044);
- Camp Permits (Health and Social Services, Permit to Operate);
- Camp Lease with Energy Mines and Resources, Government of Yukon; and
- Various highway access and work within the right-of-way, specifically permit 1735 for camp 325.

1.4 Alternatives

The well maintenance work is mandated by the Regulator and there are no alternatives to complete the required work. There are no alternatives for winter road construction as there are already previously existing winter roads that will be re-opened and utilized (Chance and Blackie). This approach reduces the potential effects associated with constructing new access to the well sites.

2.0 PROJECT DESCRIPTION

2.1 Project Activities

This section provides an overview of the proposed Well Maintenance Program. There are two main components to the Project that include:

- Routine maintenance of suspended wells (well workover); and
- Re-establishment of the Chance winter road and Blackie winter road.

The well maintenance activities proposed are being conducted in order to satisfy a direct order from Government of Yukon, Oil and Gas Branch. Accessory activities, such as construction and re-establishment of the winter roads, is required to access the suspended well sites and complete the maintenance of each well. A letter outlining the order from the Government of Yukon, Oil and Gas Branch is provided in **Appendix A**. Locations for each of the wells is provided in **Table 2.1** and **Figure 2.1**. Location of the winter roads are also provided in **Figure 2.1**.

2.2 Well Maintenance

The following section describes the work proposed at each of the wells. Each of the wells is deemed suspended by the Yukon Oil and Gas and Drilling Production Regulations (OGDPR) (is not producing and safely secured). Well maintenance is required to continue to meet the OGDPR suspended well status regulations. Well servicing equipment may include a service rig, wireline truck and cementing trucks along with the associated support equipment. All equipment will be mobilized to each of the wells on a sequential basis (one at a time) to complete the required maintenance work (downhole suspension, wellbore fluid replacement, replace substandard equipment). The eight wells that require maintenance include:

- Socony Mobil WM Blackie No 1 M-59 (M-59);
- Western Minerals Chance YT No 1 M-08 (M-08);
- Canoe River Chance YT J-19 (J-19);
- Socony Mobil WM Chance YT No 1 YT G-08 (G-08);
- NCY McParlon A-25 (A-25);
- NCY Ehnjuu Choo B-73 (B-73);
- NCY West Chance H-28 (H-28); and
- NCY East Chance E-78 (E-78).

A description of the planned activities at each well is summarized in the following sections.

Table 2.1: Well Locations

Well Name	Location	
	Latitude	Longitude

2.2.1.1 Socony Mobil WM Blackie No 1 YT M-59, Western Minerals Chance YT No 1 M-08, Canoe River Chance YT J-19, and Socony Mobil WM Chance YT No 1 YT G-08

A pressure test is conducted to ensure the integrity of the wellhead and the existing casing in the wellbore. The well will then undergo surface casing vent flow and gas migration testing. Surface casing vent flow (SCVF) is a condition where fluid or gas is flowing from the surface casing vent assembly. A well that has a leak, or a well integrity problem may exhibit signs of SCVF. Gas migration tests are conducted to determine if the well has a gas migration problem. For the purpose of this test, gas migration can be defined as the movement of gas from a subsurface zone to surface through a barrier that should prevent its movement, whether this barrier is natural (overburden, shale) or artificial (cement sheath, external casing packed, pipe joints etc.). It should be noted that during annual inspections, no SCVF has ever been detected.

Once the pressure testing, surface casing vent flow testing and gas migration testing is complete, the service rig, support equipment and wireline will be moved to the wellsite. A blowout preventer (BOP) will be installed on the well. Blowout preventers are specialized pressure-control equipment attached to the wellhead to seal, control and monitor oil and gas wells to prevent the uncontrolled release of crude oil or natural gas while operations are occurring on the well. A temperature log will then be conducted to a depth of 300 meters below Kelly bushing (mKB). The temperature log is interpreted by looking for anomalies, or departures, from the reference gradient. This reference gradient might be the geothermal gradient, a log recorded before production or started, or a log recorded with the well shut in. Most anomalies are related to the entry of fluids into the borehole or fluid exit into the formation. Following the temperature log, a cement bond log will be run. The cement log is a log that uses the variations in amplitude of an acoustic signal travelling down the casing wall between a transmitter and receiver to determine the quality of cement bond on the exterior casing wall. The fundamental principal is that the acoustic signal will be more attenuated in the presence of cement than if the casings were uncemented. The cement log is used to identify sections of the well bore that will need interventions to isolate porous formations from adjacent formations.

To isolate a formation from an adjacent formation, the casing will be perforated at the appropriate depth with a wireline conveyed perforating gun. Tubing will then be used to inject cement through the perforations in sufficient quantity to ensure adjacent formations are isolated from each other, at which point pressure will be applied from surface to force the cement into the perforations. Once the cement has cured, the cement will be pressure tested as per the Yukon Oil and Gas and Drilling Production Regulations. The process is then repeated until all formations are isolated from one another and pressure tested. The isolation operations will begin with the deepest non-isolated formation and progress to the shallowest non-isolated formation. Once all the testing/isolation procedures are complete, the tubing will be pulled from the well, a new well head assembly will be installed, and the well head will be pressure tested once more. The service rig and all support equipment will then be removed from the site.

Additional activities at M-59 include installation of a wellhead that conforms to the OGDPR regulation. In addition, for G-08 and J-19, the tubing and packer will be removed during the workover following completion of gas migration testing and temperature log will not be conducted.

2.2.1.2 NCY McParlon A-25, NCY Ehnjuu Choo B-73, NCY West Chance H-28, and NCY East Chance E-78

A pressure test is conducted to ensure the integrity of the wellhead and the existing casing in the wellbore. The well will then undergo surface casing vent flow and gas migration testing. SCVF is a condition where fluid or gas is flowing from the surface casing vent assembly. A well that has a leak, or a well integrity problem may exhibit signs of SCVF. Gas migration tests are conducted to determine if the well has a gas migration problem. For the purpose of this test, gas migration can be defined as the movement of gas from a subsurface zone to surface through a barrier that should prevent its movement, whether this barrier is natural (overburden, shale) or artificial (cement sheath, external casing packed, pipe joints etc.). It should be noted that during annual inspections, no SCVF has ever been detected on any of the wells.

A temperature log will then be conducted to a depth of 300 meters below Kelly bushing (mKB). The temperature log is interpreted by looking for anomalies, or departures, from the reference gradient. This reference gradient might be the geothermal gradient, a log recorded before production or started, or a log recorded with the well shut in. Most anomalies are related to the entry of fluids into the borehole or fluid exit into the formation. Following the temperature log, a cement bond log will be run. The cement log is a log that uses the variations in amplitude of an acoustic signal travelling down the casing wall between a transmitter and receiver to determine of the quality of cement bond on the exterior casing wall. The fundamental principal is that the acoustic signal will be more attenuated in the presence of cement than if the casings were uncemented. The cement log is used to identify sections of the well bore that will need to be hydraulically isolated.

The wellbore fluid will be sampled and tested to determine if the fluid meets the OGDPR regulations. After the wellbore fluid is tested and if necessary, a service rig may be moved in to replace the well fluid to conform to the Yukon Oil and Gas and Drilling Production Regulations 99(a) and 99(b). A wellbore fluid test is a test or series of tests, performed to check that no undesirable reactions occur with a specific fluid. The testing process may include checks for compatibility with other treating fluids, wellbore fluids, reservoir fluids, and the reservoir formation. No other activities are anticipated at these wells.

2.2.1.3 Equipment

Equipment required for well maintenance is described below in **Table 2.2**. Equipment will be stored on site mainly on trucks and flatbed trailers. Some items such as the boiler and cement tanks will be placed on the ground on skids.

Table 2.2: Equipment required

Component	Description
Boilers	Used extensively in very cold and Arctic climates for preventing equipment and fluids from freezing.
Light Towers	Light towers will be required on the wellsites as the operations will run 24 hours a day
Construction Equipment	Challenger cats, D6 cats, snow cats, graders, snow making equipment, water trucks and drags will be utilized during the initial phase of the project to prepare the roads and well pads for the operations
Light trucks	Pickup trucks will be used for transportation of work crews, fuel and other supplies.

Component	Description
Vacuum truck	Used for removal and transportation of wastewater and sewage from the medic/first aid traler for disposal.
Cement	Cement storage and mixing for use in wells.
Medic / Office Trailers	Essential personnel trailers which serve as offices. All office trailers will have self-contained sewage storage and sewage will be moved periodically to the sewage lagoon at the Chance camp at Km 324
Flare Tank and Flare	Flare used to burn combustible gas from the well. The flare tank is a reservoir to ensure the flare does not starve of combustible gases.
Fuel Storage	Fuel for use for equipment including service rig, pumps, generators, etc. Bulk fuel will be staged at the Chance camp at Km 324 and daily needs will be distributed via pickup trucks with slip tanks during crew changes.
Garbage and Incinerator	Storage area for waste and incinerator to dispose of food waste.
General Storage	Storage and laydown area for equipment needed on site.
Main Workover Fluid Storage	Location where all the fluid additive materials are stored. Normally these materials are delivered on pallets neatly stacked and shrink wrapped to protect them during the truck journey north.
Tubing Storage	Tubing will be stored on location until required to be run in the hole.
Cement Bins	Large tanks, normally upright, fully enclosed and pressurized, where cement products are stored. Cement is pneumatically pumped from the tank into the cementing unit.
Pumps	Pumps used to circulate the fluid down the pipe, around and up the annular space between the pipe and the casing to surface.
Service Rig Structure	Components required to service the well, including: • Sub-structure, or base, to which the derrick (i.e. framework to support drilling apparatus) is fixed • Derrick that supports the draw works and handling equipment • Draw works that lifts and lowers the handling equipment in the derrick/mast to run pipe in and out of the hole • Blowout preventers, which are pressure control equipment that can hydraulically shut in a well in the event of unplanned influxes of formation fluids into the wellbore
Water Storage and Water Treatment	Water storage tank and treatment containers to provide potable water for the rig crew and personnel.

2.2.2 Winter Road Construction

2.2.2.1 Site Access

By road, the Project is accessed via the Dempster Highway. The majority of highway traffic comes from the south bringing supplies and personnel from Whitehorse, YT; however, some traffic comes from the north (Fort MacPherson and Inuvik, NWT).

Wells H-28, J-19, M-08, G-08 and H-28 will be accessed by re-establishing the Chance winter road. Wells A-25 and B-73 are located immediately adjacent to the highway, and already have access routes with rig matting in place. Well M-59 will require the construction of the new Blackie winter road. The Blackie winter road is approximately 6.5 km in length and approximately 8-10 m in width. The Chance winter road is 25

km long and 8-10 m in width (**Figure 2.1**). The total surface area of the both the Chance winter road and Blackie winter road is 1,875 m^2.

2.2.2.2 Winter Road Construction Methods

Winter road construction will utilize similar techniques as previously applied by Chance in previous assessments (YESAB # 2006-0237, 2006-0285, 2007-0219, 2008-0047 and 2012-0140). Before any winter road construction will proceed, a minimum snow depth of 10 cm will be verified to ensure there is sufficient snow cover to protect the ground surface from tires or tracks of vehicles. To promote snow compaction in the early winter, the Chance winter road and Blackie winter road will be driven with snowmobiles and snowcats in late fall/early winter. Upon construction, if the snow depth (minimum of 10 cm) is not sufficient in certain areas, additional snow will be trucked in to fill those areas. This helps to ensure adequate protection to surface vegetation and duff. In the event this is required, snow will be removed from appropriate locations in the immediate vicinity of the winter road (i.e. surrounding area that has ample snow coverage) and added to the snowpack of the winter road.

Once the snow depth is adequate (i.e. 10 cm or greater in depth without compaction), vegetation along the routes will be cleared using a bulldozer and mulcher. The bulldozer blade will be raised off the ground such that it does not cut the tops of hummocks, tussocks or high spots. The vegetation removed will be mulched with a track mounted mulcher and distributed on the road. The mulch helps keeps the soil in place while protecting the root system of ground-cover plants and natural grasses. Any trees or large brush encountered will be broken at the ground surface to avoid tearing the surface organic layer thereby reducing the chance of thawing ice-rich mineral soil beneath. The likelihood of large trees or brush is low on the Chance winter as the road was last used in April 2014. Where it is safe and practical, standing live or dead trees along the route that provide wildlife habitat will be saved.

Following vegetation removal, the surface of the road will be constructed using accumulated snow to construct berms on the road margins and filling the space at the roads edge with snow and water trucked from approved sources. A combination of snowcats and bulldozers using drags will be used to push and compact the snow along the access routes. To ensure the roads ability to safely support the service rig and other heavy loads, all construction activities will be supervised by a qualified geotechnical engineer.

The same methods will be utilized to establish well sites and clear any vegetation surrounding the well site for equipment and site infrastructure. It is anticipated approximately 1,000 m^2 of vegetation will be cleared.

2.2.2.3 Water Withdrawal

Water sources will include the Eagle River and the Ogilvie River. The water will be used to make ice for the winter road(s) and will be trucked from the source to the point of use. The ice is built up along the entire length of the lease road to ensure stability. Each truckload holds approximately 30 m^3 and it is anticipated a truck can probably complete 4 to 6 deliveries per day. No more than 300 m^3 of water will be withdrawn daily. All water withdrawal will be conducted following DFO's Freshwater Intake End-of-Pipe Fish Screen Guidelines (DFO 2020).

2.2.2.1 Watercourse Crossings

The roads are designed to have as few water crossings as possible by following previously travelled trails and roads located on ridges or higher areas above to stay out of wetter lower elevation areas. All water

bodies will be treated as fish bearing and be constructed following Fisheries and Oceans Canada's (DFO) Operational Statement on Ice Bridges and Snowfill (DFO 2007).

Vegetation near or within riparian zones will be preserved to the greatest extent possible. No deleterious substances will be allowed to enter any watercourse. Machinery will be clean and inspected for leaks prior to working near a watercourse. Servicing of equipment and refueling will occur such that if a spill were to occur, it would not enter the water. Additionally, a Spill Contingency Plan (see Appendix B) and emergency spill kit will be on site and available for all work crews.

2.2.2.2 Maintenance

Maintenance of winter access routes may include low ground pressure vehicles (e.g. snowcats), a road grader equipped with a wing snow plow and some water application. Grading may be required over certain stretches and depressions along the roads filled with snow, to smooth the surface.

In the event that natural snowfall is below the minimum required depth to construct and maintain the winter roads, snow making may be used to make up the shortfall. This is a contingent consideration and could require up to 300 cubic meters (m^3) of water per day for a short period of time (a few days to a week). The sources of water include the Eagle River and the Ogilvie River. The water to be used to make snow and ice the winter road(s) will be trucked from the source to the point of use. At maximum, something between 20 and 30 truckloads per day are needed. The actual number of trucks being used will be less since a truck can probably complete 4 to 6 deliveries per day. Generally low snowpack is only an issue during the early part of winter so this provision would only apply on a contingent basis during the months of November, December and January. The timing for making artificial snow will depend on how late in the winter season winter road construction begins. If, for example, in late December there is little or no snowfall or snow accumulation on the ground, snow making could ensure a sufficient snow base to commence winter road construction. Snow can only be made when the ambient temperature drops to zero degrees centigrade.

2.2.2.3 Equipment

Equipment will be required for clearing, grading, water transport, and material transport. Light equipment for personnel, fuel and other supply transport will be required periodically during construction and well maintenance.

It is anticipated that Challenger cats, D6 cats, snow cats, graders, snow making equipment, water trucks and drags will be the primary construction equipment. Pickup trucks will be used for transportation of work crews, fuel and other supplies. Water trucks will be used for transport of water from the Eagle River and the Ogilvie River to the Project. Flatbed trailers would be used to transport equipment and larger supplies.

2.2.3 Access Control

Chance understands that increased winter access into the area is of significant concern to VGFN, local residents, trappers and outfitters. As the envisioned winter road will connect to the public road network, gates will be placed that will restrict access to the road. Gates will be constructed of heavy materials and located such that there are obstacles on either side as much as possible (i.e. heavy forest) to restrict vehicle access.

2.2.4 Anticipated Road Use

The majority of the traffic volumes include mobilizing the service rig and site infrastructure, the setup of the service rig will take approximately one day to complete at each well site. A total of eleven flatbed truck loads will be required to mobilize equipment into each well site. Once a site is established (i.e. maintenance equipment set up), traffic will include approximately 1-2 pickup trucks (for supplies and personnel), 1 water truck and one fuel truck. The fuel and water trucks will come to the project site approximately every three days or as demand dictates.

All vehicles will be equipped with radio communication and any traffic on the roads will be radio controlled. Unauthorized vehicles will not be allowed on the winter roads and the roads will be restricted from public access.

2.2.5 Reclamation

The Project proposes to construct up to 6.5 km of winter road to one existing well site (M-59), and re-open (i.e. clear existing vegetation to allow for winter road construction) the Chance Access Road for J-19, M-08, G-08 and H-28. Wells A-25, E-78 and B-73 are located immediately adjacent to the highway, and already have access routes with rig matting in place.

Reclamation activities will aim to return the site as closely as possible to its pre-project condition. These activities are intended to effectively:

- Leave the site clean following project completion;
- Remove all garbage, petroleum products, and equipment; and
- Prevent long-term erosion/slumping and promote successful revegetation of disturbed areas.

As discussed in **Section 2.1.3**, access to each of the roads will be restricted during operations and following the completion of the proposed activities. This will ensure that the road can fully melt, without any potential for more disturbance from outside users.

2.2.6 Camp Facilities

The Eagle Plains Hotel, located at kilometer 371 of the Dempster Highway, has been operating since the late 1970's and provides a variety of services including hotel facilities, accommodations (64 people during peak use), restaurant, lounge, public washroom, laundromat and service garage. The hotel is a recognized tourist destination and provides support services to the Government of Yukon, Department of Highways and Public Works, Eagle Plains Maintenance Camp. The hotel will serve as accommodations for up to 36 Chance staff from December to April of 2021. It is anticipated ten people will always be on site, with up to 17 at any one time (including personnel on standby at the hotel) and up to 25 during rig mobilization. The hotel is located approximately 44 km north of the previously established camp and airstrip (YOR 2013-0067-099-1). Using the lodge as accommodation during the Project will lead to an additional three to four vehicles on the Dempster Highway per day. It is anticipated both emergency airstrips located at about KM 325, adjacent to Chance's camp (Figure 1-2) and KM 389 north of Eagle Plains for a small number of crew changes during the program. Two to four shift changes are anticipated over the duration of the project.

A small medic/first aid trailer equipped with a heater may be installed at the wellsite being where work over operations are occurring to provide refuge for workers and essential first aid supplies. Sewer facilities and

water will be available in the trailer. All wastewater and sewage will be collected in tanks and transported offsite for disposal in the approved sewage lagoon at the Chances camp.

2.2.7 Fuel Storage

A Spill Contingency Plan has been developed and is provided in Appendix B. The plan outlines the procedures to be followed in the event of a petroleum product spill during all phases of the project. Safety procedures for personnel and proper equipment usage during such operations are discussed in this plan

Fuel will be stored in portable tanks (i.e. slip tanks) and tanker trucks and will not exceed 8000 litres in aggregate. Fuel storage will only occur during periods necessary for the road construction and well maintenance and will be removed upon completion. All fuel caches will be located a minimum of 60 m from the high water mark of any nearby watercourse.

Fuel will be transported in tidy tanks or by tanker truck, as required. A fuel spill contingency plan will be posted at all storage areas and fueling stations.

2.2.8 Waste Management

All garbage and recyclable materials will be taken off site and disposed of at a licensed disposal facility.

Once all the testing/isolation procedures are complete, the tubing will be pulled from the J-19 and G-08 wells. If it is deemed that it is still usable, it will be stored at Chance's camp and if not, it will be transported to approved disposal facilities in Yukon, Alberta or British Columbia. Cement waste and wastewater will be collected and transported to an approved disposal facility.

2.3 Project Schedule / Temporal Scope of Activities

Construction of the winter roads and well maintenance is anticipated to occur during the winter of 2020/2021. Initial site visits would occur in late November or early December of 2020, timed to meeting the minimum snowpack, to pack the access routes with snowmobiles. Winter road construction is anticipated to occur in late December to February. Well maintenance activities are anticipated to take approximately up to 70 days to complete the work at all eight wells. It is anticipated that well maintenance activities will commence in February and be completed by mid-April.

APPENDIX 2-B-46. *Eagle Plains Environmental Studies 2018*

Eagle Plains Environmental Studies 2018

Chance Oil & Gas is conducting environmental studies in summer 2019 to collect data on fish, water, permafrost, vegetation and wildlife to support its proposal to conduct exploration activities in the Eagle Plains project area. Chance welcomes participation of local First Nation citizens and traditional knowledge holders in these programs.

All projects will require varying degrees of hiking in steep, rugged terrain and thick bush under production-oriented work conditions. Participants will require average to above average fitness to participate in the work, depending on the survey.

Chance regrets that opportunities for participation in the field studies are limited due to safety and logistical considerations, and all interested citizens may not be able to participate. The logistics of participation in the studies are still being finalized, however, there will be approximately spots for two participants from each First Nation with Traditional Territory overlapping the project area. Travel to and from Eagle Plains Hotel will need to be coordinated by each First Nation.

In addition to these field programs, Chance will be holding a number of community meetings, to provide an opportunity for First Nation citizens, who cannot participate in the field programs to be able to comment on the proposed program.

Access to all work sites will primarily be by helicopter out of Eagle Plains. A small number of sites will be accessed off the Dempster Highway.

A short description of each survey is provided, below.

Bird Surveys

Bird surveys will follow standard 'point count' methods that involve recording all the birds the observers hear and see from an observation station during a 10-minute survey period. Stations are located 500-1500 m apart and are accessed via hiking. This work is very production oriented in order to meet sample size requirements during the relatively short 'dawn chorus' when birds are singing and requires above average fitness to hike quickly between stations. Total hiking distance of 5-10 km per day through rugged terrain and thick bush will be required. The daily work shift is 2:30 am to noon. Participants should have a set of binoculars to get the most out of the survey, but they are not absolutely required.

Vegetation Surveys

Vegetation surveys are being conducted to verify ecosystem/habitat maps and to survey for rare plants. Work will be split over 2 shifts. The daily shift in round 1 will be from 4am to 3pm, to coordinate helicopter use with bird surveys. The shift during the second round is a more civilized 7am-6pm. The work will consist of 15-45-minute vegetation plots where the surveyors record plant occurrences, site conditions, and wildlife sign and habitat. Successive plots will be accessed by a combination of hiking and heli bumps. Participants will need to hike 3-6 km per day through rugged terrain and thick bush, requiring average fitness. No special gear is required.

Seismic Line Study

The purpose of the seismic line study is to document the degree of vegetation regeneration on old lines from past exploration programs 1950-2000's and to characterize the characteristics of new lines (i.e. from 2014) and how they may affect wildlife. The details of survey methodology are still being developed but will likely consist of ~15 minute vegetation plots at multiple spots along different seismic lines. Successive plots will be accessed by a combination of hiking and heli bumps. Participants will need to hike 3-6 km per day through rugged terrain and thick bush, requiring average fitness. No special gear is required.

Aquatic Surveys

Fish and water surveys are being conducted to improve knowledge of fish distribution and water conditions across the proposed project area. Surveys at each site will include electrofishing, stream site descriptions, and water sampling. Each site will take 45-90-minutes to complete. Access to most sites will be via helicopter with a relatively short walk to the stream (i.e. <300m). However, some sites may require hikes of up to 1km to get into.

Chest waders are required to participate in the fish and water surveys.

Required Field Gear for all projects includes:

- Sturdy hiking boots (second pair for when the first get wet is recommended)
- Rain gear
- Appropriate layers of clothes
- Personal first aid/survival kit
- Bug hat/insect repellent
- Hat
- Backpack or cruisers vest
- Bear spray (*Note that EDI does not permit firearms to be carried in the field or brought to a work site).

APPENDIX 2-B-47. DFO License Application Notice Letter

Chance Oil and Gas Limited
Suite 1000, 340 – 12th Avenue SW
Calgary, AB T2R 1L5
T: 587.390.4136

June 14, 2019

Gwich'in Tribal Council
1-3 Council Crescent, Box 1509
Inuvik, Northwest Territories X0E 0T0

Attention: David MacMartin, Director, Intergovernmental Relations

Dear David MacMartin,

Re: DFO License Application Notice

The purpose of this letter is to provide notice to Gwich'in Partners of the intention of Environmental Dynamics Inc. (EDI) to submit an Application for a *License to Fish for Scientific, Experimental, Education, or Public Display Purposes, Under Section 52 of the Fishery (General) Regulations.* Chance Oil and Gas Limited (Chance) has contracted EDI to perform fish studies, among other environmental studies, within the project area described in the Draft Project Description delivered to Gwich'in Partners on June 7, 2019.

The fish studies are scheduled to take place from July 1, 2019 to July 10, 2019 pending approval of the DFO license. Please see attached for EDI's application and list of watersheds and species for the permit.

If any questions should arise regarding the license application or EDI's field work, please contact Emily Mann at Hemmera and she will coordinate a reply.

Sincerely,

Greg Charlie
Vice President Government and Community Relations

APPLICATION FOR A LICENCE TO FISH FOR SCIENTIFIC, EXPERIMENTAL, EDUCATIONAL or PUBLIC DISPLAY PURPOSES, UNDER SECTION 52 OF THE FISHERY (GENERAL) REGULATIONS *(Yukon /Transboundary Rivers Area)*

(Check one)
- ☐ SCIENTIFIC PURPOSES *
- ☐ EXPERIMENTAL PURPOSES**
- ☐ EDUCATIONAL PURPOSES***
- ☐ PUBLIC DISPLAY PURPOSES****

(see footnote for descriptions)

(Check one, and provide the additional info if required)
- ☒ New Application
- ☐ Renewal of previous year's licence — Previous Licence #:
- ☐ Amendment to a current licence — Current Licence #:

Yes ☐ No ☒ Do you have an Animal-Use protocol approved by a CCAC-accredited animal care committee? *(http://www.ccac.ca/en_/standards/guidelines)*

1. Please briefly describe the purpose of your application request. If this is an amendment to a previous license, briefly describe the requested changes to the original license.

The Chance Oil and Gas Project Area covers approximately 2,500 km^2 and includes 1,467 streams. Very little fisheries data exists for the proposed Project Area, with the most recent (limited) sampling occurring in 2001. EDI Environmental Dynamics Inc. proposes to conduct fish sampling on streams from each order throughout the Project Area. Fish sampling will mostly be conducted using electrofishing methods, with beach seining where necessary on 4th or 5th order streams. Electrofishing effort will be approximately 100-300 meters and for a minimum of 400 seconds in order to adequately sample each site. The length of stream sampled will be proportional to the stream width (i.e., narrow creeks will be sampled for longer distance than wide creeks). Sites will be sampled a minimum of 100 m upstream from the nearest confluence. The planned target of sites is 50, with an allowance up to 100.

2. Indicate the desired start and end date for the requested licence/permit. (Licence/permits may only be issued for up to one year.)

Start Date: 2019-07-01 End Date: 2019-10-01

Details (Specify sampling periods, if applicable): *Sampling is intended to begin in mid-July, but may require subsequent sampling.*

3. Applicant Information:

Legal Name of Applicant: Petra Szekeres Date of Birth: 1990-07-24

Organization or School: EDI Environmental Dynamics Inc.

Street Address/Unit#: 2195 Second Avenue City: Whitehorse

Province/Territory: Yukon Postal Code: Y1A 3T8

Phone: (867) 393-4882 Fax: Email: pszekeres@edynamics.com

Cell:

List individuals that will be assisting with the activity, DOB is required. *(Attach additional page if needed)*

	Legal Name	Date of Birth (YY/MM/DD)		Legal Name	Date of Birth (YY/MM/DD)
1)	Jonathan Lowey	90/12/07	6)	Scott Cavasin	86/09/05
2)	Dawn Hansen	88/10/11	7)	Ben Schonewille	82/07/14
3)	Joel MacFabe	85/09/17	8)		
4)	Annina Altherr	94/10/20	9)		
5)	Pat Tobler	72/08/24	10)		

4. SAMPLING PROGRAM - METHODS/LOCATION/SPECIES/DETAILS/OBJECTIVE etc..

Details of where the sampling is to occur, and the gear being used (*Provide detailed information including when, where, and how much sampling will occur)*

Name of River/Stream/Lake/Creek *(use a separate line for each waterbody)* **Watershed codes:** *search http://cmnmaps.ca/fiss_yukon/*	Detail of each sampling method *(ie. #trap nights, electrofishing seconds, # and duration of net sets, mesh size, etc. per sampling site etc. Also specify details of multiple sampling periods if applicable)*
See attached.	

Include species and life stage. Specify planned upper limit of sample size, maximum number and species of specimens that will be retained (if any). (Details not provided in specified fields, to be completed in "Additional Details" below.)

Species *(attach additional page if needed)*	Life stage	# of Fish Sampled	# of Fish Retained	# Estimates of Mortalities	Specify location of all mortalities and/or # retained
Arctic grayling	subadult/adult	200	0	5	
Arctic grayling	juvenile	200	0	10	
Slimy sculpin	subadult/adult	200	15	25	5 Peel w/s, 5 Bell w/s, 5 Whitestone w/s
Round whitefish	subadult/adult	100	0	10	
Lake whitefish	subadult/adult	100	0	10	
Longnose sucker	subadult/adult	100	0	10	

Details (Explain the purpose of retaining mortalities and/or lethal samples):	For the 15 retained slimy sculpin, the purpose is to provide DNA samples (fin clips) for the University of Montana to identify additional potential conservation units (subspecies, species) for a North America wide project. These individuals will ideally be chosen from any incidental mortalities and will only be retained in the event of no incidental mortalities. If there are any incidental mortalities of other species they will also have fin clips submitted to support this initiative.

Additional details (attach additional page if needed).

Include as much detail as possible including your research activities, methods of collection provide details, disposition of the specimens details of regarding release methods and location, and precautions that will be taken to avoid fish mortality. Provide information on handling of non target species if appropriate. etc..

Sites will be chosen to cover the spatial extent of the Project Area to provide a general understanding of fish distribution in different ordered streams. Each stream site will have a Site Card completed as well as fish sampling and in-situ water quality will be taken. Fish sampling will mostly be conducted using electrofishing methods, with beach seining where necessary on 4th or 5th order streams. Electrofishing effort will be approximately 100-300 meters and for a minimum of 400 seconds in order to adequately sample each site. The length of stream sampled will be proportional to the stream width. Sites will be sampled a minimum of 100 m upstream from the nearest confluence. In-situ water quality will be taken at each site, which includes the collection of temperature (degrees Celsius), pH, dissolved oxygen (mg and %), and specific conductivity (µS/cm). All fish captured will be identified to species and enumerated; up to 10 individuals from each species caught will be measured at each site before being returned to the water. Handling and air exposure will be kept to a minimum for all fish.

Footnotes:
* Scientific Purposes includes: Salvage (for fish collection associated with in-stream works etc.); Environmental Impact assessment (pre and/or post development project monitoring); Inventory (species abundance and distribution and/or presence/absence study)
** Experimental Purposes: Research (i.e.. fish collection as part of a experimental procedure, or research to determine how fish populations respond to habitat manipulations)
*** Educational Purposes: Training
**** Public Display Purposes: Samples for display purpose

Applications are to be submitted to:

PRIVACY NOTICE STATEMENT
The information you provide on this form is collected under the authority of the Fishery General Regulations for the purpose of issuing a licence for scientific, experimental, educational or public display purposes. The information may be used for program planning or management, reporting, audit, administration purposes or disclosed to other government departments or agencies, within other divisions or branches of the institution, with provincial, territorial or foreign government or First Nation organizations as applicable. Failure to provide this personal information may result in your licence being denied. You have the right to the correction of, access to, and protection of, your personal information under the Privacy Act and to file a complaint with the Privacy Commissioner of Canada over DFO's handling of your information. Personal information collected through the processing of your application is described in DFO Personal Information Banks and can be accessed and assessed for accuracy. For more information visit Info Source www.infosource.gc.ca.

5. RELATED LINKS INFORMATION ETC

Collection Period: Sensitive timing periods in aquatic environments in Yukon and transboundary waters can be found at: http://www.dfo-mpo.gc.ca/pnw-ppe/timing-periodes/index-eng.html. If you plan to sample using instream methods during sensitive periods, we suggest you describe means by which you will mitigate any negative effects.

Transfer or Transplant of Live fish/eggs/milt: Any transfer of live fish into fish habitat and transfer of live fish to a fish rearing facility, requires a permit from the Federal/Provincial/Territorial Introductions and Transfers Committee. Applications and contacts can be found at:
BC - http://www.pac.dfo-mpo.gc.ca/aquaculture/licence-permis/intro-trans/process-processus-eng.html
Yukon – http://www.pac.dfo-mpo.gc.ca/yukon/trans-eng.html

Species At Risk: Research into any species listed in the Species At Risk Act (SARA) requires a permit issued under SARA. Application forms can be found at: http://www.dfo-mpo.gc.ca/species-especes/permits-permis/permits-eng.htm

Canadian Council on Animal Care (CCAC): DFO is a member of the Canadian Council on Animal Care (CCAC) and has committed at the Ministerial level to follow the entire CCAC program in Departmental activities in research, teaching and testing with vertebrate animals. Nearly all universities and colleges in Canada follow this program as well. It is expected that if DFO financial or human resources are involved in the work under this requested licence, or if the applicant is based at an institution having a CCAC-accredited Animal Care Committee, then evidence of an approved Animal Use Protocol (AUP) will be submitted with this application, and CCAC guidelines will be adhered to in any work with live vertebrates. The issuing authority for this licence accepts the CCAC's exemptions for certain animal-use activities as not requiring an approved AUP. More information about the CCAC program is at *www.ccac.ca.*

Note: - Use of carbon dioxide/CO2 (e.g. Alka-Seltzer tablets) to immobilize fish for sampling should not be done without a continuous supply of oxygen, with levels of both gases monitored and regulated.
- Clove-oil products are not regulator-approved in Canada, as a fish anaesthetic.

Aquatic Invasive Species: To prevent the introduction of aquatic invasive species there are a few simple things that can be considered:
a) Before leaving an area: Drain water from boat, trailer and gear, remove all plant parts and mud and.
b) before entering another water body: Wash all your gear including waders with soapy water.
For Further Information:

To: [redacted]@gwichin.nt.ca
Cc: Richard Wyman [redacted]@chanceyukon.ca>
Subject: Geological Mapping program Consultation

H[redacted],

Hope all going well this spring! We are required to consult under the geoscience licence guideline to inform TGC that we are planning a field work from July 10th – 24th, 2019. We will based out of Eagle Plains Lodge with helicopter. The following is basic geological mapping operation we will perform in Eagle Plains Basin;

We will be flying to remote outcrop locations through out the Eagle Plains Basin to extract rock sample with geological hammer. There will be no mechanical tools used in this field work.

Please let me know if you have any questions or comments and can be reach by telephone or email.

We look forward to your response.

To Whom It May Concern,

Re: Eagle Plains Multi-Well Exploration Program - Northern Cross (Yukon) Ltd.

We have reviewed the above application against our heritage databases, and we have the following concerns.

1. There has been no Traditional Use/Traditional Knowledge study conducted, to the knowledge of the GSCI, with the Gwich'in participants who use this area or have knowledge of it. Without a traditional use study, the effects on traditional use cannot be assessed. In addition, integrating traditional and scientific knowledge into impact assessments is considered best practice, but traditional knowledge is held by land users and must be gathered in targeted studies. Traditional Use and Traditional Knowledge studies with Gwich'in participants are covered by a TK Policy (http://www.gwichin.ca/TheGwichin/traditional.html).
2. The GSCI has not been afforded the opportunity to fully review the development proposal against existing cultural and heritage data. This review would provide the proponent with more detailed information for use in planning and mitigation, and would be done at the cost of the proponent.
3. This project will contribute to climate change. Climate change is causing changes to the land (for example, retrogressive thaw slumps), the weather, and the animals upon which the Gwich'in depend for food. Climate change is affecting the ability of the Gwich'in to travel on and use the land for traditional pursuits.
4. The size of the project is of great concern to the GSCI. The high number of wells proposed, the establishment of new roads, in particular new all-season roads, are of particular concern.

5. The Porcupine caribou herd is invaluable to the Gwich'in. This herd has always been a key resource for the Teetł'it Gwich'in, and due to the decline in other herds (Bluenose-West and Cape Bathurst herds), the Porcupine herd is also of great importance to Gwich'in from other communities. The project is located within the winter range of the Porcupine caribou herd. The GSCI has concerns that the development itself will affect the caribou by changes to the land, and will also change the way harvesters are accessing the herd.
6. The GSCI is concerned about leakage into the surrounding waterways. The headwaters of several important rivers are located within or nearby the development location.
7. The GSCI is concerned about the development of an extensive network of not only temporary but permanent roads, and how this activity might affect the water and fish in the area.
8. There are a number of traditional Teetł'it Gwich'in trails which cross the development. Traditional trails are associated with an increase in archaeological sites, many of which are unrecorded. Trails also indicate traditional use – in this case, winter use for hunting and trapping.
9. The area has been recorded as being of traditional use for hunting moose, barren-ground and woodland caribou, and had Teetł'it Gwich'in traplines.
10. Wolverine, a species designated of Special Concern by COSEWIC, was a particular focus of Teetł'it Gwich'in trappers in the area, suggesting there is likely particularly good habitat for wolverines.
11. The headwaters of Tth'an Dhidlii Njik ("Bone-they are scattered around-creek," also known as Dalglish Creek) is within the development. As the name suggests, this creek is known to the Teetł'it Gwich'in to have paleontological remains.

As with any application, if archaeological or heritage materials are encountered during development within the Gwich'in Settlement Area, all work must cease immediately as required by law, and the appropriate authorities (including the GSCI) must then be contacted.

Sincerely,

[redacted]
Executive Director, GSCI

C.C.

APPENDIX 2-B-50. *Project Summary Draft for Research Ethics Review Application*

Aurora Research Institute
Project Summary

Draft for Research Ethics Review Application

Instructions: Provide a brief (no more than 2 pages) summary of the purpose, objectives, and aims of the research. Describe your methodology and what will be required of the human participants. Please use language that can be understood by a non-specialist. (Note: The Committee may refuse to review applications with summaries exceeding 2 pages).

Community Research Summary

Purpose: This research is being conducted to inform the Chance Oil and Gas Limited (Chance) Eagle Plains Exploration Project (the Project) Proposal to Yukon Environmental and Socio-Economic Assessment Board (YESAB) for an Executive Committee level screening. The proposed Project is an oil and gas exploration project located in Eagle Plains Basin.

Background: The *Yukon Environmental and Socio-economic Assessment Act* (YESAA) requires that social and economic impacts of the Project be analysed, along with environmental impacts, to assess how the Project may affect the people who use the Project Area, live near to the Project Area, and/or whose Traditional Territory overlaps the Project Area. YESAA defines "socio-economic effects" as "effects on economies, health, culture, traditions, lifestyles, and heritage resources." YESAB's Executive Committee is required to "give full and fair consideration to scientific information, traditional knowledge and other information provided to it" (YESAA 2015).

Approach: Hemmera Envirochem Inc. (Hemmera) has been retained by Chance to conduct the socio-economic impact assessment for the Project. Hemmera is also managing the Project Proposal to YESAB and is working with consultants across a variety of disciplines to develop the Project Proposal.

To conduct the socio-economic impact assessment, Hemmera will be doing two complementary studies to collect primary data. Each study will be conducted in Inuvik, Aklavik, Tsiigehtchic, and Fort McPherson.

1. Socio-Economic Interviews (Socio-Ec Interviews) with service providers

2. Traditional Knowledge and Traditional Use Workshops (TK/TU Workshops).

Study 1: Socio-Economic Interviews

Objective: To learn how the proposed Project may positively or negatively affect the socio-economic conditions of communities near to the project footprint.

Methodology: Semi-structured, open-ended interviews will be conducted using an interview guide. Interviews will be approximately an hour in length and be conducted in a manner that meets the participants needs in terms of location, time, and language. If a translator is required for an interview to be conducted, additional time will be allotted to the interview, and a translated interview summary will be prepared by the translator in both languages for approval by the participant and for use by the researchers. Interview summaries will be created after each interview and shared with the interviewee via phone or email to provide the interviewee with an opportunity to make sure the summary is accurate and approve its content.

Recruitment: In each community, Hemmera will seek to interview representatives of the following organizations.

- RCMP and Conservation Officers
- Nursing Stations
- Primary and secondary school educators, and Yukon College, or other training facilities

- Utility service providers
- Business owners and operators
- First Nations Government including the Gwich'in Councils and the Band Offices in each community
- Renewable Resources Councils

To recruit participants, Hemmera will use publicly available contact information and contact potential participants to see if they are willing to participate. Hemmera will also work with GTC, band offices, DGOs and Renewable Resources Councils over phone or email to identify potential participants and contact them.

Study 2: TK/TU Interviews

Objective: To gather Traditional Knowledge and Traditional Use information about the Project Area, with an emphasis on use and access to the Porcupine Caribou Herd.

Methodology: A TK/TU workshop will be conducted with Elders and Traditional Knowledge holders who will be openly invited to participate in the study in each community. The workshop will be half a day to a full day in length. Participants will be guided by a trained facilitator to share TK/TU information. Notes will be taken during the workshop and participant specific contribution summaries will be created and reviewed with each participant via phone or email to provide each participant with the opportunity to approve their contributions before they are used. Workshop participants will receive a Honoraria or gift card as compensation for their time.

Advertising and Recruitment: Hemmera will work with the GTC, DGOs, and the Renewable Resources Councils to invite Elders and Traditional Knowledge Holders to participate in the workshops. Advertisements will be placed in communities and Elder and Traditional Knowledge Holders will be contacted with an invitation to participate.

Hemmera's Practices to be Applied to both Study 1 and Study 2

Informed Consent: Before each interview begins and before the workshop begins participants will be guided through an informed consent form.

Quality Assurance and Quality Control: All documents that are produced by the research team for submission to Aurora College, GTC, community members, or are produced for use in workshops will be reviewed by one of Hemmera's socio-economic and TK/TU technical experts for alignment with Aurora College and GTC research guidelines as well as environmental assessment best practices.

Data Storage, Confidentiality and Anonymity: Data will be protected through storage methods and managed such that sensitive information remains confidential and/or the anonymity of community contributors is protected. Digital copies of qualitative data (e.g. interviews, workshop findings, etc.) will be stored in a password protected file on Hemmera's server. Hard copies of interview material will be stored in locked file cabinets in Hemmera's Whitehorse office. Participant information will be confidential and used only for the YESAB report. If participants wish to have their contributions archived, information will be shared with the GTC archive. Participant information will be kept anonymous in reports unless participants indicate they would like to be mentioned by name.

APPENDIX 2-B-51. Initiation of Engagement for Eagle Plain Well Maintenance Project Letter

May 22, 2020

Gwich'in Tribal Council

1-3 Council Crescent
Box 1509
Inuvik, NT
X0E 0T0

Attention: [redacted]**, Director of Lands and Resources**

Re: Initiation of Engagement for Eagle Plain Well Maintenance Project

The purpose of this letter is to inform the Gwich'in Tribal Council of Chance Oil and Gas Limited's (Chance) proposed project for Eagle Plain Well Maintenance (the Project), and to initiate Chance's engagement with the Gwich'in Tribal Council for the Project. An email was sent to the Gwich'in Tribal Council on Monday March 23rd from [redacted] that briefly mentioned the Project. In accordance with the Gwich'in Partners and Chance Oil and Gas Communications and Consultation Plan, this letter is intended to provide a more formal introduction.

Government of Yukon, Department of Energy, Mines and Resources, Oil and Gas Resources Branch, has directed Chance to assess the integrity of, and conduct maintenance on, eight suspended wells in the Eagle Plain area. Government of Yukon has also indicated that this maintenance work is required in order for Chance to receive an extension of the suspended status of the eight wells. The wells in question are M-59, M-08, J-19, G-08, A-25, B-73, H-28, and E-78.

The maintenance work will require re-establishment of two winter access roads (i.e., Chance Winter Road and Blackie Winter Road), mobilization of a service rig and related equipment, preparation of the well site areas, well maintenance, de-mobilization of service rig and related equipment, and lastly, decommissioning of winter access roads. Re-establishment of winter roads will begin as soon as there is sufficient snow during the winter of 2020/2021. Well maintenance activities will commence in late January or early February 2021 and are anticipated take approximately 70 days to complete.

This Project triggers a Yukon Environmental and Socio-economic Assessment Board (YESAB) Designated Office (DO) evaluation and will also require a Land Use Permit for the construction of the winter access roads. Chance has hired Hemmera Envirochem Inc. (Hemmera) to manage its Dawson DO submission, manage the Land Use Permit application, and support all engagement activities with the Gwich'in Tribal Council and Yukon First Nations. Currently, Chance and Hemmera are in the planning phase of the Project.

The Project and all proposed Project activities are within the Tetlit Gwich'in Secondary Use Area of the Gwich'in Settlement Region as well as the traditional territories of the First Nation of Na-cho Nyäk Dun and the Vuntut Gwitchin First Nation. The proposed Project area is north of the Tr'ondëk Hwëch'in Traditional Territory. In accordance with guidance from YESAB, Chance would like to discuss any potential impacts

that the Gwich'in Tribal Council believes may arise as a result of the Project and what Chance could do to address them. Specific information on any measures you believe could be taken to address potential impacts would assist in our understanding and Project development. Additional Project details have been attached to this letter for your convenience. A copy of the Draft Project Description can be provided upon request.

Given recent developments with respect to the COVID-19 Virus, we understand that meeting in-person is not an option. Chance is committed to addressing any concerns you may have and would be more than happy to work with you via conference call, email, or any other method you prefer. We also respect that your government and its people have many competing priorities at this time and appreciate any feedback you wish to provide. Please let us know if there is anything Chance can do to facilitate and ease the burden of this process.

Thank you for your time and attention.

Additional Project Information

1.1 Project Overview

The proposed Well Maintenance Program (Project) is comprised of two main components:

- Routine maintenance of suspended wells; and
- Construction of new winter roads and maintenance of previously existing roads.

A map depicting the location of the wells as well as the winter roads is attached.

1.2 Types of Maintenance Activities and Tests

Wellhead Inspection: The wellhead is the equipment on the surface used to maintain safe operation and manage the flow of oil and gas. A wellhead inspection is conducted to ensure all surface equipment is in good condition and operating as required (e.g., providing a barrier against hydrocarbon leakage, reliable in emergency situations). This inspection is conducted in accordance with the standard Yukon Government Oil and Gases Resources Well Inspection Report.

Pressure Test: A test to determine the strength or fracture pressure of the rock around a borehole (i.e., the formation). During the test, the well is shut in (i.e., process of isolating the well where the master valve and casing valves are closed) and fluid is pumped into the wellbore to gradually increase the pressure that the formation experiences. At a certain pressure, fluid will enter the rock surrounding the borehole, either moving through permeable paths in the rock or by creating a space by fracturing the rock. The results of a pressure test indicate the maximum pressure that may be applied to the well during drilling operations.

Surface Casing Vent Flow (also referred to as a "Bubble Test") and Gas Migration Tests: When a well is drilled, it must be cased with steel pipe to provide stability to the wellbore and to ensure fluids are contained within the well. Multiple casings are used within a well. The shallowest casing is the surface casing. The surface casing isolates usable groundwater from the well and stabilizes the well. After the casing is installed, cement is pumped in the space between the casing and the geological materials that surround the wellbore, as well as between casings, in order to achieve a seal. Surface Casing Vent Flow involves the movement of gas, in rare cases liquid, between the surface casing and the next string of casing upward and out of the surface casing vent assembly. Gas Migration is the flow of gas outside the surface casing of a well and may be tested by doing a soil vapor survey.

Temperature Log: A detailed depth-related record of temperature. The temperature log is interpreted by looking for anomalies from a baseline (i.e., a log recorded before production or recorded with the well shut in). Temperature logs have many applications, with the most common being to identify areas where the wellbore is taking in fluid, to evaluate a cement or hydraulic fracture treatment, and to locate casing leaks. A temperature log tends to reflect the behavior of a well over a longer time period than other measurements.

Cement Log: A log that uses the variations in amplitude of an acoustic signal travelling down the casing wall between a transmitter and receiver to determine of the quality of cement bond on the exterior casing wall.

Hydraulically Isolate Formations: An activity where the casing is perforated at the appropriate depth. Tubing is then used to inject cement through the perforations (i.e., holes in the casing and cement that allows cement to flow from the well into the surrounding formation) in sufficient quantity to ensure hydraulic isolation. Then pressure is applied from surface to force the cement into the perforations. Once the cement has cured, the cement will be pressure tested as per the *Yukon Oil and Gas and Drilling Production Regulations*. This process is repeated until all formations are hydraulically isolated and pressure tested. These operations begin with the deepest non-isolated formation and progress to the shallowest non-isolated formation. Once all the isolation/testing procedures are complete, the tubing will be pulled from the well, a new well head assembly will be installed, and the well head will be pressure tested once more.

Wellbore fluid test: A test, or series of tests, performed to check that no undesirable reactions occur with a specific fluid. The testing process may include checks for compatibility with other treating fluids, wellbore fluids, reservoir fluids, and the reservoir formation.

1.3 Well Maintenance Activities

The following table describes the tests proposed for each well:

1.4 Personnel and Equipment Needed

The Eagle Plains Hotel will serve as accommodations for up to 36 personnel from November 2020 to April of 2021. It is anticipated ten people will always be on site, with up to 17 at any one time (including personnel on standby at the hotel) and up to 25 during rig mobilization.

Equipment required for well maintenance and winter road construction is described below (Table 2).

Table 2: Equipment required for Well Maintenance

Equipment	Description
Boilers	Boilers are used in cold, Arctic climates for preventing equipment and fluids from freezing.
Cement	Cement storage and mixing for use in wells.
Cement Bins	Large tanks, normally upright, fully enclosed and pressurized, where cement products are stored. Cement is pneumatically pumped from the tank into the cementing unit.
Medic/Office Trailers	Essential personnel trailers which serve as offices.
Flare Tank and Flare	A flare is used to burn combustible gas from the well. The flare tank is a reservoir to ensure the flare does not run out of combustible gases.
Fuel Storage	Portable tanks will be used to store fuel on site.
Garbage and Incinerator	An incinerator will be used to dispose of food waste. All garbage and recyclable materials will be taken off site and disposed of at a licensed disposal facility. All wastewater and sewage will be transported offsite for disposal at an approved facility.
General Storage	Storage and laydown area for equipment needed on site.
Main Workover Fluid Storage	Fluid additives will be stored on pallets that are stacked and shrink wrapped.
Tubing Storage	Trailer for storing pipes until they are required.
Pumps	Pumps are used to circulate the fluid down the pipe and then back up to the surface in the ring-shaped space between the pipe and the casing.
Service Rig	The Service Rig includes a base, a derrick, equipment for lifting/lowering equipment into the pipe, and blowout preventers.
Water Storage and Water Treatment	Water storage tank and treatment containers to provide potable water for the rig crew and personnel.
Vehicles	It is anticipated that standard sized bulldozers, graders, snowcats, and water trucks will be the primary vehicles. Pickup trucks will be used for transportation of work crews, fuel and other supplies. Water trucks will be used for transport of water from the Eagle River and Ogilvie River to the Project. Flatbed trailers would be used to transport equipment and larger supplies. A total of eleven flatbed truck loads will be required to mobilize equipment into each well site.

1.5 Winter Road

Wells H-28, J-19, M-08, G-08 and H-28 will be accessed using the previously existing Chance Access Road. Wells A-25 and B-73 are located immediately adjacent to the highway and already have access routes. Well M-59 will require the construction of approximately 11 km winter road to access the site mostly by reactivating a long disused winter access route. Winter road construction will utilize similar techniques as previously applied in previous assessments (YESAB # 2006-0237, 2006-0285, 2007-0219, 2008-0047, and 2012-0140).

Winter roads required for the Project are designed to have as few water crossings as possible. All water bodies, that maybe crossed, will be treated as fish bearing and winter roads will be constructed following

Fisheries and Oceans Canada's (DFO) Operational Statement on Ice Bridges and Snowfill (DFO 2007). Water needed to make ice and/or snow will be trucked from the Eagle River and/or Ogilvie River. Gates will be placed at the entrance of Chance and Blackie Winter Road to restrict access.

1.6 Project Timelines

Construction of the winter roads and well maintenance is anticipated to occur during the winter of 2020/2021. Initial site visits would occur in late November or early December 2020 to pack snow along the access routes with snowmobiles. Winter road construction is anticipated to occur in late January and February 2021. Well maintenance activities are anticipated to commence in late February and take approximately 70 days to complete the work at all eight wells.

1 INTRODUCTION

The proposed Eagle Plains Exploration Project (Project) is located in the Eagle Plains area, between the Ogilvie and Richardson Mountain ranges in the Yukon**.** The Project encompasses a 2,386 square kilometre (km²) area in north-central Yukon, centred approximately 605 kilometres (km) north of Whitehorse and 40 km south and west of the Eagle Plains Hotel, along the Dempster Highway (**Map 1-1**).

Chance Oil and Gas Ltd. (Chance) is the Project Proponent. The Project consists of two phases:

1. Exploration Phase; and
2. Reclamation and Closure Phase.

Within the Exploration Phase, there are three principal components:

1. a seismic exploration program.
2. an oil and gas exploration drilling program; and
3. a drill stem test (DST) and extended flow testing (EFT) at select wells.

1.1 PROJECT LOCATION

The Project is located within the southern part of Eagle Plain Sedimentary Basin in northern Yukon, northeast of Dawson City and southwest of the Yukon/Northwest Territories (NWT) border (**Map 1-1**). The main camp (Chance Camp) is located at km 325 of the Dempster Highway.

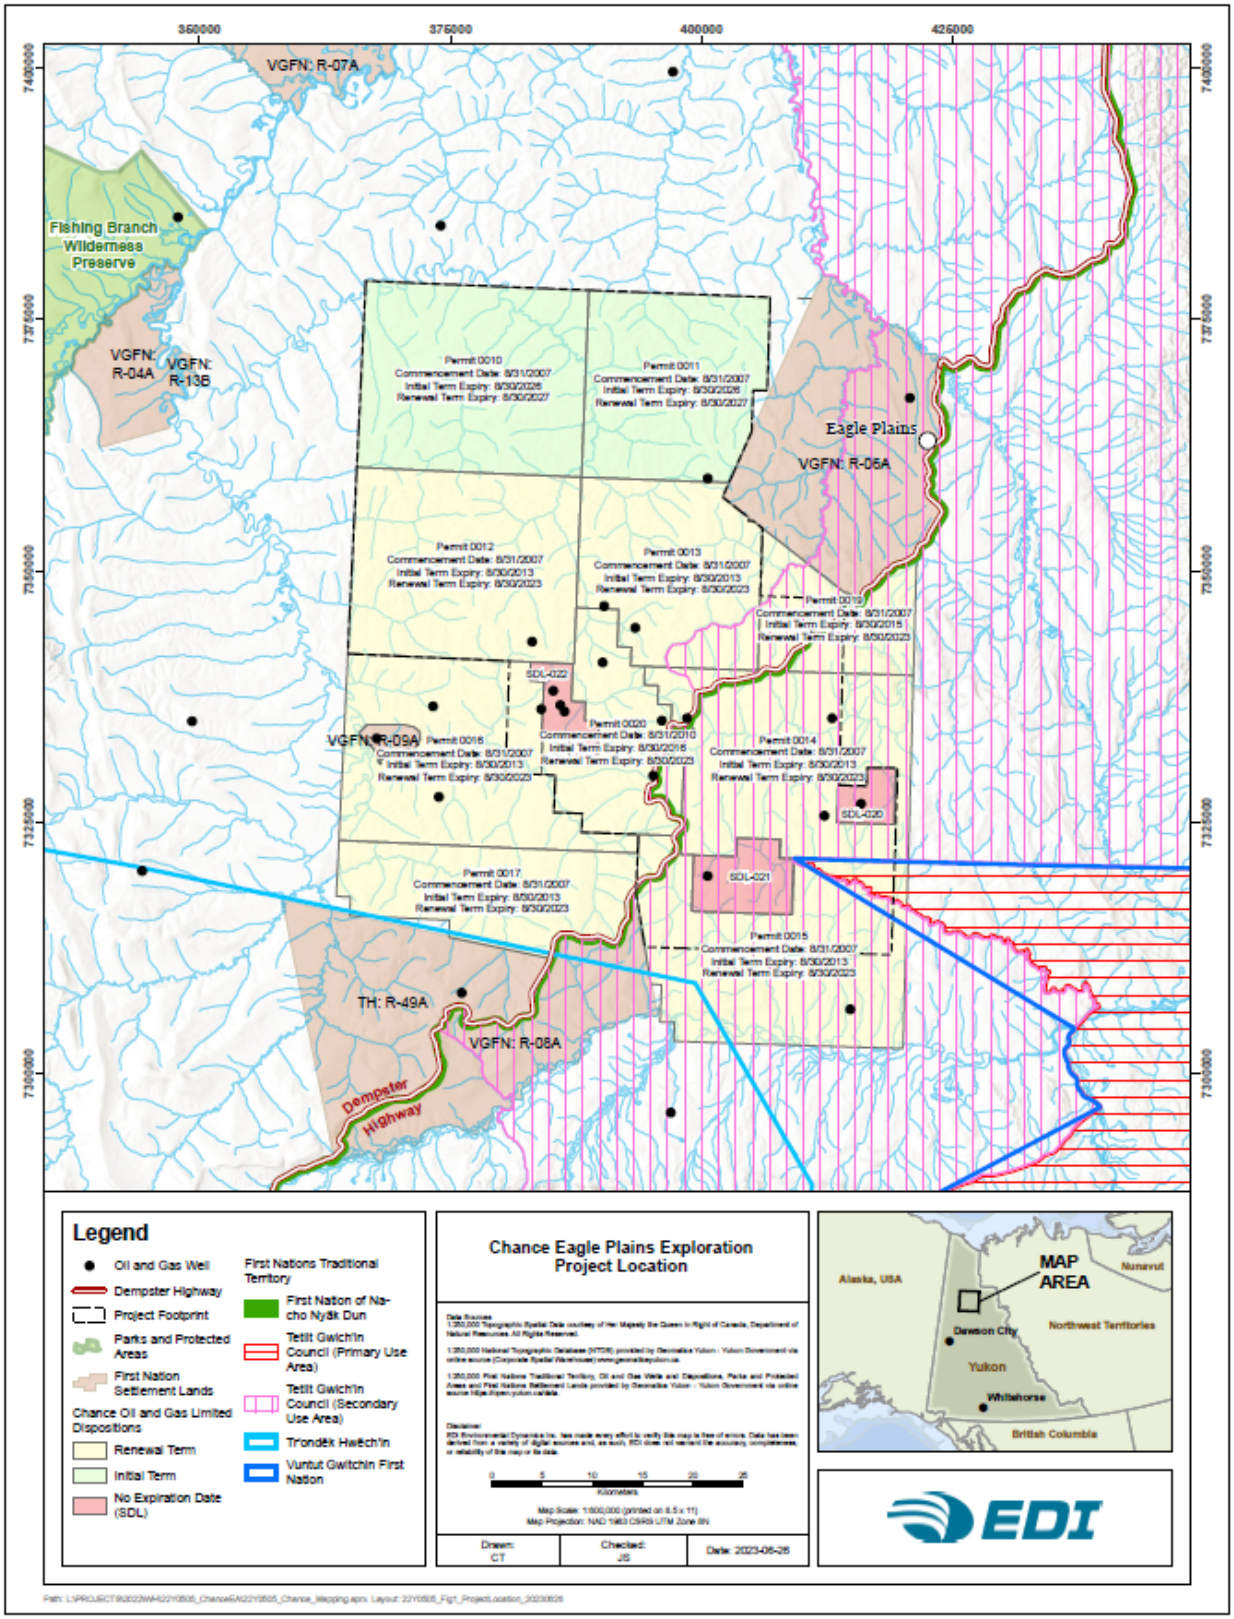
The Project overlaps the Traditional Territories of four First Nations. Most of the Project is within the Traditional Territory of the Vuntut Gwitchin First Nation. The southeastern portion is in an area of overlapping Traditional Territories of the Tetlit Gwich'in Council, Tr'ondëk Hwëchin, the First Nation of Na-Cho Nyäk Dun, and Vuntut Gwitchin First Nation. The Project does not fall within any First Nation Settlement Lands and borders the east and southwest portions of the Vuntut Gwitchin First Nation Settlement Lands.

1.1.1 Exploration History

The Project occurs within the Eagle Plains sedimentary basin, north of the Ogilvie River and west of the Richardson Mountains. The basin contains proven natural gas and oil reserves (Government of Yukon 2019), including 4.6 billion cubic metres (m³) of gas and 3.2 million m³ of oil (Hannigan 2014).

The Project area has had intermittent periods of oil and gas exploration since the 1950s. That activity has established winter roads, seismic lines, and exploratory well sites across parts of the current RSA. Approximately 40 exploration wells have been drilled in the Eagle Plains sedimentary basin. Eight wells are currently being maintained in suspended status, and the remaining wells have been plugged and abandoned. Seismic exploration has included approximately 10,000 km of two-dimensional (2D) lines (mostly before 1985), and about 325 km² of three-dimensional (3D) seismic was conducted in 2013/2014 (Northern Cross (Yukon) Ltd. 2014).

Chance has completed Project-related baseline studies, including surface and groundwater, permafrost, aquatics and fish, vegetation, wildlife, socio-economic, and heritage resources.



Map 1-1. Eagle Plains Exploration Project location.

1.2 DOCUMENT PURPOSE

This document provides an overview of the Project, its location and details about the phases, principal and accessory components, and scheduling. The Draft Project Description outlines a proposed program that will build on past exploration to better define the extent, amount and quality of oil and gas deposits in the area. Under the program, Chance proposes conducting additional 2D and 3D seismic data acquisition programs and drilling up to 30 exploratory wells over ten years. Depending on the drilling program results, EFT, lasting up to two years, may be conducted at wells where crude oil or natural gas are discovered to determine the quantity, quality and extent of the oil and gas deposit(s). The existing winter road network will be expanded to support the seismic, drilling, and flow testing programs. Most of the work and all the new land disturbance will occur in the winter (e.g., seismic line clearing and drilling). Work outside of the winter includes aerial-supported seismic recordings, and EFT may also occur during summer.

The information in this document is conceptual and intended to provide a level of detail supporting discussions on the draft Project Description with potentially affected First Nations, residents of local communities, and stakeholders. Development of this draft document is based on the *Proponent's Guide to Information Requirements for Executive Committee Project Proposal Submissions* (YESAB 2005), specifically Part 1, Section 5.0 Project Description.

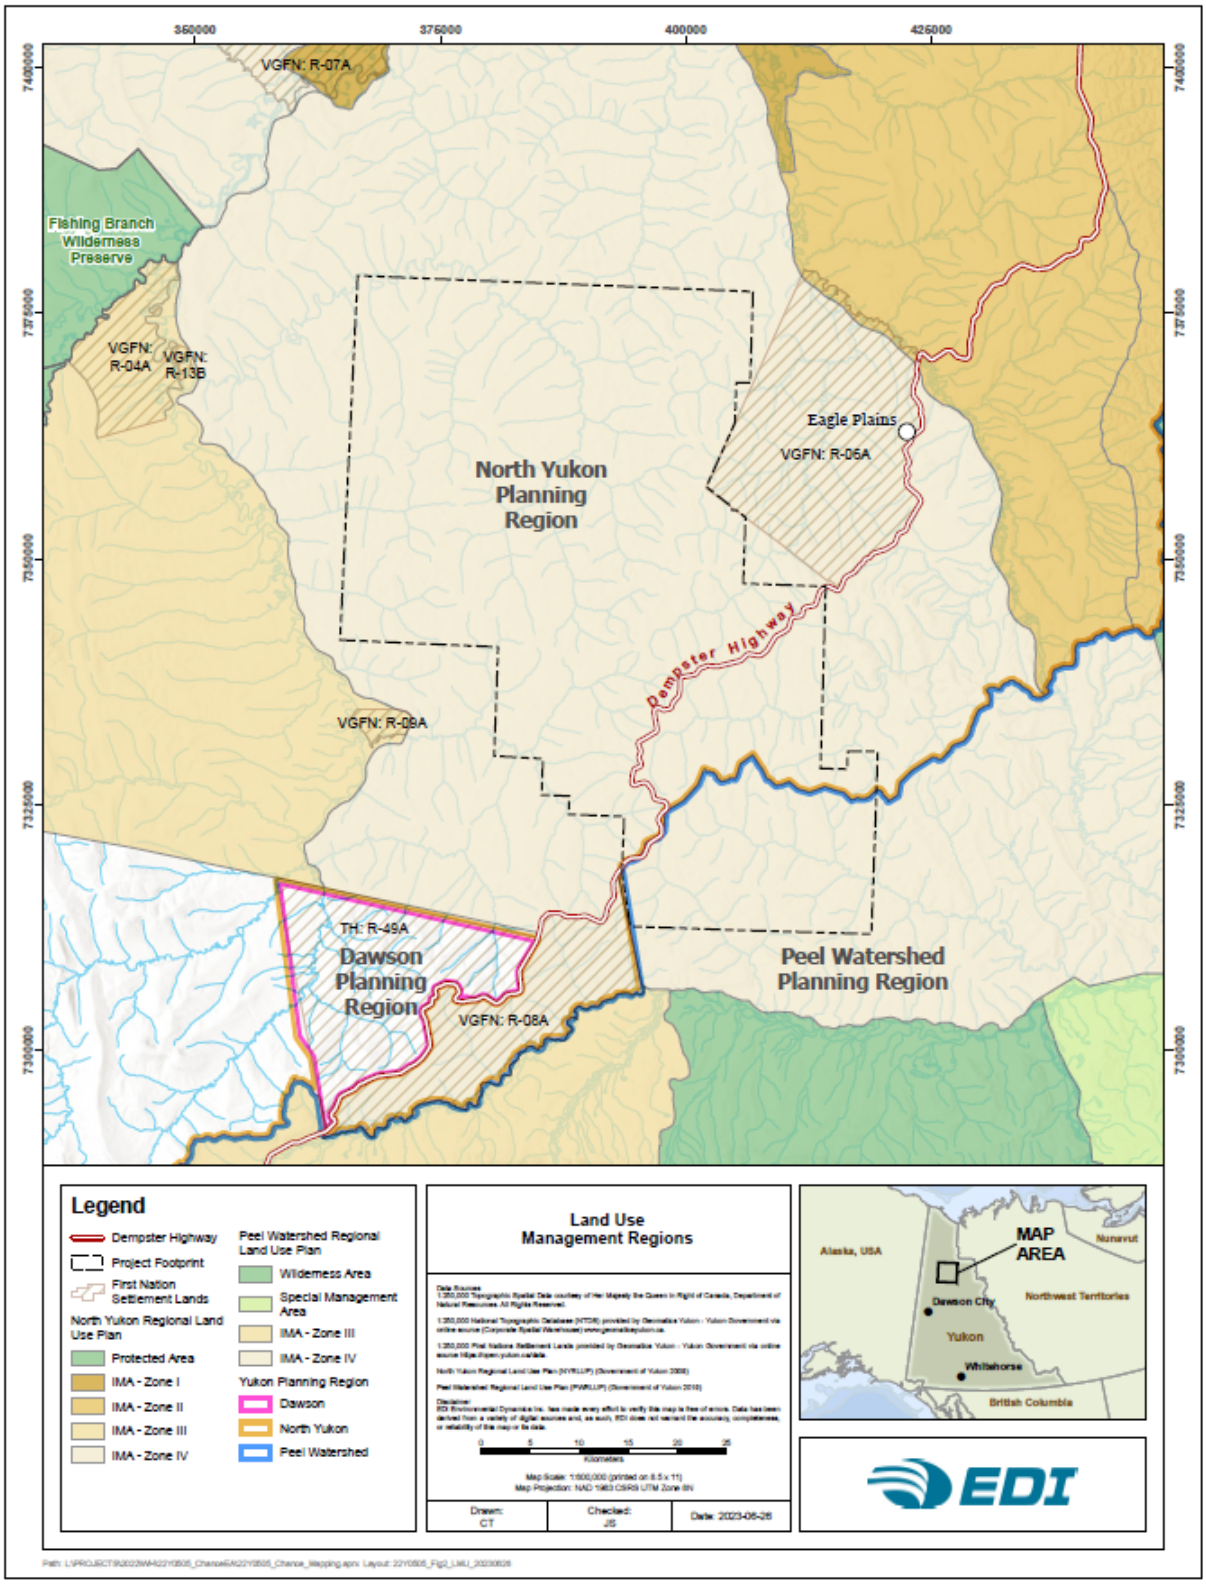
1.3 REGULATORY CONTEXT

The Project is subject to a screening by the Yukon Environmental and Socio-economic Assessment Board (YESAB) Executive Committee, as stated in the *Designated Office Evaluation Report* issued on February 9, 2016 (Project Number: 2014-0112). Development of this draft Project Description is based on the *Proponent's Guide to Information Requirements for Executive Committee Project Proposal Submissions* (YESAB 2005), specifically Part 1, Section 5.0 Project Description. Given that the regulatory framework and process, as developed by YESAB, has changed since the issuance of the Evaluation Report, Chance will collaborate with the Executive Committee on determining the appropriate regulatory process and required project information going forward, including potential environmental and socio-economic effects assessment information.

Detailed Project design and implementation procedures will be developed following Project approvals. Design, methods, or procedural changes will conform to the commitments made by Chance and the terms and conditions stated in Decision Document(s) resulting from the YESAB Executive Committee screening process, once defined. A complete list of required federal and territorial permits, licences, approvals, and assessments will be clarified with the appropriate regulatory agencies as the Project proceeds through the defined permitting and regulatory process.

1.4 RELEVANCE TO LAND USE PLANS

The Project is located within the North Yukon Planning Region and Peel Watershed Planning Region. The Project is, therefore, subject to the approved *North Yukon Regional Land Use Plan* (NYRLUP) (Vuntut Gwitchin Government and Yukon Government 2009) and the *Peel Watershed Regional Land Use Plan* (PWRLUP) (Peel Watershed Planning Commission 2019) (**Map 1-2**).



Map 1-2. Eagle Plains Project and Land Use Planning Units (LMUs).

Each First Nation government has provided input to and approved the Regional Land Use Plan(s) on their Traditional Territory under the respective First Nation Final Agreements.

1.4.1 North Yukon Regional Land Use Plan

The Project lies mainly within the North Yukon Planning Region and is subject to the North Yukon Regional Land Use Plan (NYRLUP). The NYRLUP was created to protect the natural and cultural resources of the region while allowing sustainable economic development opportunities (Vuntut Gwitchin Government and Yukon Government 2009). It provides management direction for using public and settlement lands based on four principles: sustainable development, precautionary principle, conservation, and adaptive management. The NYRLUP divides the Planning Region into 23 Landscape Management Units (LMU), classified into three categories: protected area, integrated management area (IMA), and community area. IMAs are further classified into four zones: Zone 1 (lowest development), Zone II (low development), Zone III (moderate development), and Zone IV (highest development). IMA zones are classified based on the area's sensitivity to landscape disturbance, ecological and cultural values, risk of significant impacts, and level of acceptable change. The RSA is a Zone IV IMA with lower ecological and cultural values in a moderately sensitive biophysical setting. Subsequently, Zone IV IMAs allows for the highest development level to occur.

The NYRLUP encourages results-based management and uses cumulative effects indicators to determine if goals and objectives are met. Results-based management allows for innovation and creativity in land-use strategies and approaches. The two cumulative effects indicators included in the NYRLUP are direct surface disturbance and linear density. The NYRLUP guidelines for Zone IV IMAs are 0.75–1.0% surface disturbance and 0.75–1.0 km/km² linear density (Vuntut Gwitchin Government and Yukon Government 2009). However, as surface disturbances and linear features reach a level of functional recovery and become part of the continuous landscape, they can be subtracted from the total amount of disturbed area (Vuntut Gwitchin Government and Yukon Government 2009). The NYRLUP suggests using a height of 1.5 m for woody vegetation in forested areas, as vegetation above this height would likely no longer allow for travel or access by humans or wildlife and is, therefore, considered functionally recovered. Activities considered exempt from functional disturbance restrictions are (1) new linear features less than 1.5 m wide; (2) land-use activities that occur on frozen water bodies; (3) winter work with no required clearing of trees; and (4) winter work that uses existing disturbances and linear features.

1.4.2 Peel Watershed Regional Land Use Plan

The southeastern corner of the Project lies within the Peel Watershed Planning Region (PWPR) and is subject to the Peel Watershed Regional Land Use Plan (PWRLUP) (Peel Watershed Planning Commission 2019). Like the NYRLUP, the PWRLUP was established to provide management direction and ensure long-term sustainable development in the Planning Region. The PWRLUP was founded on three main themes: environmental protection, social considerations, and economic development. It follows a similar framework as the NYRLUP. The PWPR is divided into 16 LMUs, each with similar ecological characteristics, planning issues, and management intent. Each LMU is categorized by a land-use designation system. Conservation Areas are managed to protect ecological and cultural resources, while IMAs are 'working' landscapes where new development and surface disturbance may be allowed. IMAs are further classified into Zones, which correspond to the level of allowable development with comparable justification as the NYRLUP. The RSA

is part of LMU 7 (Dalglish Creek), classified as an IMA Zone IV, allowing for the highest level of development.

Like the NYRLUP, the PWRLUP encourages results-based management and uses the same cumulative effects indicators, surface disturbance and linear density to inform decisions. The PWRLUP cautionary and critical indicators are identical to the NYRLUP: 0.75–1.0% surface disturbance and 0.75–1.0 km/km² linear density. As surface disturbances reach a level of functional recovery and no longer enable travel or access by wildlife and people, they can be subtracted from the total amount of disturbed area. The PWRLUP suggests using a 1.5 m woody vegetation height as a threshold for functional recovery in forested or shrubland areas. In areas dominated by low-growing vegetation, a feature could be considered functionally recovered when covered by native species roughly the same height and composition as the surrounding vegetation. To be considered as "functionally recovered," features must have similar sediment and run-off compared to background levels, roughly match original contours, and have no human-brought materials on the site. Exceptions to the linear density calculation are identical to those outlined in the NYRLUP.

1.5 BASELINE DATA AND MANAGEMENT PLANS

Baseline environmental information and data are required for proposed oil and gas projects submitted to the YESAB Executive Committee for screening under the *Yukon Environmental and Socio-economic Assessment Act, S.C. 2003, c.7* (Government of Canada 2003) (*YESAA*), and applications submitted for other permits and licences. To receive authorization for the Eagle Plains Project to proceed, the Project must be evaluated under *YESAA*.

Environmental baseline reports describing current conditions and outlining specific objectives, as identified in YESAB's *Proponent's Guide to Information Requirements for Executive Committee Project Proposal Submissions* (YESAB 2005), have been prepared and will be included in the Project proposal submission and following the regulatory process moving forward, once defined. A series of management plans are under development by Chance to provide additional information on infrastructure design and component-specific activities, including follow-up monitoring. These plans will be further developed to include any input from potentially affected First Nations, residents of communities, territorial and federal government departments, and recommendations from the YESAB Executive Committee.

1.6 COLLABORATION WITH FIRST NATIONS AND COMMUNITIES

Chance is committed to developing collaborative working relationships with potentially affected First Nations through the ongoing consultation and engagement process, including the Tetlit Gwich'in Council, Tr'ondëk Hwëchin, the First Nation of Na-Cho Nyäk Dun, and Vuntut Gwitchin First Nation, and residents of nearby communities. The Draft Project Description is one of the multiple opportunities for leadership, individuals, and groups within these communities to share comments, concerns, and recommendations regarding Project activities. Chance will work to incorporate feedback shared on the Project to maximize Project-related benefits for potentially affected First Nations and residents of communities, to address concerns and mitigate potentially adverse effects.

2 PROJECT OVERVIEW

This section provides a summary of the proposed program. Subsections provide additional details on the seismic and exploratory drilling programs, the DST and EFT, accessory Project components, reclamation and closure information, and an overview of Project components and schedule.

The Project area comprises approximately 2,400 km² of oil and gas claims on either side of the Dempster Highway south and west of the Eagle Plains Hotel. The Project and its principal components are exploratory and have been designed to confirm the quality, quantity, and areal extent of any accumulations of hydrocarbons. Hydraulic fracturing is not proposed as part of the Project. Chance intends to conduct Project activities over ten years, primarily during the winter, from winter 2025 to winter 2035.

The Project consists of two phases:

1. Exploration Phase; and
2. Reclamation and Closure Phase.

The key Exploration Phase activities are outlined in **Table 2-1** and the key Reclamation and Closure Phase activities are outlined in **Table 2-2**

Table 2-1. Summary of key Exploration Phase activities.

Project Activity	Key Construction Phase Activity
Engagement	Ongoing engagement with First Nations.
	Ongoing engagement with community residents.
Main Camp	Opening the camp — mobilization of equipment and personnel
	The camp will house the drilling and seismic crew and other support services.
	Construction of the Central Processing Facility (CPF) (once extended flow tests [EFTs] are proposed)
Tree Clearing and Grubbing	Salvage during the winter, before the construction of the winter access roads
Winter Road Construction	Winter roads are required for seismic and well drilling, so will be the first activities of a winter operation.
Seismic Exploration	Access road construction
	Seismic line construction, hazard identification, cutting, surveying, etc.
	Line preparation and drilling
	Data acquisition and recording
Exploration Well site Construction	Well site pads will be constructed using snow, water to freeze the site, a protective liner and rig mats.
Drilling	Up to 30 pads will be constructed and used for exploration drilling over the 10-year life of the Project.
	Remote sump access for drilling mud and rock cutting disposal
	Stripped drilling fluid will be disposed of at deep zone injection wells located at Eagle Plain.
	Completing drill stem tests

Project Activity	Key Construction Phase Activity
	Acid stimulation and completion of wells for testing
Well Testing	Facilities to be installed, as needed, for testing and extended well tests.
	Routine maintenance of facilities, production equipment and well bores, as needed
	Gas is to be flared off, and oil is placed in storage tanks. Recovered formation water (if any) will be disposed of in deep zone injection wells.
Accessory Activities	Winter road construction
	Construction of a winter-use airstrip
	Vehicle traffic related to drilling and construction activities
	Water use permit for lease and winter road construction and waste disposal at the camp
	Baseline data collection and environmental monitoring
	Maintaining and snow-clearing roads and leases
	Water permit use for boilers during winter drilling

Table 2-2. Summary of key Reclamation Phase and Closure Phase activities.

Project Activity	Key Reclamation Phase Activity
Engagement	Ongoing engagement with First Nations.
	Ongoing engagement with community residents.
Seismic Lines	Low impact seismic, narrow construction, stem bending, natural regeneration
Well Suspension	Wells that have successfully undergone EFT will be suspended pending future development approval.
Well Abandonment	Unsuccessful wells and wells not used for disposal will be abandoned when testing or production phases are complete.
	Testing facilities are to be removed from each site.
Mix Bury Cover (MBC) Sump Site Reclamation	The site will be reclaimed as per AER *Directive 050 Drilling Waste Management* (Alberta Energy Regulator 2023)
Central Processing Facility	Upon complete field decommissioning activities, the removal of the Central Processing Facility will occur.
Well Site Reclamation	Well site equipment will be removed.
	Area will be allowed to revegetate naturally.
Accessory Activities	Discussions with regulators (as necessary) before reclamation work to determine whether there should be changes to the Plan
	Annual monitoring until vegetation regrowth is deemed satisfactory
	Conduct a Phase 1 Environmental Site Assessment (ESA) for each location.
	Obtain Regulatory Closure approval.

2.1 EXPLORATION

2.1.1 Seismic

Seismic exploration uses a compressional seismic p-wave (like an ultrasound) to remotely image rock layers beneath the surface. The technology measures the reflected energy waves (p-waves), akin to multiple echoes from each rock layer, to identify geological settings where oil and natural gas might be located. This imaging allows geophysicists and geologists to map the subsurface structure of rock formations that could contain hydrocarbons and help pinpoint areas of the greatest potential for drilling a successful well.

Small dynamite charges in shallow holes, called shot holes, are used to create the p-waves that reflect off the various rock layers underground; the reflected p-waves are recorded by very sensitive devices called geophones (that can even detect wind or the footsteps of people passing by). The small dynamite charges within each shot hole force the explosive energy downward through the various rock layers. A seismic detonation of one kilogram (kg) is comparable to the sound of a passing diesel truck and is only 0.5 seconds in duration. The time it takes to receive the reflected sound wave from the detonation tells geophysicists and geologists where the rock layers are, based on where the sound-conducting properties of the rocks change. Very little sound or vibration is perceptible at the surface by anything other than the geophones.

The seismic exploration program will consist of up to 1,500 km² of 3D Low Impact Seismic (LIS) data acquisition and up to 2,000 km of 2D LIS data acquisition. Seismic exploration relies on the geophones placed in a single line (2D) or along multiple, usually parallel, lines (3D). The 2D program may be undertaken as a single program or several smaller programs; the 3D program will be conducted as several programs of 400–700 km² areas. The winter seismic programs will minimize terrain, terrestrial and aquatic environmental effects. The seismic recording will take place in summer to minimize ground disturbance and allow for decreased Health, Safety and Environment (HSE) concerns.

2.1.2 Drilling

The exploratory drilling program consists of up to seven wells, drilled sequentially each year, to a maximum of 30 wells over 10 years. The well locations will be selected based on existing geological and geophysical data, data from previously drilled wells, data from the seismic program, and data from the wells drilled as part of this program.

The exploratory drilling program is planned to begin in winter 2025/2026. Three to five wells may be drilled during the winter, depending on their proximity to the Dempster Highway. Access to initial well sites will be via winter access roads. The well sites will be prepared using winter access methods and rig matting. The winter timing and access location will minimize ground disturbance and potential effects on permafrost and vegetation.

The sequence in which wells are drilled for the exploration program depends on previous drilling success, EFT results, data collected from the seismic exploration program, weather, and road conditions. The ongoing process of interpreting seismic data will allow Chance to understand better the geological setting and size/geometry of potential prospects.

If crude oil or natural gas are discovered in sufficient quantities, Chance will conduct EFT at that well. A maximum of 30 wells may have EFT. The EFT at an individual well can last from several months to several winter seasons, depending on the well and whether the discovery is principally crude oil or natural gas. At a maximum annual drilling rate, with all drilled wells deemed suitable for EFT, 10 wells could be undergoing EFT at any time for this Project.

Once a well has been drilled and tested to determine whether oil and gas reservoirs were encountered, Chance will decide whether to complete the well[1] and conduct EFT or safely and securely abandon the well and reclaim the well site. Once the well completion determination has been made, the drill rig will be removed from the well site and proceed to the next exploratory drilling location.

2.1.2.1 Extended Flow Testing

The EFT provides data on fluid composition, reservoir properties, areal extent, and pressure, both during the EFT and as it builds up following the flow period of the EFT.

If Chance decides to proceed with EFT at a well site, it will be reconfigured to support EFT. A completion, or service rig, will be moved to the site to install the EFT equipment in the well. At the depth where oil or gas has been identified, the cemented in-place steel casing is perforated for fluid to flow out of the geologic formation and into the well.

Some combination of natural gas, crude oil, and formation water (i.e., very deep non-potable groundwater that is usually saline, located in the same rock formation as the oil and gas deposit) are usually extracted during EFT. Fluids produced during EFT will be separated and measured in mobile units on the well pad. Natural gas may be flared but preferentially used as fuel for process heating, mechanical power, and onsite power generation. Formation water will be disposed of by re-injecting it into a compatible and approved geological formation via an existing Eagle Plains well converted to a deep injection well. Existing suspended wells may be converted to deep-injection wells as needed.

2.2 RECLAMATION AND CLOSURE

Progressive reclamation and closure activities are ongoing during the Exploration Phase. This includes the reclamation of winter roads, abandoned well pads, seismic lines, and clearings due to accessory activities. As this Project primarily involves winter activities (except for seismic recording), reclamation will mostly rely on low impact seismic, stem bending, and natural regeneration, intending to minimize ground surface disturbance. A Conceptual Reclamation and Closure Plan will detail reclamation, abandonment, and closure activities.

2.3 ACCESSORY PROJECT COMPONENTS

Additional activities required to support the principal Project components are as follows:

[1] Completion of the well at this stage involves inserting steel pipe, referred to as casing, into the well bore and injecting cement into the annular space between the outside of the casing and the native rock formations to set the casing in place and to prevent any fluids in the rock formation from flowing to surface uncontrolled, and capping the well with a series of valves, referred to as the wellhead, or Christmas Tree.

- Construct a series of Mix Bury Cover (MBC) sumps covering an area of up to approximately 6.4 hectares (ha) to dispose of drill cuttings. These sumps are in an area adjacent to the existing Devon sump (which pre-dates Chance) at km 336 of the Dempster Highway, which has been identified as a suitable location.
- Construct winter access roads.
- Construct an airstrip for seasonal (winter) use on the Chance Winter Road location west of the Dempster Highway.
- Mobilize equipment, supplies, and personnel to the Project and Project area.
- Use the existing Chance Camp at km 325 of the Dempster Highway to house up to 75 workers on a rotational shift basis, and occasionally use the Eagle Plains Hotel,.
- Use a remote fly-in camp near the proposed East Greaves and West Greaves Winter Trails, roughly 40 km from the Chance Camp, to accommodate approximately 25 operations personnel.
- Construct a Central Processing Facility (CPF) at the existing Chance Camp, which will allow Chance to store, further treat/separate fluid produced during EFT and transfer it to trucks for disposal. The additional processing enabled by the CPF will stabilize the crude oil, as required for future truck transport to an appropriate approved crude marketing point.

2.4 SCHEDULE

The Project will enter the YESAB Executive Committee Screening Process by 2024, aiming to have all necessary permitting and approvals by mid-2025. Chance plans to begin exploration activities as early as late 2025, and the Project is planned for up to 10 years. The progress of each component and accessory activity will be scheduled, located, and timed to accommodate factors such as remoteness, weather, seasonal operations, and lack of resourcing, including finding qualified oilfield staff in the region. Certainty around schedule and outcome will be gained as initial data is analyzed from the first few wells that are drilled and had EFT and subsequently from the seismic program. The timing of the three principal Project components and accessory activities is shown in **Table 2-3.**

Exploration activity can start as early as December 2025 and continue for up to 10 years. Scheduling detail is provided for the first three years. The data collected during those initial years will strongly influence future activities' timing, location, and intensity. The schedule only generally accounts for operational interruptions such as severe weather, geological re-interpretation, equipment breakdown or other delays beyond the operator's control.

Chance will engage potentially-affected First Nations and residents of communities throughout the life of the Project.

In summary, Chance will conduct a seismic program staged over five to eight years and drill up to 30 wells over the course of the 10-year Project starting the winter of Project approval. Due to the limitations of the camp and the Eagle Plains Hotel, the exploration work will be undertaken in a logical sequence alternating between drilling and seismic. If a well is successful (i.e., if there is a discovery of crude oil or natural gas in sufficient quantities), Chance will conduct an EFT for up to two years on that particular well.

Table 2-3. Project component and accessory activities timing.

Component	Timing	Details (as needed)
Seismic Exploration Program	except for seismic data recording, the seismic programs will occur during the winter and alternating with the drilling activities due to capacity constraints at the camp.	Subject to this limitation, seismic programs could occur during the 10-year exploration period.
Drilling Exploration Program	alternating with seismic programs initially, starting during the winter months (October through April).	Drilling may be interspersed with accessory activities such as preparing/decommissioning access to well sites, mobilizing/demobilizing equipment, and reclamation activities.
EFT program	timing will depend on the exploration drilling results, primarily the discovery of crude oil or natural gas, and the capacity of the 75-person camp to accommodate the necessary crews.	The EFT will be staggered across the Project area, but it is expected that one or more EFTs will happen in the Project area during the winter operating season.
MBC sumps or pods construction	will occur in every season that drilling is happening, and sumps will be built on an as-needed basis to dispose of drill cuttings	
Airstrip and CPF construction	will likely occur within the first or second winter season.	
Reclamation	will be ongoing throughout the Project's life.	

3 PROJECT DETAILS

Information provided below for each Project component includes its location, key design features, and the results of any relevant investigations to establish site conditions (e.g., seismicity, geotechnical parameters), where applicable. An overview of each Project component and associated activities is described in **Table 3-1.**

The principal Project components in the Exploration Phase are:

1. seismic exploration program.
2. drilling exploration program; and
3. extended flow testing program.

All three components are intended to operate simultaneously, sequentially, or alternatively. The data collected during each program contributes to a more robust characterization of the geological setting in the Project area. A better understanding of the geological setting allows Chance to identify prospects showing potential for oil and gas reserves to accumulate. A combination of existing data and data from seismic exploration, new drilling, and EFT will evaluate these prospects.

The proposed seismic exploration program, consisting of up to 1,500 km² of 3D LIS seismic and up to 2,000 km of 2D LIS seismic, is intended to further identify and map oil and gas prospects where the potential for hydrocarbons to accumulate exists in the Project area. The 3D seismic program will likely be undertaken in a series of smaller areas of 400–700 km² areas and undertaken in a sequential, alternating program with drilling activities. The 2D seismic program could be conducted at once, or as a series of smaller areas connected to a broader program execution strategy.

The exploration drilling program will occur 24 hours per day, seven days per week, once underway, during the winter. When using one drilling rig, Chance will drill one well at a time and up to seven wells per year. Additional wells could be drilled if two rigs are being used. When hydrocarbon resources are discovered (either natural gas or crude oil), Chance will conduct EFT to gather data about the nature of the resource accumulation and its productive capability, which will be used to determine future development plans for each location. EFT timelines vary between wells with a primarily natural gas discovery and wells with a primarily crude oil discovery as follows:

- EFT on wells with a primarily natural gas discovery: maximum of one to two months; and,
- EFT on wells with a primarily crude oil discovery: maximum of two years.

EFT is typically conducted continuously (i.e., 7 days a week, 24 hours a day) until complete; once EFT has begun on a well, pausing or ceasing EFT is logistically challenging and time intensive. Up to 10 wells may be undergoing EFT concurrently, based on the proposed exploration drilling schedule, and up to 30 wells may undergo EFT over the life of the Project, depending on hydrocarbon resource discovery.

The Project does not include hydraulic fracturing.

Table 3-1. Project components and activities overview.

Project Component	Activities
General Project Overview	• Exploration activities for crude oil and natural gas in the Eagle Plains area: ▫ 2D and 3D seismic exploration ▫ Exploration well drilling, flow testing, suspension, decommissioning, and abandonment. ▫ Successful wells will be suspended but may be brought forward in future development project proposals. • Use of existing Chance camp to store equipment and supplies and to house personnel: ▫ Water use up to 20 cubic metres per day (m³/day) (for washing, showers, toilets, etc.). Bottled drinking water will be supplied to the camp ▫ Use and maintenance of existing wastewater treatment facilities ▫ 75-person capacity • Transport of goods, materials, and personnel to/from the Project area and within the Project area. • Project components will occur sequentially at each new well site over the 10-year Project term as follows: ▫ Initial mobilization of equipment to the Project site. ▫ Construction of required infrastructure. ▫ Well site development, drilling, testing, decommissioning, and abandonment. ▫ Progressive reclamation. ▫ Final closure and reclamation. • Ongoing engagement with First Nations. • Ongoing engagement with local community residents.
Seismic Exploration	• Establishment of seismic line mulching areas: ▫ Up to 1,500 km² of 3D seismic (2.75 m wide source lines, 1.75 m wide receiver lines all mulched) ▫ Up to 2,000 km of 2D seismic (2.75 m wide) • Global Positioning System (GPS) Survey of receiver points and source points • Low Impact Seismic (LIS) tracked air hammer drilling of seismic shot holes • Explosives storage (magazines), transportation, and use (1 kilogram [kg] per source point) • Recording with wireless system. Helicopter use for deployment and recovery of recording equipment and conducting data recording.
Drilling Exploration	• Winter establishment of up to 30 well sites, each approximately 1.44 hectares (ha) within the Project area ▫ Site levelling using packed snow or ice and rig matting as required • Installation of surface infrastructure on drill sites including: ▫ Drill rig ▫ Mud tanks, pumps, and mud mixing and separation systems ▫ Power generators ▫ Boilers ▫ Flare tanks and flare stack ▫ Blowout preventer accumulator system ▫ Fuel storage

Project Component	Activities
	▫ Cement mixing and storage ▫ Storage bins for rock cuttings removed from the drilling mud ▫ Trailers for offices, first aid, rig crew sleeping quarters, water storage and treatment, sewage storage, and food waste incinerator. • Drilling wells up to 2,500 m deep ▫ Wells drilled sequentially, one to two wells at a time, up to seven wells per year ▫ Use of low-toxicity, water-based mud system ▫ Use of an average of 15 cubic metres (m^3) and up to a maximum of 100 m^3 of water per operating day for drilling ▫ Disposal of drill cuttings into individual Mix Bury Cover (MBC) sumps or pods approximately 300 m^3 over an area of 800 square metres (m^2) (estimated volume of drill cuttings for one well) ▫ Disposal of approximately 200 m^3 of drilling mud in MBC • Drill Stem Tests (DST): one or more on each well at depths where formations with the potential to produce crude oil or natural gas were encountered. ▫ Potential acid stimulation using approximately 5–10 m^3 of a weak concentration of hydrochloric acid (10-20 percent [%]) ▫ Production and separation of fluids recovered from the well during the DST(s). ▫ Flaring natural gas, separation of crude oil and any produced formation water. • Disposal of formation water, saline fluids, liquid faction of drilling fluids and rig wash underground in deep-injection wells converted from existing suspended wells or wells drilled as part of this Project.
Extended Flow Testing (EFT)	• Installation of surface and subsurface equipment and facilities to enable EFT including: ▫ Casing of entire wellbore and perforation of the casing at zones of interest ▫ Packer, tubing, and downhole measurement gauges ▫ Wellhead valve assembly ▫ Flare tank and flare stack ▫ Separator vessel, treating vessel, and storage tanks ▫ Appropriate artificial lift systems (e.g., pumps) ▫ Heaters ▫ Dehydrators ▫ Flow lines ▫ Metering equipment ▫ Portable generators • Conduct EFTs on up to 30 wells ▫ May be completed within a few weeks at a predominantly natural gas bearing zone or may require up to 2 years for a predominantly crude oil-bearing zone. ▫ Separation of natural gas, crude oil, and formation water ▫ Production of crude oil and transportation of produced crude oil from the site to markets. ▫ Using natural gas on site for process heating, storage tanks and other vessels used, fueling artificial lifting to assist crude oil production, or compression of natural gas to be used in other areas of the operation such as fuel to heat the camp. ▫ Flaring natural gas during EFT if unable to use on site.

Project Component	Activities
	• Disposal of formation water, saline fluids, liquid faction of drilling fluids and rig wash underground in deep-injection wells converted from existing suspended wells or wells drilled as part of this Project.
Well Maintenance (Workovers)	• Suspended wells are inspected annually, and active wells are subject to servicing on an as-needed basis to address operational issues that interrupt the EFT, requiring mobilization and installation of a service rig to the well site to remedy the problem. • Maintenance activities include: ▫ Wellhead Inspection Pressure Test of surface wellhead valves ▫ Surface Casing Vent Flow test ▫ Gas Migration test ▫ Repair or replace pumping equipment ▫ Clear blockages to fluid flow that can develop during EFT ▫ Replace worn-out downhole equipment ▫ Set up EFT in other formations within the same wellbore ▫ Suspend or abandon wells after EFT
Access Roads	• Construction of winter trail access for exploratory well drilling, DST, EFT, and seismic program access and execution. • Clearing woody vegetation along identified route above the surface of the snow. • Minimum of 10 centimetres (cm) of packed snow accumulation, packing snow and, in some sections, spreading water to create ice on the ground surface. • 8–10 m wide with wider pullouts of 16–20 m spaced every 5 kms to allow for passing traffic. • The total length of winter access roads per season will vary based on locations identified for exploration drilling each winter; new well sites will be accessed using existing/previously used routes as much as possible to minimize new clearing and linear disturbance. ▫ Each season, a maximum of 125 km of new (previously uncleared or used more than ten years ago) winter access roads will be created. ▫ Approximately 15% of the roads will be built on previously disturbed ground (old roads, cutlines, etc.) ▫ A maximum of 200 km of winter access roads (new winter access + previously cleared winter access) will be active each season. • Clearing of vegetation.
Mix Bury Cover (MBC) Construction and Operation	• Construction of MBC sump approximately 6.4 ha total in area to dispose of drill cuttings and drilling by-products. ▫ The sump will be excavated as disposal volume is required to minimize potential permafrost exposure (possibly in narrow compartments oriented east-west to maximize shading). ▫ Each MBC “pod” will be 800 m^2 and contain the drill cuttings from one well; only one pod at a time will be active/excavated. ▫ A typical well produces up to 300 m^3 of drill cuttings for disposal; development of the MBC would parallel the rate of exploration drilling (i.e., typically 1,500 m^3 of drill cuttings for disposal each year) • Removal and stockpile of organic cover material and silts for use in reclamation.
Central Processing Facility (CPF)	• Construction of CPF adjacent to the camp, which would include: ▫ Multi-stage and multi-phase separators ▫ Heat treatment

Project Component	Activities
	▫ Vapour and gas collection system for flares or to provide fuel for camp use ▫ Processing of crude oil to stabilize and meet specifications for truck transport ▫ Storage of approximately 3,180 m³ of crude oil ▫ Storage of approximately 119 m³ of formation water • Fuel storage facility ▫ 151,000 L diesel fuel ▫ 24,000 L propane • Storage and use of chemicals and reagents: ▫ Hydrochloric acid (10% to 20% concentration) ▫ Methanol ▫ Additives to prevent corrosion of oilfield processing and handling equipment ▫ Demulsifiers to be used in treating fluids to better separate oil from formation water • Bulk explosive compound to store dynamite for seismic exploration.
Airstrip	• Construction of an airstrip approximately 1,500 m long located at about km 4 along the Chance winter road from the Dempster Highway intersection • Airstrip use throughout the Project life, approximately two flights per week. • Aviation fuel storage
Water Use	• Use of up to 300 m³ of water per day (or per permitted limits) for making snow to build winter trails, ice roads and temporary well sites, not exceeding 10% of the instantaneous flow from the following extraction points: ▫ Year-round extraction from the Eagle River, Ogilvie River, and Whitestone River. ▫ Seasonal extraction from Glacier Creek and Fly Camp. • Use up to 20 m³ of water daily (for washing, showers, toilets, etc.); bottled drinking water will be supplied to the camp. • Construction of a water reservoir at the camp for water storage and use during low water periods.
Transportation	• Use Dempster Highway, North Klondike Highway, and Alaska Highway to access Project site. • Approximate offsite traffic on public roads between the site and supply points is estimated to be: ▫ 7–10 water trucks and up to 3 fuel trucks per week. ▫ 8–9 lightweight service vehicles per week as needed. • Onsite traffic on Proponent-controlled roads is estimated to be: ▫ Fuel and water deliveries at a rate of 5-8 trucks per week. ▫ Lightweight service vehicles daily to transport personnel and gear from camp to well sites.
Camp and Workforce	• Up to 75 people on-site during all Project components. • Continued use of existing 75-person Chance Camp, located at km 325 of the Dempster Highway. ▫ Existing waste management and disposal facilities. ▫ Existing wastewater treatment infrastructure. • Use Eagle Plains Hotel to accommodate personnel overflow for short periods, if required.

Project Component	Activities

Reclamation and Closure	• Progressive abandonment and reclamation of unsuccessful wells.
	  ▫ Installation of cement plugs across all porous/permeable zones within the wellbore, across the base of each casing section and including an overlapping portion below the surface casing with the base of the surface casing.
	  ▫ Cutting a surface portion of well casing(s) off at least 1 m below ground level and welding steel plates to cap the casing.
	• Progressive decommissioning and reclamation of access routes when they are no longer necessary.
	• Well suspension or abandonment at the end of Project.
	• Decommissioning and reclamation of the MBC sump area and airstrip at the end of the Project.

3.1 SEISMIC EXPLORATION PROGRAM

3.1.1 Seismic Data and Drill Locations

Seismic uses a compressional seismic p-wave (like an ultrasound) to remotely image layers of rock beneath the surface. The technology measures the reflected energy waves to identify geological settings where oil and natural gas might be deposited. This imaging allows geophysicists and geologists to map the subsurface structure of rock formations that could potentially contain hydrocarbons. The placement and orientation of these layers help to pinpoint the area with the greatest potential to drill a successful well.

Source points use small dynamite charges in shallow holes to create the p-waves that reflect off the various rock layers underground like an echo to be recorded by highly sensitive recording devices called geophones. The detonations used to create the seismic wave are contained within the hole to force the energy downward through the various rock strata. A seismic detonation of 1 kg creates a dull thud that can be heard only near the hole. It is comparable to a passing diesel truck for ½ second duration. As the energy bounces back to the surface, the geophones detect the seismic waves and record the data **Figure 3-1.** The time it takes to receive the sound wave from the detonation tells geophysicists and geologists where the rock properties change, helping to find the oil and gas deposits. Very little reflected energy is perceptible at the surface by anything other than the highly sensitive geophones.

Once all source points have been detonated in sequence, the data are processed and analyzed. The interpretation of the seismic data can give geophysicists detailed cross-sections (2D seismic lines) and multi-dimensional graphics (3D seismic programs) of the sub-surface area. This information is combined with previously known information about the rock types within the area and their properties, such as hardness, density and porosity, to support drilling locations for wells. The decision to drill wells or acquire additional seismic is determined by the amount and quality of the data available (**Figure 3-2**).

Decisions to drill wells or acquire additional seismic data is an ongoing process to define the resource potential in a particular geological formation or geographic region and is a combination of geological and geophysical efforts. The process includes ongoing seismic acquisition and geological evaluation as the wells are drilled and production capabilities are examined.

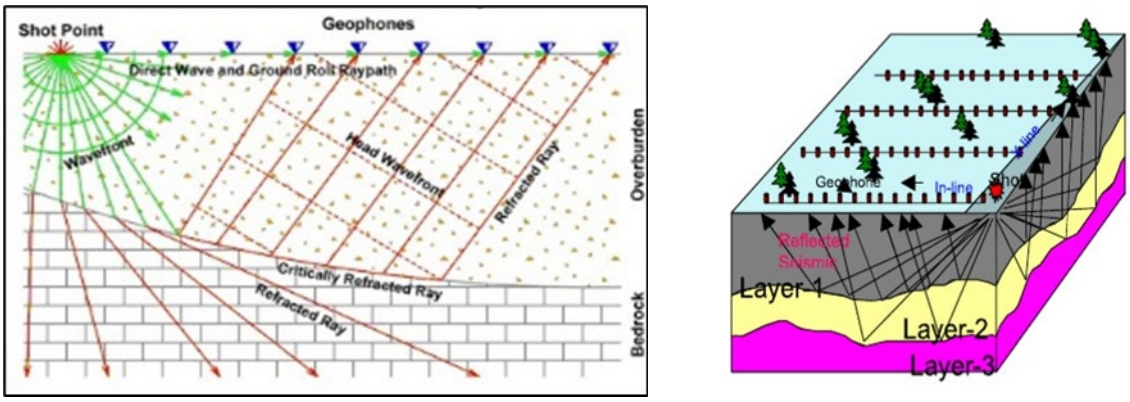


Figure 3-1. A graphic example of the reflection seismic exploration data collection process.

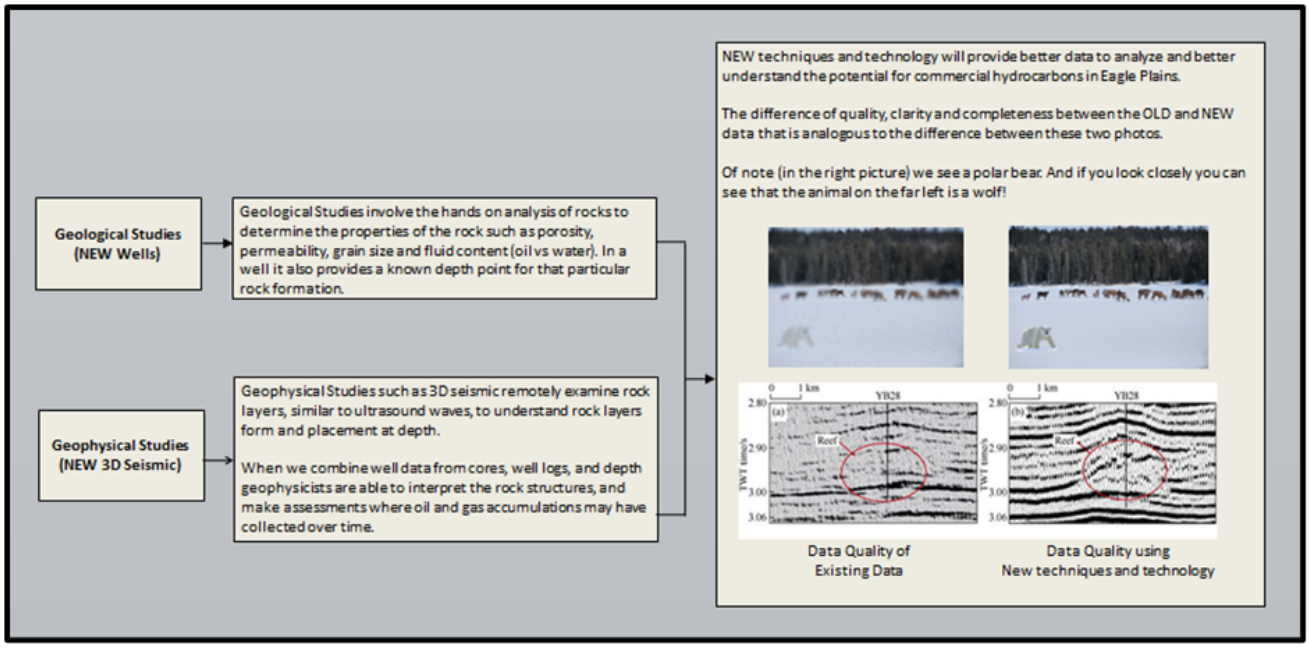

Figure 3-2. Example geological and geophysical studies.

3.1.1.1 Seismic Data

Seismic data is required in the Eagle Plains Basin to understand the area's complex geology. Modern seismic techniques will provide high-quality information about the geology of Eagle Plains while minimizing environmental effects. The proposed area for seismic exploration consists of about 1,500 km² of new 3D and 2,000 km of new 2D reflection seismic exploration within Chance's exploration permit area. **Map 3-1** illustrates the extent of the exploration area. However, the location of each annual seismic program, whether 2D or 3D, will be determined by analyzing the exploration drilling results and how seismic may help determine the knowledge of the basin. Low Impact Seismic 2D programs can be used to determine the extent or edge of a prospect, and LIS 3D will show more detail.

Depending on available accommodations, personnel, and equipment, the seismic data will likely be acquired in several discrete programs of approximately 400–700 km² areas. Year-round operations will enable resource allocation by completing line preparation during the winter and conducting the recording activities during the summer using heli-portable operations. Lines will be prepared in winter when snow is present, and the ground is frozen. Winter ground preparation will protect the active layer and underlying permafrost and preserve saplings and small shrubs. Year-round operations will enable larger portions of the seismic program to be completed with reduced disruption within the Project area.

For LIS 3D, a design is created by a professional 3D designer. For the Eagle Plains area, receiver lines will have an east/west orientation, and source lines will be oriented north/south. The spacing between points is determined by the level of data resolution required to image the shallowest rock formation of interest. It is estimated to vary between 40 and 50 m since the geology at Eagle Plains dips from the northeast (NE) to the southwest (SW). For a given layer of rock, it will be physically shallower in the NE part of the basin and deeper in the SW. The receiver lines will be mulched with the narrowest mulch head size (1.75 m wide), allowing for safe travel by foot, snowmobile or ATV and will run roughly parallel to other meandering receiver lines spaced approximately 200 m apart. The north-south source lines will be mulched (2.5 m wide) to allow access for the tracked drills that make the shot holes. The source lines run roughly parallel to other meandering source lines approximately 300 m apart. For LIS 2D, the geophones and sources are located within the same meandering, about 2.5 m wide, line.

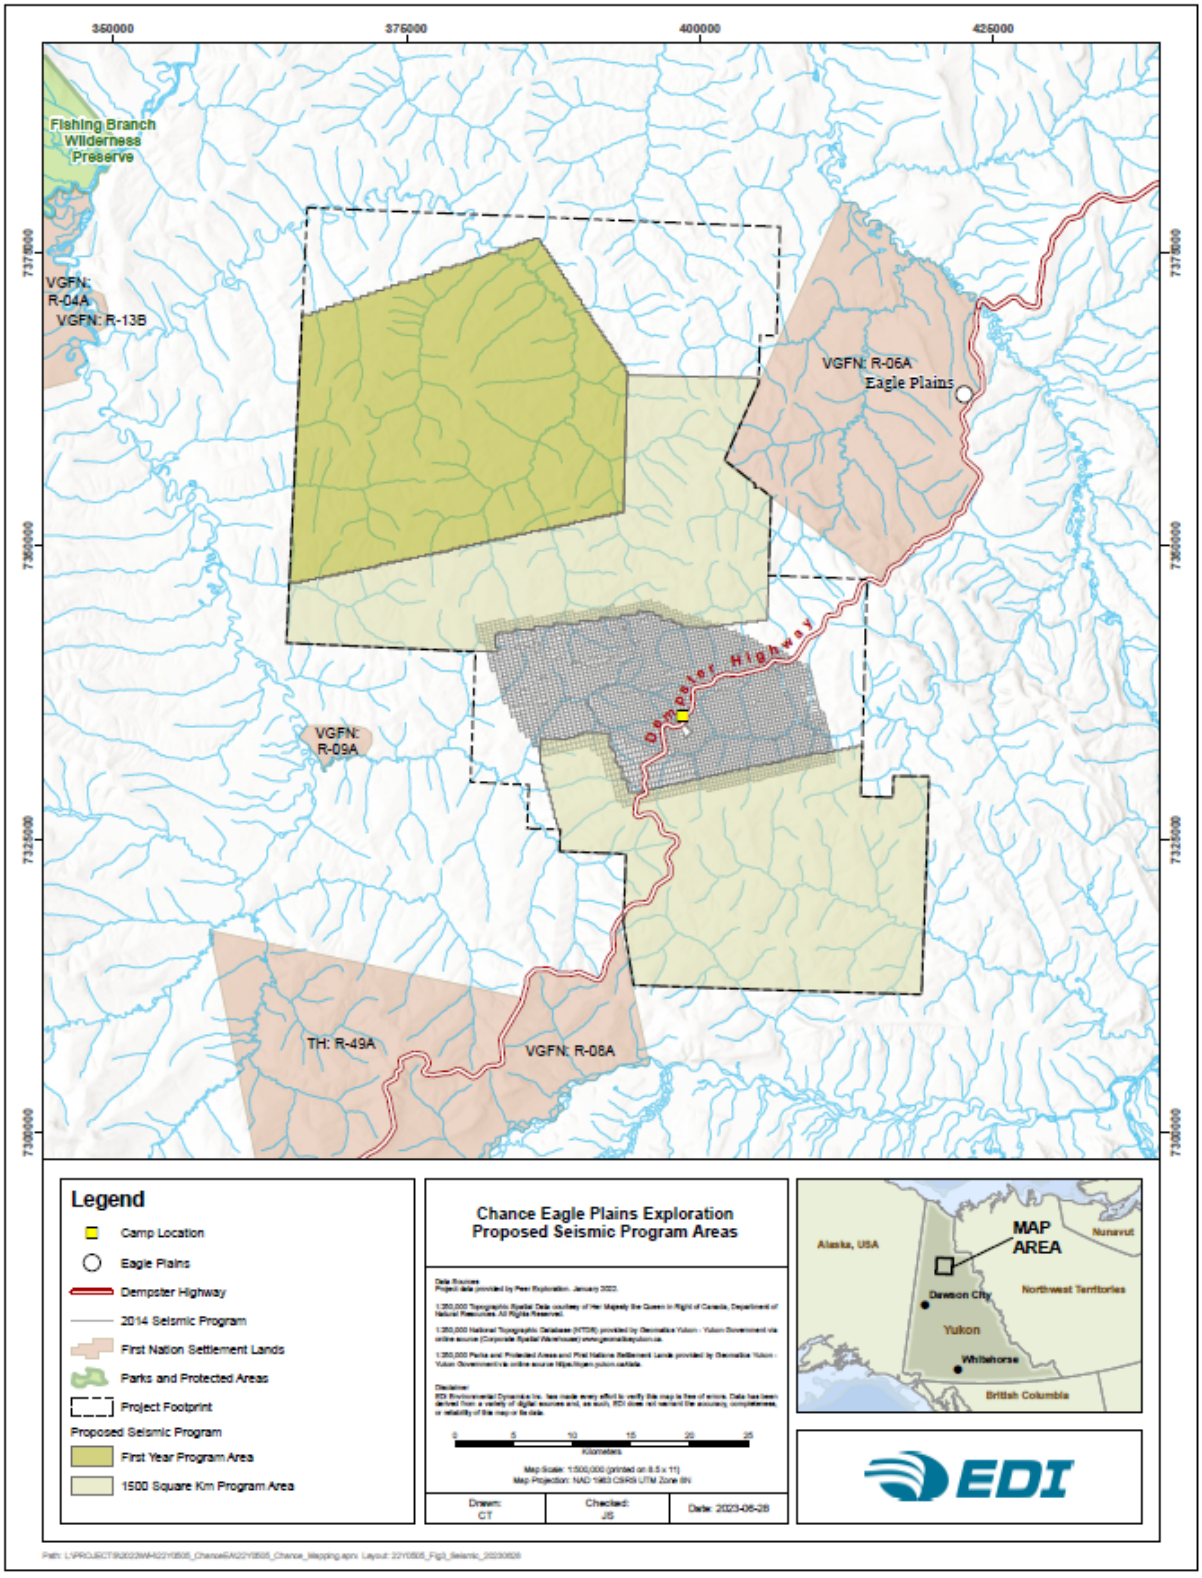
During the recording process, each source point is detonated separately upon the initiation of a radio signal directed by the field operator called a “shooter”. The shooter is positioned at least 30 m from the active station and can survey the surrounding environment to observe detonation safety. The source point that will be detonated is in the source “swath” area and provides a center point for the recording patch. A recording “patch” is the area of live (active) geophones that are closest to the source point swath area (within 3,000 m). Upon detonation of the source point within the swath, the geophones in the recording patch collect the data. For the Eagle Plains area, the patch size is comprised of 16 lines containing 140 geophones each (**Figure 3-3**). The patch ensures that far offset distances are greater than the depth of target formation; therefore, the data will encompass areas large enough to prevent gaps in the data. The patch is moved digitally and physically as the shooter travels from east to west and then north to south. Geophones are continually picked up from the recorded area and moved to the next area ahead of the recording patch.

As seismic program data will be acquired over several years, naturally occurring fires are likely in the area. Several fires have occurred in the Eagle Plains basin, and approximately 60% of the Project area has been burned. The most recent wildfire occurred in 2017, burning 294 km² within Chance’s exploration permits 0010 and 0012 (**Map 3-2**).

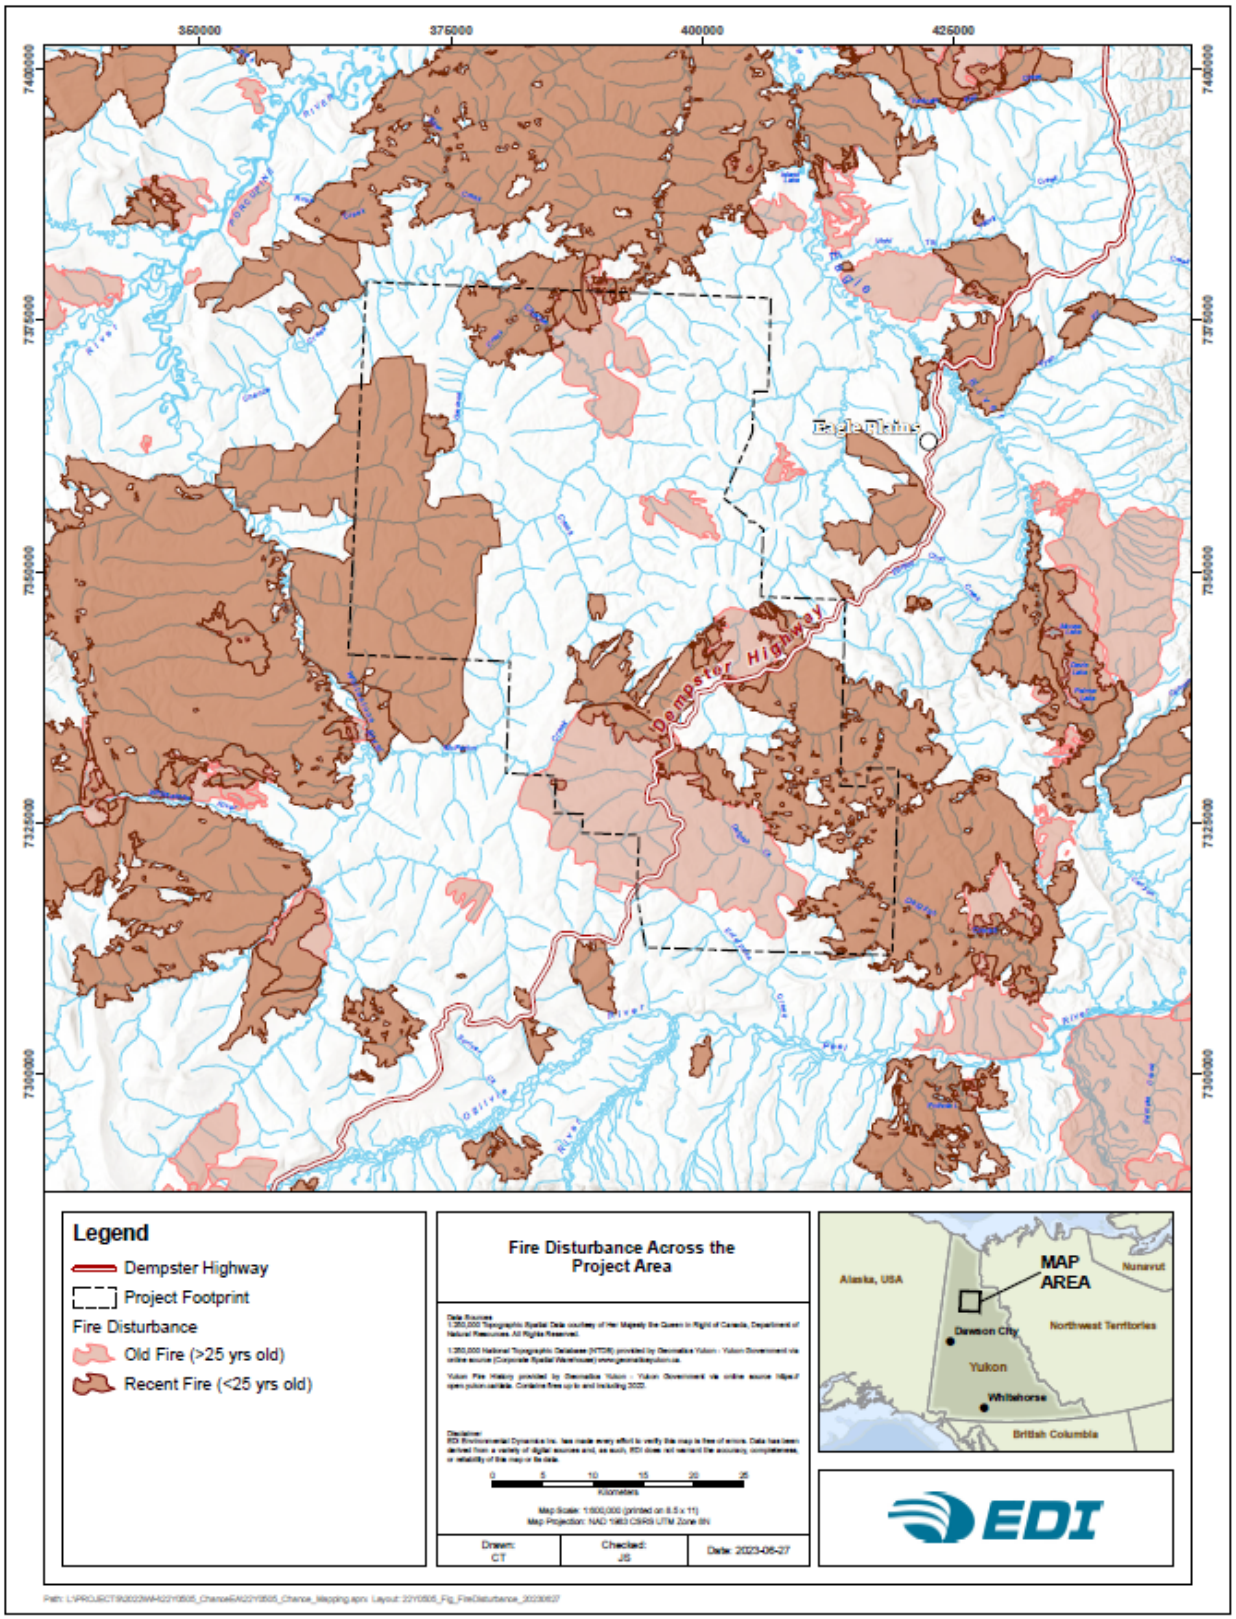
Each year that a seismic program with be conducted, an analysis of mitigation strategies is undertaken, and appropriate strategies are implemented to reduce the environmental effects in the area. One example is using existing burn areas rather than clearing new vegetation where possible. The proposed first-year seismic program was designed considering the existing open meadow and burn areas. Lines traversing these areas will not disturb live vegetation and should not be regarded as a functional disturbance. Regrowth in these areas will also be monitored to gauge the natural regeneration conditions in the area. Previous LIS seismic line disturbances will continue to be, analyzed to ensure that current methods of line

preparation provide optimal conditions for regrowth in the Eagle Plains area. Ecological, permafrost and historical data have been extensively gathered and incorporated into the operations plan.

Seismic operations are planned for year-round operations in the year that they are to be conducted, based on length of time required to conduct each component of the program and the limited personnel, equipment, and accommodations available in the Eagle Plains area. The line preparation (access trail construction, line cutting, surveying, and drilling) will be conducted during the winter months (December through April) under frozen ground conditions and recording would then follow in the summer months (July through September) (**Figure 3-3**).



Map 3-1. Proposed seismic program area in the Eagle Plains Project Area.



Map 3-2. Forest fire burn areas in Eagle Plains.

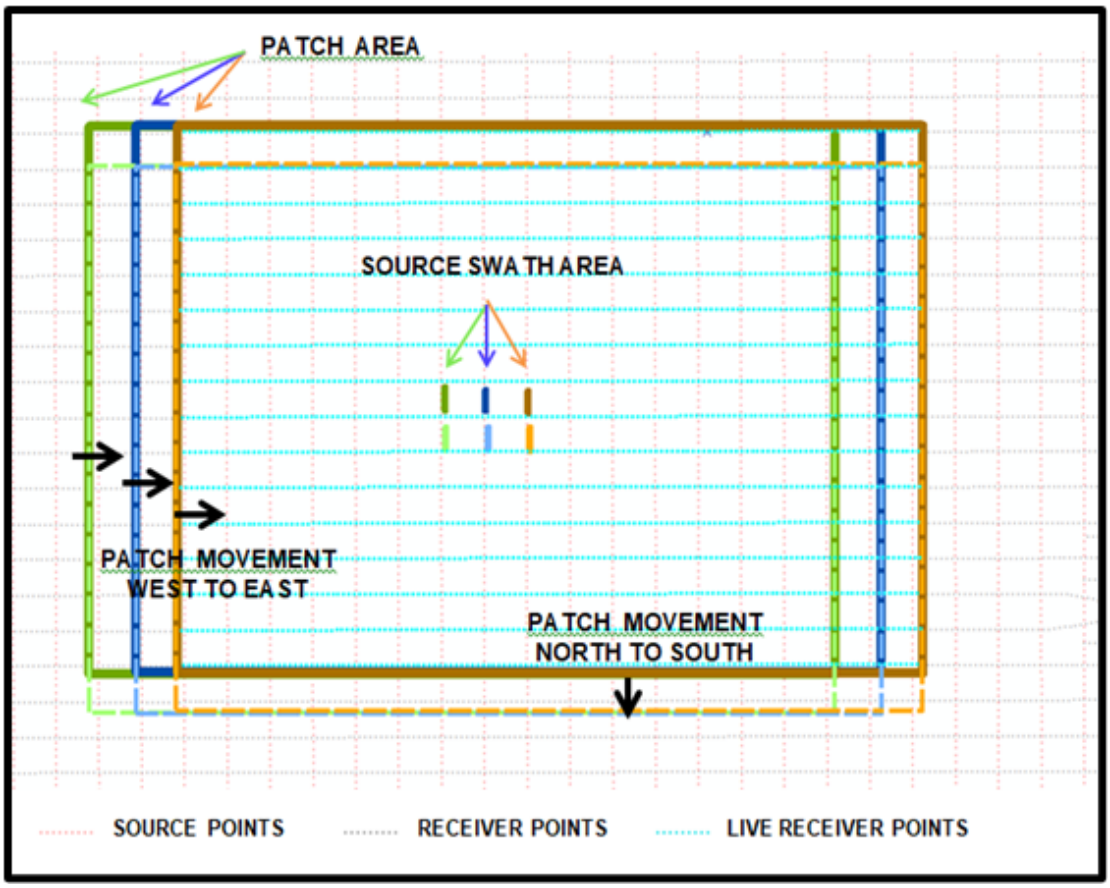


Figure 3-3. Proposed seismic patch size and movement throughout the Program area.

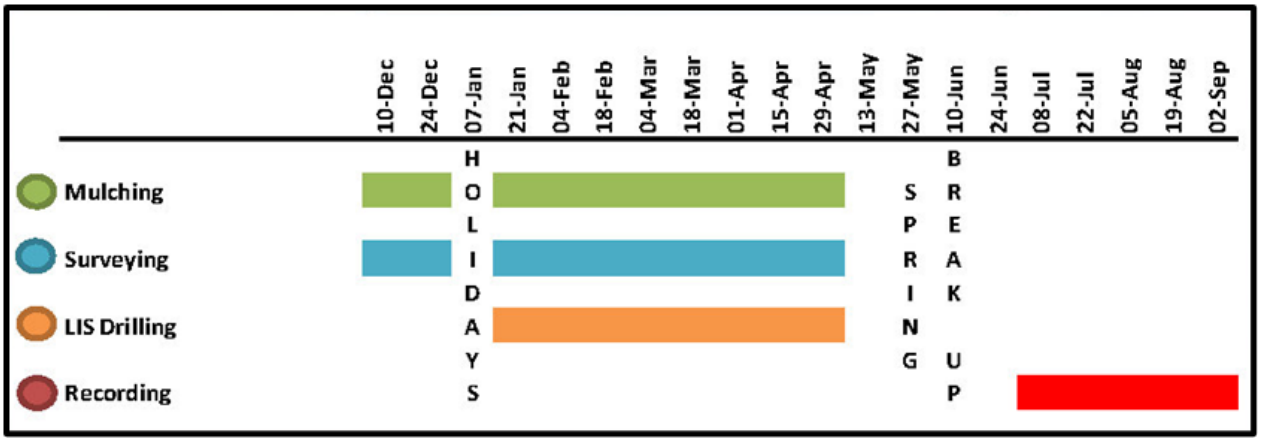

Figure 3-4. Proposed year-round schedule in Eagle Plains.

3.1.1.2 Seismic Line Construction

The historical seismic data in the Eagle Plains area consists of “Legacy” 2D seismic lines and the “Modern” LIS 3D seismic program conducted in 2013–2014. The methods used to construct the Legacy 2D lines included 6–10 m wide lines in straight (linear) patterns that cross the landscape. These lines are visible today mainly due to the use of bulldozers to remove over/understory — clearing methods and wider lines that are not required in modern LIS practices. Modern LIS line construction methods use narrow line widths that meander and create non-linear line disturbances. Bulldozers are no longer used in seismic line construction; smaller and narrower mulchers are now used to support the preservation of the active layer and reduced vegetation removal.

Line preparation will use the LIS methods, reducing the landscape footprint. This technique creates meandering source and receiver lines that limit the line of sight to less than 70 m, which minimizes any predator (e.g., wolf) line of sight for prey. The LIS method also ensures that the line can avoid removing larger timber that shelters under canopy vegetation by adjusting the meander of the line to avoid larger trees and mature vegetation.

3.1.1.3 Constraint and Sensitive Habitat Identification and Mitigation

Before line preparation, a detailed line-by-line spatial analysis (area examination) is performed using a combination of air photos, Light Detecting and Ranging (LiDAR), field scout information, Geographic Information System (GIS) information, First Nation cultural inputs and heritage studies, permafrost studies and flora and fauna assessments. Existing disturbances, burn areas, and natural open areas will be used rather than create new cutting where possible. Topography, natural drainage, and runoff patterns will be considered when developing the seismic design to prevent impediments to water flow. All lines will have offsets to protect sensitive habitats. Streams and rivers will be avoided except for crossings at access points. Doglegs will be used where lines intersect major access routes to reduce visibility and use as access.

Planning the seismic, winter access, and well pad sites considered water, landscape, landform (e.g., permafrost), vegetation and habitat sensitivities to disturbance. A “Constraints Map” exercise was conducted to identify especially sensitive or high quality environmental and heritage values where project work should be avoided. Constraints include areas that are sensitive for environmental, cultural, or safety reasons. In seismic exploration, the term “constraints” is often referred to as “hazards”. Examples of environmental values in Eagle Plains include permafrost areas, high-value wildlife habitat, wetlands, riparian areas, and heritage sites. Management measures applied with the constraints map include complete avoidance of project development/activities within the mapped areas and a range of other types of mitigations where avoidance is not possible — examples include rig matting, winter work, LIS, etc.

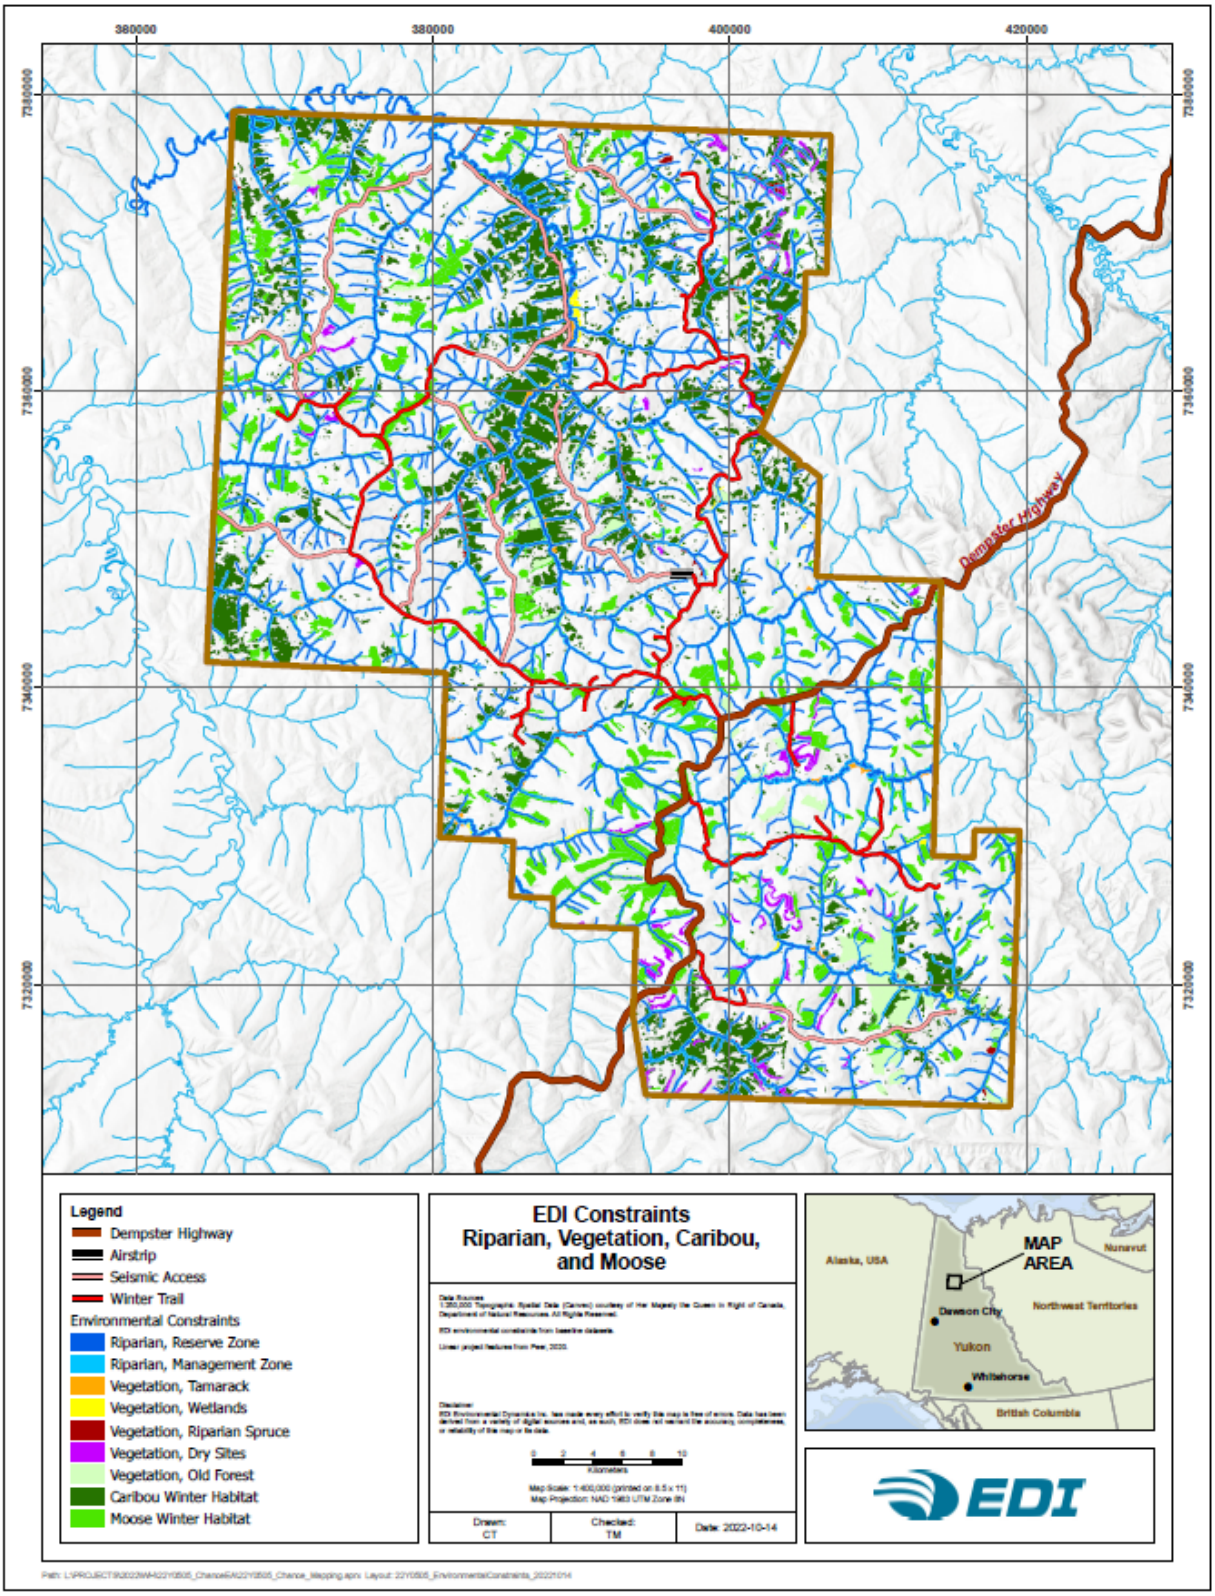
Developing and applying a constraints map for environmental and heritage sites is especially useful when certain project features cannot be preplanned (i.e., mapped), which is the case for multiple features in the Eagle Plains Project. Since Chance cannot plan exactly where Project features will occur as exploration proceeds, identifying high value areas where Project features cannot occur is a good approach to mitigating potential effects.

Details of the constraints mapping approach will be provided in the environmental assessment portion of the Project Description. Several important landscape and ecological features were considered, but the key features built into the constraints map (**Map 3-3**) included the following:

- Surface water and fish were considered by creating no-disturbance buffers in riparian areas to higher order streams where fish are likely present in the summer.
- Vegetation was considered by identifying sensitive Ecological Landscape Classification units including dry sites, riparian spruce sites, tamarack sites, and unique wetland sites.
- Moose habitat included high-rated forage sites.
- Heritage sites and high heritage potential identified by the Yukon Government, First Nations, or site-specific surveys.
- Caribou high value forage habitat.

The avoidance priority considering all constraints is as follows:

1. Heritage sites;
2. Permafrost/terrain sensitive areas;
3. Riparian management areas;
4. Priority ELC units;
5. Caribou habitat; and,
6. Moose habitat.



Map 3-3. Constraints Riparian, Vegetation, Caribou, and Moose.

Pre-flagging may be conducted to identify Pand mark line locations containing riparian areas, difficult terrain, hazards or constraints, historical/archeological areas, animal features and facilities. This is done by personnel on the ground marking the line locations and areas of concern for the mulchers and chainsaw operators to follow or avoid. These areas will be added to the Project map and used to plan each area's activities strategically. Decisions can be made to delay progress in certain areas due to wildlife presence or to employ different equipment that would be better suited to the terrain in that area. In addition, geofences can be created to monitor activities near “Hot Spots” which are areas of concern that personnel must avoid. Handheld GPS units support accurate line placement and automatically notify management when the mechanical equipment approaches a “Hot Spot” or stations encroach on any buffered zones or areas. Personnel trained to monitor the production crew’s location based on the GIS data gathered during the pre-flagging stage to ensure designated equipment and personnel in the area are safe.

3.1.1.4 Line Preparation — Cutting

A combination of mulchers and operators with chainsaws will prepare source and receiver lines that will be closely monitored and quality controlled. Mulchers (**Photo 3-1)** are equipped with GPS units with seismic line data to allow the operator to follow a pre-planned course. Mulcher operators have detailed information on the area’s pre-identified hazards or constraints, culturally sensitive locations, flora and fauna setbacks, and course derivations, and the operator takes care when approaching these areas of concern. Lines will be doglegged (or bent) at locations crossing any major access trails and open clearings to reduce the visual identification of access points into the program area. Meandering line construction chooses the path of least resistance and avoids timber larger than 20 to 30 cm in diameter (**Photo 3-2** and **Photo 3-3**). This technique reduces the line of sight down line to less than 70 m. Studies conducted on the 2014 3D seismic program found that the average off-line sight line was 46 m due to the region's sparse tree density and large burn areas.

Source lines will be mulched to 2.5 m wide (**Photo 3-2**) to accommodate tracked LIS drill vehicles, and receiver lines will be 1.75 m wide (**Photo 3-3**) to accommodate snowmobiles, ATVs and personnel. A minimum of 10 cm of packed snow will be left online to mitigate possible damage to vegetation or permafrost. Riparian areas and lines containing pokers or leaners will be hand cleared with chainsaws.

The seismic line preparation will be done using rough mulching: a technique that removes the branches but leaves the tree's stem intact. This technique is useful in leaving evenly distributed coarse, woody debris allowing for more rapid decomposition of the fallen timber while enabling the new vegetation to propagate through the mulch (**Photo 3-4**). The mulcher heads are set to high blade, leaving the active layer undisturbed and soil or permafrost unaffected. The mulch also protects the root system of young timber from heat, cold, drought and erosion. Rough mulching makes lines narrower, creating more natural lines with weakly defined cut-width edges.

The Eagle Plains Basin has few watercourses of substantial size. Most watercourses are intermittent and have little or no year-round fish-bearing potential as they freeze to the bottom in winter. The most notable watercourses are Chance Creek and Greaves Creek (in the North), McParlon Creek (Central) and Dalglish and Enterprise Creeks (in the South). The Whitestone River is west of and outside of the Project area.

Since creeks in the program area freeze to the bottom in winter, no “major” watercourse crossings will be required. A major watercourse crossing is any stream or river that will not freeze to the bottom or the water flow is too great to sustain a snow fill crossing. Crossings are categorized as mechanical (equipment crossing) or foot crossing. The mechanical crossings (**Figure 3-5)** will be constructed using snow fills and may require a water truck to make snow and freeze in the crossing. Water crossings are first packed with clean snow pushed from the creek surface to the crossing location. This prevents woody debris from contaminating the creek during spring melt. The snow is then hardened using a water truck to form ice to strengthen crossing integrity with the weight of the equipment. Snow fills in both creeks and drainage areas will preserve the integrity of the banks for adequate water flow and run-off. All crossings will be removed before spring break-up to allow obstruction-free drainage. All snow fills will be constructed following the Department of Fisheries and Oceans (DFO) *Code of Practice: Ice Bridges and Snow Fills* (September 2022) (Government of Canada 2022).

Riparian areas are also examined and added to the program map. Since riparian areas provide key resources for wildlife and bank stability, mechanical equipment is restricted to a 55 m setback from the bank edge. This setback protects vegetation disturbance in the area and makes sure source holes terminate at a safe distance to avoid flowing holes (**Figure 3-6)**.

Photo 3-1. A 2.5 m wide mulcher.

Photo 3-2. A 2014 3D source 2.5 m wide line in the Project Area.

Photo 3-3. A 2014 3D receiver 1.75 m wide line.

Note: minimal disturbance to the active layer and minimal mulch produced.

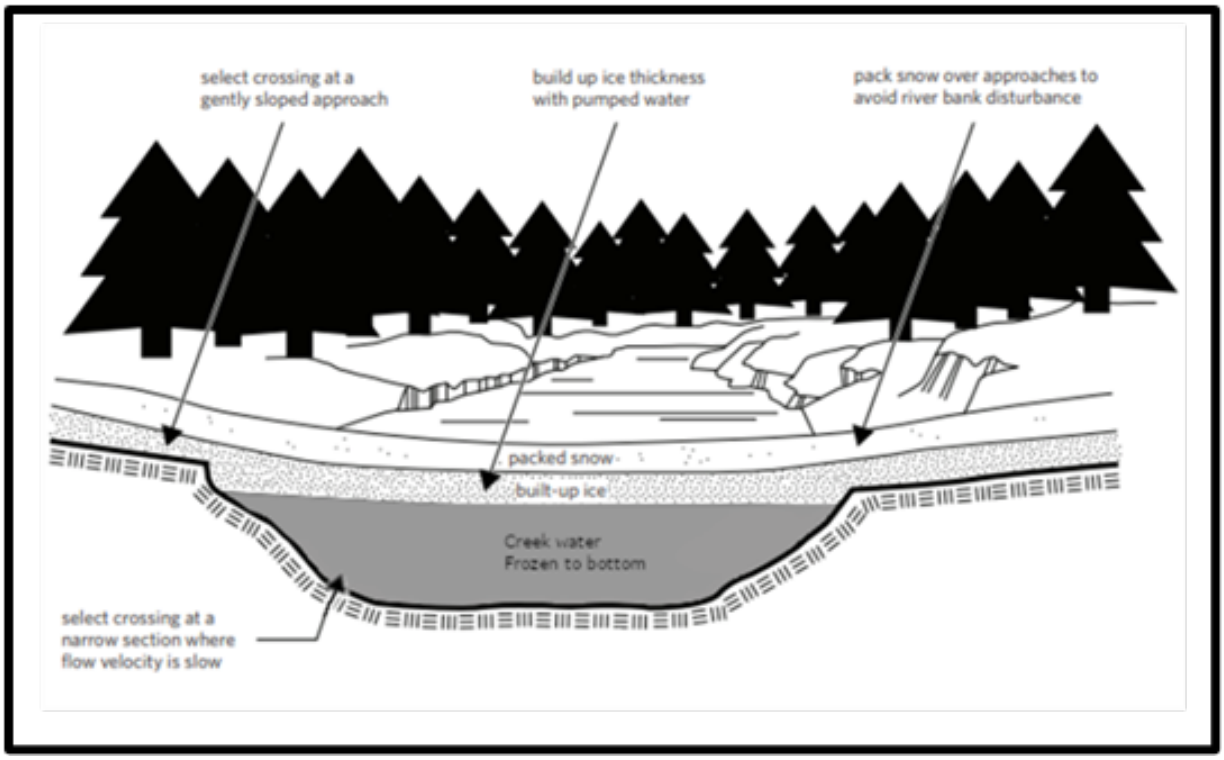

Figure 3-5. Typical creek crossing in Eagle Plains. Creeks are crossed at a 90-degree angle to banks to preserve bank stability.

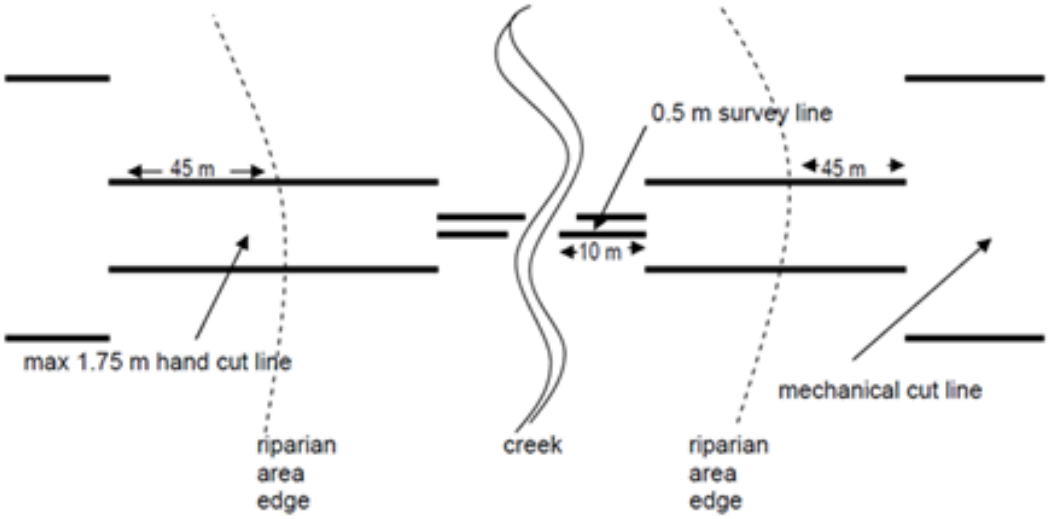

Figure 3-6. Riparian area diagram with cutting and mechanical equipment setbacks.

3.1.1.5 Line Preparation — Surveying

Once there are a sufficient number of source and receiver lines cut to allow the next stage of the seismic program to occur, surveyors then travel the source lines using all-terrain vehicles (ATVs) and snowmobiles to survey and mark each drill location of the source holes; and on receiver lines they mark the receiver points where the recording crew will place the wireless geophones.

Surveyors also add to the hazard/sensitive site assessment map as they record their GPS data. These data include:

- riparian areas;
- difficult terrain;
- historical/archeological areas;
- animal sites/features;
- facilities;
- hazard identification;
- proper line placement;
- movement around thick bush;
- refining cutting requirements; and,
- flag all hazards or constraints and riparian areas.

3.1.1.6 Line Preparation — Drilling

Once source points are surveyed, narrow-tracked LIS drills (**Photo 3-5)** are deployed to drill a 10 cm diameter, 6 m deep hole at each location. For the proposed seismic programs in Eagle Plains, the source points will be spaced along the source lines at approximately a 50 m interval.

No water was required to drill the source holes during the 2014 seismic program, and cuttings were easily reloaded into the hole chamber after the dynamite was placed at the bottom of the hole. Source holes are loaded with 1 kg of dynamite to be later detonated by the recording crew (this is called pre-loading). As

provincial/territorial and federal legislation requires, each source point is plugged with drill cuttings (soil, rocks, etc.) brought up to the surface from the drill stem). An industry-approved plug is inserted into the hole at a minimum depth of 30 cm below the surface and then filled to the surface with more drill cuttings.

Peer and the industry's explosive providers are aware of the regulations under the federal *Transportation of Dangerous Goods Act, S.C. 1992, c. 34* (Government of Canada 1992) and strictly adhere to those regulations. Explosives will only be transported in approved magazines and by individuals trained in transporting dangerous goods. Natural Resources Canada (NRCAN) regulates and controls all aspects of explosive possession and transportation through magazine licenses which are renewed annually. The new Electronic License Management System (eLMS) allows up-to-date management of all explosive purchases, transport, and incidents to ensure explosives are tracked and safely stored. The two types of magazines that will be used to store explosives are as follows:

Maxam Type 9 Magazines (Photo 3-6):

- There are two compartments — dynamite and detonator.
- Type 9 magazines are lined with 7/8" Armortex (Bullet Proofing and Blast Resistant). Dimensions are 58" wide x 144" long x 66" high.
- Doors are high security and built as per NRCAN Regulations and issued a Federal Tag #.
- There will be two different sizes of skidded Type 9 magazines which will store up to 3,000 kg of explosives and 5,000 detonators, depending on packaging. There are also wheeled Type 9 magazines built to the same specifications but with reduced capacities.
- Construction from the outer skin to inside is:
  - ¼" steel plate;
  - 7/8" Armortex; and,
  - ¼" plywood interior.
- Weight is 7,500 pounds (lbs).
- These magazines are transported by either small custom-built tandem axle trailers, tandem axle recovery/tow truck with a flat bed or any truck trailer unit such as a low boy.

Maxam Type 4 Magazines:

- Single-compartment magazine;
- Various sizes — 8' wide x 12' long x 7' high with a capacity 7,500 kg;
- High-security door construction as per NRCAN Regulations and issued a Federal Tag #;
- Construction from the outer skin to inside is:
  - ¼" steel plate;
  - 3" gravel;
  - ¾" plywood interior.
- Weigh 18,000 lbs; and,
- These magazines are transported with either a tandem axle recovery/tow truck with a flat bed or any truck unit such as a low boy.

Photo 3-5. Narrow Low Impact Seismic (LIS) drills.

Photo 3-6. Explosives magazine storage (Maxam Type 9).

3.1.1.7 Data Acquisition — Recording

Recording the seismic program consists of two stages: laying out and picking up equipment on the receiver lines; and detonation at each source hole.

Geophone "Lay-out"/ "Pick-up" — Line crew members place the geophones (**Photo 3-7**) and associated equipment at each receiver point location. Using a long line and heli-bags, a helicopter will place and retrieve recording equipment along the receiver lines at predetermined intervals. Recording personnel will access the equipment in the heli-bags and place a series of geophones approximately every 40 m along the receiver lines. The recording crew will be using a cable-less recording system. Cableless recording systems are ideal for gathering seismic data because they reduce the constraints on geophone placement, eliminate downtime for cable repair, and reduce the number of crew members required to deploy the equipment. Once in place, the geophones record the seismic waves created by the charges detonating on the source lines. Once the section of geophones is recorded, personnel and a helicopter return to retrieve the equipment and any debris used to mark the surveyed receiver locations. The geophones are returned to the staging site, downloaded, cleared and deployed back to the program to be laid out again to record the next section of line.

Photo 3-7. Example of a geophone.

Source Point Detonations — This stage begins after the first section of geophones has been laid out on the receiver lines. Specially trained personnel called "shooters" traverse the source lines on foot, via ATV or snowmobiles, to each source point. The shooter examines the area around the source point for any possible hazards, constraints, or wildlife and inspects the condition of the leads. They connect the detonation device to the leads and signal to the Observer (located at the staging site) that the charge is safe to detonate. The shooter stands clear of the source hole (approximately 30 m) but remains within

viewing distance to watch the area remains clear. A specific radio signal initiates the detonation, and the shooter returns to the hole to remove the detonation device, the leads, and any flagging or markers in the area. The shooter then proceeds to the next source point and repeats this procedure.

Once the program is complete, a crew may be deployed to clean up any remaining material used online for the seismic program. The garbage is returned to a staging point and discarded in an approved bin to be transported to a waste facility. The crew also reports issues that may require further reclamation to be immediately addressed.

During the recording stage, the equipment on the source and receiver lines is accessed by foot, ATV or snowmobile or by helicopter. The helicopter will be based out of the Chance Camp at km 325, and the use of the helicopter will be minimized as much as possible. Where possible, the helicopters will be sourced from local operators familiar with the environment and the Flying in Caribou Country guidance document (Government of Yukon 2010); however, specialized long-lining operators will be required outside Yukon for the recording operation. The addition of helipads will also be required for safety and medevac reasons but will be selected in naturally open and sparsely treed areas.

Staging sites will store some or all of the following equipment throughout the seismic program. All equipment is moved to the next staging site as the equipment is required in the next area of the program:

- Trucks (1/2, 3/4, and 1 ton);
- ATV and snowmobiles;
- Trailers (flat decks and covered);
- Double-walled fuel tanks (diesel 145,228 L, Gas 83,825 L and Jet-A 35,000 L) The fuel will be contained at the main camp in double-walled tanks and transported to the staging sites in a 2,000 L tank trailer for use during operational activities in each area.
- Helicopter & fuel tanker;
- Picker trucks (1-ton trucks with equipment);
- Recording bags;
- Garbage bins to temporarily store garbage before incineration;
- Magazine;
- Survey and drill supplies;
- Canvas tents;
- Medivac unit;
- LIS drill units;
- Seacan for storage and tools;
- Snow cats;
- Water truck;
- Battery truck; and
- Mulchers.

3.1.1.8 Program Access and Remote Camp

Access Trails & Road Crossings — Access routes will be created in strategic corridors to maximize HSE Occupational Health and Safety (OH&S) requirements and to minimize environmental effects. Proposed access trails will be developed using a combination of existing trails, historical seismic lines, or on new cut lines. All access trails will be developed and used to minimize disturbances to the soil, permafrost and vegetation. Where possible, trails will be positioned to follow the shortest and flattest routes, sharing existing linear features or open and burned areas. Construction will follow minimum disturbance techniques, such as mulcher high-blading, to keep the active layer intact. Most trails will be frozen-in or allowed to freeze up naturally.

The width of the access trails will be a maximum width of 6 m wide and will also have a minimum of 10 cm of packed snow. Proposed access is classified as “Winter Trails” and “Seismic Access”. The Winter trails are primary access routes and are expected to be used for seismic, drilling operations and potentially EFT activities with an upgrade to year-round access status. They must be 8 m wide to accommodate two-way traffic and large trailers. Seismic access is only required to be 6 m wide as these trails are only needed for the seismic programs and will be less used. There are potentially 120 km of new “Winter Trail” access and 158 km of new “Seismic Access” to be prepared.

Few new crossings will be required off the Dempster Highway as less seismic is proposed. The areas of the seismic program that encroach on the highway will be managed in two ways. The source and receiver lines will terminate 10 m from the Dempster Highway. Access to the source and receiver lines will be via access trails (connecting the source and receiver lines with the Dempster Highway). The width of access trails will be kept to a minimum while allowing safe access. Access trails will also be doglegged 30 m back from the highway (per the Department of Highways and Public Works guidelines for a 90-degree entry to the highway) (**Figure 3-7**). This will allow personnel an unobstructed view of the traffic on the highway so that safe entry from the access trail to the highway can be made. It also creates an obstructed view from the Dempster Highway users, which will assist in minimizing aesthetic concerns and use as access.

To the extent possible, the intention of the Dempster Highway Development Area (DHDA) will be a primary consideration during line placement of seismic lines near the highway. Travellers also use the Dempster Highway to gain access to the remote regions of the North Yukon and NWT. Chance understands that tourism is an important industry for the area. Since most seismic activity will be conducted during the winter and in remote areas, the effects on tourism are expected to be minimal.

Winter Seismic Transportation — During winter seismic operations, approximately 30 one-ton or ½-ton 4x4 trucks will transport personnel to and from the Chance Camp to their specific job site location daily. It will include mobilization/demobilization and crew transport to and from the main Chance Camp. Using a remote camp will reduce vehicular travel on all roads, including the Dempster Highway, as the proposed remote camp locations are 40 km closer to the seismic program area than the Chance Camp. This will reduce the environmental effects on the roads and surrounding areas and limit the likelihood of accidents or incidents due to travel.

The vehicles will primarily be travelling on the Chance and Blackie roads and other proposed winter access trails, as well as a small section of the Dempster Highway. Any use of the Dempster Highway will occur during specific times of the day as crews will be transported to and from their work site at daybreak, and sundown. Although the proposed project will increase traffic along the Dempster Highway, it is not anticipated to substantially affect users of adjacent Settlement Lands and traditional uses of the area. During the winter, a low number of vehicles (40 to 50 per day) travel the Dempster Highway; therefore, it is anticipated the added traffic for the seismic program will not interfere with regular highway users.

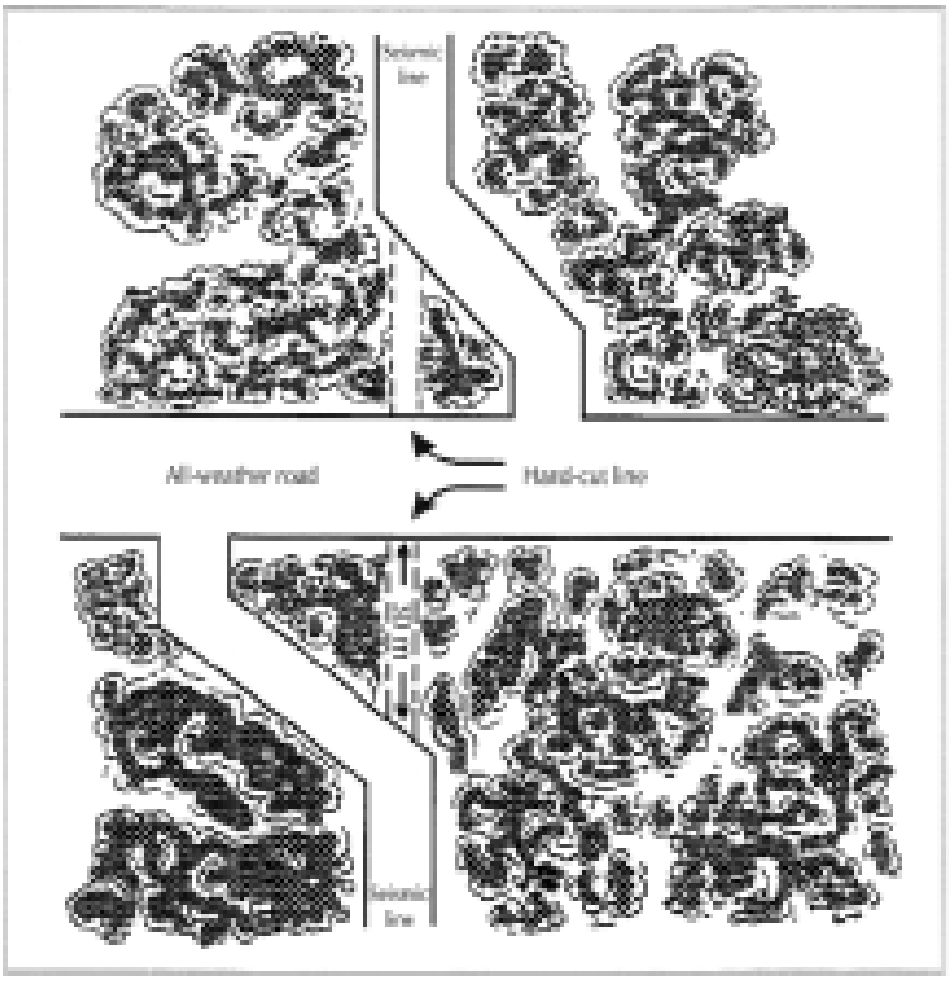

Figure 3-7. "Dogleg" seismic line at access points to limit visibility.

Source: (Yukon Energy Mines and Resources 2006)

Signs stating "Seismic Activity" will be erected in areas where the program is near the Dempster Highway. To avoid possible crew encounters, these signs promote awareness by regular users of the area where the workers are present. The potential for vehicular and hunting conflict will likely be minimal due to the remoteness of the seismic programs; however, crews working on the seismic program are mandated to wear brightly coloured safety vests and hard hats to improve visibility. Seismic crews must also give the right-of-way to all traffic and users of the area. Considering other Dempster Highway users, signage will be posted in communities (i.e., Dawson, Stewart Crossing, Carmacks and Inuvik) one month before the project starts to notify potential highway users that additional traffic may be encountered. Additionally, the Yukon Department of Highways and Public Works will be notified. With these measures, it is anticipated that potential effects on other highway users will be reduced or eliminated.

Summer Seismic Transportation — The summer operations will be limited to seismic recording. Two helicopters (Bell 412 type, capacity of 13 people) will transport workers to and from the program area. This will consist of approximately three trips in the morning and three trips returning to camp in the evening. The recording equipment will be deployed via A-Star type helicopter and long line. Aerial access protects the active layer and underlying permafrost, preserving saplings and small shrubs along the access routes as vehicular traffic will be limited. As caribou are not usually present in the Eagle Plains area during the summer, it is unlikely that they would be affected by the activity in the area. The proposition of year-round activities will also enable larger seismic program areas to be completed in one year, reducing the number of seismic programs needed to acquire the desired dataset.

3.2 DRILLING EXPLORATION PROGRAM

Chance may establish up to 30 well sites during the 10-year Project life, each approximately 1.44 ha. Total approximate disturbance due to well sites throughout the Project is anticipated to be a maximum of 43.2 ha if all 30 wells are drilled.

Initial drilling results will inform subsequent areas of investigation and well site locations. Chance will continue interpreting seismic and exploratory drilling data throughout the Project to understand better the geological setting, size, location, and geometry of potential prospects.

3.2.1 Well Site Locations

Well sites will be preferentially located on heights of land, and will consider the following:

- Avoidance of areas with challenging permafrost conditions.
- Avoidance of ecologically sensitive areas such as riparian corridors (i.e., within 45 m of a perennial watercourse), wetlands, steep slopes, old forest, sensitive wildlife habitat and permafrost features.
- Avoidance of areas with identified or potential heritage values (noted as “avoidance areas”) in Heritage Resource Overview Assessment and Heritage Resource Impact Assessment studies conducted for lands within the Project area (Matrix Research Ltd. 2008, 2013, 2014, Bennett 2022, 2023).
- Requirements from the Yukon *Oil and Gas Act*, RSY 2002, c.6 (*YOGA*) (Government of Yukon 2002) and the *Oil and Gas Drilling and Production Regulations* (Government of Yukon 2004).

3.2.1.1 Pre-Drilling Preparation

The first exploratory wells will be drilled in the winter of Year 1. Pre-drilling preparation will require preparation of winter roads to the selected well sites, and preparation of the well sites. Winter road and well site preparation require a minimum of 10 centimetres (cm) of packed snow cover (including the highest hummocks) to prevent damaging the surface vegetation (Stanley Associates Engineering Ltd. and Sentar Consultants Ltd. 1993). At least 30 cm of snowfall is required to produce 10 cm of compacted snow (Stanley Associates Engineering Ltd. and Sentar Consultants Ltd. 1993). Snow packing via snowmobile or snowcat earlier in the season (potentially as early as November or December) is usually undertaken to facilitate freezing in the winter trail and well site locations and assist with full construction before drilling operations. Based on historical trends (i.e., when 10 cm of packed snow accumulation has been achieved in past

years), actual construction of the winter roads could occur as early as December or as late as mid-to-late January. Additional details are provided in **section 4.3.1**.

3.2.1.2 Preparing Winter Well Sites

Well site set-up typically requires approximately five days, during which 15 to 20 truckloads are required to mobilize the drill rig and other equipment/materials/infrastructure. Once established, well sites will be approximately 1.44 ha for single well pads and up to 2.5 ha for multiple well pads and will contain the drill rig, flare stack, rig trailers, and office trailers. There will also be trailers to provide sleeping capacity for key personnel required to stay at the rig full-time.

Vegetation clearing at each well site will be minimized as much as possible; well sites will be levelled by packing snow at the site and then icing to form a level pad, or, if not enough snow is available, using water to freeze well pads or making snow artificially. An impermeable liner will be laid on the pad, followed by interlocking wooden rig mats, where required. Rig mats are approximately 16 feet by 8 feet and may be used to cover the entire well site, the area around the drilling rig, or both.

Matting is used at well sites in northern locations to provide insulation and protection to the underlying snow and ground surface, distribute the weight of equipment, and minimize ground disturbance while using the site. Matting will be used when, a) the ground is uneven and leveling the well site with snow and ice is not possible or b) the ground may not be competent enough to support the heavy rig loads and the dynamic loading that is typical of a drilling operation. At winter well sites constructed without densified fill material as the base of the pad, equipment will always remain on matted surfaces in case of early thaw conditions.

3.2.1.3 Well Site Surface Infrastructure

Figure 3-15 illustrates the general layout of equipment, storage, and structures at a proposed well site. The planned 1.44 ha (120 m × 120 m) area is designed to accommodate the drilling operation and associated setback distances from surrounding vegetation, a separation between pieces of equipment, and personnel working and sleeping quarters. It should be sufficient to accommodate the well completion and EFT equipment. As presented in past assessments, Chance plans to use a drill rig with similar capabilities to Chance Rig #1. The drilling rig will be capable of drilling to depths of up to 2,500 m (vertically). The final area of each well site may not be square since the area will depend on topographical constraints.

The rig layout depicted is for a winter drilling operation (distinguished by the number of boilers onsite). Boilers are used extensively in very cold climates to prevent equipment and drilling fluids from freezing.

Table 3-2 describes the drill rig components identified in **Figure 3-8**. Well sites are defined as industrial areas and are therefore restricted entry areas; only appropriately trained, authorized personnel wearing all required personal protective equipment (coveralls, steel-toed boots, hard hat, gloves, and safety glasses) are allowed access. **Photo 3-8** shows a typical example of a Chance rig and is shown at night. **Photo 3-9** shows a typical Chance rig set up at the end of a constructed winter access road.

Table 3-2. Well site components shown in Figure 15 general layout of a well site.

Component	Description
Boilers	Used extensively in very cold climates to prevent equipment and drilling fluids from freezing.
Cement	Cement storage and mixing for use in wells to secure casing and seal off porous and permeable formations to prevent fluid inflow.
Medic, Offices, and Sleeping Trailer	Essential personnel trailers which serve as offices or sleeping quarters and include a multi-room sleeper for some of the personnel at the drilling location.
Flare Tank and Flare	Flare used to incinerate combustible fluids from the well. The flare tank is a reservoir to ensure the flare does not starve of combustible fluids.
Fuel Storage	Fuel used at the site for equipment including drill rig, pumps, light towers, accommodation trailers, boilers, generators, etc.
Garbage and Incinerator	Storage area for waste and incinerator to dispose of food waste.
General Storage	Storage and laydown area for equipment needed onsite.
Mud Tanks	Tanks where drilling mud is stored (drilling mud is a viscous fluid mixture, water based for this operation, used in oil and gas drilling operations to lubricate/cool the drill bit, to carry rock cuttings to the surface and to provide hydrostatic pressure within the drill hole to prevent fluid inflow from porous and permeable rock formations). The tanks are usually upright, fully enclosed, and pressurized, storing bulk materials for drilling mud. Section 31 of the *Oil and Gas Drilling and Production Regulations* (Government of Yukon 2004) under *Yukon Oil and Gas Act*, SY 2019, c.6 (*YOGA*) (Government of Yukon 2002) stipulates that the "combined capacity of the drilling fluid tanks of every fluid system must not be less than the greater of 120 m^3 and 50% excess of the volume of the wellbore." Cement materials both prior to and after mixing are stored in similar tanks.
Main Mud Storage	Location where all the drilling mud materials are stored. Normally these materials are delivered on pallets stacked and shrink wrapped to protect them during transport and storage.
Drill Pipe Storage	Racks in which drill pipe is stored until required to be run in the hole.
Mud Mixing	Tank in which drilling mud products are first mixed with water to facilitate further mixing with drilling mud already mixed and in use. Products such as bentonite clay, for example, require a caustic soda solution to facilitate good mixing and preserve good flow characteristics
Mud Pumps	Pumps used to circulate the drilling mud down the drill pipe, around the drill bit, and up the annular space between the drill pipe and the open hole or casing to surface.
Return Mud Separator	The area where the return mud separator, known as a shale shaker, separates rock cuttings from the drilling mud. The rock cuttings are then centrifuged to separate residual liquid from the cuttings so the cuttings can be disposed in a Mix Bury Cover (MBC) sump. The centrifuge is also used at the end of the drilling operation to recover water for use in the next well and the spent mud is also disposed of in the MBC sump.
Drill Structure	Components required to drill the well, include: • Sub-structure, or base, on which the derrick is fixed. • Derrick that supports the draw works and top drive which hold drill pipe before it is run into or retrieved from the well and the equipment used to rotate the drill pipe during the drilling operation.

Component	Description
	• Top drive that is a mechanical, electrically powered linking device that attaches to the pipe in the hole and rotates it when drilling while simultaneously pumping drilling mud through the drill pipe and out of the drill bit at the bottom end. • Draw works that lifts and lowers the travelling block in the derrick/mast to run pipe in and out of the hole. • Blowout preventers are a series of closing valves that can hydraulically shut in a well in the event of unplanned influxes of formation fluids into the wellbore and prevent blowouts.
Water Storage and Water Treatment	Water storage tank and treatment containers to provide potable water for the rig crew and personnel.

3.2.1.4 Drilling Operations

Eagle Plains well sites and well design will incorporate the following key features to enhance efficiency, reduce waste, and minimize general effects on the surrounding environment.

- The rig will use sufficient casing pipe to reach the projected total depth of up to approximately 2,500 m (vertical depth). For reference, the well casing program will typically comprise the following elements:
  - Conductor of 13-3/8-inch diameter to approximately 25 m below ground level, cemented to surface.
  - Surface casing of 9-5/8-inch diameter to approximately 25% of the planned, measured depth of the well below ground level, cemented to surface.
  - Production or intermediate casing of 7-inch diameter either to total depth or within Yukon's Oil and Gas Drilling and Production Regulations requirement of not more than 25% of open hole remaining uncased at any time (Oil and Gas Drilling and Production Regulations Section 55-(1) (c) (i)) (Government of Yukon, 2004). This casing will also be cemented to surface.
  - 4-1/2-inch liner to a depth of 2,500 m, cemented with a minimum 100 m overlap into the previous casing.
- The nominal diameter of the various casing strings (all selected to meet industry standard dimensions) will reduce the size of the hole drilled and of drill cuttings generated as the well is deepened. For example, a 3,500 m exploratory well typically produces 400–500 metric tons of cuttings. Less than 150 metric tons will be produced for the typical exploratory well depth of 2,500 m proposed at Eagle Plains.
- A water-based mud system will be developed and managed by a specialized service contractor with comprehensive knowledge of the Alberta Energy Regulator (AER) *Directive 050 Drilling Waste Management* (AER 2023) requirements as they pertain to the Yukon jurisdiction regulations.
- All requirements in Sections 26 to 65 of the Yukon *Oil and Gas Drilling and Production Regulations* (Government of Yukon, 2004) (covering well design, casing design, groundwater protection, mud products, blowout prevention and choke/kill systems, fire detection and gas detection systems, safety of personnel, mitigation of operations effects, and more) will be either met or exceeded in the design, selection, and deployment of materials.
- Proposed drilling design planned operations procedures, relevant health, safety, and environment plans; oil spill contingency plans; and emergency response plans will be provided to the regulator for review at least six months before planned mobilization to site. Any perceived or identified deficiencies will be discussed and addressed with the Yukon regulator to confirm what is required before operations.
- Chance will enforce compliance on all third-party service suppliers to ensure that (1) their health, safety, and environment management systems address regulatory requirements in personnel training and skill development; (2) personal protective equipment provided to workers meets Canadian Standards Association (CSA) and international safety standards; and (3) supervisors are knowledgeable about operational standards related to health, safety, and environment. Chance company representatives will perform periodic inspections and audits during mobilization and operations.

- All wells will be drilled initially as “keepers” to facilitate EFT or to become early producers if the Project progresses to full development. The only wells likely to be abandoned would be unsuccessful (dry) wells with no potential to be used as water or natural gas disposal wells.
- Well sites will be designed and constructed with purpose-built collection berms to recover and contain for disposal any fluid not otherwise contained by the operation’s process control. During well site/well pad construction, an impermeable layer will be laid to prevent seepage into the ground below the fill material pad.
- Rig drilling, cementing, or DSTs fluids will be contained and recovered until disposal following regulations.

Drilling contractors must provide training and have operational procedures certified by a recognized professional or regulatory body in blowout prevention and well control. Crews undergo simulated safety drills at each shift on a 2-shift, 24-hour work rotation. During these safety drills, the response and efficiency of drill crews are evaluated. The equipment is also evaluated, and deficiencies are corrected immediately following the drills. Drill crew and well supervisor well control/blowout prevention/hydrogen sulphide certificates are normally inspected by a visiting inspector to confirm compliance when operating.

3.2.1.5 Drilling Mud

Drilling mud is a viscous, heavy liquid used in drilling oil and gas wells to lubricate and cool the drill bit, to carry the rock cuttings out of the drill hole and back to the surface where the cuttings are separated from the mud, and the mud is recycled for reuse in the drilling operation. The drilling mud system currently under consideration for the Project is a low-toxicity water-based drilling system; Chance is assessing systems and suppliers based on several factors, including ease of disposal at the end of its use.

The main function of drilling mud is to over-balance the well pressure to ensure that the pressure in the wellbore is higher than the pressures expected to be encountered from the various geological formations as the drill bit penetrates them. The drilling mud prevents formation fluids from entering the wellbore. It keeps the drill cuttings in fluid suspension when drilling is paused or the drilling assembly is cycled in and out of the hole for bit changes, well logging, DST work, or any other downhole activity. Drilling mud is selected to provide operational efficiency, minimize formation damage, reduce corrosion, and minimize the environmental effects of handling and disposal.

Project operations will minimize the volume of drill cuttings and drilling waste generated by drilling smaller-diameter holes. Drilling waste is composed of rock chips and cuttings. The drilling fluid returned to the surface is sent through a shale shaker to separate rock cuttings, and the drilling mud is returned to the well to continue drilling. The recovered cuttings are put through a centrifuge, where the drill cuttings are further separated from any residual water before being disposed of in an MBC sump. At the end of the drilling operation, the mud slurry is run through the centrifuge to separate the water for future use in the next well. Recovered mud is disposed of in the MBC sump.

3.2.1.6 Cement Plugs and Permafrost

When mixed with water and begin to set, typical oilfield cements produce heat, known as the heat of hydration. This heat can thaw the permafrost adjacent to the wellbore. Permafrost cements are a specific mixture of typical oilfield cement (Portland Cements) with additives such as gypsum (calcium sulphate) to

eliminate the heat of hydration. Calcium and sulphate are naturally occurring molecules at Eagle Plain and are environmentally benign. Use of permafrost cements will minimize the risk of permafrost degradation.

Permafrost cement usually is only used for the surface casing installed to isolate the wellbore from the rock formations and protect permafrost. Chance plans to install surface casing to a depth of 400 m at minimum.

3.2.1.7 Drill Stem Testing (DST)

Depending on the analysis of rock cuttings, measurements made of drilling fluids during the drilling operation, the well log results, and any core samples taken, it may be desirable to test prospective zones before drilling deeper or running casing. In these cases, a DST is commonly done. Drill stem tests are conducted through a special string of drill pipe that includes two packers, which are devices that, when inflated, serve to isolate the zone (the geological formation) of interest from the rest of the well and are set in place just above and below the zone undergoing DST. A special annular pressure-operated valve is placed inside the drill pipe near the zone to be tested. This valve is opened, and in a controlled manner, fluids in the formation are allowed to flow into the drill pipe and up to the surface for separation, measurement, and sampling.

At the surface, the drill pipe is connected through a series of valves allowing the operator to control the flow of fluids from the well and direct them through a pipe system, called flowlines, to the separator and the separator for measurement and sampling.

Figure 3-18 shows the DST process on the surface. Surface flow lines carry the fluids to a test separator. The separator splits the fluid mixture into component elements, which could combine crude oil, natural gas, and formation water. Each fluid stream is measured by flow meters to confirm the volume, pressure, temperature, and rate of flow. From the separator, the crude oil stream would be directed into a holding tank, the natural gas to the choke manifold on the derrick, and then sent to the flare stack or another pre-determined place (e.g., burned for heat, power generation or mechanical power). The separated formation water would be collected and hauled away for disposal; in an existing deep injection well located in the Eagle Plain area.

The exploration wells may encounter several hydrocarbon-bearing zones that could be evaluated by conducting a DST (or DSTs). Before DSTs are conducted, a well site-specific plan and DST procedures will be developed by Chance. Plans for all DSTs will be based on well results and will be discussed with the Oil and Gas Resources branch of the Yukon Department of Energy, Mines and Resources.

A well site-specific plan will be specific to the formation to be tested and the existing wellbore conditions. This plan will protect the safety of personnel, equipment, and the environment and provide for handling any fluids that may be recovered. Enform *IRP 4 Well Testing and Fluid Handling - An Industry Recommended Practice* guidelines (Enform Canada 2015) are one of the sources that will be referenced in preparing the plan. The formal project proposal will include a sample plan with information on how the plan will be assembled.

Flaring of gases during DST is a widely applied activity. The process, however, can only be undertaken in compliance with *YOGA Oil and Gas Drilling and Production Regulations* section 128 (Government of Yukon 2004), which is provided below for reference. Additionally, DST guidelines outlined in Enform *IRP 4 Well*

Testing and Fluid Handling – An Industry Recommended Practice (Enform Canada 2015) are intended to ensure that safe work procedures are in place and to "minimize the probability of either the mechanical or human systems failing during a test, as well as establishing minimum health, safety and operating standards". In addition, they are "designed to allow flexibility and must be used in conjunction with competent technical judgment".

As required, the flare line must be positioned downstream of the derrick's choke manifold, designed to prevent fluid accumulation within the line, and installed and anchored as specified by regulation. Gas encountered during DST is circulated through a degasser system to separate it from the drilling mud, rendering the mud safe to pump back into the wellbore. Larger volumes of gas may be control-burned through the flare stack according to the flare permit issued by the Oil and Gas branch of the Yukon Government.

An example of a typical well site flare process layout is illustrated in **Figure 3-9**, a typical flare stack and gas/vapour recovery flowsheet is illustrated in **Figure 3-10** and a typical portable flare stack is shown in **Figure 3-11**. Normally the flare line from the choke manifold is connected to the flare stack inlet to permit the direction of the gas to the flare for total control. The flare stack will be a minimum of 18 m high and a maximum 30 m high depending on surface conditions to assist in air dispersal of combustion end products and mitigate effects on permafrost.

Following the regulated spacing requirements, the flare stack will be positioned on the well site. If flaring is necessary, the flare will be higher than the surrounding vegetation or trees (as required by the *Oil and Gas Drilling and Production Regulations* [Government of Yukon, 2004]). Noise from flaring typically only occurs when very large volumes of high-pressure natural gas are being flared. During DST, flaring would only occur for a maximum of one day at the end of a drilling program for one well.

YOGA Oil and Gas Drilling & Production Regulations Part 9 (Government of Yukon 2004) specifies these parameters.: The flare stack will meet the requirements as follows:

> *128. Flare requirements*
>
> *Unless otherwise approved or directed by the Chief Operations Officer, any gas that is flared will be discharged from a flare stack that:*
>
> *(a) is at least*
>
> *(i) 50 metres from any well, treater, separator, compressor, crude oil storage tank or any other unprotected source of ignitable vapours*
>
> *(ii) 80 metres from any right-of-way, easement, road, public utility, building, installation, works, place of public concourse or any reservation for national defence, except only when there may exist special circumstances that, in the opinion of the Chief Operations Officer, justify the positioning of the stack at a greater or lesser distance*
>
> *(b) is adequately anchored and suitably protected against freezing*
>
> *(c) is designed to ensure flame stability and efficient combustion*
>
> *(d) is of sufficient height and diameter to ensure*
>
> *(i) that the average concentrations of hydrogen sulphide and sulphur dioxide in the ambient air do not exceed limits specified under the Occupational Health and Safety Act*

(ii) that vegetation combustion is prevented by maintaining an area free of vegetation and combustible debris around the base of the flare stack or the end of the flare line to the following minimum distances:

(A) 10 metres or 1.5 times the stack height, whichever is greater, in cultivated areas

(B) 30 metres or 2.5 times the stack height, whichever is greater, in forested areas

(C) 1.5 times the stack height, in any other area

(iii) that a minimum stack height of 2.5 times the height of the highest third-party building located within a distance equal to 5 times the height of the building is maintained

(iv) that any heat generated around the base of the stack does not exceed the manufacturer's specifications for any equipment situated there, to a maximum of 4.73 kW/m²

(e) has a sufficient exit velocity and is provided with guards or other features to prevent extinction of the flame.

(f) if the gas flow is intermittent, is provided with an ignition device to ensure continuous ignition of any gases.

To minimize potential deposition of residual chemicals produced via flaring on vegetation and soil, the site design will include an appropriate spacing between the flare stack and vegetation. Vegetation and soil adjacent to and downwind (prevalent) of each flare stack will be sampled before an activity that could result in gas production to provide a baseline of identified substances of concern at the site. Samples will then be taken during flaring for comparison with the baseline to monitor potential deposition. Visual monitoring will occur throughout flaring to observe nearby vegetation's safety and protection.

A typical operational sequence of DST is:

1. Wellbore is drilled to a depth of interest.
2. Well is logged using various diagnostic tools, and depth intervals for testing are selected.
3. Test equipment is connected to the end of a drill string and run into the well bore. The test equipment generally consists of two packers set above and below the geological formation being tested to isolate the formation to be tested from the rest of the wellbore. Inside the drill pipe between the packers, an annular pressure-controlled downhole valve to open and close at the beginning and end of the DST, respectively, and pressure gauges to measure the bottom flowing and shut-in pressures.
4. A cushion of fluid may be contained in the drill pipe to initially provide back pressure on the formation being tested, which may be required to control initial flow rates out of the formation, into the drill pipe, and up to the surface.
5. Once the test string is positioned at the zone to be tested, the packers are set, and the downhole valve is opened to allow formation fluids to flow into the drill string.
6. Fluids produced during the test are carried from the wellhead to a test separator as described above, where any natural gas, crude oil or formation water are separated for individual measurement, sample collection for further laboratory analyses, and either flared (natural gas), recovered for eventual disposal at a terminal in NEBC (crude oil) or disposed of (formation water) into one of the disposal wells designated by Chance.

7. Initially, the valve is opened and the well flows relatively quickly to clean up the wells (normally, this period may be a few hours). Following this period, flow is temporarily shut in the downhole, and a pressure buildup is recorded (with the initial shut-in period lasting 2 or 3 times the initial flow period).
8. The test zone is then flowed at constant or variable rates by opening the valve located in the packer and allowing formation fluids into the drill pipe and flow up to the surface. Each constant flow period is normally followed by a shut-in period to record how long it takes for the pressure to build back up inside the well.

- Before concluding the series of test rates, bottom hole and surface samples are collected. Samples are taken of all fluids for analysis (both Pressure Volume Temperature samples under the flowing reservoir pressure, temperature conditions and atmospheric samples to check for “base sediments and water characteristics of the produced fluid”).

After the DST, the tools are closed, packers unset (removed) and any samples within the drill pipe are reverse circulated to surface. A normal DST takes a few hours, not including the time required to prepare the tools, run pipe to depth and do the reversed process on completion.

Well log results, sample analysis and DST results are used to decide whether to abandon or insert casing into the well, pending further evaluation. To abandon the well, cement plugs are inserted using an open-ended drill pipe across all porous/permeable zones and the base of each casing string. At the surface, the well casing(s) are cut off 1 m below ground level and steel plates are welded across the top of the casing. A well sign is erected and the well site re-contoured and re-vegetated, all pursuant to the relevant *YOGA Oil and Gas Drilling and Production Regulations (Government of Yukon 2004).*

At least one DST per successful well will be conducted unless several zones require testing. If more than one prospective/productive formation is encountered in a well and is separate from other formations, DSTs will be conducted on those separate formations independently of each other. Sometimes, a DST may be re-done if there is a mis-run, or if the DSTs were not done in a steady sequence. The order in which DSTs are conducted will depend on where the zones of interest are found in relation to the various casing strings that could be set as the well is being drilled.

All well testing will be performed with the guidance of AER *Directive 034: Gas Well Testing, Theory and Practice* (Alberta Energy Regulator 1979) and in consultation with the Oil and Gas branch of the Yukon Government. Chance will follow related legislation, such as the *Oil and Gas Drilling and Production Regulations* (Government of Yukon 2004). Part 5 of this regulation provides detail on well evaluation and testing requirements.

Specific details of past drilling experiences can be found on the Yukon Oil and Gas Online Information Site: (http://maps.gov.yk.ca/imf.jsp?site=OilandGas_wells). Chance’s comprehensive casing designs and rig and blow-out prevention system conform to *YOGA* and the *Oil and Gas Drilling and Production Regulations* (Sections 33-61 (Government of Yukon 2004). Additional details of Chance’s system configuration are confidential as per Section 176 (4) of the *Oil and Gas Drilling and Production Regulations* (Government of Yukon 2004).

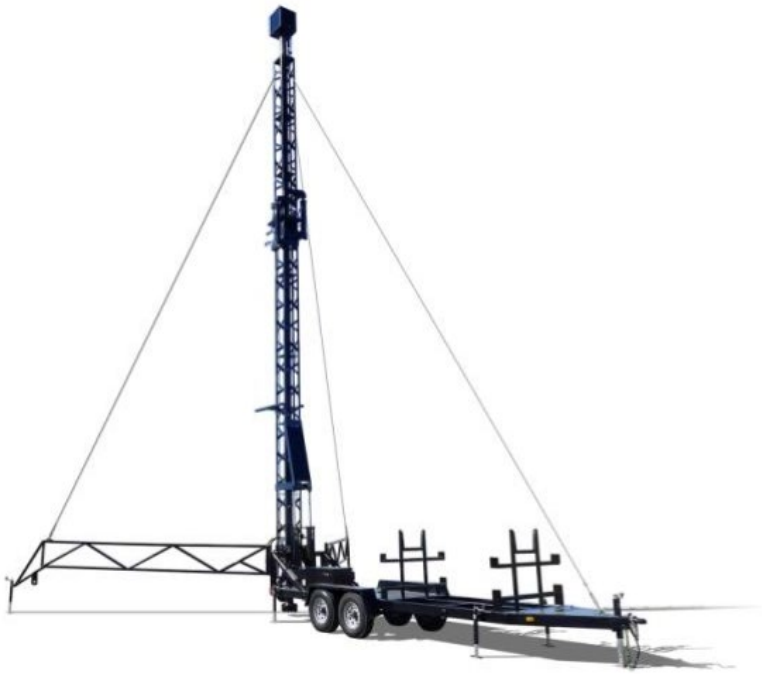

Figure 3-11. Typical flare stack unit on a portable rig.

3.2.1.8 Further Testing Details

Swabbing — Swabbing is usually conducted to help initiate fluid flow from the formation into the well and flow to the surface. Wells will only be swabbed if the well is drilled, cased, and a potential reservoir has been:

- identified;
- perforated;
- testing reveals that reservoir pressure is insufficient to flow liquids to the surface without swabbing; and/or,
- if well stimulation results in wellbore liquids that prevent flow to the surface.

Swabbing reduces in-well bore pressure that otherwise prevents a potentially productive formation from flowing to the surface naturally.

Acid Stimulation — Eagle Plains' previous oil and gas exploration activities indicate that small-volume acid stimulation treatments effectively remove scale and other impedances to allow or improve fluid flow into the wellbore. Acid stimulation entails pumping discrete amounts of hydrochloric acid at varying depths.

The acid is trucked to location in specially sealed tanks in compliance with regulations under the federal *Transportation of Dangerous Goods Act, S.C. 1992, c. 34* (Government of Canada 1992) and transferred to the cement pumping unit for pumping downhole. Treatment batches of 10 to 25 barrels (approximately 1.6 to 4.0 m^3) are pumped at controlled pressure until complete. The weak acid serves to dissolve scale

(calcium carbonate) or cement. The chemical reaction of the hydrochloric acid with carbonates forms non-toxic and pH-neutral calcium chloride salt and water as by-products.

The application of acid is for a new well and not used for an existing one that has been in operation for some time. Acid cleans up a newly drilled well to improve initial flow rates. It is also used as a remedial tool to improve production where there is evidence of flow impairment. For an exploration project, this improves production in a setting where little prior information or data exists and is therefore undertaken on a trial basis.

The product's Safety Data Sheets (SDS) describe the toxicity limits for oilfield hydrochloric acid. Oilfield concentrations are normally 10%, 15%, or 20% hydrochloric acid. In winter, if acid is spilled, like water, it would freeze and can be recovered from the surface snow or a thin soil layer.

3.2.1.9 Drilling By-Products Disposal

Eagle Plains is a sedimentary basin, and drill cuttings will consist of sandstone, shale, and carbonate rock none of which are significantly sulphide-bearing. Drill cuttings from wells drilled in 2012 were examined by Chance geologists; based on this examination and previous exploration / geological work in the area, the potential for acid rock drainage (ARD) from drill cuttings was determined to be remote to non-existent.

Naturally occurring radioactivity will be measured by gamma ray (GR) or spectral gamma ray wireline logs, a regulatory requirement in the *Oil and Gas Drilling and Production Regulations* (Government of Yukon 2004). Gamma ray is a radioactivity detection device (similar to a Geiger Counter) that detects radioactive Uranium, Thorium or Potassium isotopes in the rock formations drilled. No abnormal detections have been made other than that attributed to natural rock formation radioactivity. Therefore, radioactivity appears absent or undetectable in the fluid of the Eagle Plains sedimentary formations.

The Oil and Gas branch of the Yukon Government has adopted the AER *Directive 050: Drilling Waste Management* (Alberta Energy Regulator 2023) procedures for the disposal of drilling wastes within the Yukon. Chance will manage the operation following the MBC requirements of the Directive for the remote sump locations.

Solid Drill Cuttings — Drill cuttings are a direct by-product of the drill bit grinding through rock. Cuttings are brought to surface with the drilling mud and separated via shale shakers and centrifuges, as described in **section 4.3.2**.

“Stripping” is running the drilling mud through centrifuges as it returns to the surface to separate the water from any solids suspended in the fluid stream. Cuttings are separated during stripping and stored separately on the well site until they can be disposed of. The fluid is then either recycled back into the mud system in the drilling operation or retained for use in future drilling locations.

Close attention to the dryness of the cuttings moving across the shale shakers and collected in the shale bins are required for the following reasons:

- Less total weight in the cuttings equals less cost associated with future handling of the drill cuttings.

- In the winter, handling and moving dry cuttings is easier as they do not freeze and create large blocks of material.
- Recycling more fluid separated from the cuttings reduced the need for additional make-up drilling fluid.

Drill cuttings will be removed from the well sites for disposal at the MBC, as described in **section 4.3.3**.

Drilling Mud — Chance is proposing to use water-based drilling fluid systems. After drilling a few wells using recycled drilling fluids, the mud system may need to be partially or fully reconstituted (disposal of the current fluid and mixing fresh water and new drilling fluid products). This ensures the drilling fluid is fresh and capable of drilling through the different rock types found in the proposed wells and is performing to meet operational needs. Chance has successfully re-used drilling fluid systems across multiple wells to reduce the overall need for make-up water and the total fluid volume for disposal at Eagle Plains.

The proposed drilling system and the site conditions present at the drilling locations and in the Eagle Plains general area have directly influenced the disposal options for waste drill fluid. Accordingly, the following conditions were established for the selection of the drilling mud system:

- Low-toxicity mud system confirmed through laboratory analysis;
- Meets operational requirements (maintain formation stability, hole cleaning and well control, etc.); and,
- Suitable for disposal via the MBC disposal process at a nearby location.

Any drill fluid selected must satisfy Section 32 "*Approved Drilling Fluid*" of *YOGA*'s *Oil and Gas Drilling and Production Regulations* (Government of Yukon 2004). The type and chemistry of the drilling fluid is described further in this section.

Injection Well — AER *Directive 050 Drilling Waste Management* (Alberta Energy Regulator 2023) covers the disposal of drilling fluid. Drill cuttings will be mixed with the required amount of soil following AER *Directive 050 Drilling Waste Management* and disposed of in the MBC sump. Drilling fluid will be stripped back to the clear portion and disposed of in one of the injection wells.

Disposal requires further injectivity and suitability investigations. This cannot occur until the wells are re-entered and ready for the investigation trials. Chance candidate wells could be one or more of the following suspended well(s): Chance J-19, Chance M-08, Chance G-08, Blackie M-59, McParlane A-25 and Chance E-78 all of which are located within the Chance licence areas. Any well that is not a preferred EFT or future production candidate could be an injection well if strategically located near a usable well or wells and if it exhibits the required characteristics for injecting fluids. For this exploration project, the priority wells for disposal are A-25 and E-7, however others could be part of the disposal mix depending on the outcome of well maintenance assessment activities.

The *YOGA Oil and Gas Drilling and Production Regulations* (Government of Yukon 2004) require that any produced water not be disposed of at the surface unless its quality and/or salinity is equal to or greater than the quality limits set out in producing field facility licence.

Any plans or intention to dispose of produced water from reservoir fluids separation must be submitted to the regulatory authority and must meet the environmental standards as well the oilfield waste disposal standards and limits (reference *YOGA Oil and Gas Drilling and Production Regulations* Sections 122. 123. 124, 130 and 165) (Government of Yukon 2004). Produced water disposal is only authorized when the operator demonstrates legislation requirements have been met and that good oilfield and reservoir management practices are satisfied.

Once their disposal suitability is established, the following liquid materials (treated with bactericide) and their volumes may be disposed of:

- Produced water per well (water cut 20% to 60% for 200 barrels of oil per day (BOPD)) = approximately 40 to 120 barrels water/day but dependant on field conditions;
- Workover fluids: Maximum 7" casing volume full = 276 barrels;
- Rig wash: hose flowing at five gallons per minute (gpm) water for one hour = ±seven barrels per day in summer;
- Saline fluids (completion brines) same as workover fluids = 276 barrels; and
- Liquid fraction of drilling fluids = approximately 200 m^3 at end of Project.

The zone must have an impermeable barrier above it to prevent migration of the injected fluid and be deeper than 750 m. The rock's Permeability and porosity must permit fluid pumping at low surface pressure and well below formation breakdown pressure. Testing must determine injection fluid compatibility between the rock and native reservoir before injection. The injection pressure and rate are measured, indicating the porosity and permeability of the formation and reservoir used for injection.

Disposal of highly saline-produced water at surface disposal sites may be greatly restricted in quality and quantity. To support best reservoir management practices, the re-injection of produced formation water back downhole may sometimes be required.

3.2.2 Extended Flow Testing

As noted above, well testing will be performed following the guidance of AER *Directive 034: Gas Well Testing, Theory and Practice* (Alberta Energy Regulator 1979) and in consultation with the Oil and Gas branch of the Yukon Government. Chance will also follow related legislation, such as the Yukon *Oil and Gas Drilling and Production Regulations* (Government of Yukon 2004). Part 5 of this regulation provides detail on well evaluation and testing requirements.

Petroleum or natural gas reserves identified through DST are expected to undergo EFT to gather important information about the nature of the resource accumulation and its productive capability. Duration of EFTs at each well where petroleum or natural gas is identified may occur during successive winters for up to two years. The information obtained from EFTs is critical to determining the future development plan for each discovery. The planned wells are exploratory; any flow testing will be contingent on identifying formations potentially containing hydrocarbons. Part 8, Section 103 (1) of the *Oil and Gas Drilling and Production Regulations* (Government of Yukon 2004) requires:

> *"The Licensee of a well shall obtain sufficient well tests, formation flow tests, wireline logs, analyses, surveys, conventional cores, cuttings and samples during the drilling of the well to ensure that a comprehensive geological and reservoir evaluation can be made."*

EFTs will be undertaken if preliminary results from DST are encouraging, and the following criteria have been met:

- The well is drilled and cased;
- A potential reservoir is:
  - Identified;
  - DST has been conducted; and,
  - Test analysis of the DST concludes sufficient hydrocarbons present to proceed to further evaluation of the hydrocarbon bearing formation.

Table 3-3 outlines the sequence of activities in developing the well site areas.

The same regulatory constraints apply to fluids produced by EFT as to recovery by any other means.

EFT operates on a similar principal as DST. The main difference is that EFTs are undertaken after the well has been cased. In an EFT however, the drilling rig would be removed to drill another well while the drilled well is prepared for testing. As each well is drilled and drill stem tested to evaluate its candidacy for extended testing, it is left in a safe, secure state for further testing after removing the drilling rig. Mobilizing a service rig to complete the work may become necessary before turning the well to extended testing. A well service rig has very similar capabilities and equipment to a drilling rig except that it generally has fewer modules and is lighter equipment. If a service rig is required, it would be incremental equipment to the drilling rig.

Table 3-3. Sequence of well development activities.

<table>
<tr><th colspan="3">The sequence of Well Development Activities</th></tr>

The sequence of Well Development Activities		
Suspend well to become an alternative location for deep zone injection (finish casing, perforate the casing, and install production flow control devices, steel tubing, and wellhead components).		
Remove all surface infrastructure.	Install required surface facilities (separator vessel, heaters, dehydrators, stock tanks, flow lines, metering equipment, portable generators, and flare stack).	Install required surface facilities (separator vessel, heaters, dehydrators, stock tanks, flow lines, metering equipment, portable generators, and flare stack).
Remediate well site area.	Conduct EFT over period of 1 – 2 months	Conduct EFT over period up to 2 years
Recontour well site area and revegetate disturbed areas to natural conditions.	Measure natural gas and water from wells.	• Measure, store, and process crude oil, natural gas, and water from wells. • Transport crude oil from EFT to central processing facility, then to acceptable market.
Recontour access roads and revegetate disturbed areas to natural conditions.	Conduct maintenance on well as required (work over).	Conduct maintenance on well as required (work over).
	Once EFT is, complete either: • Decommission and abandon well or • suspend well pending future use (e.g., develop further project proposal to bring into production)	Once EFT is complete, either: • Decommission and abandon well or • suspend well pending future use (e.g., develop further project proposal to bring into production)
	Abandon well (cement all perforated producing zones, install shallow cement plugs, and cut surface casing 1 m below normal ground surface).	Abandon well (cement all perforated producing zones, install shallow cement plugs, and cut surface casing 1 m below normal ground surface).
	Remove all surface infrastructure.	Remove all surface infrastructure.
	Remediate well site area and allow to regenerate naturally	Remediate well site area and allow to regenerate naturally

To allow the zone of interest to flow into the wellbore, the casing is perforated which is a routine procedure achieved by either using a wireline from surface or attached to the end of the production tubing from the surface to the zone of interest. In this case, the well is first completed with a packer attached to a tubing string and have downhole gauges to record flowing temperatures and pressures in real time. The surface would have the necessary “Christmas Tree” wellhead equipment and be flow line connected to the test separator through a choke manifold. Well fluids (gas, oil and water) would then be handled similarly.

Several wells at different locations could undergo EFT simultaneously, depending on drilling success/DST outcomes.

Extended flow testing is normally performed by specialists who provide the equipment, supervise the EFT operation, administer the safety protocols, and have the required certifications to perform the associated tasks. Extended flow testing however would be handled in the same fashion as production operations and still be conducted by trained professional operators under the direct supervision of a Production Superintendent.

EFTs will require installing surface and subsurface equipment and facilities at each well site to measure, process and store produced fluids. There is the potential to undertake more than one EFT per well if more than one zone is suitable for testing. The specific details of this equipment is subject to the nature of the discovery and could include:

- Casing of entire wellbore and perforate casing at zone of interest;
- Packer, tubing and downhole gauges;
- Wellhead valving assembly;
- Flare systems;
- Separator vessel;
- Treater to do additional separation of the produced fluids;
- Storage tanks;
- Appropriate artificial lift systems;
- Heaters;
- Dehydrators;
- Flow lines;
- Metering equipment; and,
- Portable generators.

Chance anticipates a delay (e.g., the following winter season) between completing DST, completing the well/removing the drill rig, and commencing EFT to allow time to design the flow test, secure the equipment and operating personnel, ship the equipment to site, install the equipment, and commence the operations. This program would include ancillary services to set up and perform the EFT (e.g., service rig). EFT will be undertaken on a maximum of 30 wells drilled during the exploration well drilling program. EFT may require up to a month to complete for a predominantly natural gas well or up to 2 years for a predominately crude oil well. Chance anticipates that up to 10 wells may undergo EFT simultaneously (based on the planned drilling schedule).

Fluids produced during EFT will be some combination of natural gas, crude oil and possibly formation water, which will be separated, measured, processed, used, sold, or disposed of as follows:

- Natural gas could be flared for short periods of time but would be preferentially used for process heating, fuel for mechanical power or possibly onsite power generation. Heaters are used to provide heat to vessels treating the produced fluids or keeping stored fluids warm; they can include heating an intermediate fluid such as glycol at the heater and circulating the glycol in a network of raised or insulated pipes (to prevent thawing ground surface) to the places where heat is required. The mechanical or power generators would likely be small engines fuelled with natural gas and sized according to the location's needs.
- Crude oil produced during the EFT would be preferentially stored temporarily for potential future shipment to market. This will require some processing at the well site or the CPF to

stabilize the crude oil for truck transport to a suitable, approved crude oil marketing point (i.e., terminal).
- Formation water produced with crude oil or natural gas will be separated from the hydrocarbon streams and disposed of via existing deep injection wells at Eagle Plains.

EFTs involve the flowing of a well or wells under human supervision, while wells flow unimpeded for the duration required for the test. In a multi-well producing field, for example, a maximum of three persons can manage the production operator tasks of a field with 50 or more producing wells (double that number when working a 24-hour day). Field production operators visit each well at least once daily unless there is a need for remedial work. They record flowing well pressures, ensure fluid pumps operate properly, have enough fuel to continue operating and visually inspect the facility for anything unusual.

Chance plans to use up to three operators to manage the EFT wells in any 12-hour cycle. A second set of up to three will form the cross-shift for a total number of six operators.

3.3 ACCESSORY PROJECT COMPONENTS

The following activities are required to support the principal exploration drilling and EFT:

- building and maintenance of winter access roads;
- other project facilities (i.e., remote camps and fuel storage);
- some surface facilities (e.g., flare stacks, flow lines, storage, processing, injections);
- airstrip construction and operations (estimated two fixed-wing aircraft flights per week); and,
- water use for drilling and camp needs, and for short periods to make snow and freeze in access trails.

Chance Camp at km 325 will be the main accommodation facility for the exploration program. During drilling operations, there will be some accommodation for essential staff in a mobile camp at the well location. This mobile camp will be occupied 24 hours per day, 7 days per week, to house essential personnel (rig supervisors, medic, geologist, etc.).

3.3.1 Well Maintenance

Any well completed for EFT, or not completed for EFT and suspended, may require maintenance during the 10-year term of the Project. Well maintenance is required on any suspended well before abandonment, conversion to an active well, or annually if it remains suspended. Well-maintenance equipment may include a service rig, wireline truck, cement trucks, and associated support equipment. Under the *Oil and Gas Drilling and Production Regulations* (Government of Yukon 2004), a well is deemed suspended when it is safely secured, but not producing oil or natural gas.

Well maintenance activities, also known as workovers, generally include the following:

- pressure testing to confirm integrity of the casing and well head valves;
- removal of equipment in the well bores such as tubing and plugs;
- wireline investigations to measure temperatures and cement integrity and convey any perforating equipment;
- remedial work such as cement squeezes; and,

- wellbore integrity assessment.

3.3.1.1 Pressure Test and Surface Casing Vent Flow Test and Gas Migration Test

A pressure test will be conducted at each well to evaluate the integrity of the wellhead and the existing wellbore casing. The well (or Legacy well) will then be tested for surface casing vent flow (SCVF) and gas migration. Chance reports that no SCVF has ever been detected in existing suspended wells during annual inspections. If SCVF is identified, the well will be inspected and test results logged using various tools (e.g., noise tool, temperature tool, bond log tool) to determine the source of the SCVF and/or gas migration. The logs will be analyzed, and a plan will be formulated to complete a downhole shut-off at the source of the SCVF or gas migration if required. This is only done for significant vent flow events or when abandoning a well. Non-significant vent flows are normally left until end-of-life for newly producing or suspended wells. Depending on the status of the well (e.g., cased or completed with perforations) and the nature of the problem, the equipment needed to fix the problem will involve some combination of a service rig, wireline services and possibly cementing services.

3.3.1.2 Temperature Log and Cement Bond Log

Once SCVF and gas migration testing is complete, the service rig, support equipment, and wireline will be moved to the well site. A temperature log will be recorded from the surface to 300 m Kelly-Bushing below the surface (mKB) to identify anomalies or departures from the reference gradient. Most anomalies are related to fluids entering the formation through the borehole or fluid exit. If there is no anomaly, this work will be a good measure of the depth and thickness of permafrost.

A cement bond log will be run after the analysis of the temperature log. The cement log uses the variations in the amplitude of an acoustic signal travelling down the casing wall between a transmitter and receiver to determine the quality of a cement bond on the exterior casing wall. The acoustic signal will be more attenuated in the presence of cement than if the casings were uncemented. The cement log is used to identify sections of the well bore that will need intervention to isolate porous formations from adjacent formations.

3.3.2 Access Roads

Winter roads will be used for the exploration program. There will be no permanent roads within the exploration stage of the project. Temporary drilling pads created from snow on cleared but undisturbed ground will be used and will only exist during winter. **Figure 3-12** below shows the maximum potential winter road network to the exploration sites. Each winter road's number, location and length will be determined as the exploration program develops. As the program unfolds, the access road network's ultimate size will depend on drilling results (success). If drilling results are discouraging, the road network may be less than shown.

This project's proposed winter road construction method will be a compaction of the natural snow cover. Water may be needed in some areas to reinforce the packed snow. Some snow may be hauled to low areas or areas that are wind-blown. The natural vegetation cover will be preserved and remain undisturbed as much as possible. Compacted snow roads are appropriate to serve low ground pressure geotechnical field programs or winter roads with low traffic volumes. This method will suit this exploration program, as the expected traffic on this road will be the transport of a drilling rig with anticipated one to two moves (this

number could be up to 5 depending on the time needed to drill and evaluate a given well) per season, and a small number of support vehicles.

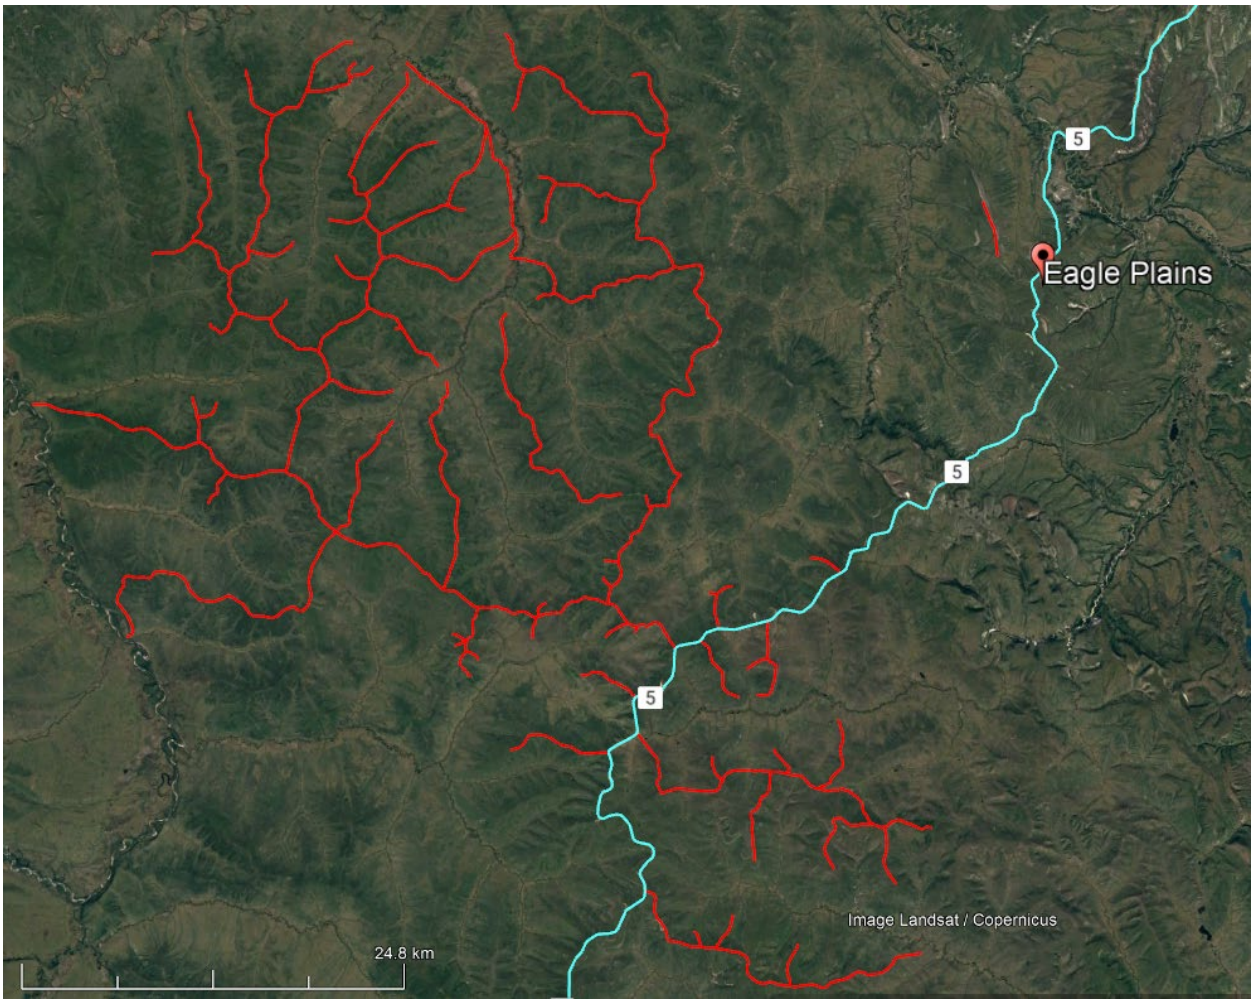

Figure 3-12. Conceptual winter road network.

3.3.2.1 Routing Rationale for the Winter Roads

The routing of a winter road needs to consider the following criteria (discussed in detail below):

- road geometry, such as grades and curves to suit the intended vehicles;
- number and width of water crossings;
- avoidance of unfavorable terrain;
- avoidance of selected areas determined by historical resources, vegetation, wildlife habitat, etc.; and,
- sensitivity of permafrost terrain to the construction of a winter road.

Road geometry — Ideally, for vehicle safety and operations, the maximum gradients on the road should be 6% or less, with only short sections up to 10%. The routing developed for this Project generally falls within this range, although route adjustments will likely be undertaken in the field if these desirable gradients are met.

Number and width of water crossings — Selecting routes that minimize the number and width of water crossings reduces the complexity of the winter road construction and the uncertainty or risk during operation. For this Project, there is only one wide crossing, and all crossings are expected to be completely frozen during the operating season.

Avoidance of unfavorable terrain — Chance has undertaken terrain mapping of the area. The route is located on bedrock, weathered bedrock and colluvial sediment where possible.

Sensitivity of permafrost terrain to constructing a winter road — Chance has undertaken permafrost mapping in combination with terrain mapping. The route, where possible, is generally located on ice-poor to ice-moderate permafrost. Ice-rich permafrost is sensitive to the activities associated with the construction and operation of winter roads and should be avoided to the extent possible. Specific mitigation to preserve permafrost will be undertaken in situations where it must be crossed.

The development of the routing for the potential winter road network has considered these criteria. The potential routes have been selected to minimize the effect of unfavorable terrain and thaw sensitive permafrost terrain while balancing the need to access sites.

3.3.2.2 Construction Considerations and Operating Season

The winter road will not be constructed until the ground is sufficiently frozen and has adequate snow cover to limit disturbance to the ground and vegetation.

Winter road construction will commence when the depth of snow cover is approximately 10 cm and sufficient to cover low-lying vegetation thereby minimizing effects to the ground. The winter road will be constructed with dozers supplemented with steel frame drags. Other equipment may be required to haul snow as necessary.

The winter road widths will be dependent on the size of vehicles to be used each season. Single-lane winter road for smaller lighter equipment and very low traffic volumes will be as narrow as 5 m. Wider two-lane winter roads, approximately 9 to 10 m in width, will be constructed for larger equipment and greater numbers of vehicles.

Closing a winter road is based on observed depletion of snow cover and current and forecasted weather. Once the insulating snow softens and disappears and the daily air temperatures rise above 0°C for a few days, the winter road will be operated only at night, and eventually closed before the ground thaws. Diligent and ongoing observations of the conditions and the forecasts will be undertaken to ensure that equipment is moved off site and the winter roads are closed appropriately.

The general operating season for a winter road in this area is estimated to be from the end of January to the end of March. Still, it could last longer depending on the timing of opening and the end of winter.

3.3.2.3 Mix Bury Cover (MBC) Sump Access Road

Chance also proposes constructing a 400 m long, 6 m wide winter road to the proposed MBC sump area. This road will be built as early in the operating season as possible (soon after mid-January as snow and weather permit) and will take approximately two weeks to complete. It will be reopened each winter season that drilling occurs. The proposed route follows an existing access trail; no major clearing will be required. The proposed route includes no watercourse crossings and is 800 m from the nearest surface water body.

3.3.2.4 Access Road Maintenance

Maintenance of winter access routes may include low-ground-pressure vehicles, a road grader equipped with a wing snow plough, some water application, and use of matting where required. Grading may be required over certain stretches of the route, and depressions along the roads will be filled with snow to smooth the surface. If required, water will be withdrawn from approved water sources using adequately sized intakes and screened to prevent debris blockage and fish mortality; refer to Interim *Code of Practice: End-of-Pipe Fish Protection Screens for Small Water Intakes in Freshwater* (Government of Canada 2020).

3.3.3 Mix Bury Cover (MBC) Sump

As described and detailed in AER *Directive 050 Drilling Waste Management* Section 13 (Alberta Energy Regulator 2023), and accepted in the Yukon, MBC is a method of disposing of drilling waste (both drill cuttings and drilling mud) by which the by-products and spent mud are mixed with a local receiving soil at a specific mix ratio, deposited into a sump area, and then covered with clean subsoil.

A typical MBC sump design consists of three distinct layers:

- A clean subsoil layer 1 to 1.5 m deep on top of the drill cuttings and soil mix; this layer acts as an insulator between the subsoil/drill cutting mix and the vegetative layer to ensure that, after final reclamation, the site is returned to its original state.
- The subsoil/drill cutting mix layer is where the receiving subsoil is mixed at a specified mix ratio with the disposed of material (e.g., drill cuttings, spent drilling mud, etc.).
- Clay-rich material exceeding 1 m depth below the drill cuttings and soil mix, or alternative impermeable liner, acts as a hydraulic isolator.
- The identified MBC sump location will be investigated for suitability via drill cores to confirm the following conditions are present and at what depth:
- Sump soil has appropriate deposits of clay-rich soils.
- Appropriate clay-rich material of 1 m is beyond the horizontal and vertical dimensions of the sump to ensure hydraulic containment.
- There is an absence of hydraulic defects or ways for fluid to leak out of sump.
- A composite sample, made up of five subsamples, is required for every 3,000 m³ proposed to be used for MBC.

Before Chance begins exploratory drilling, a test sample of the drilling fluid will be analyzed and compared against the receiving soils at the proposed MBC site to estimate the soil/waste mix ratio to ensure the final soil composition complies with AER Directive 050 Drilling Waste Management Section 3 (Alberta Energy Regulator 2023). While an MBC sump is actively being used, Chance will monitor and inspect the site to evaluate sump integrity, volumes of material involved, and if further work is needed to the sump location.

For the proposed Project, drill cuttings will be transported to and disposed of at the identified MBC sump site, while drill fluids will be reused until the end of the Project or the end of the season. Chance plans to construct a new MBC sump (see **Figure 22**). The Devon sump location has not been used by Chance to dispose of drill cuttings or drilling fluid, and there are no plans to do so. The preferred MBC location for this Project is an adjacent, previously undisturbed area of approximately 63,910 m².

Figure 3-13 shows the proposed area with several 800 m² MBC pods representing an estimated area required to dispose of 300 m³ of drill cuttings, approximately one well's worth. The additional area is to accommodate spacing between MBCs for truck access and to stockpile excavated material. Typical operational practice is to have only one MBC pod open at a time to minimize potential permafrost exposure to ambient air temperature.

As per the AER directive, sampling drill waste will undergo the following sampling procedures:

- During drilling, the environmental monitor will be onsite to conduct sampling in compliance with AER *Directive 050 Drilling Waste Management* (Alberta Energy Regulator 2023) to ensure that drilling waste is compliant and accurate records are being kept, and to respond to any spills.
- The environmental monitor will take soil samples at the MBC site before use for MBC and after closure and reclamation.

If drilling by-products do not meet AER *Directive 050 Drilling Waste Management* (Alberta Energy Regulator 2023), the disposal materials will be transported to an appropriately permitted facility for disposal. Chance has previously used permitted facilities that can accept specified waste in Whitehorse and northeast BC.

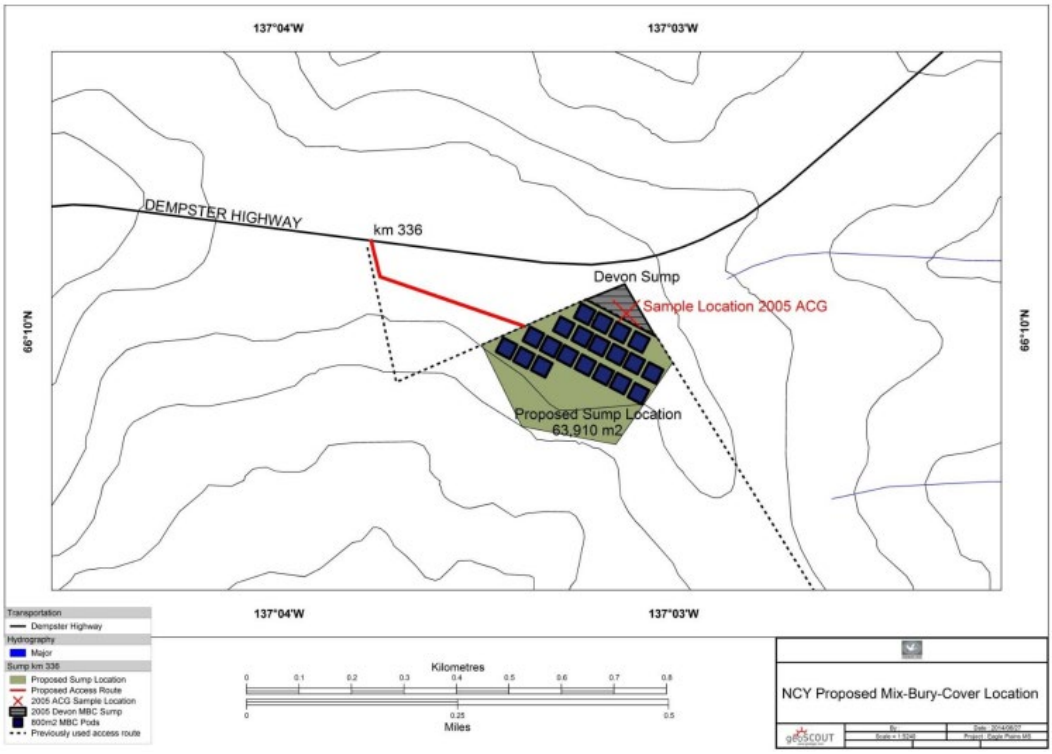

Figure 3-13. General location and plan of the proposed Mix Bury Cover (MBC) sump.

3.3.4 Central Processing Facility (CPF)

The Chance Camp's Central Processing Facility (CPF) will be located at the southernmost end of the camp area, furthest from other camp structures and personnel. The CPF will comprise multi-stage and multi-phase separators, heater treaters (to remove any remaining emulsified formation water and residual natural gas still in solution), a vapour and gas collection system, and a possible central power generation facility to charge all discrete well batteries. Trucks will transport fluid produced during EFT or (occasionally) DST from exploration wells for further processing at the CPF. Separated water will be further treated to remove any hydrocarbons, scale, anaerobic bacteria, and other colloidal or suspended solids ready for disposal in a nearby deep injection well.

Crude oil produced during the EFT would be preferentially stored temporarily for future shipment to market. This may require some processing at the well site or the CPF to stabilize the crude oil for truck transport to a suitable, approved crude oil marketing point (i.e., terminal). The volume (stored in up to five surface tanks in full compliance with Yukon and Canadian standards and regulations) also ensures safe crude stabilization before loading onto southbound trucks. In terms of maintenance, the only treatments appearing necessary at this stage of design are fluid separation (to separate oil from gas and water into three distinct streams), heat treating the crude to remove water remnants from the separated crude, and gas dehydration to make the gas useable as a fuel.

3.3.5 Airstrip

Chance will construct an airstrip along the existing Chance winter trail approximately 4 km off the Dempster Highway. The airstrip will be about 1,500 m long and part of the road network west of the Dempster Highway. This airstrip will be used only during the winter when the surface can be levelled using winter road construction techniques. If sufficient air traffic support is required, Chance may upgrade the airstrip to year-round usage. Until the Chance Road airstrip becomes serviceable each winter or at the end of the winter season operations when trail conditions deteriorate, Chance will continue to use the Dempster Highway adjacent to the camp as a periodic airstrip.

At the beginning of an operating season, the 800-m stretch of the Dempster Highway adjacent to the camp will be used as an airstrip similar to previous periods. Once the Chance winter road airstrip is built, flights will move to that location.

3.3.6 Transportation

For most of the exploration program, Chance will attempt to limit traffic on the winter access roads to authorized personnel. Traffic will include approximately eight to nine light-weight service trucks daily (for supplies and personnel), one to two water trucks, and one fuel truck as frequently as operations dictate. The fuel and water trucks will come to the Project site approximately three times per week or as demand dictates, and there will be occasional transport of drill cuttings from the well sites to the sump location. Air traffic is estimated at two flights in/out per week (normal arrival times between 10:30 a.m. and 12:00 p.m.).

Most traffic volume on winter access roads will be related to mobilizing the drill rig and constructing the site infrastructure. Well site set-up will take approximately five days, including 15 to 20 loads, to mobilize the drill rig. Winter roads will be restricted from public access for safety reasons. Chance's contractors will be transporting crews between the camp and the well site using company vehicles; all vehicles will be equipped

with radio communication and, particularly during busy times (i.e., setup and demobilization), traffic will be radio controlled. For safety reasons, any personnel accessing the areas (i.e., winter roads) must notify the appropriate staff (i.e., security personnel or managers/supervisors) when they leave the Dempster Highway and arrive at the well sites. Chance staff hired as wildlife monitors and security personnel will monitor access to the winter roads.

A typical description of road traffic during the prime operating periods (January 1 to April 15; May 1 to December 1) is presented in **Table 3-4**, and road users will follow the schedule as indicated previously in **Table 2-3** and **Table 3-3.**

Table 3-4. Typical road traffic during operating windows.

	Activity Description	Peak Traffic	Normal Traffic
1	Early Season Mobilization (Winter)	High	Light /High
2	Rig Mobilization (Winter)	High	Light /High
3	Drilling (Winter)	Light/High	Light
4	Access Road Construction (Winter)	Light/High	Light
5	Extended Flow Testing (Winter)	Light/High	Light

Notes:

1. High: 20–40 vehicles per 24-hour day
2. Light: less than 20 vehicles per 24-hour day

Chance expects vehicle volumes on the winter access roads during exploration drilling activities will range between medium and light traffic volumes. Minimal additional traffic is expected to and from the site, except for the trips by the water truck and fuel truck, which will be on-demand, transportation of other supplies as needed and possibly transport crude oil produced during EFT to an acceptable market off-site.

Trucking a stabilized crude oil cargo in specially constructed transporting tanks presents the same risk as transporting the diesel fuel required and used in Yukon. The process of loading and dispatching trucks at regular intervals will be planned and handled by professionals who will also maintain constant communication and GPS tracking of trucks as they travel down the Dempster Highway and on other connecting routes to their destination.

Chance has practised Journey Management on its previous exploration drilling work at Eagle Plains. In this instance, any unit transporting materials to Chance's Camp at km 325 will be called and tracked periodically by the dispatcher. The exact location when reaching certain pre-determined checkpoints will be relayed to the Chance Camp Management and Logistics Coordinator; this will ensure road safety for the truck driver and other road users and the safety of the vital cargo. It also provides critical planning information for receiving staff to plan for offloading its cargo and possibly loading backhauls.

The journey distance is 1,029 km from Eagle Plains to Skagway. The journey duration is approximately 17.5 hours driving at an average speed 59 km/hr. Other options exist, including truck delivery to terminals in Fort Nelson and Fort St. John, BC, or Grand Prairie, Alberta. The driving times will vary depending on which of these options is used, but the management procedures will remain the same.

Chance and its trucking contractor(s) will develop a *Transportation Alert and Emergency Response Plan* to manage potential risks and provide a clear chain of communication and action in the event of an accident while in transit on Yukon roads and highways. The plan will address any other Provincial routes. All reputable trucking contractors versed with transporting flammable liquids and petroleum products generally are mandated to follow the *Transportation of Dangerous Goods Act* (Government of Canada 1992). Ensuring the truck is safety-checked and the drivers are qualified and adhere to their company's safety policies are the key to preventing an incident or accident. Tracking the drivers to check on transit speed on a real-time basis means the truck's progress is never neglected and the driver is on notice to observe all road traffic rules at all times.

All incidents affecting Chance's trucking contractor are reported to Chance Operations Management and form part of Chance's safety statistics. Every incident is investigated, and the causes for each occurrence are closely analyzed and discussed with the truck owner. Should any trucking contractor exhibit an undue number of close calls/near misses or a series of incidents with the same causes, they would be removed from the contract without delay and replaced with a more competent and safety-minded contractor.

3.3.7 Workforce and Accommodations

Workforce requirements will vary over the life of the Project and will ultimately be limited by the existing camp capacity. During past drilling and seismic exploration programs undertaken between 2012 and 2014, Chance had no more than 75 to 80 people on-site at any time. During drilling, Chance operated on a 24-hour clock with a 20-day-on and 10-day-off crew rotation cycle, meaning that one-third of the crew was off duty at any point. Chance operated on a 12-hour clock for the seismic exploration program and cycled the various services as the program unfolded with limited crew changes, mostly connected with the camp catering operation.

Chance's existing camp (Chance Camp), office, and storage yard was established in October 2011 and is located at km 325 of the Dempster Highway. It is accessible year-round unless the highway is closed due to weather or construction. For this Project, Chance plans to use the camp for storing and transporting equipment and supplies needed for operations and personnel accommodations. The Chance Camp is the Project's main accommodation facility, and it can house up to 75 people in trailers and kitchen, sanitary and potable water treating facilities. Camp waste management consists of an incinerator for burning non-toxic and food waste and a secure storage area for other forms of waste. All non-incinerated waste will be transported to an appropriate municipal waste facility for disposal.

Due to the remoteness of some well sites, a remote camp (fly-in) would be established near the proposed East Greaves and West Greaves Winter Trails, roughly 40 km from the Chance Camp, to accommodate approximately 25 personnel. It would be used as an operations camp with full services, including food, fuel, sleeper trailers, bathrooms, water storage, and project management and HSE offices. The fly camp is necessary for operations planned in the winter months as the cold temperatures approaching -50°C, nearly 24-hour darkness and the potential of "white out" snow storms pose a real threat to crew member safety.

In addition, a mobile camp will be established at each active well. This will be a trailer that accommodates sleeping and a small medical/first aid trailer equipped with heat, power, water, and sewer service that may be installed at the well site during workover operations to provide essential first aid supplies and refuge for

workers. All wastewater and sewage will be collected in tanks approved by the CSA and transported off-site for disposal at an approved facility in Fort McPherson.

Chance aims to offer training, employment and contracts to its First Nation/Yukon partners as identified in sec. 68 of *YOGA* (Government of Yukon 2002). During its last drilling/seismic program, Chance successfully hired a workforce from the communities from Old Crow, Fort McPherson, Dawson, Whitehorse, and Inuvik.

3.3.8 Project Water Use

Water for the drill rig, winter road construction and the camp operation will be primarily sourced from existing withdrawal locations on the Eagle River, with locations on the Ogilvie River and Whitestone River as an alternative source. Licensed allowances will determine water usage. All water withdrawals will follow the DFO's *Interim Code of Practice: End-of-Pipe Fish Protection Screens for Small Water Intakes in Freshwater* (Government of Canada 2020).

If natural snowfall is below the minimum required depth to construct and maintain the winter roads, snowmaking equipment may be used to make up the shortfall. This is a contingent consideration and could require up to 300 m³ of water per day for a short period (a few days to a week) in the early winter. The sources of water include the Eagle River and the Ogilvie River. The water used to make snow and ice for the winter road(s) will be trucked from the source to the point of use, with each truck expected to complete between one and three deliveries per day.

Potable water for the Project will be sourced from the Eagle River, Ogilvie River and potentially the Whitestone River at a maximum rate of 20 m³/day, as described in Water Licence MN12-061 and treated at the Chance Camp using a combination of ultraviolet (UV) treatment, chlorination, and filtration. Wastewater disposal at the Camp consists of a wastewater treatment plant, holding lagoon, and exfiltration system.

3.3.9 Fuel Storage

Operation of the camp will require diesel and propane for power, heating and cooking. Diesel will be stored on-site in 15,000 L Enviro Tanks. There will be four to six tanks at the camp and one to two at the rig site. The tanks are bulk fuel, double-walled storage tanks with built-in secondary containment. The drilling rig, boilers, and any light towers at the rig site will have their own built-in fuel storage tanks.

Propane will be used to fuel the furnaces, hot water tanks, and the kitchen at the camp and at the rig sites and will be stored in 1,500 L propane bullet tanks. There will be six at the camp and one to two at the rig camp.

3.4 RECLAMATION AND CLOSURE

3.4.1 Seismic Lines

In addition to the low impact seismic methodology, with reduced line width and meandering paths, a remediation plan involving access deterrence will be used. Although nominal, standing timber will be gently pushed across lines to create a Leaning Tree Stand (LTS) using a "Stem Bending" method to decrease

these sight lines. Although not expected to be required to a great extent in the Eagle Plains area, this technique is highly effective in reducing access and enabling sufficient cover for vegetation regeneration.

3.4.2 Mix Bury Cover (MBC) Sump Site Reclamation

The standard AER *Directive 050 Drilling Waste Management* (Alberta Energy Regulator 2023) of action prescribes the following closure and reclamation actions for MBC sumps:

- Upon completion of the Project, remote disposal locations will be covered with a minimum of 1.0 m of capping material and contoured to meet background topography.
- A Phase 1 Environmental Site Assessment (ESA) will be completed for each well and corresponding remote MBC location to identify any potential areas of environmental concern.
- If the Phase 1 ESA triggers a Phase 2 ESA, soil samples will be collected and analyzed at an accredited laboratory.
- If contamination is identified, a Remediation Action Plan will be prepared and upon approval, the remedial program will be completed. Once all contamination is addressed either in the Phase 1 ESA, Phase 2 ESA, or Remediation, a surface program including soil and vegetation will be conducted.
- Once vegetation is established, a Detailed Site Assessment; comparing soil lithology and vegetation onsite to offsite) will be completed.

The stockpiled vegetative layer and soil will be re-applied to the MBC sump area on top of the capping materials and after contouring has been completed.

Environmental monitors will follow the testing requirements in accordance with AER *Directive 050 Drilling Waste Management* (Alberta Energy Regulator 2023):

1. Receiving soil
    a. Electrical conductivity and sodium adsorption ratio
2. Waste (solids or total waste)
    a. pH, electrical conductivity, sodium adsorption ratio, sodium (Na)
    b. nitrogen (N), if additives/products added to the drilling mud/waste system contain any amount of N or if N content was unknown
    c. metals, if concentrations exceeding limits were added to the drilling mud system or if the metal content of additives/products is not known
    d. hydrocarbons, if a hydrocarbon flag was encountered
    e. toxicity, if toxicity data are unknown for any of the mud additives/products used in the drilling mud system or if concentrations used exceeded pass threshold for luminescent bacteria toxicity test
3. Waste/soil mix (post-disposal)
    a. conductivity (EC), sodium adsorption ratio (SAR), and Na, if drilling waste EC >10 decisiemens per metre (dS/m) or Na >3000 milligrams per litre (mg/L) (saturated paste extract or filtrate from oversaturated waste)
    b. metals, if concentrations in drilling waste exceed concentrations listed
    c. hydrocarbons, if concentrations in the drilling waste exceed concentrations

d. N, if the nitrogen concentration in the drilling waste (wet weight) is ≥6 milligrams per kilogram (mg/kg) for disposals in coarse soil or ≥120 mg/kg for disposals in fine soil.

The first task on any well site is constructing the well pad or preparing the surface on which matting can be safely placed. The next step is to lay the mats on the 10 cm of packed snow, moving snow as needed to create a flat surface. The final process, before deploying the drilling equipment, is a professional geotechnical check on the stability of the surface and its resultant ability to support the maximum anticipated loads with a suitable safety factor. Finally, the geotechnical engineer will provide a signed/stamped report attesting to the stability and strength of the facility for the work contemplated.

3.4.3 Well Abandonment

As mentioned, the 30 proposed wells are part of an exploration program to help determine the region's oil and gas resource potential. Depending on the outcome of results, a given well may be tested and additional plans developed to bring it into production or decommissioning and abandonment if determined to be unproductive. As the Operator, Chance will always be responsible for all wells deemed its property. This responsibility can never be delegated to any other party unless and until such time Chance relinquishes ownership according to *YOGA* and its regulations (Government of Yukon 2002, 2004).

The standard AER *Directive 050 Drilling Waste Management* (Alberta Energy Regulator 2023) of action prescribes the following closure and reclamation actions for well sites:

- A Phase 1 ESA will be completed for each well location to identify any potential areas of environmental concern.
- If the Phase 1 ESA triggers a Phase 2 ESA, soil samples will be collected and analyzed at an accredited laboratory.
- If contamination is identified, a Remediation Action Plan will be prepared and upon approval, the remedial program will be completed. Once all contamination is addressed in the Phase 1 ESA, Phase 2 ESA, or Remediation, a surface program will be conducted, including soil and vegetation.
- Once vegetation is established, a Detailed Site Assessment; comparing soil lithology and vegetation onsite to offsite) will be completed.

Wells required for further operational uses such as producing wells, water or gas injector wells will be maintained in a suspended state and can be converted for use in the future. The *Oil and Gas Drilling and Production Regulations* under *YOGA* (Government of Yukon 2004) have specific actions required from an operator to maintain a well in a suspended state; key among these actions is to periodically conduct inspections to ensure that the integrity of the well is intact. While a well is in suspended status, the regulator requires a sum of money to be placed on deposit to cover the cost of abandonment and remediation of the site. Once abandoned, the status becomes permanent, and re-entering such a well would not be possible.

The normal stages before decommissioning/abandonment of a well are as follows:

- The well is first determined to be unusable.
- The perforations are first cemented by placing a cement plug below and above them and squeezing cement into the formations to isolate them within the wellbore permanently. A

mechanical shut-off device called a bridge plug may also be wireline set above the cement plug to add protection or isolation.

- A second cement plug would be set higher in the production casing and below the estimated permafrost maximum depth. This plug is normally set on top of a bridge plug to ensure it does not leak down in the casing. The plug is also "felt" with a drill bit to confirm its existence and hardness.
- The casing at the surface is cut 1 m below the original ground and buried under the soil to remediate the location entirely. The soil will be left to achieve a frozen state naturally, and permafrost is expected to establish within it at the same depth as the surrounding area.
- The lease is remediated by removing all equipment and infrastructure to restore the location to its original status. The surface location is left to be revegetated naturally.

When appropriate, a decommissioning/abandonment plan for the well sites will be developed to comply with Part 7 of the *Oil and Gas Drilling and Production Regulations* (Sections 95, 96, 97, 99) (Government of Yukon 2004). Wells would require final well abandonment according to the *YOGA Oil and Gas Drilling and Production Regulations* (Government of Yukon 2004).

During winter work, sampling can be accomplished from the surface snow deposits around the well site. Chance has selected well site dimensions to ensure a sizable perimeter for containing liquid or solid waste from the Project. The well site will be lined to contain potentially released fluids. An outline procedure prepared by Chance in compliance with the *YOGA Oil and Gas Drilling and Production Regulations* (Government of Yukon 2004) is presented as follows:

- Seal off all perforations in the casings not already sealed with cement squeezes.
- Pressure test the casings to 7,000 kilopascals (kPa) to confirm isolated and sealed formations.
- Cut off the wellhead and casings to 1 m below ground level and weld/install plates to cover each casing string at the surface.
- Install well identification marker visible above ground level.
- Bury the cut casings to complete the abandonment.

If the entire Project had to be suspended but not completed, the infrastructure would be preserved and maintained until the Project resumes. If it is decided to terminate the Project, the infrastructure will be decommissioned. While operations are suspended, Chance would ensure access from the Dempster Highway would be barricaded and visually inspected periodically.

3.4.4 Winter Roads and Winter Well Sites

Reclamation activities will aim to enable sites to revegetate naturally as quickly as possible throughout the life of the Project. Well site and winter road reclamation activities will be designed to meet the following objectives:

- Leave the site uncontaminated following the completion of Project activities.
- Remove all garbage, petroleum products, and equipment.
- Prevent long-term erosion or slumping and promote successful natural revegetation of disturbed areas.

Given the winter road construction methods that will be employed (i.e., packing snow to a minimum thickness of 10 cm), no additional reclamation is anticipated to be required for the winter roads. Proposed Project activities will take place during winter, and the winter access roads and well site pads will be constructed using snow and ice to minimize damage to the vegetative layer or compaction/scarification of the organic soil layer. The proposed measures to promote successful natural revegetation are as follows:

- Complete removal of equipment, matting, materials and debris from well sites.
- Leaving the well sites and winter roads in such a condition that water ponding, slumping or soil erosion are unlikely outcomes – if (unplanned) soil disturbance takes place, the surface would be contoured to minimize erosion (depending on the area disturbed), roughened, and covered in a layer of mulch or cut vegetation.
- No stockpiles of snow or ice will be left at the well sites or along the winter roads, to minimize melt-related effects on vegetation.
- Existing shrub-stage vegetation will be pushed over, or cut as high as possible, during winter road construction.
- Trees and shrubs will be cleared but ground vegetation will be left intact and protected via minimum 6” packed snow or rig mats. Where trees and large shrubs exist, they will be hand cut and piled to form brush piles that will inhibit human travel and provide ongoing soil/non-woody vegetation protection post-melt.

Access to winter roads will be restricted during and after operations. Restricting access will ensure that the road can fully melt in spring, thus reducing the potential for additional disturbance from outside users and reducing risk to Chance employees and the public.

Re: Eagle Plains Oil and Gas Exploration Planning: Surficial Geology/Permafrost and Exploration Development Suitability Mapping

---

1. Introduction

Palmer is pleased to submit this report to Chance Oil and Gas Limited (Chance) to accompany and explain the interpretive surficial geology/permafrost and exploration development suitability mapping in a priority area of its Eagle Plains property in northern Yukon. Our work provides a basis for Chance to effectively plan upcoming maintenance programs for its abandoned wells and the next phase of its exploration, by distinguishing areas well and poorly suited to road and well pad construction, and mix-bury-cover (MBC) drill cuttings disposal. It also aims to help streamline Chance's exploration permitting process by proactively characterizing the distribution and relative ice content of permafrost in anticipation of related information requests from the Yukon Environmental and Socio-economic Assessment Board (YESAB).

Following provision of important background information (Section 1), we provide an overview of the physical setting (Section 2) and describe the methods used to produce the interpretive mapping and derivative products (Section 3). Key results portrayed by the maps, including the areal distribution of distinct areas and implications for exploration development, are highlighted in Section 4. Recommended follow-up investigations are highlighted in Section 5.

1.1 Background

Chance is interested in expanding its exploration for oil and gas reserves within its property near Eagle Plains. Exploration is planned in phases across a 2,400 km^2 area within its property. To support exploration planning and associated permitting, Chance is seeking insight into the distribution, characteristics, and sensitivity of permafrost terrain within its exploration area as a basis for optimizing initial ground testing and ultimate site selection for its exploration wellpads, access roads and MBC disposal sites. A number of key characteristics are particularly important for assessing site-specific sensitivities to disturbance, including: permafrost extent (laterally) and depth (active layer thickness) with consideration of potential talik (unfrozen) zones; relative ice content (e.g., ice-rich or ice-poor); and past or present instabilities expressed by

thermokarst, gullying, shallow landslides and ice-wedge polygons. Indicators of concentrated and seasonally prolonged shallow groundwater flow, such as slopewash runnels and the margins of existing or recently abandoned water bodies, are also important considerations for site selection and land management as these may increase construction costs and maintenance requirements.

Palmer previously completed surficial geology/permafrost and derivative suitability mapping for a 440 km^2 subset of the Chance Eagle Plains property, located approximately 40 km southwest of Eagle Plains. This study builds on and refines the previous work to complete seamless mapping expanding from the 440 km^2 subset into the surrounding area. In addition, this study takes advantage of the previous reporting by Palmer (2015a), which has been adapted for the current objectives, updated based on limited field observations, and revised where necessary.

1.2 Study Area

The study area is located approximately 20 km southwest of Eagle Plains, and measures approximately 2,400 km^2, inclusive of the 440 km^2 subset mapped in 2015 (Figure 1). The Dempster Highway diagonally crosses the southern half of the study area between kilometres 300 and 347. The northern edge of the study area roughly coincides with the Arctic Circle at 66°30’00” N, while the southern edge is approximately 8 km north of the Peel River valley at 65°55’00” N.

1.3 Objectives

The overall objective of this study is to expand the existing understanding of terrain and permafrost distribution and will ultimately provide Chance with advance knowledge of permafrost sensitivity and development suitability across its 2,400 km^2 Eagle Plains study area. To accomplish this main objective, Palmer completed the following:

- A field reconnaissance program to calibrate the terrain and permafrost characteristics with limited helicopter- and ground-based observations;
- Surficial geology mapping for the study area, including delineation of terrain features through the newly added 1,960 km^2 expansion area and review and refinement of the original 440 km^2 subset;
- Classification of permafrost conditions across the study area, with a focus on describing relative active layer thickness and permafrost ice content; and
- Derivation of an Exploration Development Suitability map with a focus on highlighting regions where constraints related to terrain and permafrost conditions are most likely to affect road routing and design, wellpad siting and layout, and future construction and maintenance activities. The Exploration Development Suitability map also draws attention to areas potentially suitable for MBC disposal of drill cuttings.

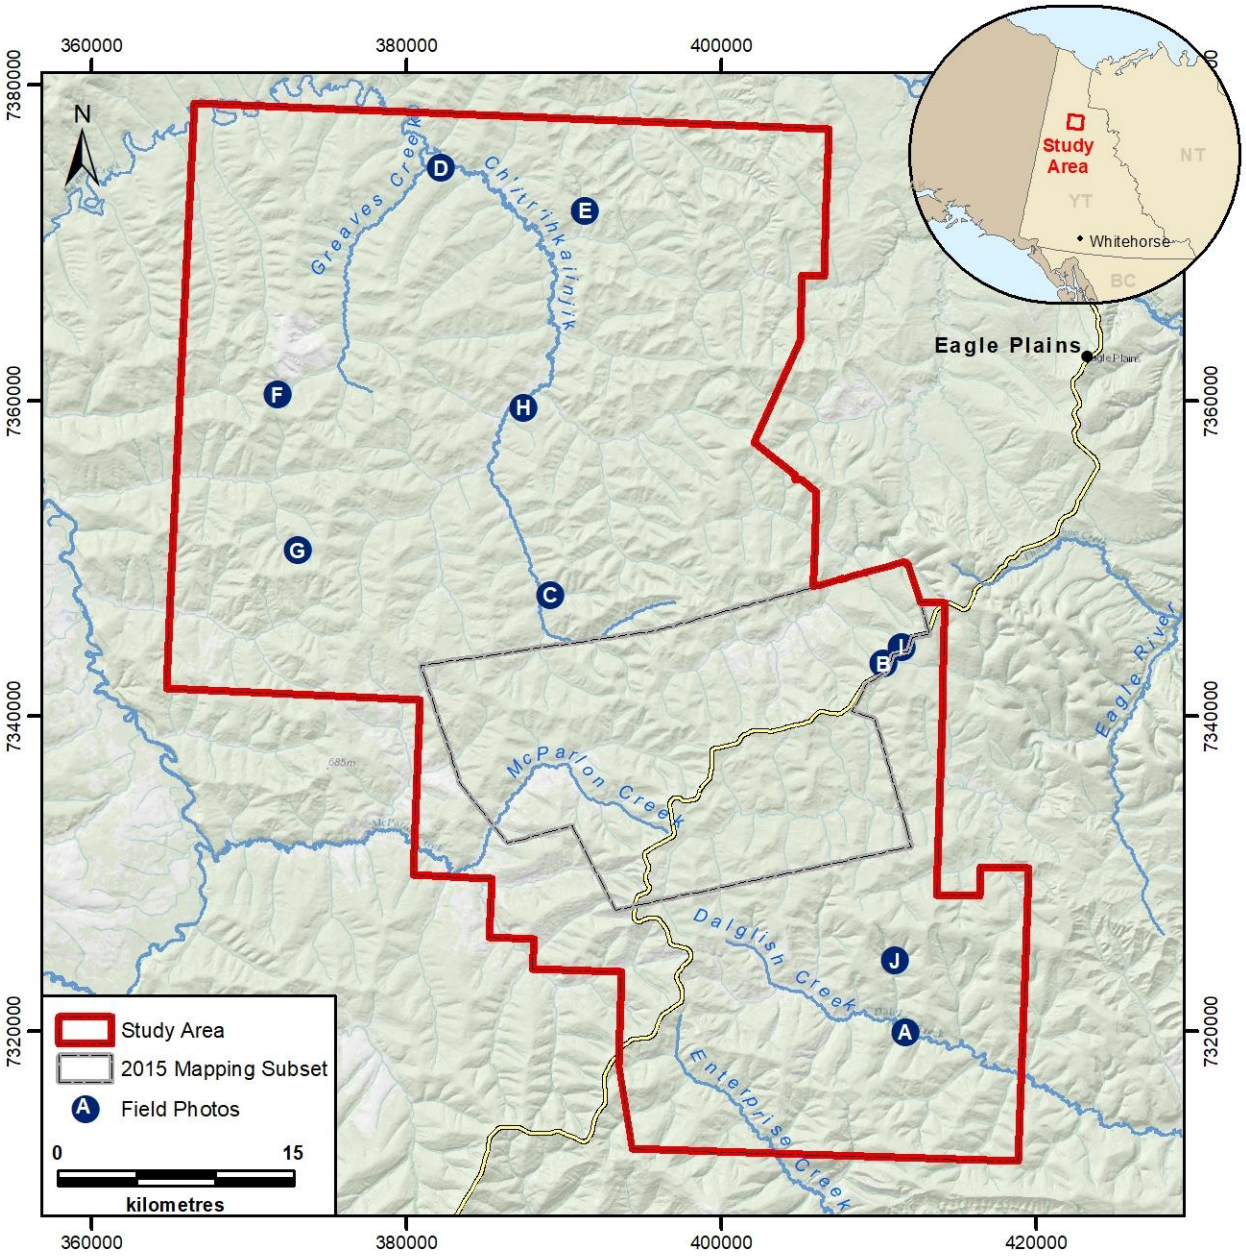

Figure 1. Eagle Plains study area and locations of representative field photos included below.

2. Physical Setting

The study area lies within the Eagle Plains Ecoregion, an area of modest relief in the lowlands between the North Ogilvie and Richardson mountain ranges (Yukon Ecoregions Working Group, 2004). Elevation ranges between 350 m asl at the base of the northernmost river valleys to 750 m asl at high points along the broad ridge system followed by the Dempster Highway. Climate is characterized by prolonged winter conditions which persist up to eight months of the year. Mean annual temperature is near -7.5ºC, with mean July temperatures around 13ºC and mean January temperatures slightly colder on the valley floors (-31ºC) than over higher terrain (-25ºC) due to strong temperature inversions associated with Arctic high pressure.

Annual precipitation is approximately 400 mm, falling mostly as rain during the summer months (Yukon Ecoregions Working Group, 2004). Most surface water drains into the northern-flowing Porcupine River, via major tributaries such as the Eagle River and Whitestone River; in the southeastern corner, Dalglish Creek and Enterprise Creek drain into the Peel River, which flows east to the Mackenzie River.

2.1 Bedrock Geology

The bedrock geology of the study area is dominated by the Upper Cretaceous rocks of the Cody Creek, Burnthill Creek, and Eagle Plain formations (Yukon Geological Survey, 2020). These rocks comprise fine- to medium-grained sedimentary sequences including sandstone, shale, siltstone, bituminous shale, mudstone, and coal. The easternmost edges of the study area intersect the mixed carbonate and clastic rocks of the Hart River and Ford Lake formations.

Differential weathering of these lithologies has contributed to the unique landscape in the study area. Broad ridges are formed by comparatively erosion-resistant sandstone beds. The Dempster Highway and Chance Road generally follow a network of these more resistant ridges. Isolated knolls along the ridge crests are likely remnants of the more competent bedrock in the area.

2.2 Landscape Evolution

Much of Yukon has been repeatedly glaciated during the Pleistocene, causing multiple episodes of erosion and deposition of thick and extensive glacial sediments. Beyond the maximum limit of glaciation, however, surficial deposits generally comprise deeply weathered bedrock and soils on plateaux and slopes, organic-rich soils and peat in depressions, and fluvial silts, sands, and gravels along river valleys (Hughes, 1972). During the last glaciation, the Laurentide Ice Sheet reached its all-time limit occupying the region surrounding the lower Mackenzie River Valley and reaching as far west as parts of the Richardson and Mackenzie Mountains. The study area lies within an unglaciated region to the west of this limit (Duk-Rodkin, 1999), and is generally unaltered by glacial processes. However, Laurentide ice obstructing the Peel River valley and impounding Glacial Lake Hughes diverted meltwater flow northward through the Eagle River valley (Duk-Rodkin and Hughes, 1995). Thus, glacial processes may have had an indirect effect on the study area by lowering the base level of the Eagle River and increasing the rate of incision of its upstream tributaries.

The lack of glacial erosion has resulted in broad, rolling uplands that are typically covered by veneers of relatively fine-grained colluvium or weathered bedrock and commonly bounded by well-drained scarps where more resistant bedrock transitions into fluvially incised, V-shaped valleys. The valley sides are covered by thick, fine-grained colluvium, locally overlain by organics. Thick, fine-grained to gravelly fluvial deposits occupy the valley bottoms. Remnant terraces perched above the floodplains within some of the larger valleys are composed of peat overlying fine sands and silts (Thomas and Rampton, 1982). The lower permeability and valley bottom position of these thicker sediments results in the preservation of ice-rich permafrost, which can introduce challenges for exploration and infrastructure development in these areas.

2.3 Permafrost and Periglacial Processes

Permafrost is ground, including both unconsolidated sediments and bedrock, that remains below 0°C for more than one year. Chance's Eagle Plains property is entirely within the zone of continuous permafrost,

based on property-specific geological and geophysical field data, ground surface expression visible in aerial photography, and regional-scale permafrost mapping compiled by Heginbottom et al. (1995) (Palmer, 2015b).

The depth to permafrost (or active layer thickness) varies spatially at regional and local scales, and temporally with changing seasons. The active layer is generally <1 m thick in the study area, even at its late summer maximum, although it may reach around 2 m in particularly well drained, elevated sites. Active layers may be even thicker, locally reaching bedrock at a depth of 3-4 m, following wildfire (Coates, 2008; Kryotek Arctic Innovation, 2015). At a local scale, active layer thickness primarily depends on elevation, aspect, slope position and shape, soil texture and drainage, snow pack and vegetation cover (Williams and Burn, 1996; Bonnaventure et al., 2012; McKillop et al., 2013). Well drained soils insulated by thick annual snow cover tend to have thicker active layers (deeper permafrost table) than wind-swept, poorly drained areas (shallower permafrost table). In areas of thick, mossy organic cover, permafrost may be encountered at depths as shallow as just a few tens of centimetres even at the end of summer. Active layer thickness increases following snowmelt in spring, and typically peaks in late summer.

Permafrost may or may not contain ice, depending primarily on the material within which it exists and its hydro-geomorphic setting. Most commonly, ice is restricted to the pores or fractures within surficial materials or bedrock, respectively. Such ‘ice-poor’ permafrost is widespread in the study area and most common in areas of exposed or shallow bedrock, along ridges of weathered bedrock, and on relatively well drained colluvial slopes. Where soil textures and drainage conditions permit, thin seams or small lenses of ice may form, representing a more moderate volumetric content of ice. Broad valley bottoms, which have been infilled with mixtures of fine-grained colluvium, fluvial deposits and organic matter, may contain ‘ice-rich’ permafrost. In addition to pore and lens ice, massive bodies of ice may exist within the unconsolidated material. Such bodies grow and shrink in response to changing climatic conditions and ground thermal regime (e.g., organic cover thickness, local drainage conditions). They may form ice wedges, which commonly form geometric networks well expressed at surface by interconnected, linear furrows. Ice-wedge polygons also occur on some gentle slopes, including broad ridge crests and shoulders within portions of the study area.

The sensitivity of permafrost to disturbance depends on a variety of factors, including its temperature, ice content, insulating ground cover (e.g., organics) and the material within which it is held. Relatively warm permafrost (i.e., warmer than -2°C) is more susceptible to thaw due to localized and even minor disturbances to the ground surface, whereas cooler permafrost is able to withstand minor disturbances without appreciable effect. Permafrost that is decoupled from current climatic conditions and only persists in areas of thick, mossy organic cover is more sensitive to disturbance through ground disturbance (e.g., stripping or compaction of organics). Permafrost within fine-grained materials is more likely to contain discrete bodies of ice and, thus, is more sensitive than that within weathered bedrock or coarse-grained colluvium.

Permafrost has a strong influence on soil and drainage conditions, the rates and mechanisms of colluvial (mass movement) processes, and overall hillslope and valley bottom morphology. An appreciation for periglacial processes is important to exploration planning. Permafrost acts as a barrier to water flow, in the absence of any taliks (unfrozen areas bounded by permafrost), so unconsolidated materials within the

active layer commonly become saturated during the summer. On level ground, differential frost heave may occur in the snow-free season, resulting in frost (mud) boils, irregular micro-topography and the formation of earth hummocks. Ice-wedge polygons may form under certain conditions. In areas of ice-rich permafrost, even minor ground disturbances may trigger thermokarst activity (e.g., natural windthrow ripping the surface organic mat and exposing underlying sediments), through which the ground subsides and slumps in response to the melting of buried ice bodies. Thermokarst commonly continues for extended periods of time (i.e., years to decades), once initiated, through a positive feedback cycle between increases in thaw and increases in water ponding. Retrogressive slumping is common along the shores of thaw ponds and along the banks of thermokarst gullies, which incrementally enlarges the area of subsidence.

On slopes, summertime saturation reduces the shear strength of the soil and promotes solifluction, the gradual, downslope creep of material on the permafrost table; or active-layer detachment, the rapid, downslope slide and/or flow of material on the permafrost table. Both processes increase in frequency and magnitude shortly after wildfire (Coates, 2008), mainly due to the loss of rooting strength and insulating organic cover (thaw rate and depth increase). Solifluction is best recognized at surface by conspicuous ‘lobes’ of organics and sediment, defined by a steep, rounded front and a gradual tail. Areas of active solifluction can destabilize roads through irregular settlement and mounding. Certain slopes are commonly prone to active-layer detachments; their histories of landslides are commonly indicated by conspicuous fall line-oriented ‘stripes’ of deciduous trees.

Slopewash is another widespread and important process on slopes underlain by permafrost, through which material is transported downslope through a combination of sheetwash (entrainment in surface runoff) and piping (entrainment in water percolating through the active layer). Shallow ‘runnels’ (also known as ‘water tracks’) are a surface manifestation of slopewash, formed by the repeated and preferential downslope transport of sediments along natural drainage paths. As slopewash runnels deepen, they concentrate and prolong the conveyance of surface runoff and shallow groundwater, resulting in a local depression in the permafrost table (thickening of the active layer). The interception of slopewash runnels by roads necessitates cross-ditching or drainage culvert installation; still, such sites may form ‘icings’ during the winter and spring months, which increase maintenance requirements on road surfaces and embankments.

3. Methods

3.1 Field Reconnaissance

A one-week field reconnaissance program was completed between July 1 to 7, 2019. Weather conditions were generally clear and sunny with brief periods of light rainfall. The program was undertaken with the support of a helicopter and included reconnaissance flights over much of the study area as well as ground-based assessments. The program was completed with a focus on characterizing a diversity of landforms, surficial materials, and permafrost conditions across the study area. Ground-based field observations were made through a series of foot traverses to document changes across the landscape. Field assessment involved examining sediments and visible ice in hand-dug soil pits and natural exposures (e.g., landslide scarps, gullies, stream cut-banks); measuring depth to frost (which may not have represented the true depth to permafrost at the start of the summer); determining material textures, origins, and expressions; and describing geomorphological processes. The program was completed in parallel with an ecological field program undertaken by Environmental Dynamics Inc. (EDI). Where possible, terrain interpretations were

supplemented by opportunistic field observations made and shared by EDI's ecologists as part of their field program.

3.2 Terrain Mapping

Palmer completed surficial geology/permafrost mapping for the 2,400 km^2 study area as a basis for communicating the distribution of distinct ground conditions. The mapping represents the seamless integration of the previously mapped 440 km^2 area (Palmer, 2015a) with the expanded interpretations within the surrounding 1,960 km^2. The 440 km^2 subset was reviewed and standardized for consistency with the surrounding area. Terrain interpretations were completed using a combination of multiple stereo-imagery sources in combination with high-resolution LiDAR-derived elevation data. Aerial photographs were acquired by Chance over the northern and southern regions of the study area, but smoke from wildfires precluded acquisition within the central portion of the study area. Satellite imagery acquired between 2014 and 2019 were overlain onto a digital elevation model to generate pseudo-stereo imagery and were used as a substitute for stereo aerial photographs in this region. Terrain interpretations were refined based on LiDAR-derived elevation data, available across the study area at a resolution of 2 m. Surficial mapping was digitized directly into a geographic information system (GIS) using DAT/EM's Summit 3D mapping software in conjunction with Esri's ArcMap.

Surficial geology/permafrost mapping was completed at a view scale of 1:20,000 using the standardized Yukon surficial geology mapping protocols (Lipovsky and Bond, 2014), which are an adaptation of the *Terrain Classification System for British Columbia* (Howes and Kenk, 1997), with modifications to accommodate project-specific objectives. Terrain polygons were delineated based on internally homogenous combinations of surficial materials, textures, surface expressions, drainage classes, and geomorphological processes. Under this system, up to two surficial materials were identified in each polygon as either a primary or secondary material, or in stratigraphic relation to each other. Relative depth to, and relative ice content of, permafrost were estimated for each map polygon using the terrain characteristics and calibrated based on ground observations made during the field reconnaissance program. Relative depth to permafrost refers to the approximate maximum (end of summer) depth of the permafrost table (active layer thickness) and is an inferred average value for the polygon (Table 1). Relative ice content is an inference of the amount of pore ice, segregated ice, massive ice, and/or excess ice (Table 2). Terrain and permafrost interpretations are limited by the mapped scale, and represent the average conditions within each map unit (polygon). It is possible that ground ice is more or less extensive than its mapped representation due to a necessary generalization of the terrain characteristics or geomorphological processes of the map unit. Polygons have been symbolized based on the primary surficial material. Discrete terrain features and geomorphic processes too small to be mapped as individual polygons, such as thermokarst subsidence and active-layer detachments, have been identified using on-site point and line features. All codes used in the mapping are defined in the legend.

3.3 Exploration Development Suitability

The Exploration Development Suitability maps represent the general suitability of distinct areas for the establishment and maintenance of access roads and wellpads, and for disposal of drill cuttings using MBC techniques. The general characteristics of terrain suitable for wellpads and access roads were assumed to be similar in the study area, so these suitabilities have been considered together.

Table 1. Inferred relative depth to permafrost.

Depth Classification	Definition	Description
Near-surface	Permafrost table located less than 0.4 m from the ground surface.	Permafrost is typically found within or at the base of surface organics. Includes map units overlain by organic blankets and veneers; very poorly to imperfectly drained fluvial fans, terraces, veneers; and inactive floodplains.
Shallow	Permafrost table located between 0.4 and 1.0 m from the ground surface.	Applies to relatively fine-grained and matrix-supported sediments and is considered the typical permafrost depth class through the study area. Includes most imperfectly to moderately well drained deposits, active floodplains and most deposits with mapped ice-wedge polygons or thermokarst subsidence.
Deep	Permafrost table located more than 1 m from the ground surface.	Typically applies to relatively coarse-grained and clast-supported deposits. Includes bedrock and most moderately to well drained colluvium and weathered bedrock along convex ridges and scarps.

Table 2. Inferred relative ice content of permafrost.

Ice Content Classification	Pore Ice	Segregated Ice	Massive Ice	Excess Ice[1]	Description
Ice-rich	Continuous	Extensive	Indicated (Xw), Inferred (Xt), or likely; widespread	Major	Typically includes sediments overlain by organic blankets and veneers; poorly to very poorly drained, mostly inactive fluvial deposits; and map units affected by ice-wedge polygons or thermokarst subsidence.
Ice-moderate	Continuous	Widespread, in seams and lenses	Possible, locally	Moderate	Includes fluvial deposits not previously classified as ice-rich; fine-grained colluvial aprons and blankets; imperfectly to poorly drained matrix-supported colluvial blankets; and map units affected by sheetwash or solifluction.
Ice-poor	Discontinuous to Continuous	Local, mostly in seams	Unlikely, except in isolated areas	None to minor	Applies to most moderately to well drained terrain throughout the rolling uplands and colluvial slopes and is considered the typical ice content class in the study area.

[1] Excess ice refers to the volume of ice that exceeds the total voids (e.g., pore space) that would be present under natural, unfrozen conditions.

The road and wellpad suitability and MBC disposal suitability classifications were derived from the 1:20,000-scale surficial geology interpretations and are specific to (and relative within) the project area. Map units (polygons) were categorized into five road and wellpad suitability classes (ranging from Very High to Very Low) and two MBC disposal suitability classes (Potentially Suitable and Probably Unsuitable) based on terrain characteristics, site drainage, and permafrost conditions, also considering field observations and professional experience in unglaciated Yukon (e.g., McKillop et al., 2013; McKillop et al., 2016). Definitions, explanations and implications of each class are outlined in Section 4.3 in association with the presentation of results. A lower suitability rating does not necessarily mean suitable terrain is not present in the map unit; localized portions of these polygons may be suitable for exploration development or MBC disposal based on site-specific terrain characteristics. Similarly, a higher rating does not necessarily mean the entire polygon is suitable for exploration development or MBC disposal. Field investigations remain warranted to evaluate suitability classifications at a site-specific level.

4. Results and Discussion

4.1 Key Field Observations

Ground observations were made at 103 field reconnaissance sites and supplemented by opportunistic observations and photographs taken along foot traverses and helicopter flights. An overview of representative photograph locations is shown in Figure 1, and examples of common terrain units and processes are presented in Figure 2. Most of the study area consists of gently sloping uplands dissected by stream valleys punctuated by bluffs at the crests of slopes (Photos A to C). Geomorphological processes related to ice-rich permafrost are visible by surface expressions including ice-wedge polygons (Photo D) and thermokarst subsidence (Photo E). Mass movements such as active-layer detachments were observed on gentle to moderate gradients along valley walls (Photo F).

Representative photographs of permafrost conditions and sediments in the study area are presented in Figure 3. Measurements of the active layer thickness at the time of site inspection (July 1 to 7, 2019) are estimated to be slightly thinner than the late summer maximum. In general, depth to frost was less than 1 m throughout the study area. Measurements were generally deeper near active streams and were assumed to be relatively deep on well drained, weathered bedrock ridges where high clast content typically restricted measurements using a frost probe. Permafrost was near-surface (<0.4 m) beneath areas of thick organic cover, such as fluvial terraces and inactive floodplains. Typically, ice content increases toward lower valley positions, and was noticeably higher within inactive floodplains. In one such environment, an eroding stream bank exposed massive ground ice in wedges >2 m high (Photo G). Excess ice was also observed within thick, fine-grained colluvial deposits (Photo H).

Competent bedrock rarely outcrops at surface through most of the study area, but several conspicuous outcrops of sandstone and conglomerate were observed near the Dempster Highway (e.g., Figure 3 Photo I). Most ridge crests appear as weathered bedrock and consist largely of well drained sands and angular clasts (Photo J).

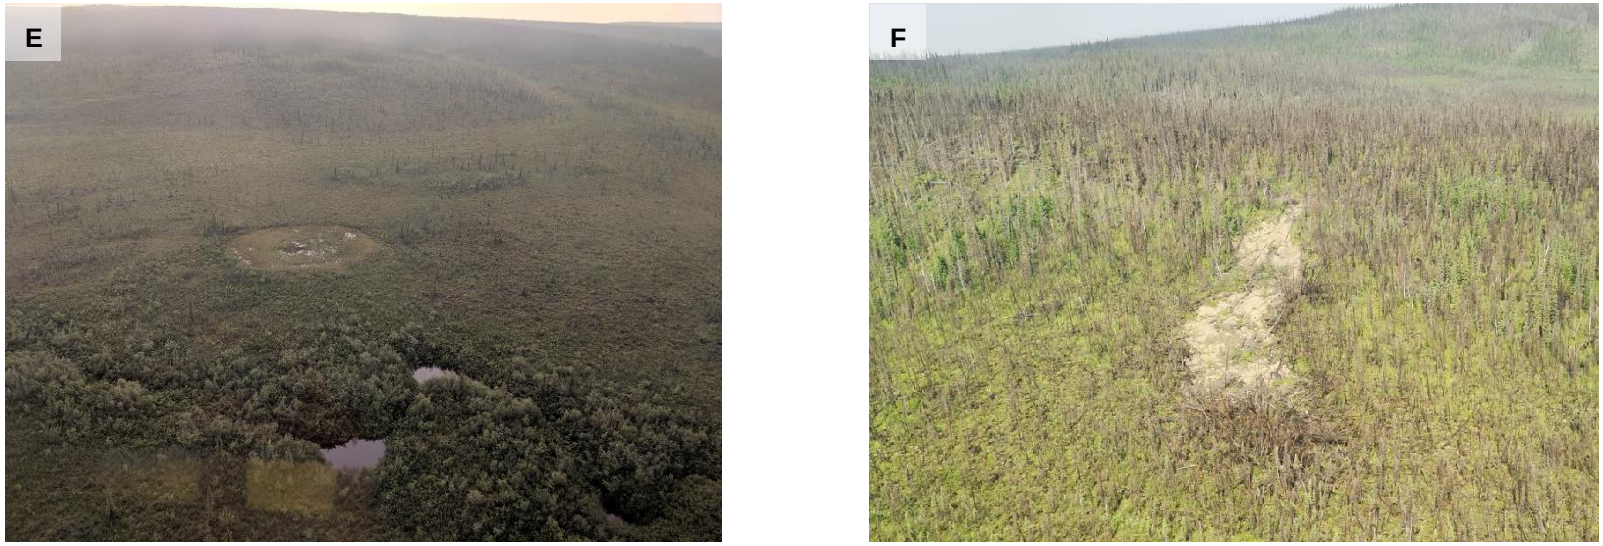

Figure 2. Field photographs representative of common landforms and geomorphological processes within the study area: A) View of the Dalglish creek valley, showing an irregularly meandering channel and several areas of lateral erosion where the creek has cut into the valley walls; B) Convex, mid-slope composed of more-resistant bedrock mantled by a veneer of weathered bedrock and colluvium; C) Gentle fluvial fan exhibiting a triangular- or wedge-shape, transitioning into a modern stream valley (lower right); D) Geometric surface expression of ice-wedge polygons over an inactive region of the floodplain; E) Thermokarst depression in an inactive region of the floodplain; and F) Recent active-layer detachment initiated at the crest of a gentle colluvial slope.

Figure 3. Field photographs representative of typical surficial material characteristics: G) Ice wedge exposed in freshly eroded stream bank (1.9 m-tall person for scale); H) Ice lens within fine-grained, colluvial sediment; I) Outcrop of more-resistant conglomerate exposed in a bluff near the Dempster Highway; J) Sandy, clast-supported veneer of weathered bedrock, typical of deposits found in weathered bedrock bluffs and knolls.

4.2 Surficial Geology and Permafrost

The results of the surficial geology/permafrost mapping are presented in the series of maps shown in **Appendix A**. Most landforms and materials in the study area are interpreted to have originated prior to the last glaciation. Apart from organics, recent fluvial deposits, and areas recently affected by active geomorphological processes, the landscape is dominated by deeply weathered sediments that have developed on slopes and ridges over many millennia.

Colluvial deposits (aprons, veneers, blankets, and mantles of variable thickness) are the most extensive surficial material, located ubiquitously on slopes and ridges and comprising 71.8% of the study area (Table 3). Fluvial deposits comprise 8.4% of the study area and are generally identified along the bottoms of broad valleys, although fans and veneers of fluvial sediments are mapped at confluences and within narrow ravines, respectively. Organic material accumulates on most imperfectly to very poorly drained deposits throughout the study area, but it is only identified in the terrain code when its thickness exceeds about 0.5 m. Organic veneers and blankets are generally mapped in low valley positions near active streams, and comprise 1.6% of the study area. Bedrock within the study area is commonly fissile and deeply weathered, located along ridge tops and convex slope-breaks along the crests of valley walls. Weathered veneers of bedrock cover 17.3% of the study area. Intact bedrock is rare at surface and is limited to exposures in steep scarps lining the broad ridge tops, covering 0.9% of the study area. Areas significantly disturbed by human activity (excluding road networks) have been mapped as anthropogenic landforms, and cover <0.1% of the study area

Table 3. Areal distribution of surficial materials and landforms by primary surface material.

Surficial Material and Landform	Terrain Code	Areal Extent	Areal Percentage
Anthropogenic	A	1.41 km^2	< 0.1%
Organic Veneer	Ov	10.24 km^2	0.4%
Organic Blanket	Ob	28.85 km^2	1.2%
Colluvial Apron	Ca	188.77 km^2	7.9%
Colluvial Veneer	Cv	816.12 km^2	34.0%
Colluvial Blanket	Cb	401.01 km^2	16.7%
Colluvial Mantle of Variable Thickness	Cw	315.50 km^2	13.2%
Weathered Bedrock Veneer	Dv	414.07 km^2	17.3%
Fluvial Plain (active and inactive)	FAp; Fp	111.80 km^2	4.7%
Fluvial Veneer (active)	FAv	49.53 km^2	2.1%
Fluvial Fan (active and inactive)	FAf; Ff	36.29 km^2	1.5%
Fluvial Terrace	Ft	2.87 km^2	0.1%
Bedrock	R	20.47 km^2	0.9%
Total		**2,396.93 km^2**	**100%**

Relative depth to permafrost is estimated to be shallow (0.4-1 m) across the majority of the study area (86.2%), and is found on most broad ridges, colluvial slopes, and around active floodplains (Table 4). Relative depth to permafrost is estimated to be near-surface within poorly drained valley bottoms and beneath organic deposits, comprising 3.6% of the study area. Relative depth to permafrost is estimated to be deep (> 1 m) across 10.2% of the study area and is commonly mapped in association with coarse colluvial or weathered bedrock deposits typically found along convex ridges and bluffs, and bedrock scarps.

Permafrost is estimated to be ice-rich across 12.9% of the study area, and is commonly found below poorly drained, inactive fluvial deposits and below organic cover (Table 4). Ice-rich permafrost may also be found along fine-grained colluvial slopes and even along some ridges where the surface expression of ice-wedge polygons is visible in LiDAR data or aerial imagery. Ice-moderate permafrost comprises 40.8% of the study area, and is commonly found below imperfectly drained fluvial deposits and thick, fine-grained colluvial deposits. Ice-moderate permafrost is also inferred in regions affected by sheetwash or solifluction. Nearly half the study area has been estimated to contain ice-poor permafrost (46.3%), which applies to most moderately to well drained terrain along ridges and upper valley slopes.

Table 4. Area distribution of permafrost conditions by relative depth and relative ice content.

Permafrost Condition Classification		**Estimated Relative Ice Content**			
		Ice-poor	**Ice-moderate**	**Ice-rich**	**Total**
Estimated Relative Depth	**Near-surface (<0.4 m)**	0% *(0 km²)*	0.1% *(2.2 km²)*	3.5% *(84.1 km²)*	**3.6% *(86.3 km²)***
	Shallow (0.4 – 1 m)	37.0% *(885.8 km²)*	39.9% *(955.6 km²)*	9.4% *(224.7 km²)*	**86.2% *(2,066.1 km²)***
	Deep (>1 m)	9.4% *(224.3 km²)*	0.8% *(20.2 km²)*	0% *(0 km²)*	**10.2% *(244.5 km²)***
	Total	**46.3% *(1,110.2 km²)***	**40.8% *(977.9 km²)***	**12.9% *(308.8 km²)***	**100% *(2396.9 km²)***

4.3 Exploration Development Suitability and Associated Implications

The series of Exploration Development Suitability maps is provided in **Appendix B**. The maps combine the results of the road and wellpad suitability classifications with the MBC disposal suitability classifications.

Road and wellpad suitability are presented as a five-class system (Table 5). A total of 17.4% of the study area has been classified as Very High or High suitability. These areas comprise ice-poor, isolated topographic highs and moderately to well drained ridge systems, which form sinuous networks through the landscape. Conversely, lower valley terrain such as floodplains and fine-grained colluvial aprons are generally prone to higher ice contents, and active permafrost and periglacial processes, including active-layer detachments, solifluction, thermokarst, and sheetwash. A total of 54.2% of the study area was classified as Low to Very Low suitability, due to one or more development constraints. The remaining 28.4% of terrain was considered moderately suitable for development and may be reasonable for road and wellpad establishment by employing proactive mitigation measures where necessary.

Table 5. Road and wellpad suitability classification and implications for construction and maintenance.

Road and Wellpad Suitability	Description	Implications for Construction and Maintenance	Percent of Study Area
Very High	Moderately well to well drained, isolated topographic highs with deep or shallow, ice-poor permafrost. Generally considered to be stable terrain, and typically located along wide, rounded ridge crests.	Favourable conditions for access road and wellpad establishment through standard best management practices. Minimal expectation for maintenance requirements.	8.1%
High	Generally, moderately well to well drained areas with deep or shallow, ice-poor permafrost. Typically associated with ridges of weathered bedrock or shallow colluvium over convex topography.	Generally favourable conditions for access road and wellpad establishment through standard best management practices. Low to moderate expectation for maintenance requirements.	9.3%
Moderate	Imperfectly to moderately well drained colluvial slopes with deep to shallow permafrost, commonly with poor to moderate ice content; Convex weathered bedrock bluffs, typically at moderate slope gradients; and fluvial terraces above the influence of modern stream processes.	Generally reasonable conditions for access road and wellpad establishment. Where necessary, employment of mitigations may be to proactively manage natural concentrations of surface runoff and to protect thaw-sensitive permafrost. Moderate expectation for maintenance requirements. Field reconnaissance would help inform route/site selection and mitigation requirements.	28.4%
Low	Poorly to imperfectly drained, thick colluvial slopes with shallow permafrost, commonly with moderate to rich ice content; imperfectly drained fluvial fans and veneers. Regions affected by sheetwash, gully erosion, and ice-wedge polygons are typically included in this category. Surface runoff becomes concentrated.	Generally unfavourable conditions for access road and wellpad establishment, except through mitigations to proactively manage natural concentrations of surface runoff and to protect thaw-sensitive permafrost. Moderate to high expectation for maintenance requirements. Field reconnaissance is necessary to inform route/site selection and mitigation requirements.	32.8%
Very Low	Very poorly to imperfectly drained areas with shallow or near-surface permafrost, commonly with rich to moderate ice content. Includes most floodplains and steep bedrock scarps. Thermokarst subsidence and ice-wedge polygons are common on level to gently sloping ground, and slopes may be subjected to mass movements including solifluction and active-layer detachments.	Unfavourable conditions for access road and wellpad establishment. Any necessary crossings will require comprehensive mitigations to protect thaw-sensitive permafrost and manage surface runoff and compressible, fine grained sediments. Road construction through steep bedrock scarps would require earthworks and potentially localized blasting. Maintenance expectations are high. Field reconnaissance is critical to inform route/site selection and mitigation requirements.	21.4%

Most moderate terrain can be found over mid- to upper-valley slopes and is mantled by imperfectly drained colluvial veneers and convex, moderately sloping weathered bedrock ridge crests. A summary of the implications for construction has been presented in association with typical constraints expected within each class (Table 5). Design, construction and maintenance of exploration infrastructure generally require greater effort and more complex mitigative solutions as road and wellpad suitability decreases.

The MBC disposal suitability serves to highlight ice-poor, gently-sloping, and relatively stable regions of the landscape set back from significant watercourses as potentially suitable for MBC disposal (Table 6). These criteria were generally met along broad ridge systems and isolated knolls. A total of 13.2% of the study area has been classified as potentially suitable for MBC drill cuttings disposal, most commonly in association with areas classified as High or Very High suitability for road and wellpad suitability. Runoff may be variable at the mapped scale such that different areas within a polygon may have less or more interaction with surface water. For example, polygons affected by slopewash may show discrete runnels where runoff is concentrated. As a result, field investigations are suggested to refine the MBC disposal suitability classifications at a site-specific scale which would better determine target areas for cuttings disposal within each map unit (polygon).

Table 6. Mix-bury-cover (MBC) disposal suitability classification.

MBC Disposal Suitability	Description	Percent of Study Area
Potentially Suitable	Generally geomorphologically isolated regions on level or near-level, elevated areas with minimal or no receipt of surface runoff (i.e., 'shedding sites'). Areas are typically located along broad to rounded ridge crests and knolls that are set back from significant watercourses.	13.2%
Probably Unsuitable	Includes moderate to steeply sloping regions; areas with ice-rich permafrost; and areas exhibiting evidence of geomorphological instability such as fluvial erosion, thermokarst subsidence, solifluction, and active-layer detachments.	86.8%

5. Recommendations

Palmer recommends Chance consider a number of logical follow-up initiatives based on the results of this mapping project to help optimize its upcoming multi-year, multi-well drilling program:

- **GIS-based road routing optimization analysis** – To minimize design, construction, maintenance, and rehabilitation costs, project elements and infrastructure should be site to minimize exposure to low Exploration Development Suitability terrain to the extent possible. This may be accomplished through a collaborative GIS-based road routing analysis between Palmer and the Chance project team, whereby effort and cost are attributed to distinct terrain units, and optimized for development.

- **Incorporation of environmental discipline perspectives into suitability** – The Exploration Development Suitability classification was prepared with a focus on terrain and permafrost constraints. Combining this with the perspectives of other environmental disciplines would yield a more robust suitability classification by accounting for additional environmental values (e.g., vegetation, wildlife habitat, First Nations land uses, archaeological resource potential, etc.).
- **Road alignment delineation** – Following determination of an approximate road route at the polygon-scale (two bullets above), more precise delineation of an actual road alignment would help enable avoidance of local terrain and permafrost constraints (e.g., drainage runnels, thermokarst).
- **Targeted field investigations of complex terrain and areas for MBC disposal** – Complete avoidance of terrain with low or very low Exploration Development Suitability may not be feasible given its abundance in lower valley and floodplain positions. Targeted field investigations in these locations would serve to fine-tune the alignment and confirm the interpretations, site conditions, and cost implications. As local permafrost and runoff conditions may show slight variability at the mapped scale, targeted field investigations would also benefit the selection of specific sites for MBC disposal within polygons identified as Potentially Suitable for MBC disposal.
- **Proactive identification of rehabilitation plans** – It may be productive for Chance to proactively identify its planned approaches for site, road, and wellpad rehabilitation following the completion of work, in anticipation of comments by YESAB, First Nations, and other stakeholders. Rehabilitation plans are best tailored to existing ground and runoff conditions.

6. Statement of Limitations

This report has been prepared by Palmer for Chance in accordance with the agreement between Consultant and Client, including the scope of work detailed therein (the “Master Service and Supply Agreement”). The report and the information it contains may be used and relied upon only by Client, except (1) as agreed to in writing by Consultant and Client, (2) as required by-law.

The extent of this study was limited to the specific scope of work for which Palmer was retained and is described in this report. Palmer has assumed that the information and data provided by the client or any secondary sources of information are factual and accurate. Palmer accepts no responsibility for any deficiency, misstatement or inaccuracy contained in this report as a result of omissions, misinterpretations or negligent acts from relied-upon data. Judgement has been used by Palmer in interpreting surficial geology, geomorphological processes, and exploration development susceptibility based on desktop analysis and limited field reconnaissance. Interpretations of subsurface conditions have been made based on surface observations and limited subsurface exposures and may not fully capture the variability in the study area or within a given map unit (polygon).

Palmer is not a guarantor of site conditions or potential hazards or risks but warrants only that our work was undertaken and our report prepared in a manner consistent with the level of skill and diligence normally exercised by competent geoscience professionals practicing in Yukon. Our findings, conclusions and recommendations should be evaluated in light of the limited scope of our work.

7. Certification

This memorandum was prepared and reviewed by the undersigned.

APPENDIX 2-B-57. Land Tenure Extension Request for Exploration Permits 0008-0017, 0019 and 0020 (“Permits”) Letter

Chance
OIL AND GAS LIMITED

December 15, 2021

Government of Yukon
Department of Energy, Mines and Resources
P.O. Box 2703
Whitehorse, YT
Y1A 1B2

sent via email: john.streicker@yukon.ca

Attention: Hon. John Streicker, Minister of Energy, Mines and Resources
Dear Sir:

Re: Land Tenure Extension Request for Exploration Permits 0008-0017, 0019 and 0020 ("Permits")

Chance Oil and Gas Limited ("Chance", the "Company") hereby requests that the referenced Permits be extended for an additional five years pursuant to Sections 27(b), 28(1)(c) and (d) and 31.01 of the Yukon *Oil and Gas Act* (the "Act"). The basis for this extension request is described in the following paragraphs and has not materially changed since the last request for tenure extension was made on March 11, 2020 for one of the Exploration Permits. Timelines to be able to exercise exploration rights in Yukon are long and growing.

The actions of Chance and its predecessor, Northern Cross (Yukon) Limited, in respect of the rights under the Permits have been consistent with the Act by diligently trying to conduct an exploration program at Eagle Plains to evaluate the crude oil and natural gas resource potential. These efforts are substantially documented in the records of a variety of government departments, including Energy Mines and Resources. The Company has only been partially successful accomplishing its exploration objectives.

Unfortunately, Chance has been subjected to external influences beyond the control of the Company. These include the indefinite, perhaps permanent, moratorium on hydraulic fracture

stimulation ("Moratorium") in the Eagle Plain Sedimentary Basin, the impact of the Peel Watershed Land Use Planning exercise which challenged access, and the inconsistent, unpredictable and expanded time and information requirements of environmental impact assessment processes with the Yukon Environmental and Socio-economic Assessment Board ("YESAB"). Timelines and conditions related to the conduct of exploration activities are further increased by the requirement under Ministerial Orders whereby Chance has established Engagement and Communication Plans ("Plans") with four First Nations, including designated organizations. The Company is using its best efforts to actively implement these Plans in respect of a significant exploration project, but the pace of this implementation is slow and uneven and has been dramatically affected by Covid 19. The collective impact of these influences was not reasonably foreseen at the time Chance was awarded the Permits nor after exploration activities commenced, but they have adversely affected the ability of the Company to exercise its exploration rights either in a timely way or at all.

Since the Permits were originally awarded during the period between 2007 and 2010, Chance has demonstrated its commitment to oil and gas exploration in Yukon by diligently undergoing several YESAB assessments, obtaining regulatory approvals, and executing drilling and seismic data acquisition programs within the area of the Permits. This work was conducted in an environmentally and corporately responsible manner and in full compliance with various permits and licenses issued to undertake this exploration work. The efforts of the Company have advanced the geological understanding of the Eagle Plain Sedimentary Basin while providing very significant benefits to Yukon in the form of employment, training, and business opportunities. Well over $100 million has been spent, which is about five times the amount that was committed at the time these Permits were originally awarded. Most of this investment is now stranded in view of the Moratorium.

Chance has undertaken or consultants acting on behalf of Chance have undertaken the following activities related to the proposed multi-well exploration and seismic data acquisition program:

1. Geological field program to sample rocks at various outcrops at Eagle Plain to help mature new prospects,
2. Purchased under license vintage 2D seismic data in the Eagle Plain area,
3. Bird survey,
4. Fish and other aquatic surveys,
5. Site investigations of vintage and modern seismic lines to understand use by wildlife and humans and regeneration patterns,
6. Field studies covering a range of permafrost processes;
7. Water sampling at various locations in the proposed area of exploration interest;
8. Porcupine Caribou studies in collaboration with the Porcupine Caribou Management Board,
9. LiDAR and aerial photography surveys; and

10. Meetings with affected First Nations in Old Crow, Inuvik, Tsiigehtchic, Ft. McPherson, Aklavik, Dawson City, Mayo and Whitehorse in respect of a proposed multi-well exploration and seismic data acquisition plan.

More field work is planned for the winter of 2022-2023 to evaluate the condition of 8 suspended wells operated by Chance with the objective of remediating any problems so the wells can remain suspended until used in future operations, converting two wells to become deep zone injectors or disposal wells, extended flow testing of three natural gas formations in three vintage wells and abandoning at least 3 of the suspended wells. Where possible, Chance hires First Nation citizens to participate in these field programs. In the past three years, the approximate expenses incurred to undertake these activities was $6.7 million. Spending at this level or higher is anticipated to continue for additional exploration work and related activities as described above for well maintenance and continuance. Preserving suspended status of wells that are sound and secure supports the request for tenure extension as well.

Chance is hopeful that it will be in a position to submit to the Executive Committee of YESAB under new processes expected to commence in the first quarter of 2022 to begin the assessment of the multi-well exploration drilling and seismic data acquisition project, but First Nation engagement under the Plans may be a rate determining step.

The maintenance program planned for the winter of 2022-2023 offers a great opportunity to measure the depth of permafrost and Chance plans to run a temperature survey in a number of the suspended wells to determine the geographic extent of permafrost and any variability of its depth.

Notwithstanding very limited oil field service and supply capacity resident in Yukon, the historical exploration drilling and seismic data gathering programs operated by the Company were organized and executed in a way that responded to concerns expressed by many Yukon stakeholders to maximize Yukon participation and mitigate the historical experience of intensive, short term projects punctuated by lengthy periods of inactivity that collectively had the effect of restricting local participation in employment, training and business opportunities. For almost two years, Chance's drilling and seismic programs provided reasonably steady employment for many Yukon citizens working directly or indirectly on the projects. Going forward, to overcome the frustration of starting and stopping, future activities are expected to be small scale and be undertaken over longer time periods. This style of operation has the objective of providing opportunities for Yukon citizens and businesses to invest in training and equipment to be able to assume growing roles in any activities that Chance might propose while benefitting from learning curve efficiency and economy of scale arising from steady, predictable operations. Environmental impacts are expected to be significantly reduced by operating on a small scale over longer periods of time, too.

Future exploration activities will require maximum allowable tenure extensions in order to satisfy commitments anticipated to be made under the Plans as they are implemented, undergo higher level YESAB impact assessments, obtain required regulatory approvals and ultimately undertake any planned activities. For example, in several meetings with your officials, Chance has outlined an exploration plan to drill up to thirty (30) exploration and appraisal wells, acquire up to fifteen hundred (1,500) square kilometres of new 3-D seismic data and acquire up to two thousand (2,000) kilometres of new 2-D seismic data. This plan will take years to complete especially if the scale of operations is small in order to minimize environmental impacts and maximize participation of Yukon citizens and businesses. Prior to undertaking this program, environmental impact assessments are required which are expected to take at least a couple of years to complete with more time needed to execute on approved activities.

Developing Yukon energy resources will also have a beneficial impact on greenhouse gas emissions by displacing imported fuels extracted and processed thousands of kilometres away from Yukon. In addition, as the energy market transitions to a lower or no carbon condition, the hydrocarbons in Yukon offer a great source of hydrogen and the geological formations at Eagle Plains provide opportunities to sequester CO2.

This letter has been prepared on a "Without Prejudice" basis given the unresolved legal claim that the Company has made against Yukon in respect of the damages caused by the Moratorium. Tenure extension is needed to continue implementing the Plans and advance the proposed exploration project through the YESAB process to execution.

In conclusion, Chance believes that it has diligently acted and continues to act in a manner that is consistent with the Act, that the exercise of its exploration rights has been significantly impaired by circumstances that were neither foreseen nor within the Company's control. Throughout the evolving landscape of procedural changes, political sensitivity and growing obligations to engage with aboriginal communities, Chance has taken numerous and costly measures to mitigate the impediments where it can.

Chance trusts that you will consider this tenure request in the face of expanding timelines and complexities associated with the undertaking of exploration projects.

Yours truly,
Chance Oil and Gas Limited

APPENDIX 2-B-58. Terms of Reference for Engagement and a proposed Cooperation Agreement between Chance Oil and Gas Limited and the Gwich'in Tribal Council Letter

June 7th, 2022

Grand Chief [redacted]
Gwich'in Tribal Council
1 - 3 Council Crescent
P.O. Box 1509
Inuvik, NT X0E 0T0

Dear Grand Chief [redacted]

Terms of Reference for Engagement and a proposed Cooperation Agreement between Chance Oil and Gas Limited and the Gwich'in Tribal Council

Further to our recent discussions, we refer to the Gwich'in Tribal Council (the **GTC**) and Chance Oil and Gas Limited (**Chance**) Communication and Consultation Plan dated August 1, 2018 (the **Plan**). As mentioned in the Plan, Chance would like to propose some initial terms of reference for our ongoing engagement and for the collaborative process that will be necessary to conclude a Cooperation Agreement between the GTC and Chance.

Our objective is to commence an open discussion with the GTC, in accordance with the Plan, on the potential terms for inclusion in a Cooperation Agreement. Our intention throughout this process is to work respectfully, collaboratively, transparently and in a timely fashion with the GTC with a view to finalizing a mutually agreed Cooperation Agreement in the coming weeks.

As we work together to establish the basis for cooperation, we foresee the ongoing relationship between Chance and the GTC evolving in the following stages:

1. Reaching initial agreement with the GTC on the terms of reference proposed in this letter.

2. Negotiating and concluding a memorandum of understanding (**MOU**) that will formalize the key principles for inclusion in a Cooperation Agreement.

3. Negotiating and concluding a Cooperation Agreement, incorporating the terms of the MOU, that will govern the collaborative relationship between Chance and the GTC during the pre-development phase of Chance's planned oil and gas exploration activities in the Eagle Plains basin of the Yukon Territory (the **Project**) (which pre-development phase is expected to include undertaking and concluding the regulatory processes required prior to implementation of the Project).

4. The Cooperation Agreement will then facilitate and frame the discussion around identifying economic benefits and opportunities related to the Project.

Calgary, AB T2R 1L5
Telephone (403) 699-0055
Fax (403) 699-0044

The terms of reference that we propose herein are not intended to be prescriptive and we welcome any feedback, input and ideas from the GTC that will enhance collaboration or improve transparency. We have tried to categorise the terms of reference for our engagement into the following key areas:

- Objectives of the Cooperation Agreement; and
- Key principles that will form the foundation of all engagement between Chance and the GTC.

1. **Objectives of the Cooperation Agreement**:

   Although not exhaustive, from Chance's perspective, the main objectives of the Cooperation Agreement will be to:

   - cooperatively define, in greater detail, the Project and the work proposed to be undertaken by Chance in connection therewith;
   - establish a protocol for the conduct of Chance and the GTC for regular and ongoing cooperation and communication during the pre-development phase of the Project;
   - provide studies and other information related to how the Eagle Plains basin, the area in which the Project will be carried out, is used by the Porcupine Caribou Herd and seek the GTC's input into the design of management plans and mitigation measures to protect the Porcupine Caribou Herd in this area;
   - facilitate the identification of the other potential impacts of the Project on the Gwich'in (including through, among other things, ecological value assessments);
   - identify opportunities for, and impediments to, the GTC's continued engagement with Chance and its participation in the regulatory approval processes associated with the Project;
   - provide for certain reasonable and agreed financial support by Chance to the GTC to allow the GTC to participate in ongoing engagement with Chance and to participate in the regulatory processes associated with the Project; and
   - identify and discuss the potential benefits that Chance may make available to the GTC during the implementation phase of the Project.

2. **Key Principles for Engagement:**

   Without limiting the objectives and procedures outlined in the Plan, Chance has specifically identified the following key principles that should guide all interactions between Chance and the GTC:

   - Collaboration
   - Cooperation
   - Transparency
   - Timeliness

Chance is of the view that if these principles guide and inform how we interact, negotiate and work together with the GTC, a mutually beneficial and acceptable MOU and Cooperation Agreement can be finalized over the coming weeks. A mutually beneficial Cooperation Agreement that has been negotiated in accordance with these central principles will also help to ensure that an eventual, and more substantive, benefits arrangement is a realistic longer-term objective. We welcome any ideas from the GTC as to how we may effectively engage with the GTC and how we may enhance our collaborative relationship.

We look forward to working together with the GTC and adopting a unified approach towards our ongoing engagement and the conclusion of a Cooperation Agreement. We welcome your input and, upon settling our agreed terms of reference, we would be pleased to prepare a first draft of an MOU for the GTC's consideration.

APPENDIX 2-B-59. Land Tenure Extension Request for Exploration Permits 0012-0017, 0019 and 0020 (“EP’s”) Letter

Chance
OIL AND GAS LIMITED

March 7, 2023.

Government of Yukon
Department of Energy, Mines and Resources
P.O. Box 2703
Whitehorse, YT
Y1A 1B2

sent via email: john.streicker@yukon.ca

Attention: Hon. John Streicker, Minister of Energy, Mines and Resources
Dear Sir:

Re: Land Tenure Extension Request for Exploration Permits 0012-0017, 0019 and 0020 ("EP's")

Chance Oil and Gas Limited ("Chance", the "Company") hereby requests that the referenced Permits be extended for an additional five years pursuant to Sections 27(b), 28(1)(c) and (d) and 31.01 of the Yukon *Oil and Gas Act* (the "Act"). The basis for this extension request is described in the following paragraphs and has not materially changed since the last request for tenure extension was made on December 15, 2021. Timelines for the exercise of exploration rights in Yukon are long and growing.

The actions of Chance and its predecessor, Northern Cross (Yukon) Limited, in respect of the rights under the EP's have been consistent with the Act by diligently trying to conduct an exploration program at Eagle Plains to evaluate the crude oil and natural gas resource potential. These efforts are substantially documented in the records of a variety of government departments, including Energy Mines and Resources. The Company has only been partially successful accomplishing its exploration objectives and is planning further exploration drilling and seismic data acquisition programs.

Unfortunately, Chance has been subjected to external influences beyond the control of the Company. These include the indefinite, perhaps permanent, moratorium on hydraulic fracture stimulation ("Moratorium") in the Eagle Plain Sedimentary Basin; the impact of the Peel Watershed Land Use Planning exercise which impaired access to and cancelled exploration opportunities on affected EP's located in protected areas of the Peel Watershed; and the inconsistent, unpredictable, and expanded time needed to complete environmental impact assessment processes with the Yukon Environmental and Socio-economic Assessment Board ("YESAB"). The most recent example of unexpected YESAB process uncertainty is the advice the Company received in July 2022 that the Company's proposed multi-year exploration project would be treated as a referral to Executive Committee, based on the YESAB decision made in 2016 in respect of a different multi-well exploration drilling project despite the fact that the currently proposed program is different in terms of breadth of activity, scale of operations, location, and duration. This advice was not expected since the Company was preparing to enter the Executive Committee of YESAB under the new pre-submission process that took effect last year. The timing for the Company to submit a much larger and comprehensive document is now expected to be this year though timing is always subject to satisfactory engagement with affected First Nations.

On that point, as further frustration of the Company's ability to advance exploration work, stonewalling behavior of the Vuntut Gwitchin First Nation ("VGFN") is evident by the unilateral decision made by the Vuntut Gwitchin Government ("VGG") to suspend indefinitely the Communication and Engagement Plan ("Plan", or "Plans" as they collectively refer to all Engagement and Communication Plans that Chance has with affected VGG and the First Nation of Na-Cho Nyak Dun, the Trondek Hwech'in First Nation and the Gwich'in Tribal Council) and all engagement activities thereunder as was approved in 2018. This has adversely affected the ability of the Company to cooperatively share information and engage in a constructive manner with the VGG, as the representative of the VGFN. However, over the past year, Chance was able to host several community meetings in Old Crow where information was shared with VGFN citizens and VGG government officials who attended in an "unofficial" manner. Chance has used its best efforts under Plans with the four affected First Nations with interests in northern Yukon in accordance with the terms of various Orders in Council granting tenure extension in the past. The engagement log has been shared with officials of the Yukon Government. The Company is clearly struggling to make headway when a key party is unwilling to engage. Finally, Covid-19 had a notably negative impact on the Company's ability to meet and furnish information to affected First Nation communities due to travel restrictions. The collective impact of these influences was not reasonably foreseen at the time Chance was awarded the EPs nor after exploration activities commenced, but they have negatively impacted the ability of the Company to exercise its exploration rights in a meaningful way.

Since the Permits were originally awarded between 2007 and 2010, Chance has demonstrated its commitment to oil and gas exploration in Yukon by diligently conducting geological and geophysical studies, designing various exploration programs, undergoing several YESAB assessments, obtaining regulatory approvals, and executing drilling and seismic data acquisition programs within the area of the Permits. This work was conducted in an environmentally, socially and corporately responsible manner and in full compliance with various regulations and conditions of permits and licenses issued to undertake this exploration work. The efforts of the Company have advanced the geological understanding of the Eagle Plain Sedimentary Basin while providing very significant benefits to Yukon in the form of employment, training, and business opportunities. Well over $100 million has been spent, which is about five times the amount that was committed at the time these Permits were originally awarded. Most of this investment is now stranded as a result of the Moratorium.

Chance has undertaken, or consultants acting on behalf of Chance have undertaken, the following activities related to the proposed multi-well exploration and seismic data acquisition program:

1. Geological field program to sample rocks at various outcrops at Eagle Plain to help identify and mature new prospects;
2. Purchased under license vintage 2D seismic data in the Eagle Plain area;
3. Bird survey;
4. Fish and aquatic surveys;
5. Heritage resource surveys within the broader Exploration Permit area;
6. Site investigations of vintage and modern seismic lines to understand use by wildlife and humans and regeneration patterns;
7. Field studies to identify and assess a range of permafrost processes;
8. Temperature monitoring in a variety of settings within the EPs to understand the near surface seasonal variation of freeze and thaw rates as they may be affected by natural or manmade disturbances, aspect to the sun, and topographical position;
9. Water sampling at various locations in the proposed area of exploration interest;
10. Porcupine Caribou studies in collaboration with the Porcupine Caribou Management Board;
11. LiDAR and aerial photographic surveys;
12. Effects assessments of planned exploration activities on various value components; and
13. Meetings over the years with affected First Nations in Old Crow, Inuvik, Tsiigehtchic, Ft. McPherson, Aklavik, Dawson City, Mayo, and Whitehorse in respect of a proposed multi-well exploration and seismic data acquisition plan.

More field work is planned for the summer of 2023 to retrieve temperature data, undertake annual inspections of suspended wells, survey well sites for design of equipment layout and access routes to undertake the required well maintenance work, mandated by the Yukon Government, and more heritage resource investigation. The required well maintenance program is planned for the winter of 2023-2024 to: (i) evaluate the condition of 8 suspended wells operated by Chance with the objective of remediating any problems so the wells can remain suspended until used in future operations, (ii) converting two wells to become deep zone injectors or disposal wells, (iii) extended flow testing of three natural gas formations in three vintage wells, and (iv) abandoning at least 3 of the suspended wells. This program has already successfully completed a YESAB screening. It has been delayed by a year due to a lack of oil field services available to do this work and challenges concluding a Benefits Agreement with affected First Nations, including VGFN, in accordance with Section 68 of the Act. Where possible, Chance hires First Nation citizens to participate in these field programs.

Since 2018, the approximate expenses incurred to undertake these activities total over $12 million. Spending is anticipated to increase in connection with the exploration project and activities described above for well maintenance and continuance of suspended wells for future use. Preserving suspended status of wells that are sound and secure supports the request for tenure extension as well.

The maintenance program now planned for the winter of 2023-2024 offers a great opportunity to measure the depth of permafrost and Chance plans to run a temperature survey in a number of the suspended wells to determine the geographic extent of permafrost and any variability of its depth.

Notwithstanding very limited oil field service and supply capacity resident in Yukon, the historical exploration drilling and seismic data gathering programs operated by the Company were organized and executed in a way that responded to concerns expressed by many Yukon stakeholders to maximize Yukon participation and mitigate the historical experience of intensive, short term projects punctuated by lengthy periods of inactivity that collectively had the effect of restricting local participation in employment, training and business opportunities. For almost two years, Chance's drilling and seismic programs provided reasonably steady employment for many Yukon citizens working directly or indirectly in and on these projects. Going forward, to overcome the frustration of starting and stopping, future activities are expected to be small scale and be undertaken over longer time periods. This style of operation has the objective of

providing opportunities for Yukon citizens and businesses to invest in training and equipment to be able to assume growing roles in any activities that Chance might propose while benefitting from learning curve efficiency and economy of scale arising from steady, predictable operations. Environmental impacts are expected to be significantly reduced by operating on a small scale over longer periods of time, too.

Future exploration activities will require maximum allowable tenure extensions in order to satisfy commitments anticipated to be made under the Plans as they are implemented, undergo higher level YESAB impact assessments, obtain required regulatory approvals and ultimately undertake any planned activities. For example, in several meetings with Yukon Government officials, Chance has outlined an exploration plan to drill up to thirty (30) exploration and appraisal wells, undertake extended flow testing of discoveries, acquire up to fifteen hundred (1,500) square kilometres of new 3-D seismic data and acquire up to two thousand (2,000) kilometres of new 2-D seismic data. This plan will take years to complete especially if the scale of operations is small in order to minimize environmental impacts and maximize participation of Yukon citizens and businesses. Prior to undertaking this program, an environmental impact assessment by the Executive Committee of YESAB is required which is expected to take at least a couple of years to complete with more time needed afterwards to execute on approved activities.

Developing Yukon energy resources will also have a beneficial impact on greenhouse gas emissions by displacing imported fuels extracted and processed thousands of kilometres away from Yukon. In addition, as the energy market transitions to a lower or no carbon condition, the hydrocarbons in Yukon offer a great source of hydrogen and the geological formations at Eagle Plains provide opportunities to sequester CO2. Lastly, developing local energy resources will provide security of supply and reliable high value added economic activity.

From a social perspective, the employees of Chance come from diverse backgrounds. Half the staff are First Nation citizens from Yukon and half are women with all working in responsible positions. The Board is composed of businesspeople from Yukon, British Columbia and Alberta and includes female representation.

Chance reserves all its rights with regard to the Company's litigation against the Yukon Government in relation to damages caused by the Moratorium. Tenure extension is needed to continue implementing the Plans and advance the proposed exploration project through the YESAB process and onward to project execution.

In conclusion, Chance believes that it has diligently acted and continues to act in a manner that is consistent with the Act and in accordance with the Plans, that the timely exercise of its exploration rights has been significantly impaired by circumstances that were neither foreseen nor within the Company's control. Throughout the evolving landscape of procedural changes, political sensitivity, and growing obligations to engage with aboriginal communities, Chance has taken numerous and costly measures to mitigate the impediments where it can.

Chance trusts that you will consider this tenure request in the face of expanding timelines and complexities associated with the undertaking of exploration projects.

Yours truly,
Chance Oil and Gas Limited

PROJECT DESCRIPTION

This document presents the location of the proposed Eagle Plains Exploration Project (Project), the preliminary scope of the Project, the principal and accessory Project components, and Project phases and scheduling. The descriptions provided below are conceptual and intended to provide the level of detail necessary to initiate discussions with stakeholders on the Project Description.

Detailed design and implementation procedures will be developed following Project approvals. All design, methodology, or procedural changes will conform to the commitments made by Chance Oil and Gas Ltd. (Proponent), as well as the terms and conditions stated in any Decision Document resulting from the Yukon Environmental and Socio-economic Assessment Board (YESAB) Executive Screening process and permits, approvals, and authorizations once issued.

The development of this section is based on the *Proponent's Guide to Information Requirements for Executive Committee Project Proposal Submissions* (YESAB 2005), specifically Part 1, Section 5.0 Project Description.

The Proponent will develop a series of management plans to provide additional information on infrastructure design and phase-specific activities including monitoring. These management plans are referenced throughout this section where relevant.

1.1 Project Description Overview

The Proponent intends to conduct exploration drilling and flow testing of any discoveries over an area of approximately 2,400 square kilometres (km²) in the Eagle Plains area, located between the Ogilvie and Richardson mountain ranges along the Dempster highway in Yukon. The purpose of this exploration drilling and flow testing program is to confirm the quality, quantity, and areal extent of any accumulations of hydrocarbons. The Proponent will drill up to 30 wells sequentially over a period of up to 10 years. If a well is successful (i.e., if there is a discovery of crude oil or natural gas in sufficient quantities), the Proponent will conduct an extended flow test (EFT) for a period up to 2 years on that particular well. There is considerable uncertainty in terms of outcome from exploration drilling, so it is only possible at this stage to speculate on the number of discoveries that will be made. For the purposes of this assessment, the Proponent estimates that crews may conduct EFTs on up to 20 wells, depending on the drilling success. Due to the exploratory nature of the work, it is impossible to predict the timing of any discovery and therefore the timing of any EFTs.

The Proponent will drill one well at a time and up to five wells per year. Assuming all wells are successful and EFTs are conducted for 2 years at each well, there may be up to 10 EFTs being conducted at one time. The information obtained from the EFTs is critical to establishing the future development plan for each discovery.

If several wells reach successful outcomes and are identified for extended flow testing, the wells will have completion equipment installed within their wellbores, the casing will be perforated, and the wells will be flowed. This would require a completion or service rig to install the completion equipment and the tubing used to conduct produced well fluid to ground surface, at which point surface equipment would then be installed, which may include artificial lift equipment to help the fluid continue to flow.

Fluids produced during EFT will need to be measured, processed, and dealt with in an environmentally responsible manner. Depending on the nature of a discovery, the Proponent anticipates that some combination of natural gas, crude oil, and possibly formation water will be extracted during the EFTs. These fluids are separated and measured in facilities on the surface. Natural gas could be flared for short periods of time, but the Proponent prefers to conserve it to provide fuel for process heating, fuel for engines providing mechanical power, and possibly onsite power generation. If natural gas quantities are significant, the Proponent would consider re-injecting surplus natural gas into a compatible reservoir in the Eagle Plains basin using an existing suspended well. The Proponent currently has 8 suspended wells that were drilled in the past, which could be used for re-injection. Alternatively, some of the new wells, drilled as part of this 30-well Project, may be used.

Fluid transportation vehicles will be required to travel from site to site and transport the produced fluid back to the Central Process Facility for storage, further treatment, and transfer to trucks for transport to market or disposal. To the greatest extent possible, crude oil produced during the EFTs will be conserved instead of flared. This will require some processing to stabilize the crude oil for truck transport to a suitable, approved crude oil marketing point, such as terminals in the vicinity of Fort Nelson or Fort. St. John, British Columbia or Grand Prairie, Alberta. All these locations are ready to receive and utilize crude oil produced from Yukon sources in the absence of such destinations existing within Yukon. The Proponent may also consider trucking crude oil produced during the EFT to ports in Alaska such as Skagway, Haines, or Valdez for onward shipping to suitable markets elsewhere in North America.

Formation water produced in conjunction with crude oil or natural gas will be separated from the hydrocarbon streams and disposed of underground into a compatible and approved geological formation at Eagle Plain using one of the suspended wells or one of the wells drilled as part of this Project. These procedures to process, transport, and dispose of various fluids produced are common practice using proven technologies and equipment in every oil and gas province in Canada.

The Proponent also intends to conduct a seismic exploration program consisting of up to 1,500 km² of three-dimensional (3D) seismic and up to 2,000 km² of two-dimensional (2D) seismic to identify and map oil and gas geological structures in the area.

Additional activities are required to support the drilling and seismic exploration, including:

- Mix Bury Cover (MBC) sump area to dispose of drill cuttings
- Construct winter and all-season access roads
- Construct airstrip
- Advance borrow source developments
- Transport equipment and supplies to the site and within the Project area
- Use existing camp at kilometre (km) 325 of the Dempster Highway and periodic use of the Eagle Plains Hotel.

The Proponent is planning to begin exploration activities as early as the end of 2021 and continue for a period of 10 years to cover the various stages of drilling and extended flow testing of the proposed wells. The execution of the EFTs will likely be phased, depending on the nature of the discovery (e.g., natural gas versus crude oil) and the capacity of the 75-person base camp and the Eagle Plains Hotel to accommodate

the necessary crews. Until there is more information about the resources discovered, it is difficult to accurately predict the full duration the complete flow testing program.

1.2 Project Location

The Project is located within the southern part of Eagle Plain Sedimentary Basin in northern Yukon (**Figure 1.1)**. The main camp is located at km 325 of the Dempster Highway, with one MBC sump area located at km 336. **Figure 1.1** illustrates the overall Project area.

The proposed Project area overlaps with the following three First Nation Traditional Territories:

- Vuntut Gwitchin First Nation
- First Nation of Na-Cho Nyäk Dun
- Tetlit Gwich'in Council Secondary Use Area.

The proposed Project area is north of the Tr'ondëk Hwëch'in First Nation Traditional Territory and Settlement Land. The Traditional Territories and Settlement Land blocks in the vicinity of the Project are detailed on **Figure 1.1**.

The proposed Project is located within the boundaries of the North Yukon Planning Region and is therefore subject to the North Yukon Land Use Plan (Plan). A main purpose of the Plan is to address oil and gas development in North Yukon. The locations of proposed well sites are within the region of the Plan designated for the highest level of development. In the Plan, this designation is described as Lower ecological and heritage/cultural values within a moderately sensitive biophysical setting.

1.3 Project Components and Activities

This section describes the principal Project components, along with accessory components that are necessary to support Project activities. Information provided below for each Project component includes its location, key design features, and, where applicable, the results of any relevant investigations to establish site conditions (e.g., seismicity, geotechnical parameters). The three main components of the Project are described as follows:

1. Exploration well program – comprising 30 wells within an area of approximately 2,400 km². Wells will be located within areas identified in **Figure 1.1**. The program includes drilling, drill stem testing, and extended flow testing of the wells. Hydraulic fracturing is not being proposed as part of the Project. See **Section 1.3.2** for details.
2. Construction of access roads to each proposed well location – roads required for the Project will be a combination of winter and all-season access roads. Details regarding road construction and location are provided in **Section 1.3.3.1**.
3. Construction of a new MBC sump area and all-season access road – (approximately 400 metres (m) long) at km 336 of the Dempster Highway, and construction of additional MBC sumps in other suitable areas. Details are provided in **Section 1.3.2.7**.
4. Seismic exploration program (**Section 1.3.2.9**) consisting of up to 2,000 km² of 2D seismic exploration and up to 1,500 km² of 3D seismic exploration.

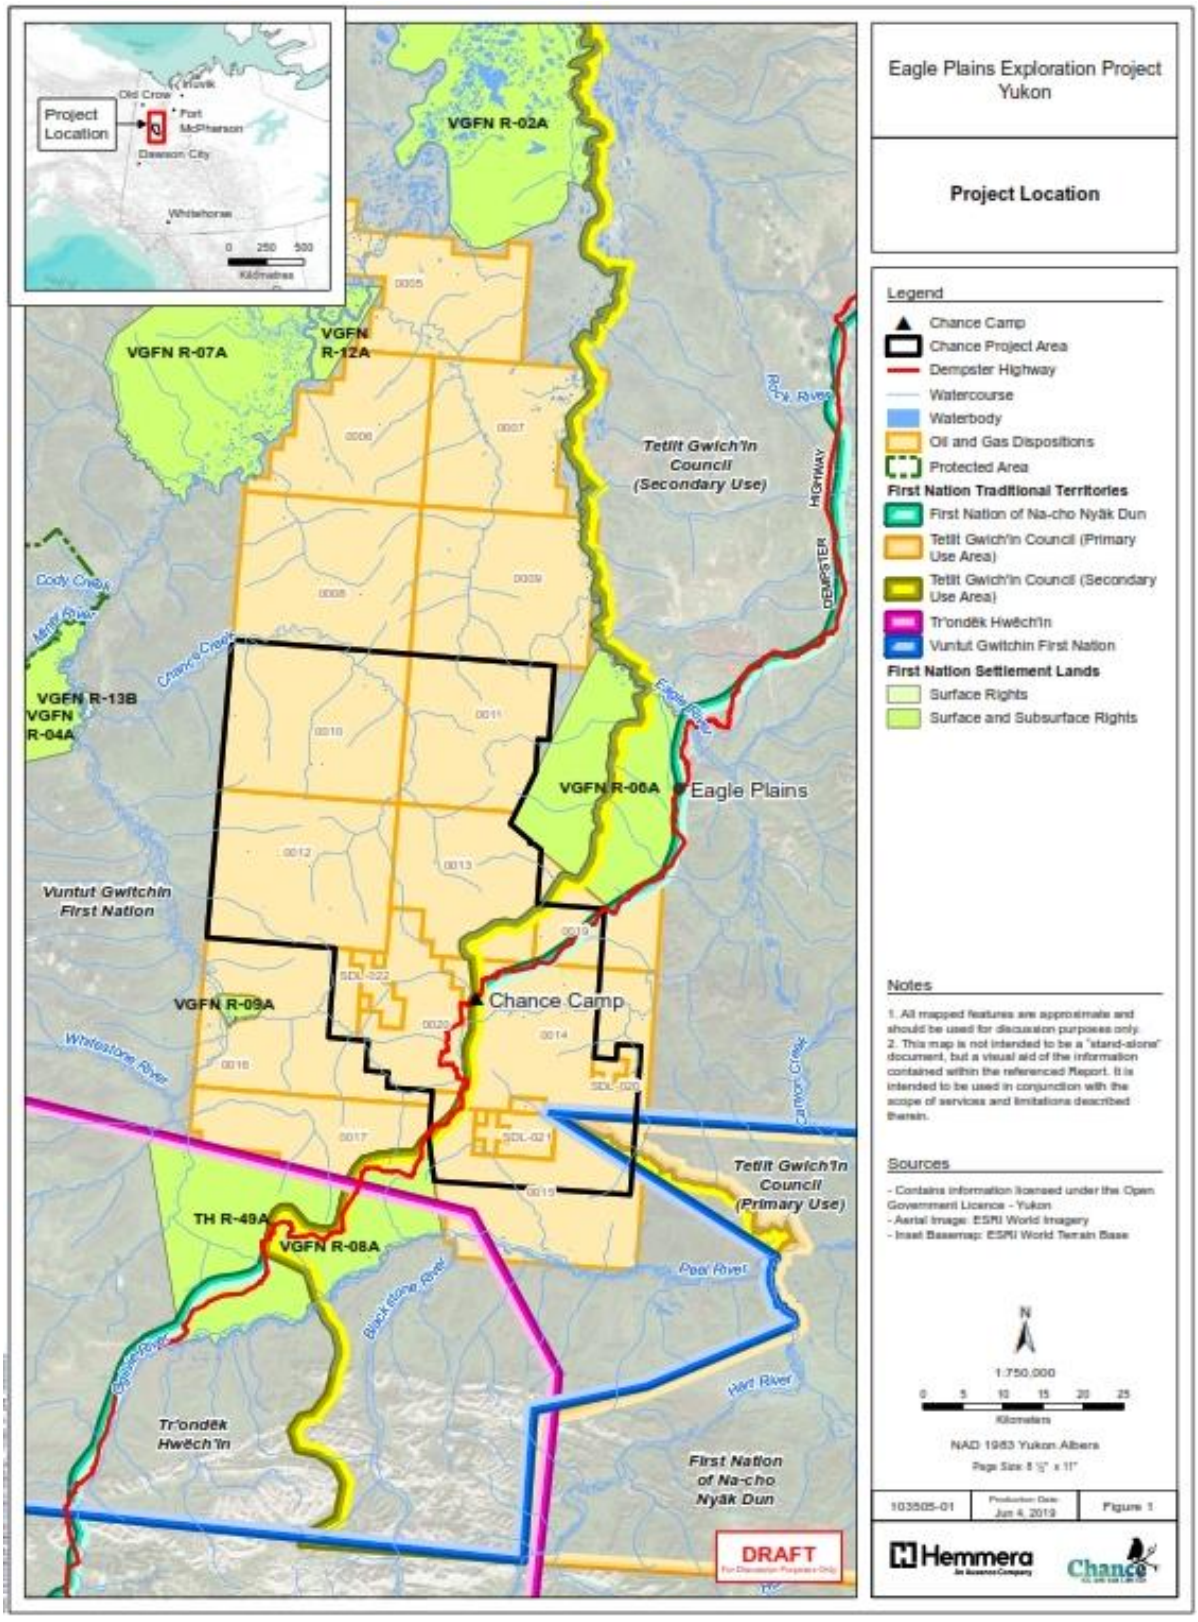

Figure 1.1 Project Location

Details related to the project components and activities are provided in **Section 1.3 Project Components and Activities** noting that the development of some Project components occurs in both phases. That is, once a well site has been prepared, drilling and well development will occur at that site, and additional well sites may be prepared simultaneously. Reclamation activities are described in **Section 1.4.4 Reclamation, Abandonment, and Closure Phase**.

1.3.1 Preliminary Scope of the Project

The preliminary scope of each Project component is described in **Table 1.1**.

Table 1.1 Preliminary Scope of Project

Project Component	Activities
General Project	• Exploration activities for oil and gas in the Eagle Plains area ▫ Exploration well drilling, testing, suspension, decommissioning, and abandonment ▫ Successful wells will be suspended and may be brought forward in future development project proposals ▫ 2D and 3D seismic exploration • Project phases will occur sequentially over a 10-year period and include ▫ Initial mobilization of equipment to the Project site ▫ Construction of required infrastructure ▫ Well development, testing, decommissioning, and abandonment ▫ Progressive reclamation ▫ Final closure and reclamation • The Project will occur over an area covering approximately 2,400 km² located at approximately km 325 of the Dempster Highway
Exploration Well Drilling	• Establishment of up to 30 well sites each, approximately 1.44 hectares (ha) in size within the overall Project area (approximately 2,400 km²) ▫ Site levelling using gravel, packed snow or ice and rig matting as required • Installation of surface infrastructure on drill sites including: ▫ Drill rig ▫ Mud tanks, pumps, and mud processing systems ▫ Power generators ▫ Boilers ▫ Blowout preventer accumulator system ▫ Fuel storage ▫ Flare tank and flare stack ▫ Cement mixing and storage ▫ Storage bins for rock cuttings ▫ Trailers for offices, first aid, rig crew sleeping quarters, water storage and treatment, sewage storage, and food waste incinerator • Drilling of up to 30 wells to a depth up to approximately 2,500 m ▫ Wells will be drilled sequentially, one well at a time, up to four wells per year • Use of low-toxicity, water-based mud system • Use of up to 15 cubic metres (m³) of water per operating day for drilling

Project Component	Activities
Drill Stem Testing	• One or more drill stem tests (DSTs) on each well to analyze prospective/productive formation areas • Potential acid stimulation using a weak concentration (10% to 20%) of hydrochloric acid approximately 5 to 10 m3 per well • Flaring natural gas • Production of crude oil and transport from the site to markets outside of Yukon
Extended Flow Testing	• Conduct EFTs on up to 20 successful wells ▫ May be conducted within a month for a predominantly natural gas well or up to 2 years for a predominately crude oil well ▫ Up to 10 EFTs conducted at the same time • Installation of surface and subsurface equipment and facilities to enable EFT including: ▫ Casing of entire wellbore and perforation of casing at zone or zones of interest ▫ Packer, tubing, and downhole gauges ▫ Wellhead valving assembly ▫ Flare systems ▫ Separator vessel, treating vessel, and storage tanks ▫ Appropriate artificial lift systems ▫ Heaters ▫ Dehydrators ▫ Flow lines ▫ Metering equipment ▫ Portable generators • Separation of natural gas, crude oil, and formation water • Flaring natural gas for a period of several days to several weeks • Production of crude oil and transportation of produced crude oil from the site to markets outside of Yukon • Use of natural gas on site for power generation, tank heating, fuelling artificial lifting to assist crude oil production, or compression for re-injection of natural gas • Disposal of formation water underground in existing suspended wells, or wells suspended as part of this exploration Project
Drilling Waste Disposal	• Construction of MBC sump approximately 6.4 ha in area to dispose of drill cuttings • Disposal of drill cuttings in MBC pods approximately 300 m^3 over an area of 800 square metres (m^2) (estimated volume of drill cuttings for one well) • Disposal of approximately 200 m^3 of drilling mud in MBC and drilling fluid underground in existing suspended wells, or wells suspended as part of this exploration Project • Disposal of the following liquid waste in existing suspended wells, or wells suspended as part of this exploration Project: ▫ Formation water ▫ Saline fluids ▫ Liquid fraction of drilling fluids ▫ Rig wash
Seismic Exploration	• Up to 1,500 km^2 of 3D seismic

Project Component	Activities
	• Up to 2,000 km² of 2D seismic • Establishment of seismic survey lines • Air hammer drilling • Receiver stations and source stations • Storage (in magazines), transportation, and use (1 kg per source station) of dynamite
Well Maintenance (Workovers)	• Mobilization and installation of a service rig to the well site • Conduct maintenance to: ▫ Install, change, or modify the production flow control equipment ▫ Perforate zones of interest for EFTs ▫ Seal some or all perforations made across productive zones ▫ Re-perforate a zone or zones elsewhere in the wellbore ▫ Other routine maintenance practices to ensure optimal production performance of the producing formation
Access Roads	• Use of permitted Chance Road all-season road for Project activities • Construction of all-season access roads to well sites requiring EFT and borrow source locations ▫ Approximately 7 m in width with pullouts on average every 750 m ▫ Up to approximately 87 km total in length ▫ Clearing and mulching of vegetation ▫ Removal and stockpile of organic cover material for use in reclamation • Construction of winter access to well sites for initial well drilling and DST
Borrow Source Development	• Quarrying of approximately 1,800,000 m³ of aggregate for use in Project activities, including: ▫ Winter development of up to 23 quarries ▫ Use of approximately 450,000 m³ of aggregate for well pads ▫ Use of approximately 1,350,000 m³ of aggregate for access road construction ▫ Use of aggregate for airstrip construction ▫ Use of aggregate for Central Processing Facility construction ▫ Use of explosives • Removal and stockpile of organic cover material and silts for use in reclamation
Central Processing Facility	• Construction of central processing facility adjacent to camp • Processing facility ▫ Multi-stage and multi-phase separators ▫ Heater treaters ▫ Vapour and gas collection system to flares or to provide fuel for camp use ▫ Processing of crude oil to stabilize and meet market specs for truck transport ▫ Storage of approximately 3,180 m³ of produced crude oil ▫ Storage of approximately 119 m³ of produced (formation) water • Fuel storage facility ▫ 151 000 litres (L) diesel fuel ▫ 24 000 L propane

Project Component	Activities
	• Storage and use of chemicals and reagents: ▫ Hydrochloric acid (10% to 20% concentration) ▫ Methanol ▫ Additives to prevent corrosion ▫ Demulsifiers • Bulk explosive compound to store dynamite for use in construction of borrow sources and for seismic exploration
Airstrip	• Construction of airstrip approximately 1,500 m long at km 4 of the Chance winter road • Use of airstrip during all phases of the Project approximately 2 flights in/out per week • Storage of aviation fuel
Water Use	• Use of up to 300 m³ of water per day for making snow to build winter trails, ice roads and temporary well sites, not exceeding 10% of instantaneous flow from the following extraction points: ▫ Year-round extraction from the Eagle River and Ogilvie ▫ Seasonal extraction from Glacier Creek and Fly Camp • Use of up to 300 m³ of water per day for camp from existing onsite groundwater water well. • Construction of portable water reservoir at the camp for water storage and use during low water periods
Transportation	• Use of Dempster Highway, North and South Klondike Highway, and Alaska Highway to access Project site and to transport crude oil to potential markets • Approximate offsite traffic on public roads between the site and supply points • Onsite traffic on Proponent-controlled roads ▫ 15 to 20 truckloads over approximately 5-day period to mobilize the drill rig to each well site
Camp and Workforce	• Workforce up to 75 people during all phases of the Project • Continued use of existing permitted 75-person camp located at km 325 of the Dempster Highway ▫ Municipal waste management and disposal ▫ Sewage treatment facilities
Reclamation and Closure	• Progressive abandonment of unsuccessful wells ▫ Installation of cement plugs across all porous/permeable zones, across the base of each casing string and at surface ▫ Cutting of well casing(s) off 1 m below ground level and weld steel plates across each string ▫ recontouring and revegetation of area • Progressive decommissioning and reclamation of borrow source and quarry areas when they are no longer useful or necessary ▫ Recontouring of area and replacement of stockpiled silts and organic cover material • Well suspension and abandonment at end of Project

1.3.2 Principal Project Components

1.3.2.1 Overview

The principal Project activities are the drilling program, well testing, and seismic exploration program. The goal of the proposed drilling program is to obtain the maximum amount of information to determine the geological settings and evaluate oil and gas reserves in the Eagle Plains area. During operation, drilling will occur 24 hours per day, and 7 days per week. Chance will drill 1, possibly 2, wells at a time and up to 5 wells per year.

Initial drill stem tests (DSTs) will occur on any or all of the 30 proposed wells. Up to 5 wells could be tested each year. Chance will conduct EFT on successful wells, where hydrocarbon resources are discovered, to gather important information about the nature of the resource accumulation and its productive capability. EFT for wells with a primarily natural gas discovery may take place over a maximum period of 1 to 2 months maximum. EFT for wells with a primarily crude oil discovery may take place over a period up to 2 years. Chance may conduct up to 10 EFTs concurrently and EFTs on up to 20 wells over the life of the Project. The information obtained from the EFTs is critical to determining the future development plan for each discovery. **Table 1.2** outlines the sequence of activities in developing the well site areas.

The Proponent also intends to conduct a seismic exploration program consisting of up to 1,500 km² of 3D seismic and up to 2,000 km² of 2D seismic to identify and map oil and gas geological structures in the area. The 3D seismic program is likely going to be undertaken in a series of smaller projects, each of approximately 400 km². The 2D seismic program could be done either as one project or as a series of smaller projects. Details on the Project components and activities are provided in the following sections.

Table 1.2 Sequence of Well Development Activities

Initial Exploration Drilling		
Develop winter access trail to well site		
Develop well site approximately 1.44 ha in area		
Install surface infrastructure on well site necessary for drilling and testing exploratory well		
Drill well		
Transport and dispose of drill cuttings in MBC sump		
Conduct DSTs to determine whether successful or not in order to move on to EFT		
Move drill rig to next well site area		
If not successful	**If successful**	
	Primarily Natural Gas Discovery	**Primarily Crude Oil Discovery**
Abandon well (cement all perforated producing zones, install shallow cement plugs, and cut surface casing 1 m below normal ground surface).	Complete well (finish casing, perforate the casing, and install production flow control devices, steel tubing, and wellhead components).	Complete well (finish casing, perforate the casing, and install production flow control devices, steel tubing, and wellhead components).
Remove all surface infrastructure.	Install required surface facilities (separator vessel, heaters, dehydrators, stock tanks, flow lines,	Construct all-season access to well site.

Initial Exploration Drilling		
	metering equipment, portable generators, and flare stack).	
Remediate well site area (remove mats and gravel fill material).	Conduct EFT over period of 1 – 2 months	Install required surface facilities (separator vessel, heaters, dehydrators, stock tanks, flow lines, metering equipment, portable generators, and flare stack).
Recontour well site area and revegetate disturbed areas to natural conditions.	Measure natural gas and water from wells.	Conduct EFT over period up to 2 years
Recontour access roads and revegetate disturbed areas to natural conditions.	Conduct maintenance on well as required (work over).	Measure, store, and process crude oil, natural gas, and water from wells.
	Once EFT is, complete either 1. develop a new proposal to bring into production, or 2. decommission and abandon well.	Conduct maintenance on well as required (work over).
	Abandon well (cement all perforated producing zones, install shallow cement plugs, and cut surface casing 1 m below normal ground surface).	Transport crude oil from EFT to central processing facility then to acceptable market.
	Remove all surface infrastructure.	Once EFT is complete, either 1. prepare development plans for future assessment and regulatory review to bring into production, or 2. decommission and abandon well.
	Remediate well site area (remove mats and gravel fill material).	Abandon well (cement all perforated producing zones, install shallow cement plugs, and cut surface casing 1 m below normal ground surface).
	Recontour well site area and revegetate disturbed areas to natural conditions.	Remove all surface infrastructure.
	Recontour access roads and revegetate disturbed areas to natural conditions.	Remediate well site area (remove mats and gravel fill material).
		Recontour well site area and revegetate disturbed areas to natural conditions.
		Recontour access roads and revegetate disturbed areas to natural conditions.

1.3.2.2 Exploration Well Drilling Program

Establishment of Well Sites and Drilling

Chance will establish up to 30 well sites, each approximately 1.44 ha in size within the overall Project area (approximately 2,400 km²). Total approximate disturbance for well site locations will be up to 43.2 ha if all 30 wells are drilled. Exact well locations and sequencing cannot be determined at this time as they are dependent on seismic data interpretation, drilling results, EFT results, weather, and local surface conditions and other environmental factors. The Proponent is continuing the ongoing process of interpreting seismic data to better understand the geological setting, size, and geometry of potential prospects. Each well drilled will add to that understanding.

Generally, well sites will be located on the heights of land. Criteria for well site locations include the following:

- Avoidance of areas with challenging permafrost conditions and ecologically sensitive areas such as riparian corridors, wetlands, steep slopes, old growth forest, and critical wildlife habitat and permafrost features.
- No drilling within 45 m of a perennial watercourse
- Avoidance of areas identified with heritage values (noted as “avoidance areas”) in the Heritage Resource Overview Assessment and Heritage Resource Impact Assessment (Matrix 2013).
- Requirements from the Yukon *Oil and Gas Act*, SY 2019, c.6 (YOGA) and the Oil and Gas Drilling and Production Regulations.

Drill Program

The first of the exploratory wells will be drilled in winter commencing around mid-January 2021. Pre-drilling preparation will entail building winter trails to gain access to the first selected well sites and to build access roads and the leases to accommodate the mobilization and setup of the drilling rig. Winter road and lease building can only commence once there is the 10 cm of snow cover required to facilitate construction. Based on historical trends, this could occur as early as December or as late as mid- to late January in any year.

Summer well sites may be established if there is already a year-round access road built nearby to service a well or wells undergoing EFT. Summer well sites will allow the Proponent to extend the drilling season into the summer if new wells can be drilled within a few kilometres of an existing road. A summer well site will require all-season access to the site.

Once established, the well site will contain the drill rig, flare stack, rig trailers, and office trailers and will provide sleeping capacity for the required number of key people to stay at the rig full time. Each well site will be approximately 1.44 ha in size to facilitate drilling and any subsequent EFTs. The amount of clearing will be kept to a minimum.

The well site dimensions should be adequate for advancing to a possible production operation in the future and therefore should accommodate all field production equipment.

Winter Matting Use

Matting for winter operations will be used when a) the ground is too uneven, b) it may not be possible to level the lease using earth-moving equipment and when the ground may not be competent enough to support the heavy rig loads, or c) when it is not possible to level the ground by laying down a base of gravel or soils. Matting may be used in drilling operations to reduce ground surface disturbance and distribute the ground pressure of equipment. Matting may also be used to stabilize the drill rig to provide insulation and protection to the snow and ground surface. Matting will not be used on the proposed roads.

The Proponent intends that well sites would be built with fill material from other well sites or from borrow sources. Should matting be used, it may cover the entire well site area (several locations of 1.44 ha) or the area immediately adjacent to where a drilling rig may be placed.

Well sites will be levelled by bringing in material such as gravel, or possibly snow for packing and then icing. An impermeable liner will then be laid on top of the pad, followed by wooden rig mats that interlock. Rig mats are approximately 16 feet by 8 feet in area, though there is some variance from one manufacturer to another.

Any matting used for this Project will be designed to support heavy loads and distribute the weight over large surface areas. The use of matting is a common practice for oil and gas drilling operations in northern locations. Any matting used for this Project will be placed on the frozen ground with snowpack and removed before spring melt.

The well site area adjacent to where the rig is situated and the road access will be matted if an unprecedented early melt occurs. In the event of an unprecedented early melt, rig equipment will be “leapfrogged” along the access road to support equipment and protect the vegetative mat as the rig is being demobilized and on its way out from the well site location. If leases are not constructed from densified fill material, equipment will remain on matted surfaces at all times in the event of early melt conditions.

Mats currently placed on previous well locations are periodically inspected for any movement or deterioration that could affect their ability to support intended loads. All matted well sites are maintained as much as possible because suspended wells must be usable by Chance in future exploratory and appraisal programs.

Summer Matting Use

The laying of matting in summer first requires the frozen level ground to be insulated with an impermeable textile layer. Laying matting early, before the thaw, ensures vegetation is not yet active and may be covered by a layer of snow or frozen soil. The Proponent plans to drill summer wells (following early exploratory successes from the winter wells) by constructing gravel pads of sufficient thickness to facilitate levelling and a firm base to support drilling loads.

The Proponent will likely use double-matting procedures where required to provide a stable, level surface on a summer location if the terrain is uneven. If double matting is used, the upper layer of mats can be lifted independently while the lower mats are left in place if frost adhesion is evident.

The Proponent expects future leases for well sites will be constructed from a more durable borrow site fill material of a suitable thickness to protect and insulate the permafrost and provide a safe and stable working surface for the drilling and subsequent extended flow testing. Should any well also become a long-term producer, the lease condition will be expected to endure for a longer term of several more years.

Geotextile membrane would only be applied over the vegetation surface as an option for locally levelling terrain. This would be necessary if double matting techniques were not possible as a solution for stabilizing mats on the vegetation surface. Geotextile will be used when:

- Levelling using fill material on top of natural vegetation could compromise the stability of the surface under loads.
- Levelling by double matting is not the best solution in the circumstances.
- Geotextile use would help protect vegetation or be a valuable aid in site clean-up.

Geotextile may be used prior to application of fill to level part of the drill site or access route, which could involve applying a minimal thickness of granular material (local rock or soil fill).

The Proponent retained EBA Engineering Consultants Ltd. (EBA) in 2008 to provide permafrost, soil, and vegetation expertise to evaluate the proposed use of industrial wooden mats for summer access. Tetra Tech/EBA (the successor company to EBA) or a similarly qualified individual or firm will be required to perform site-specific geotechnical pre-drilling investigations to confirm amounts of fill required and the proper placement of fill material to support the anticipated rig loads in accordance with good engineering practices.

Well Site Surface Infrastructure

The Proponent plans to use a drill rig with similar characteristics to Chance Rig #1 as presented in past assessments. The rig is capable of drilling to depths of up to 2,500 m. A normal rate of drilling would be to drill 1 well at a time during this exploratory phase.

Figure 1.2 illustrates the general layout of the proposed well site. The rig is designed to fit on a much smaller layout, but the planned 1.44 ha (120 m × 120 m) square layout is designed to accommodate not only the drilling operation but also the well completion and EFT equipment, and to preserve setback distances from surrounding vegetation and from personnel working and sleeping quarters. Note that the final area may not be square since the area will depend on topographical constraints. However, the total area for a well site will be approximately 1.44 ha. The rig layout depicted would likely be for a winter drilling operation distinguished by the number of boilers onsite. Boilers are used extensively in very cold or Arctic climates for preventing equipment and drilling fluids from freezing Arctic temperatures. **Table 1.3** provides a description of the drill rig components identified in **Figure 1.2**.

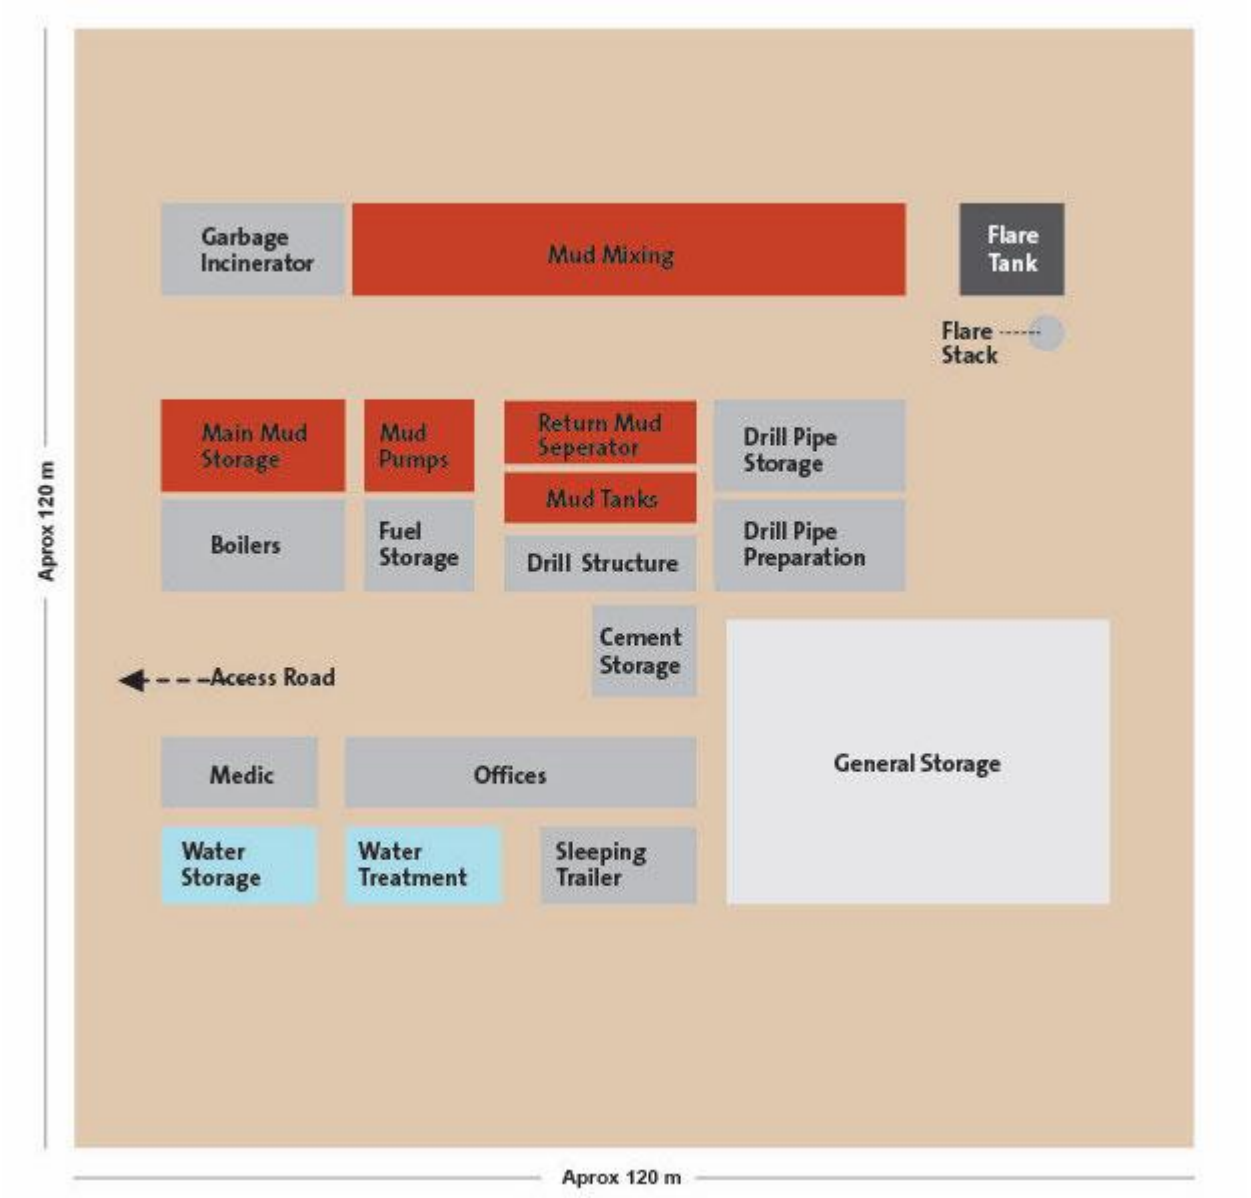

Figure 1.2 General Layout of a Well Site

Table 1.3 Well Site Components Shown on Figure 1-3

Component	Description
Boilers	Used extensively in very cold and Arctic climates for preventing equipment and drilling fluids from freezing Arctic temperatures.
Cement	Cement storage and mixing for use in wells.
Medic, Offices, and Sleeping Trailer	Essential personnel trailers which serve as offices as well as sleeping quarters and include a multi-room sleeper for some of the rig crew.

Component	Description
Flare Tank and Flare	Flare used to incinerate combustible fluids from the well. The flare tank is a reservoir to ensure the flare does not starve of combustible fluids.
Fuel Storage	Fuel for use on well site for equipment including drill rig, pumps, generators, etc.
Garbage and Incinerator	Storage area for waste and incinerator to dispose of food waste.
General Storage	Storage and laydown area for equipment needed onsite.
Mud Tanks	Tanks where all the surface mud volume is stored. Section 31 of the Drilling and Production Regulations under YOGA (Government of Yukon 2004) stipulates that the "combined capacity of the drilling fluid tanks of every fluid system must not be less than the greater of 120 m^3 and 50% excess of the volume of the wellbore."
Main Mud Storage	Location where all the mud materials are stored. Normally these materials are delivered on pallets neatly stacked and shrink wrapped to protect them during the truck journey north.
Drill Pipe Storage	Receptacle in which drill pipe is stored until required to be run in the hole.
Mud Mixing	Tank in which certain mud products are first hydrated to render them miscible with the fluid phase of the mud. Products such as bentonite clay, for example, require a caustic soda solution to neutralize the ionic attraction forces between clay flakes, allowing the water to lose its surface tension and to completely wet the flakes.
Mud Tanks	Large tanks, normally upright, fully enclosed and pressurized, where cement or bulk mud products are stored. Cement or barite (drilling mud weighting material) are pneumatically pumped from the P Tank into a smaller surge tank and then to the cementing unit or, alternatively, to the mixing or premix tank to enter the mud system.
Mud Pumps	Pumps used to circulate the drilling mud down the drill pipe, around the drill bit, and up the annular space between the drill pipe and the open hole or casing to surface.
Return Mud Separator	Area where the return mud separator known as a shale shaker is housed. The CF is the centrifuge that uses centrifugal force through high-speed rotation to separate the fluid part of the mud from the solids.
Drill Structure	Components required to drill the well, including: • Sub-structure, or base, to which the derrick is fixed • Derrick that supports the draw works and top drive • Top drive that is a mechanical, electrically powered linking device that attaches to the pipe in the hole and rotates it when drilling while simultaneously pumping drilling mud through the drill pipe and out of the drill bit at the bottom end • Draw works that lifts and lowers the travelling block in the derrick/mast to run pipe in and out of the hole • Blowout preventers, which are a series of closing valves that can hydraulically shut in a well in the event of unplanned influxes of formation fluids into the wellbore
Water Storage and Water Treatment	Water storage tank and treatment containers to provide potable water for the rig crew and personnel.

Any well site is an industrial area and therefore has restricted entry requirements, allowing entry to only authorized personnel wearing personal protective equipment (coveralls, steel-toed boots, hard hat, gloves, and safety glasses).

Figure 1.3 and **Figure 1.4** show the rig set up at the Chance camp located at km 325 of the Dempster Highway.

Figure 1.3 Chance Rig #1

Figure 1.4 Chance Rig #1 and Chance Camp at km 325 of the Dempster Highway

Drilling Operations

Well sites will be designed and constructed to support the rig and ancillary equipment positioned on them. The well site locations will be determined based on geotechnical assessments. Because construction will use borrow source fill, the well sites will be able to accommodate the drilling, EFT, and eventual production phases of well operating life. The lease area will be sized to fully accommodate a purpose-designed well pad, process facilities, and possible service rig equipment spreads that may follow in the future. Eagle Plains well sites and well design will incorporate the following key features to enhance efficiencies and reduce waste and general impact to the surroundings:

- The rig will use the minimal number of casings necessary to reach the projected total depth of approximately 2,500 m. The schematic well profile shown in Figure 1.5 illustrates a cross-section of the casing run, including annular cementation and other well features together with drilling equipment. For reference, the well casing program will typically comprise the following elements:
  - Conductor of 13-3/8-inch diameter to approximately 25 m below ground level, cemented to surface.
  - Surface casing of 9-5/8-inch diameter to approximately 400 m below ground level, cemented to surface.
  - Production casing of 7-inch diameter either to total depth or to just above the top of the Hart River formation at circa 1600 m, to comply with Yukon's Drilling and Production Regulations requirement of not more than 25% of open hole remaining uncased at any time (Drilling and Production Regulations Section 55-(1) (c) (i)). This casing will also be cemented to surface.
  - 4-1/2-inch liner to total depth at 2,200 m, cemented with a minimum 100 m overlap into the previous casing.
- The nominal diameter of the casings (all selected to remain industry standard dimensions) will reduce the size of holes drilled and of drill cuttings generated. For example, a 3,500 m exploratory well would typically produce 400 to 500 metric tons of cuttings. Less than 150 metric tons will be produced for the typical exploratory well depth of 2,200 m proposed at Eagle Plains.
- A water-based mud system will be developed and managed by a specialized service contractor with comprehensive knowledge of the Alberta Energy Regulator (AER) Directive 50 requirements as they pertain to the Yukon jurisdiction being operated in.
- All requirements in Sections 26 to 65 of the Drilling and Production Regulations (covering well design, casing design, groundwater protection, mud products, blowout prevention and choke/kill systems, fire detection and gas detection systems, safety of personnel, mitigation of operations impact, and more) will be either met or exceeded in the design, selection, and deployment of materials.
- The Yukon Oil & Gas drilling and production regulator will review proposed drilling design and planned operations procedures, as well as the health, safety, and environment policies and manual; oil spill contingency plans; and emergency response plans. Any perceived or identified deficiencies will be discussed, addressed and reported back to the regulator to confirm what action had been or needs to be taken before operations can proceed.
- The Proponent will enforce compliance on all third-party service suppliers to ensure that (1) their health, safety, and environment management systems address all regulatory requirements in personnel training and skill development; (2) personal protection equipment provided to workers

meets all Canadian Standards Association and international safety standards; and (3) supervisors are knowledgeable about operational standards related to health, safety, and environment. Periodic inspections and audits will be performed by Chance company representatives while operations are mobilized and ongoing at well sites.

- All wells will be drilled as "keepers" to facilitate EFTs and/or to become early producers in the event the Project advances to a full development. The only wells likely to be abandoned would be unsuccessful (dry) wells with no potential to be used as water or gas disposal wells.
- Leases will be designed and constructed to contain any fluid runoff into purpose-built collection ditches for recovery and disposal. A non-permeable layer will be laid during lease / well pad construction to prevent any seepage into the natural ground layer below the fill material pad.
- Rig deployment will ensure any rig wash; drilling, cementing, or DSTs fluids will be contained and recovered at all times.
- The standard and proven drilling method proposed has many advantages, including the following:
  - Large volumes of water will not be required for the drilling process because of the use of solids control equipment allows recycling of the majority of drilling fluid. Chance Rig #1 normally consumes approximately 15 m³ water per operating day averaged over the duration of the well being drilled.
  - Minimal volumes of water are expected to be lost into the formation. The Proponent's experience drilling to these depths confirms this. Studies of other offset/nearby wells also confirm this expectation.
  - In the event that hydrocarbons are encountered, they will be controlled by the drilling mud contained in the hole; as a secondary barrier, the blowout preventer system will comprise two or more rams to fully close in the well within seconds of detecting an influx into the wellbore.
  - In the unlikely event that abnormally pressured zones are encountered (all formations to be encountered in the proposed program have been previously drilled in past wells A-25, H-28 and B-73 and no overpressures have been experienced or detected), the Proponent has designed a comprehensive drilling fluids management, casing, and blow-out prevention system to control such occurrences. Well conditions and all pressure parameters are constantly monitored and detected first by the frontline drill crew members (driller constantly on the drilling control brake, mudman aided by the well monitoring personnel constantly viewing and responding to sensor responses). As an added backup, electronic detection alarms are set to trip when very small influxes occur.

Chance Rig #1 is approved to have a Class IV BOP system, which in Yukon Drilling and Production Regulations Section 33 (1) (d) permits the rig to drill wells between 1,800 m and less than 3,600 m and is rated for 21,000 kilopascals (kPa) (3,000 psi) working pressure (Drilling and Production Regulations Section 33 (2) (c)).

Drill crews, by professional training and enforced by regulatory requirement, must be fully trained and certified in blowout prevention and well control. Crews undergo simulated drills at each shift on a 2-shift, 24-hour work rotation. During these drills, the response and efficiency of drill crews are evaluated. The equipment is also evaluated, and any deficiencies are corrected immediately following the drills. Drill crew

and well supervisor well control / blowout prevention / hydrogen sulphide certificates are normally inspected by a visiting inspector to confirm compliance at all times when operating.

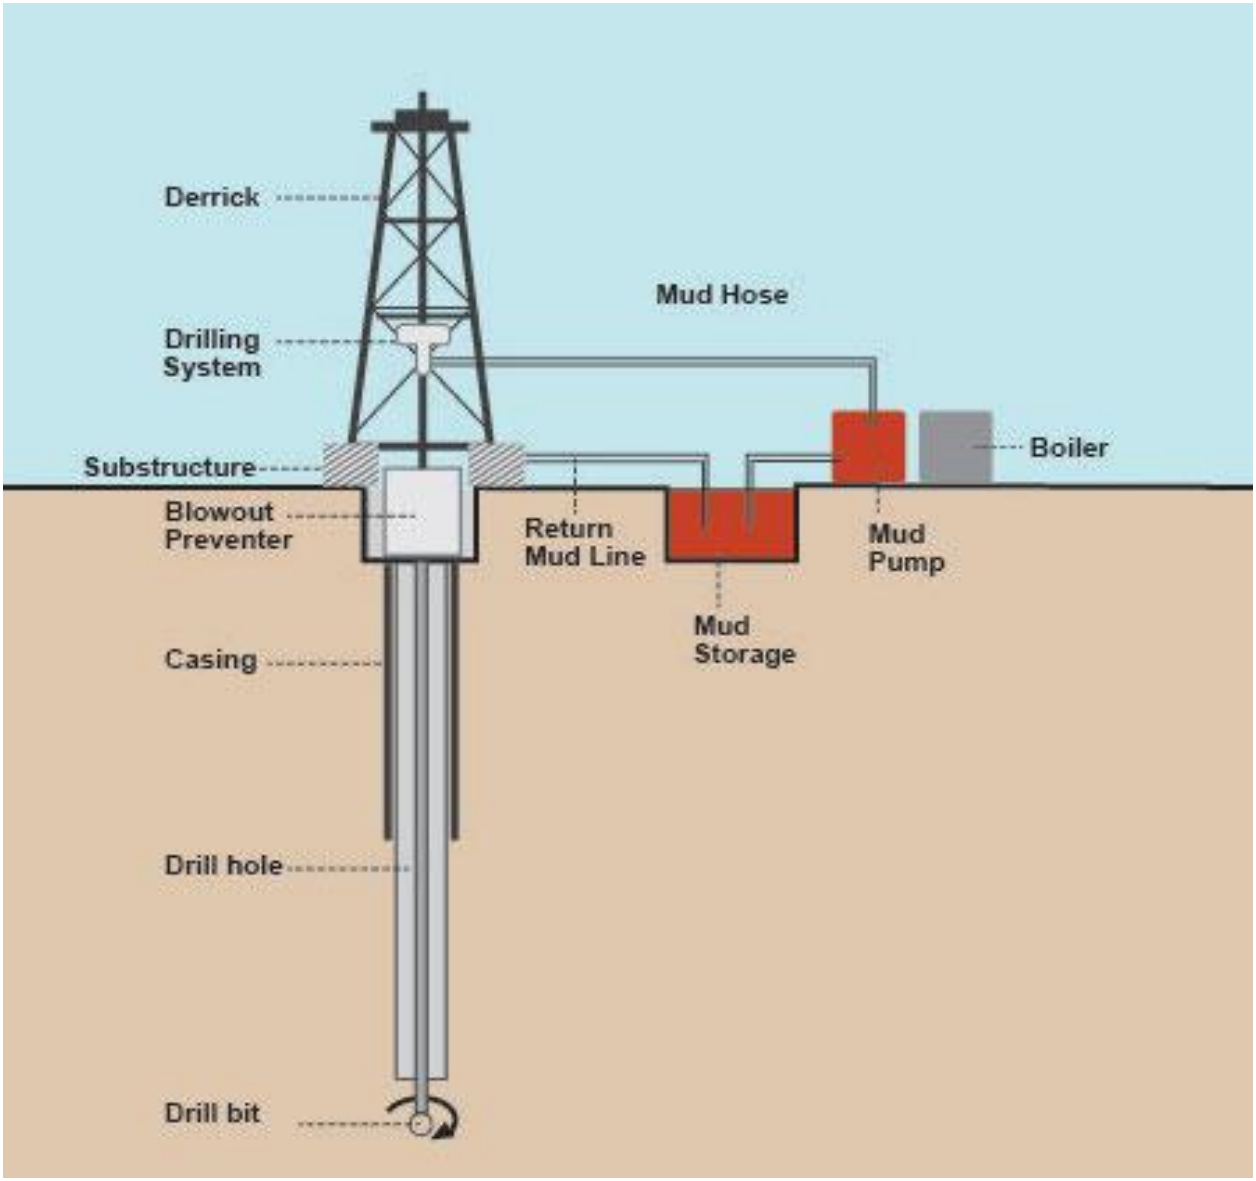

Figure 1.5 Well Profile

Drilling Fluids

Drilling fluid (or mud) is a vital component used in drilling oil, gas, and water wells. The drilling fluid system being currently researched for evaluation will be low-toxicity water-based drilling system similar to those in extensive use in other parts of western Canada. The supplier of any system will be assessed on previous comparative experience and required to pay great attention to mud system drilling performance and enhance ease of disposal to the highest standards demanded by AER Directive 50 for chemical constituents, dissolved salts, minimal oils, miscibility with native soils, and other characteristics.

A typical water-based mud system may be one of the following:

- Weighted (low-solids, non-dispersed) mud
- Glycol/glycerol mud system
- Saturated salt water mud (using sodium chloride, i.e., common salt)
- Calcium-based mud.

The list of typical mud formulations above covers a wide range of basic muds suitable for drilling in relatively benign (non-active clay), low-temperature environments. Simple muds comprise bentonite clay, caustic soda, shale inhibitors (common salt, hydrated gypsum, or lime) all well mixed together to help lift drill cuttings as well as minor additives to prevent drilling equipment corrosion, balance acidity or pH, permit the removal of drilled solids, and keep the ingredients in a slurry rather than separating or flocculating.

The Proponent has used a gel/chemical system on E-78, a relatively shallow well (approximately 1,000 m total depth). This system is used extensively in western Canada and exhibits the low-toxicity features desired for the proposed exploratory program. However, there remains the need to perform compatibility tests or analyses to confirm its suitability for drilling to 2,200 metres at Eagle Plains.

The Proponent is undertaking interviews and expanded discussions with a select number of well-established medium-sized mud services suppliers in conjunction with cuttings disposal specialists, all very active in other drilling jurisdictions. A mud services scope of work will emerge from these discussions to request proposals for providing the service for all exploratory wells. Once the system is designed and validated, all drilling mud characteristics, , such as mineralogy, lithology, pH levels, and others, will be known and can be disseminated to Yukon regulators.

The main function of drilling fluid is to over-balance the well pressure to ensure that the pressure in the wellbore is higher than the pressures expected to be encountered from the various geological formations as the drill bit penetrates them. The drilling fluid prevents formation fluids from entering the wellbore, keeps the drill bit cool and lubricated, circulates out drill cuttings, and keep in fluid suspension the drill cuttings during periods when drilling is paused or when the drilling assembly is cycled in and out of the hole. Drilling fluid is selected to provide operational efficiency, minimize formation damage, reduce corrosion, and minimize environmental impact for handling and disposal.

Project operations will utilize drilling practices that minimize the volume of drill cuttings and drilling waste generated. This minimization will in large part be due to drilling smaller-diameter holes to what will be a relatively shallow total depth. Drilling waste is composed of rock chips and cuttings and the drilling fluid that is recirculated. The drill fluid returned to the surface is sent through a shale shaker and centrifuge where the drill cuttings are separated and have most of the mud removed. The liquid fraction from the separation will be returned to the active tankage system for reuse.

Flaring

Flaring of gases during the drill stem testing part of well evaluation is a widely applied activity. The process, however, can only be undertaken in compliance with rigid regulatory controls. The requirements establish that the flare line must originate downstream of the choke manifold, must be designed to prevent the accumulation of any fluid within the line, and must be properly installed and anchored. Any amount of gas

encountered would be circulated through the rig degasser system to remove it from the drilling mud, thereby rendering the mud safe to pump back into the wellbore. Larger volumes of gas may be control-burned through the flare stack according the flare permit issued by Yukon Oil & Gas.

An example of a typical well site flare layout is illustrated below (**Figure 1.6**). Normally the flare line from the Choke Manifold is connected to the Flare Stack inlet to permit the directing of the gas to the flare until total control in terms of flow rate and flow pressures.

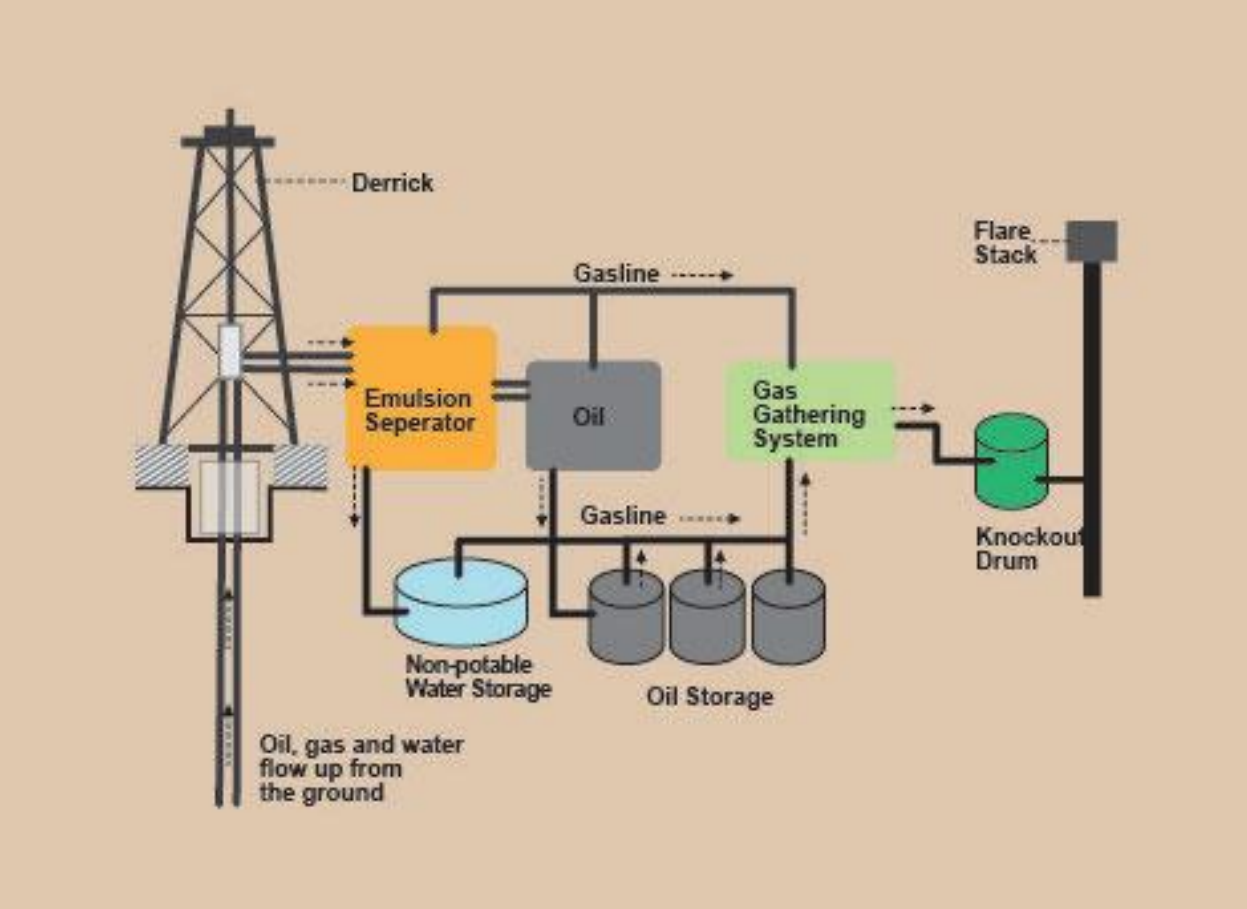

Figure 1.6 Typical Flare Stack and Gas/Vapour Recovery Flowsheet

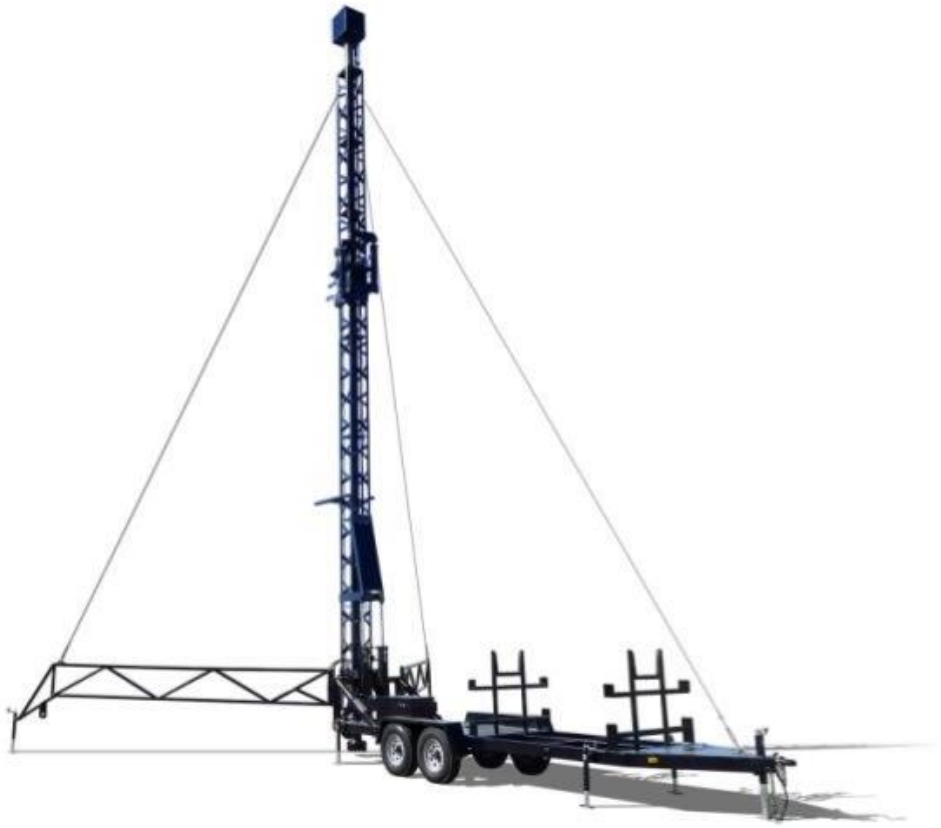

Figure 3-11 Typical Portable Rig Flare Stack Unit

Figure 1.7 Typical Flare Stack Unit on a Portable Rig.

It is expected that the targeted formations will produce less gas than in the past. Newly drilled wells will not contain the anaerobic bacterial contamination present in some of the older wells which may have caused small amounts of H_2S to be present.

The Proponent has not flared gases during the previous exploration programs; however it is likely to occur during some of the flow test operations until a use is found for the gas (heating, power generation, re-injection in a formation etc.).

In the event flaring is necessary, the flare will be higher than the surrounding area and designed to be well above vegetation or trees for example (both specific references made in the YOGA Drilling and Production Regulations quoted earlier). Noise from flaring normally only occurs when very large volumes of high pressure natural gas are being flared.

Flaring would only occur over a period of a maximum 1 day while conducting a DSTs at the end of a drilling program of one well. During extended flow testing, flaring may be necessary for between a few days to a few weeks. After that time actions would be taken to utilize the gas for power generation, tank heating or

possibly, gas lifting to assist crude oil production or re-injection. It would be the intent to eliminate gas flaring and reduce gas emissions to very small amounts when unavoidable.

The Oil and Gas group of Yukon Government's Department of Energy, Mines and Resources has adopted the AER Directive 50 – Drilling Waste Management (as recently amended and updated) procedures for the disposal of drilling wastes within the Yukon. The Proponent will manage the operation in accordance with the MBC requirements of AER Directive 50 – Drilling Waste Management for the remote sump locations and/or Alberta Forestry's "Drilling Waste Management, Disposal on Licence of Occupation" for the LWD disposal method (AER 2016).

It is not anticipated that significant levels of residue chemicals will be deposited on terrestrial and aquatic environmental components. The flare stack will be at 10 m high to assist in air dispersal of combustible end products and will be positioned on the well site in accordance with the regulated spacing requirements. All flaring processes will be in accordance with the air emission permit regulations and best practices.

To ensure that vegetation and soil are not be impacted by residual chemicals, the site design will include an appropriate spacing between the flare stack and any vegetation. Vegetation and soil samples will be taken adjacent and downwind (prevalent) and analyzed for identified chemicals of concern. These lab results will be compared to results obtained from control vegetation and soil samples taken at a similar ecosite, but not near the influence of flaring. Visual monitoring will occur throughout flaring period to ensure safety and protection of nearby vegetation.

YOG Drilling & Production Regulations specify these parameter in Part 9 of the Regulations: In summary the flarestack has to meet the following requirements (Note: operations when flaring will be conducted in full compliance with these requirements):

Flare requirements

128. Unless otherwise approved or directed by the Chief Operations Officer, any gas that is flared will be discharged from a flare stack that:

(a) is at least
    (i) 50 metres from any well, treater, separator, compressor, crude oil storage tank or any other unprotected source of ignitable vapours
    (ii) 80 metres from any right-of-way, easement, road, public utility, building, installation, works, place of public concourse or any reservation for national defence, except only when there may exist special circumstances that, in the opinion of the Chief Operations Officer, justify the positioning of the stack at a greater or lesser distance
(b) is adequately anchored and suitably protected against freezing
(c) is designed to ensure flame stability and efficient combustion
(d) is of sufficient height and diameter to ensure
    (i) that the average concentrations of hydrogen sulphide and sulphur dioxide in the ambient air do not exceed limits specified under the Occupational Health and Safety Act
    (ii) that vegetation combustion is prevented by maintaining an area free of vegetation and combustible debris around the base of the flare stack or the end of the flare line to the following minimum distances:

(A) 10 metres or 1.5 times the stack height, whichever is greater, in cultivated areas

(B) 30 metres or 2.5 times the stack height, whichever is greater, in forested areas

(C) 1.5 times the stack height, in any other area

(ii) that a minimum stack height of 2.5 times the height of the highest third party building located within a distance equal to 5 times the height of the building is maintained

(iii) that any heat generated around the base of the stack does not exceed the manufacturer's specifications for any equipment situated there, to a maximum of 4.73 kW/m²

(e) (e) has a sufficient exit velocity and is provided with guards or other features to prevent extinction of the flame

(f) (f) if the gas flow is intermittent, is provided with an ignition device to ensure continuous ignition of any gases.

Cement Plugs and Permafrost

Cement is a chemical mixture which reacts with and changes form when mixed with water. The reaction gives off heat when mixed with water. As the reaction progresses, the cement hardens. Cementing casing to attain the desired minimum hardness to withstand 500 psi (approximately 3,500 kPa) takes 6-8 hours depending on the amount of accelerator or retarder compound is mixed with the cement. This setting pressure permits the pressure testing of the casing within 12 hours of the cement job concluding to reach 80% of the casing internal yield pressure to confirm pressure integrity. Production casing for example, has an internal yield strength of 56,260 kPa (8160 psi); so 80 % test pressure would be 6525 psi or 45,000 kPa.

Permafrost cement (also named Arcticset or Polarset Cement by different suppliers) is manufactured reduce the amount of heat released during the reaction caused by mixing cement with water by adding Silica Flour mainly. When the cement is mixed with water the reaction proceeds with minimal heat generation and therefore does not contribute to permafrost degradation.

Typical oilfield cements, when mixed with water and begin to set, produce substantial levels of heat, known as the heat of hydration. This heat can melt the permafrost in the near wellbore region. Permafrost cements are a specific mixture of typical oilfield cement (Portland Cements) with additives such as gypsum and/or Calcium sulphate. This blend is specifically designed to create cement that, when mixed with water and begins to set, produces no increase in temperature of the slurry (no additional heat of hydration). This eliminates any permafrost degradation.

Permafrost cement is normally only used for the Surface Casing which is installed to protect any shallow aquifers and permafrost. The Proponent plans to install Surface Casing to a depth of 400 metres at minimum.

1.3.2.3 Drill Stem Testing

All well testing will be performed with the Guidance of AER, Directive 034: Well Testing, Theory and Practice and in consultation with Yukon Government's Energy, Mines and Resources- Oil and Gas Branch. As well, the Proponent will follow related non-discretionary legislations, such as the Drilling and Production Regulations. Part 5 of this Regulation provides detail on well evaluation and testing requirements.

Depending on analysis of rock cuttings, fluid measurements made during the drilling operation, and the well log results, it may be desirable to test prospective zones prior to drilling deeper or running casing. In these cases, a DST is commonly done. Drill stem testing or well flow tests are conducted through a special string of drill pipe anchored at the bottom of the well just above the target zone. The drill pipe would be made up to a packer that isolates the zone from the rest of the well and which would be mechanically fixed to the side wall of the wellbore A special annular pressure operated valve is placed above the packer and with either a small amount of fluid (e.g. water, diesel or other light density fluid) or with the pipe mostly empty of liquid to promote immediate flow from the formation in a controlled manner.

The surface end of the pipe would be connected to a well head made up of a series of valves to control flow and direct it where the operator requires but always with complete control. From the well head, the fluids from the well are carried by surface flow lines to a test separator. The separator splits the fluid mixture into its component elements which could be some combination of crude oil, natural gas and formation water, each stream of which is accurately measured by flow meters, to confirm the volume, pressure, temperature and rate of flow. From the separator, the crude oil stream is sent to a holding tank, the natural gas flows to the choke manifold to the approved flare or other pre-determined place (e.g. burned for heat, power or injected into an appropriate formation below ground) and the water would be filtered or treated in some manner to make is usable elsewhere or pumped back into an approved disposal well (most likely an existing suspended well in the area) in a similar manner as natural gas being injected in a suitable formation.

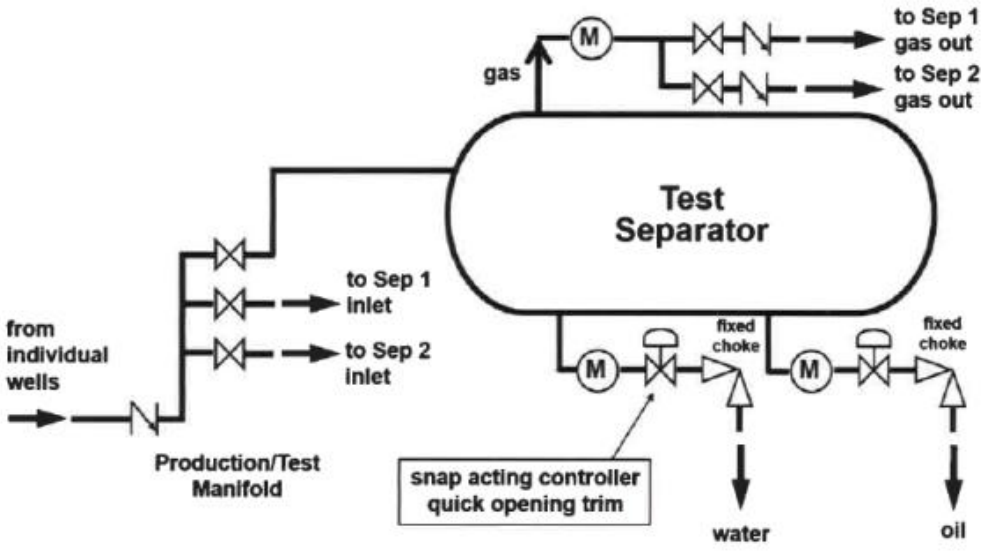

Figure 1.8 Typical Test Separator Schematic

The test separator (**Figure 1.8**) is kept operational permanently in every processing facility. This enables plant operators to assess the performance of the operation periodically. Outflow from the test separator normally is directed to a Central Processing Facility to join production from other wells. Separated natural gas may be piped to a dehydration vessel for future use as fuel or for injection downhole in a suitable well formation.

A typical operational sequence of DST is:

- Well is logged using various diagnostic tools and intervals for testing are selected.
- Test equipment is connected to the end of drill string and run into the well bor. The test equipment, generally consists of one or two packers for isolating the perforated intervals (to be tested), an annular pressure controlled downhole valve to open and shut in the well test and pressure gauges to measure the bottom flowing and shut-in pressures.
- Surface flow lines carry the fluids produced during the test from the wellhead (or surface test tree) to a test separator, where any natural gas is separated and either flared or utilized as fuel and any crude oil is separated and stored in tanks located onsite.
- A cushion of fluid contained in the drill pipe to initially ensure back pressure on the formation, which may be required to control initial flow rates.
- Once the test string is positioned at the zone to be tested, the packer is set and the down hole valve is opened to allow formation fluids to flow into the drill string.
- Initially, the well flows for relatively short period of time to clean up the wells (normally, this period may be a few hours). Following this period, flow is temporarily shut in downhole and a pressure buildup is recorded (with the initial shut-in period lasting for a period lasting 2 or 3 times the initial flow period).
- The test zone is now ready to be flowed at constant or variable rates, with each constant flow period normally followed by a shut-in period.
- Before concluding the series of test rates, bottom hole and surface samples are collected.

At the conclusion of the test, the tools are closed, packers unset and any samples within the drill pipe reverse circulated to surface. Formation fluids that may be produced during a successful test are piped into a test separator with produced gas being metered then flared and oil and/or water stored in sealed tanks.

Samples are taken of all fluids for analysis (both Pressure Volume Temperature samples under the flowing reservoir pressure, temperature conditions and atmospheric samples to check for “base sediments and water characteristics of the produced fluid”). A normal DST duration is approximately a few hours, not including the time required to make up the tools and run pipe to depth and do the reverse on completion. In addition to the time required to flow the well is an even longer period with the well shut in to determine the time it takes for the formation pressure to fully recover to pre-tests levels.

Depending on well log results, sample analysis and potential DST results, the decision is made either to abandon or case the well for further evaluation. In the former event, cement plugs are run using open-ended drill pipe across all porous/permeable zones, across the base of each casing string and at surface, the well casing(s) are cut off 1 m below ground level and steel plates welded across each string, a well sign is erected and the well site returned to original contours and re-vegetated, all pursuant to various oil and gas and land use regulations (all actions in compliance with Sections 90 to 96 of the YOGA Drilling and Production Regulations).

For each DST (minimum one per successful well unless several discrete zones require testing) one well flow should be sufficient and 30 in total days for 30 well DSTs would be typical. Should there be more than one prospective/productive formation which is separate from the other, a second (or more) DST will be

conducted on that formation. In some cases, a DST may need to re-done if there is a misrun. In addition, the DSTs may or may not be done in a steady sequence. Sequencing will depend on where the zones of interest are found in relation to the various casing strings that could be set as the well is being drilled.

Further Testing Details

The DST guidelines outlined in Enform IRP 4 are intended to ensure that safe work procedures are in place and to "minimize the probability of either the mechanical or human systems failing during a test, as well as establishing minimum health, safety and operating standards". In addition, they are "designed to allow flexibility and must be used in conjunction with competent technical judgment".

The exploration wells to be drilled may encounter hydrocarbon bearing zones that could be evaluated by conducting a DST (or DSTs). If DSTs are conducted a plan and testing procedures program will be in place, prior to conducting the test. The plan will be specific to the formation to be tested and the wellbore conditions existing at that time. The plan will be designed to ensure the safety of personnel and equipment and will provide for handling of any fluids that may be recovered. Enform IRP 4 guidelines are one of the sources that will be referenced in preparation of the plan.

Although the Proponent is the only operator currently active in the Eagle Plains basin, there have been several other operators in the past. The records of the historic wells in the basin are available on the website of Yukon Oil and Gas Resources. Nearly 200 DSTs were conducted on approximately 28 wells in the Eagle Plains during the period from 1960 to 2005. To our knowledge, there were no incidents where these tests had any adverse impact on the environment or presented any operational problems. Drill stem tests are a common method of evaluating potential hydrocarbon intervals in exploration wells and have been performed for over 60 years. They are usually of short duration. Flow periods are usually only 1 to 4 hours in duration, and seldom more than one day. The procedures for handling any produced hydrocarbons, and other fluids are the same as for any other operations conducted on the wells.

Three of the wells drilled in the Eagle Plains basin have had one, or more, acid stimulation treatments performed. One of these treatments was conducted by the Proponent. Records of these treatments are available on the Yukon Oil and Gas Resources website. These treatments are usually of small volume where the acid required for the stimulation treatment is transported in a single truck, and the treatment is performed in a single day. The fluid management practices utilized, as for other operations conducted on the well, prevent the release of any fluids to the environment.

Specific details of past drilling experiences can be found on the Yukon Oil and Gas Online Information Site: (http://maps.gov.yk.ca/imf.jsp?site=OilandGas_wells). For reference: the Proponent's comprehensive casing designs and rig and blow-out prevention system conforms fully to the YOGA (http://www.emr.gov.yk.ca/oilandgas/pdf/unofficial_office_consolidation_oil_and_gas.pdf), and the Drilling and Production Regulations (Sections 33- 61) (http://www.gov.yk.ca/legislation/regs/oic2004_158.pdf).

Further details of the Proponent's system configuration are confidential as per Section 176 (4) of the Yukon Oil and Gas Regulations. This section outlines what information is required to be non-confidential.

In consideration of the above text, it is not possible to accurately determine the number of DSTs that may be conducted at a well site. A more accurate estimation can only be determined after initial work occurs

which will inform Chance personnel of the geology, potential of oil and gas reserves. Plans for all DSTs will be based on well results and will be discussed with the Oil and Gas Resources branch of the Yukon Department of Energy, Mines and Resources.

Swabbing

There is the possibility that any well may be swabbed (normally a service/work over operation). Swabbing is a procedure to unload wellbores of heavier fluids thereby permitting the formation fluids to enter the wellbore and be circulated to surface. Wells will only be swabbed if the well is drilled, cased and a potential reservoir is:

- Identified,
- Perforated; and,
- Testing reveals that reservoir pressure is insufficient to flow liquids to surface; or,
- If well stimulation results in wellbore liquids that prevent flow to surface.

If the above criteria are met, swabbing is an accepted practice to reduce the pressure preventing a potentially productive formation from flowing to surface naturally. The same regulations affecting the handling and disposal of these fluids apply to fluids produced by swabbing as to recovery by any other means.

Acid Stimulation

Previous formation analyses have indicated small volume acid stimulation treatments would work well to clean up wells, remove scale and other impedances from formation pore throats to allow or improve flow into the wellbore. Acid stimulation entails the pumping of discrete amounts of normally hydrochloric acid at varying concentrations of 10%, 15% or 20%. The acid is trucked to location in specially sealed tanks in compliance with Transport of Dangerous Goods regulations and transferred to the cement pumping unit for pumping downhole. Treatment batches of 10 to 25 barrels (approximately 1.60 to 4 cubic metres) are pumped slowly controlled pressure until the entire batch is pumped. The relatively weak acid serves to dissolve scale (calcium Carbonate) deposited in flow paths over time. Successful stimulation is when the well flows at increased daily rates which could be +30 to 150 % of pre-stimulation rates.

The toxicity limits for oilfield hydrochloric acid are described in the Environment Canada documents and the Material Safety Data Sheets for the products. Hydrochloric acid is a gas dissolved in water to form hydrochloric acid. If heated the gas evaporates from the aqueous phase and water will be left. The chemical reaction of acid with carbonates renders the carbonates to form a harmless Calcium Chloride salt and water as by-products.

Oilfield concentrations are normally 10%, 15%, or 20% concentration hydrochloric acid. 5ppm (5mg/cubic metre) is considered safe concentration from an environmental perspective. Acid stimulation is normally only used once per well operation. The acid is transported in a special truck mounted tank that are designed and constructed for safe acid transport according to Transport Canada and Department of Transport regulations. A small quantity of relatively weak acid (10%, 15% or 20% concentration) is used on any occasion normally 5 to 10 cubic metres maximum. The acid is pumped from the truck into the pumper unit and from there downhole and never actually “sees daylight”. In winter, if acid is spilled as with water, it

would freeze and can be recovered from the surface snow or a thin surface soil layer. In summer, immediately flushing the spill with water would neutralize the acid and render it harmless (less damaging than vinegar). Flowing the well to “clean it up” would return the “spent acid solution” as Calcium Chloride, Carbon Dioxide and water.

In summary, acid stimulation is a common practice and an economic means to enhance well flow and reduce if not remove the materials impairing the ability of the formation to allow fluids to flow into the wellbore.

1.3.2.4 Extended Flow Testing

As noted above, all well testing will be performed with the Guidance of AER, Directive 034: Well Testing, Theory and Practice and in consultation with Yukon Government’s Energy, Mines and Resources- Oil and Gas Branch. As well, the Proponent will follow related non-discretionary legislations, such as the Drilling and Production Regulations. Part 5 of this Regulation provides detail on well evaluation and testing requirements.

In addition to drilling, any discoveries identified through DST are expected to undergo extended flow testing in order to gather important information about the nature of the resource accumulation and its productive capability. Given the remoteness of the region, the limited infrastructure to support oil and gas industry activities and the very early stage of oil industry evolution at Eagle Plains, the duration of these EFTs at each discovery could be up to 2 years. The information obtained from EFTs is critical to determining the future development plan for each discovery. The planned wells are exploratory; any flow testing will be contingent on discovery of formations potentially containing hydrocarbons. Part 8, Section 103 (1) of the Yukon Drilling and Production Regulations requires:

> *“The Licensee of a well shall obtain sufficient well tests, formation flow tests, wireline logs, analyses, surveys, conventional cores, cuttings and samples during the drilling of the well to ensure that a comprehensive geological and reservoir evaluation can be made.”*

EFTs will be undertaken if preliminary results from DST are encouraging and the following criteria have been met:

1. The well is drilled and cased; and,
2. A potential reservoir is:
    a. Identified
    b. DST has been conducted and
    c. Test analysis of the DST concludes sufficient hydrocarbons present to proceed to further evaluation of the hydrocarbon bearing formation.

In such a case, an EFT will be conducted to obtain more extensive information on reservoir characteristics and potential reserves. The same regulatory constraints apply to fluids produced by extended flow testing as to recovery by any other means.

EFT operates in a similar principal to DST. The main difference is that EFTs are undertaken after the well has been cased. To allow the zone of interest to flow into the wellbore, the casing has to be perforated

which is a routine procedure carried by either using a wireline from surface or attached the end of the production tubing from the surface to the zone of interest. The well, in this case, is first completed with a packer attached to a tubing string and have special downhole gauges to record flowing temperatures and pressures in real time. The surface would have the proper “Christmas Tree” wellhead equipment and be flow line connected to the test separator through a choke manifold. Well fluids (gas, oil and water) would then be handled in a similar manner as described previously. In an EFT however, the drilling rig would be removed to drill another well while the drilled well is prepared for testing.

Depending on drilling success several wells in different prospects would be flow tested simultaneously. As each well is drilled and drill stem tested to evaluate its candidacy for extended testing, it is left in a safe, secure state for further testing to take place after the drilling rig has been removed. It may become necessary to mobilize a small service rig to perform the completion work before turning the well to extended testing, but Chance Rig #1 could also perform this task and the solitary drilling/service unit at Eagle Plains. A well service rig has very similar capabilities and equipment as a drilling rig except that it generally has fewer modules and is also lighter equipment. If a service is required, it would be incremental equipment to the drilling rig.

Well testing is normally performed by specialized experts who would provide the specialized equipment, operating and safety procedures and the certification to be able to perform the associated tasks. Extended flow testing however would be handled in the same fashion as production operations and still be conducted by trained professional operators under the direct supervision of a Production Superintendent.

EFTs will require the installation of surface and subsurface equipment and facilities at each well site to measure, store and process produced fluids before it can be safely consumed, transported out of the operating area, or disposed at an approved location. The specific details of this equipment is subject to the nature of the discovery and could include:

- Casing of entire wellbore and perforate casing at zone of interest
- Packer, tubing and downhole gauges
- Wellhead valving assembly
- Flare systems
- Separator vessel
- Treater to do additional phase separation of the fluids
- Storage tanks
- Appropriate artificial lift systems
- Heaters
- Dehydrators
- Flow lines
- Metering equipment
- Portable generators

The Proponent anticipates a period of time to elapse between confirming a discovery worthy of further evaluation and commencing the EFT to allow time to properly design, fabricate, install, and commission the extended flow testing facilities.

The Proponent will conduct EFT on up to 20 successful wells. EFT may be completed within a month for a predominantly natural gas well or up to 2 years for a predominately crude oil well. There may be up to eight EFTs conducted at the same time.

Fluids produced during extended well flow testing will need to be measured, processed and dealt with in an environmentally responsible manner. Depending on the nature of a discovery, the Proponent anticipates that some combination of natural gas, crude oil and possibly formation water will be extracted during the EFTs. These fluids are separated and measured in facilities on the surface.

Natural gas could be flared for short periods of time. However, the Proponent may conserve natural gas and use it to provide fuel for process heating and possibly onsite power generation. Heaters are burners in a contained system of firetubes and the heat given off from combustion is used to provide heat to vessels treating the produced fluids or keeping stored fluids warm. The design of heaters can include heating an intermediate fluid such as glycol at the heater and circulating the glycol in a network of pipes to the places where heat is required. The generators are likely going to be small engines fuelled with natural gas and sized according to the power needs of the location.

Crude oil produced during the EFTs will also be conserved instead of flared to the greatest extent possible. This will require some processing at the well site or the central processing facility to stabilize the crude oil for truck transport to a suitable, approved crude oil marketing point, such as terminals near Ft. Nelson or Ft. St. John in British Columbia or Grand Prairie in Alberta. All of these locations are ready to receive and utilize crude oil produced from Yukon sources in the absence of such destinations within the Yukon. The Proponent may also consider trucking crude oil produced during the EFTs to ports in Alaska such as Skagway, Haines or Valdez for onward shipping to suitable markets elsewhere in North America.

Formation water produced in conjunction with crude oil and/or natural gas will be separated from the hydrocarbon streams and disposed of underground into a compatible and approved formation at Eagle Plains using one of the suspended wells. These procedures to process, transport and dispose of various fluids produced are common practice in every oil and gas province in Canada.

While water injection as a means to replace produced crude oil in the underground reservoir to maintain pressure in the reservoir is universally used in the oil and gas industry. The Proponent does not feel there is enough reservoir information data to predict the need for water injection in the future life of an Eagle Plains producing oilfield. The normal ratio of produced oil to injected water is 1:1. That is for every barrel of oil produced, there will be a requirement for a barrel of water to be injected following an initial period without water injection. The need for and the design of a water injection operational procedure will accompany and be part of a full field development plan should one transpire. One of the objectives of EFT is to gauge whether reservoir pressure maintenance occurs naturally or whether it needs to be done artificially using water or natural gas injection. This information will in turn support any longer term, development plan.

An EFT of any well can only be accomplished when year-round access to the each well is established. Producing wells require periodic inspection by field personnel to ensure the operation is proceeding within design parameters and safely. The well fluids have to be trucked out periodically as well.

During an EFT, all produced fluids will be separated into fluids that can safely be disposed of in the area (clean water) and fluids that must be transported to distant markets or safe disposal sites (crude oil, condensates). The natural gas element will, as previously stated, metered to accurately determine its volume/production rate and likely flared onsite, unless a local use can be identified (or burned for heating, gas lifting and/or power generation).

The average production rate experienced from previous well testing on the Proponent's old wells, 200 barrels of oil per day is expected to be the average per well production and less than 5% water cut is planned for. Therefore 4,000 barrels per day is likely the upper limit and a design limit of 2,000 barrels per day is more realistic for the daily maximums.

1.3.2.5 Well Maintenance (Workovers)

Any well completed for EFT or longer-term production may require workovers during its lifetime. A work over entails the manipulation of the wellbore production equipment (pumps, tubing, packers, etc.) using a suitably sized service rig or occasionally a drilling rig. In this activity the objective would be to change the condition of a well to improve productivity, replace faulty components or extend the well's productive life in some manner.

Over time, a reservoir depletes in such a way at to permit the water interface with crude oil or natural gas in the formation to rise to a point where only water flows from the wellbore. Producing too much water over a period of time could impair the ultimate recovery of crude oil or natural gas and possibly shorten the life of a producing well. Measures are needed to reduce or shut off the water flow to allow continued recovery of crude oil or natural gas. These include plugging some or all of the perforations and perforating at different section of the wellbore casing. Other factors that impair production of crude oil and natural gas include scale buildup, asphaltene (a constituent of some crude oils) plugging, etc. need remediation and this work is done using service rigs, wireline services and so on. These practices are commonly used by the oil and gas industry and conforms to the regulatory requirements to optimize the recovery of the resources from the reservoir.

The well completion design and installation phase is critical in ensuring the well maintains a longer period of uninterrupted production. To this end completions are designed to require minimal intervention for many years by installing simple less mechanically operated systems, superior corrosion protection, erosion protection, possible use of internally coated production tubing etc. All such actions are focused on making product flow as smoothly as possible. Furthermore, the actual tubular components are selected to minimize changes in internal diameter, prevent areas where turbulence is generated and reduce if not eliminate leakage paths.

The completion is also designed to make its installation as trouble free and time saving as possible (have components which could assist in pressure testing the tubing internally while being run to eliminate leaks. The simplest completion should comprise of tubing and perhaps a tubing anchor or packer. Seating or landing nipples are installed to enable internal pressure testing of a completion string as well as land

downhole pressure gauges while flowing, permit circulation of kill fluids from the annulus into the tubing bore or reverse and possibly plug a well at a certain depth. The term “kill fluid” describes a fluid of sufficient density that creates a hydrostatic pressure at the bottom of the fluid column that is equal to or great than the formation pressure and prevents formation fluid from flowing into the wellbore.

Work overs nearly always start with “killing the well” to prevent further flow and circulating the wellbore contents to be replaced with a stable, non-flammable fluid. The kill fluid is normally weighted brine with corrosion inhibitive features. Salt dissolved in water (Brine) makes the water “heavier” (denser) and therefore an over balance medium fluid to keep formation fluids in the formation and not allow then to enter the casing/well. Normal completion brines are Sodium Chloride, Potassium Chloride and Calcium Chloride depending on the bottom hole pressures encountered. Eagle Plains conventional wells can be completed with Sodium Chloride (common salt) brine mediums. Only additives that may be added to the workover brine is corrosion inhibitors and/or biocide.

Following that activity, the wellhead is removed and a blowout preventer is installed to provide additional control of the well during the work over. The production tubing is recovered to surface for reuse or disposal if it is too eroded or corroded for future use. The wellbore would be cleaned of debris accumulating over a production period (normally a bit and casing scraper run accomplishes this). The remedial work is done to the well to fix whatever problems were encountered and the well is returned to a condition that allows production to resume.

1.3.2.6 Drilling By-Products

Within the described drilling program, two forms of drilling by-products will be produced. The following sections will describe and detail their creation and industry wide solutions for dealing with these by-products.

Please note, the Proponent is drilling within a sedimentary basin. Drill cuttings consist of sandstone, shale, and carbonate rock and are therefore, not significantly sulphide bearing. These rocks have been examined by Chance geologists and do not contain the materials that cause acid creation and as such the potential for acid rock drainage caused by the disposal of drill cuttings is remote to non-existent.

Naturally occurring radioactivity will be measured by gamma ray or spectral gamma ray wireline logs, which is a regulatory requirement in the Yukon Government Drilling and Production Regulations. GR is a radioactivity detection device (similar to a Geiger Counter) and therefore detects any existence of radioactive Uranium, Thorium and/or Potassium isotopes in the rock formations drilled. To date no abnormal detections have been made other than that attributed to natural rock formation radioactivity and therefore, radioactivity appears absent or undetectable in the fluid of the Eagle Plains sedimentary formations.

Solid Drill Cuttings

When drilling a well, cuttings are produced. These cuttings are a direct by-product of the drilling action caused by the bit grinding rock. After being drilled, these cuttings are brought to surface with the drilling fluid and separated from the drilling fluid using sophisticated equipment (e.g., shale shakers and centrifuges). These cuttings are stored onsite in metal bins referred to as shale bins. Close attention is

given to the dryness of the cuttings coming across the shale shakers and collected in the shale bins. It is important that as much fluid as possible be recovered from the cuttings for a few reasons:

- Less total weight in the cuttings, hence less cost associated with future handling of the drill cuttings.
- In the winter, it is easier to handle and move dry cuttings as they do not freeze and create large blocks of material.
- Reduces the need for additional make-up drilling fluid by recycling more fluid that is separated from the cuttings.

Drilling Fluid

The Proponent is proposing to use water-based drilling fluid systems. It is not uncommon that after drilling a few wells using the recycled drilling fluids, a mud system may need to be partially or fully reconstituted (disposal of the current system and mixing of fresh water and new drilling fluid products). This ensures the drilling fluid is fresh and capable of drilling through the different rock types found in the proposed wells. It is unclear how often a reconstitution process will be needed. The Proponent has had success with re-using drilling fluid systems across multiple wells to reduce the overall need for make-up water and reduce ultimate disposal of material at the conclusion of its use. As drilling is likely confined to a winter drilling season, the Proponent will likely re-use drilling fluid throughout one drilling season.

The first stage of fluid and material management is called ‘Stripping’; this is the process of running the drilling fluid as it returns to surface through centrifuges multiple times to separate the water from any solids suspended in the fluid stream. The fluid is then either recycled back into the mud system or used elsewhere on the rig

The disposal options outlined for the drilling program have been directly influenced by both the proposed drilling system and the site conditions present at the drilling locations and in the Eagle Plains area generally.

- Accordingly, the following conditions were established for selection of the drilling mud system: a low-toxicity mud system confirmed through laboratory analysis; and
- Meet operational requirements (maintain formation stability, hole cleaning and well control, etc.)
- The following conditions were established for selection of a cutting disposal method:
  - minimize the extent of surface disturbance; and
  - minimize transporting the material off-site for disposal.

In response to both these sets of conditions, the Proponent plans to select a water-based mud system as generally described which has been previously proven suitable for the MBC disposal process in an approved nearby site.

Any drill fluid selected will first have to satisfy Section 32 “Approved Drilling Fluid” of YOGA Drilling and Production Regulations. The type and chemistry of the drilling fluid will be a key part of the drilling Program issued in application for a Well Licence. This is explained and described further in this section.

1.3.2.7 Mix Bury Cover Sump

The Yukon has accepted AER Directive 50 as the governing regulation to determine the eligibility and applicability of various disposal alternatives for various drilling by-products and mud systems. Mix-bury-cover, as described and detailed in AER Directive 50 Section 13, is a method of disposing of drilling waste (both drill cuttings and drilling fluid or just drill cuttings) by which the by-products and spent mud is mixed with a local receiving soil at a specific mix ratio, then deposited into a sump, and then covered with clean subsoil.

A typical MBC sump design consists of three distinct layers:

- A clean subsoil layer 1 to 1.5 m in depth. This layer acts as an insulator between the subsoil/drill cutting mix and the vegetative layer to ensure that, after final reclamation, the site is returned to its original state.
- The subsoil/drill cutting mix layer is where the receiving subsoil is mixed at a specified mix ration with the disposed material (e.g., drill cuttings, spent drilling mud, etc.).
- Clayey material exceeding 1 m in depth, or alternative impermeable liner, acting as a hydraulic isolator.

Sump Suitability

Initial investigation into sump locations is required. AER Directive 50 Section 6.3 specifies the procedures and parameters for sump site investigation. Any proposed location will have cores drilled and the subsoil will be analyzed to confirm the following for a proposed sump:

- Sump soil has appropriate deposits of clayey soils.
- Must have appropriate clayey material of 1 m beyond the horizontal and vertical dimensions of the sump to ensure hydraulic containment.
- Absence of hydraulic defects or ways for fluid to leak out of sump.
- A composite sample, made up of five subsamples, is required for every 3 000 m² proposed to be used for MBC.

In the instance where the subsoil is found to be saline, special care will be taken when these sumps are excavated to ensure the non-saline active layer and subsurface materials are returned to the surface allowing the site to return to its equivalent land capability.

The Proponent has begun a sump suitability study of chosen locations throughout the area proposed in this application. Core samples, from existing and potential future locations for MBC style disposal, are being examined and analyzed by qualified experts. The results of this work will determine the course the Proponent will pursue for MBC at Eagle Plains.

The actual drilling fluid system that the Proponent plans to use has not yet been determined due to the exploratory nature of the drilling program (uncertainty of lithology), more information about this can be found in the Environmental Conditions report (Appendix D) describing the geology in the area. Before the Proponent begins the drilling of a well, a test sample of the drilling fluid will be prepared. The properties of

this fluid will be analyzed and compared against the receiving soils at the MBC site(s) to estimate the soil/waste mix ratio to ensure the final soil composition complies with AER Directive 50 section 3.

The Proponent intends to assign cuttings disposal management and direction to a competent individual representing an organization with the most experience operating under the terms and conditions of AER Directive 50.

MBC is not a viable disposal option if:

- Suitable sump site that meets all of the requirements established under AER directive 50 cannot be found.
- Drilling fluid that is incompatible with receiving soils or prohibited for MBC under AER Directive 50 is used.
- Drilling by-products/receiving-soil properties require a mix ratio greater than 7.

In order to minimize the potential for deep permafrost exposure during summer exploratory drilling program, the following mitigating procedures will be adopted:

- The sump will be excavated as disposal volume is required, in order to minimize the area of basal and wall permafrost exposure at any time. This may be in the form of narrow compartments oriented E-W to maximize shading of the basal permafrost surfaces or any other field procedure determined superior at the time.
- The top of the open area of the sump may be covered if environmental/geotechnical monitoring indicates degradation of wall structures in the sump trench due to thaw.

While an MBC sump is actively being used, the Proponent will monitor and inspect the site to evaluate sump integrity, volumes of material involved and to assess if further work is needed to the sump location. The drilling operations will utilize practices that minimize the volume of drill cuttings and drilling by-products generated.

The Proponent will arrange for full-time disposal expertise, provided from the selected mud services contractor, who will be available for Project management and consultation regarding disposal operations.

As noted above, all materials to be disposed of in the sump will meet AER Directive 50. If materials to be disposed of do not meet AER Directive 50, the disposal material will be transported to an appropriate permitted facility for disposal consistent with the practice employed in previous exploratory wells drilled at Eagle Plains. The Proponent has used permitted facilities that can accept specified waste in Whitehorse and northeast British Columbia.

Drill cuttings and fluids will be held in containers for minimal periods before disposal. After drill cuttings are circulated out of the hole, they are separated from the drilling fluid and stored in 3-sided metal bins. For final disposal, the cuttings are transported to the proposed MBC site for mixing with the subsoil. After the three-sided bins have been emptied, they will be moved, along with the rig, to the next drilling location. Disposal will take place as and when required during drilling or when the shale bins contain a full truck load of material.

For the proposed Project, drill cuttings will be transported to and disposed of at the MBC sump site, while fluids will be reused until the end of the Project. The Proponent plans to construct a new MBC sump adjacent to the Devon sump area to the same specifications to dispose of drill cuttings from the proposed 30 wells (see **Figure 1.9**). The Proponent has not used the Devon site for any drill cuttings or drilling fluid disposal to date and does not intend to use the site for disposal in the future. The Proponent's preferred disposal site is separate from where Devon drill cuttings and drilling fluid were buried but in an adjacent, previously undisturbed area,The Proponent has not monitored or inspected any of the Devon sumps. The proposed exploration drilling program will be performed under a comprehensive drilling fluids management process managed by a services supplier competent in AER Directive 50 and fully versed in safe MBC techniques in use in western Canada.

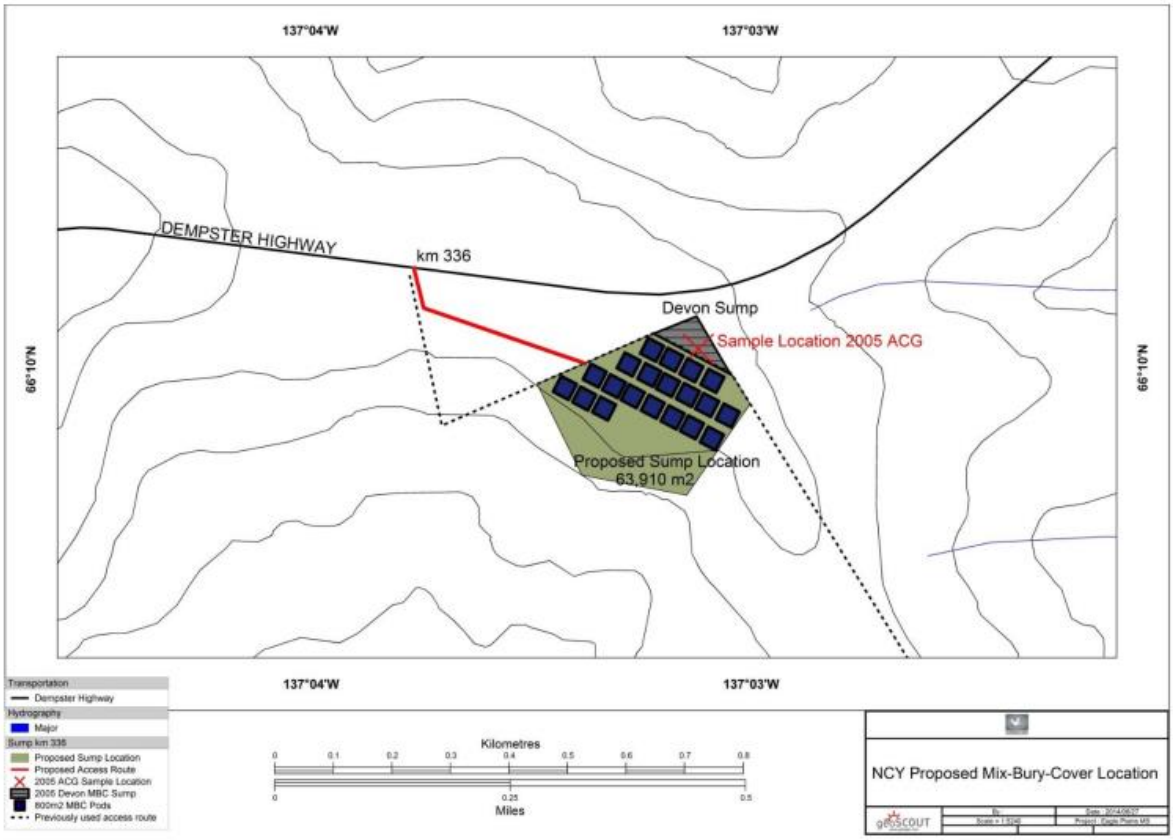

Figure 1.9 General Location and Typical Plan of MBC Sump Site

Figure 1.9 shows the 63,910 m² area proposed for MBC disposal. This area was determined based on the estimated area required for disposal. Each 800 m² MBC pod signifies an estimate of how much area would be required to dispose of one well's drill cuttings. The additional area, a rough estimate, would allow for spacing between MBCs for truck access and to pile excavated material before MBC commences. All estimated calculations, as required by Yukon Government Drilling and Production Regulations (Government of Yukon 2004), were made in accordance with the requirements of AER Directive 50. Typical operational practice is to have only one MBC open at a time.

MBC pods will be sized based on the anticipated volume of drill cuttings disposal required per well. This will ensure that the MBC opening time is minimal. As mentioned previously, a typical well would produce up to 300 m³ of drill cuttings and require an area of approximately 800 m² to dispose the drill cuttings. The Proponent proposes to only use the site described in **Figure 1.9** for the MBC sump. The section of area where the Devon 2005 MBC was located and whose exact location is known, will not be disturbed by any of the proposed operations. The Proponent aims to minimize surface disturbance by using a single previously disturbed area for multiple MBC pods. The site is adjacent to an already disturbed site used by previous oil and gas activity (Devon access road 2004) and it has already proven to have the soil characteristics required as stated in AER Directive 50 Section 6.3. There is no operational need to establish other discrete MBC locations.

1.3.2.8 Injection Well

DIR 50 covers the disposal of drilling fluid. In this case the fluid would be added to the drill cutting and then mixed with the required amount of soil in accordance with AER Dir 50. Drilling fluid may also be stripped back to just the clear portion and disposed of using an approved water injection well.

Well choice requires further injectivity and suitability investigations. This cannot occur until the wells are re-entered and made ready for the investigation trials. Chance Candidate wells could be one or more of the following suspended well(s): Chance J-19, Chance M-08, Chance G-08, Blackie M-59 and Chance E-78 all located within the Chance licence areas. Any well that is not a preferred EFT or future production candidate could be an injection well if strategically located in close proximity to a usable well or wells and if it exhibits the required characteristics for injecting fluids.

The YOGA Drilling and Production Regulations require reservoir produced water not be disposed of at the surface unless its quality and/or salinity is equal to or better than the quality limits set out in producing filed facility licence.

Any plans or intention to dispose of produced water from reservoir fluids separation have to be submitted to the regulatory authority and must meet the pertinent environmental standards as well the oilfield waste disposal standards and limits (reference YOGA Drilling and Production Regulations Sections 122. 123. 124, 130 and 165). The YOG regulator will only authorize produced water disposal when the operator demonstrates all legislation in force requirements have been met and that good oilfield exploitation and reservoir management practices are satisfied.

Once their disposal suitability is established, the following liquid materials (all treated with bactericide) and their volumes may be disposed of:

- Produced water per well (water cut 20% to 60% for 200 BOPD) = 40 to 120 barrels water/day
- Workover fluids: Maximum 7” casing volume full= 276 barrels
- Rig wash: hose flowing at 5gpm water for one hour = ±7 barrels per day in summer
- Saline fluids (completion brines) same as workover fluids = 276 barrels
- Liquid fraction of drilling fluids = approximately 200 cubic metres at end of Project

The zone must have an impermeable barrier above it to prevent migration of the injected fluid and be deeper than 750 metres. Permeability and porosity of the rock must permit pumping of the fluid at low surface pressure and especially well below formation breakdown pressure. Testing will also have to determine injection fluid compatibility between the rock and native reservoir before injection.

The injection pressure and rate, and the pressure in the casing tubing annulus will be monitored at all times. Accurate/calibrated surface pressure gauges will continually monitor pressure readings and any fluctuations. The conditions are injectivity rate, porosity and permeability of the formation being injected into.

Disposal of highly saline produced water at surface disposal sites may be greatly restricted in quality and quantity. To this end and to support best reservoir management practices, it may at times be mandatory to re-inject reservoir produced water back downhole as the only viable and environmentally safe option.

1.3.2.9 Seismic Exploration

The seismic program will consist of approximately 1,500 km² of 3D and 2,000 km² of 2D reflection seismic exploration. Actual final seismic survey location, design and layout will be dependent on drilling outcomes as they progress. Utilization of the low-impact seismic methodology will result in very low impact on the environment. Source lines are limited to 3 metres in width and receiver lines limited to 2 metres in width. The Proponent intends to leave a small amount of snow on the lines so that the tundra and permafrost are not disturbed. The low-impact seismic drills are outfitted with air hammers and as a result will not require water for drilling.

The Proponent plans to deploy a wireless recording system. This wireless system is preferred since a cabled system could present a hazard for migrating animals and requires a larger hand cut line than is necessary for a cable-less system where the layout crew only requires a path 2 metre or less through the land. A cable-less system is also less impactful on the environment as it is easier to carry down the receiver lines and requires fewer personnel on the recording crew.

Preflagging (Cruising)

Prior to line preparation, a detailed line by line spatial analysis (area examination) is performed utilizing a combination of air photos (2011 vintage with 2 m resolution), LIDAR (Light Detecting and Ranging), field scout information, GIS information, First Nation cultural inputs, and any information identified by the preflagging/cruising phase. This greatly helps reduce time spent in the field dealing with localized line preparation issues.

Preflagging (cruising) will be conducted to identify and mark line locations, areas containing riparian areas, difficult terrain, historical/archaeological areas, animal sites and facilities. This is done by having personnel on the ground marking the line locations and areas of concern for the mulchers and chainsaw operators to follow or avoid. These areas will be added to the Project map. Handheld Global Positioning Systems (GPS) units ensures accurate line placement and automatic notifications are sent to management when the mechanical equipment is approaching a “Hot Spot”, or stations that are encroaching any buffered zones or areas.

Line Preparation

A combination of low-impact seismic mulchers and chainsaw operators will be utilized to prepare source and receiver lines. Both source and receiver lines will be slashed to ensure there are no pokers or leaning trees for safety reasons. On board GPS on all mulching equipment ensures accurate line placement and automatic notifications are sent to management when the mechanical equipment is approaching an area of concern, or stations that are encroaching any buffered zones or areas. Lines will be doglegged or bent from any access point to avoid creation of a line of site and will meander to avoid disturbance of any timber larger than 20 to 30 centimetres in diameter. Source lines will be 3.0 metres wide to accommodate vehicles. A minimum of 20 centimetres of packed snow will be left on line to avoid possible damage to vegetation or permafrost. Receiver lines will be 1.75 metres wide to accommodate personnel.

Survey

After source and receiver lines are prepared, surveyors travel the source lines to mark the location of where the low-impact seismic drills will create the source points, and the receiver lines to mark where the recording crew will place the wireless recording equipment. They do this using GPS which allows for meandering and narrow lines.

Source Point Preparation

Source point holes 9 m in depth and 10 cm in diameter will be drilled every 60 m along the source lines using a small, low-impact seismic air hammer drill. A charge of one kilogram of dynamite is then loaded into the hole to be detonated by the recording crew. Dynamite is transported and stored at one of the staging sites in a federally regulated Explosives Magazine.

Recording

With the use of a long line and helibags, a helicopter will place and retrieve recording equipment at pre-determined intervals along the receiver lines. Recording personnel will access the equipment in the helibags and will place a series of geophones every 60 m along the receiver lines. The recording crew will be using a cable-less recording system. Cable-less recording systems are ideal for gathering seismic data because they reduce the constraints on geophone placement, eliminate downtime for cable repair, and reduces the impact on the environment. The geophones record the vibration created by the charges being detonated on the source lines. The data that is recorded is relayed to the observer truck. Once the data is relayed, personnel and helicopter return to retrieve the equipment and any debris used to mark the surveyed receiver and source locations.

The helicopter will be based out of the camp and the use of the helicopter will be minimal. The Proponent will follow the Flying in Caribou Country guide. Helipads will be built for safety and medevac reasons.

Access Trails/Creek Crossings

For safety reasons, vehicular and personnel movement a minimal amount of access trails will be required within the program area. This will be done on existing trails, historical seismic lines or lines that will also be used for source lines and receiver lines. The width of the access trails will be a maximum width of 5.5 metres wide and will also have a minimum of 20 centimetres of packed snow.

1.3.3 Accessory Project Components

The following activities are expected to be completed, as required, to support the principal activity of drilling completing, and testing exploration wells:

- Well site(s) preparation
- Other Project Facilities (i.e., camps and fuel storage)
- Some surface facilities (e.g., storage, processing, injections)
- Airstrip construction and operations, and 2 fixed-wing aircraft flights per week
- Building and maintenance of access roads (all-season and winter roads)
- Development of borrow sources for airstrip and roads
- Water use for drilling and camp

For drilling: Camp 325 will be the main accommodation facility for the exploration program. The Chance Rig #1 will also have a smaller mobile camp, occupied 24 hours per day, 7 days per week, to house essential personnel (rig supervisors, medic, geologist, etc.).

1.3.3.1 Access Roads

Assuming all wells are successful, all-season roads will then be required to access all 30 wells. Access to wells that are proximate to the Dempster Highway , drilled in proximity, or enroute to a successful well will have all-season access built to them. Wells undergoing EFTs, including the legacy suspended wells located on the Chance Significant Discovery Licence, will require all-season access. The Chance Road will be established as an all-season road regardless of the results of the drilling program.

After drilling several wells and depending on success in discovering hydrocarbon-bearing formations, access roads will be upgraded to all-season roads constructed from rock material from borrow fill sites. The diagram below, prepared by Boreal Engineering Ltd., illustrates a typical road construction design. The pad will be constructed to be approximately 7 m in width, sufficient for safely accommodating a transport truck, but also having roadside passing areas to allow 2 trucks to pass beside one another. Passing bays will likely have frequency of 1 approximately every 750 m allowing vehicles coming from opposite directions to have a clear view and prepare to enter the nearest passing area on their side of the road.

The estimated distance between pull outs to be 1 km; however, they should occur as/when required when the roads winds and visibility for oncoming traffic is impaired. Pullouts will be 150 m long, at inter-visible locations and identified with signs indicating the km / station. It is intended that the maximum distance between pullouts will be 1 000 m; however, they may be as close as 300 m to provide a passing lane to ensure that pullouts are inter-visible. The purpose is that if a vehicle were on the road without radio control, a widened road would be available for passing transport trucks. For the purpose of volume calculations, it is estimated that average distance between pullouts will be 750 m. Well site access roads would, in turn, also be constructed using a similar design.

The base road pad will be ultimately covered with a sandy material for protection of the road surface and endurance. All-season roads will require periodic maintenance as surface material is removed or eroded by the elements or vehicular traffic.

Winter road construction will utilize similar techniques as previously applied. Once snow cover equals or exceeds 10 cm there should be adequate snow to build winter roads. Well site access roads will also be constructed in a similar fashion using accumulated snow to construct berms on the road margins and filling the space between with amounts of snow and water trucked from approved sources. All roads will be supervised by a competent and qualified geotechnical engineer to ensure their ability to safely support the drilling rig and other similar heavy loads that will be transported across them.

Water Crossings

The access routes are designed to have as few water crossings as possible by following previously travelled trails and roads located on ridges or higher areas well above the water drainage valleys in between. The normal techniques applied when constructing water crossings is to lay a culvert of a sufficient outside diameter as to not reduce or obstruct the water flow, nor impeded fish movement along the water course. To this end, the Proponent has directed that water crossings must meet all the Yukon Government land use and transportation requirements.

Culverts will be installed per the Yukon Government Highways and Public Works standard drawing for culverts in permafrost conditions. Culverts will be installed using standard engineering practice in permafrost areas and per the attached Yukon Government standard drawing 06010-5. Culverts will be sized following a hydrological assessment by a Professional Engineer registered in Yukon to determine flow volumes. Culverts will be sized accordingly to the 100-year return event. Minimum culvert size will be 600 millimetres (mm). Culvert installation methods will follow those methods provided by *Best Management Practices for Contractors and Inspectors* handbook. The hydrological assessment is necessary to determine the stream flow for culvert sizes of each water crossing. The Alaska document urges the understanding and appreciation for the thermal effects of standing and running water because water can initiate thaw settlement and erosion that can destroy the road.

It is recommended that “the velocity and volume of water running beside the toe of a road should be carefully evaluated, providing for a series of culverts, rather than large culverts at discrete intervals rather than large culverts at great distances” (Author year) The Guidelines further recommend “Culverts should be considered in three distinct phases: 1) during the original deployment, 2) during the first summer after snow is gone and actual drainage cane be seen and reassessed and 3) in subsequent summers when perhaps the roadway and culverts have settled or other factors have influenced their effectiveness” (Author year).

The Proponent will commission a fully qualified road Arctic construction organization currently operating in Yukon who are versed in the construction techniques applied to remote areas as Eagle Plains.

Water courses will not be diverted. A culvert will be installed within the flow path of the stream. Following completion of the culvert installation, water will be directed through the culvert prior to placement of fill for road construction. Following closure of the road, the culvert will be removed and the water course will be returned to its natural state.

MBC Sump Access Road

The Proponent also proposes to construct a 400 m all-season access road to MBC sump area (Error! Reference source not found.). This road will be constructed as early in Project as possible (soon after mid-

January as snow and weather permit) and will take approximately 2 weeks to complete. The minority of the road follows an existing access trail, and no major clearing will be required. Please see photos of access and terrain. The road does not span any waterways and is 800 m away from the nearest water drainage. The road dimensions will be approximately 400 m long by 6 m wide. The material used for road construction will be approximately 3,000 m³ of locally sourced granular material.

Well Site Access – Summer

All material used for road construction will be locally sourced granular material. Materials utilized will be those approved for use as a road construction material. Several identified borrow sites have been cored and evaluated for quality and quantity of fill material by geotechnical engineers from Tetra Tech/EBA and Yukon Engineering Services. Kryotek Engineering and Boreal Engineering have also been consulted for expert advice regarding Arctic road construction techniques in Yukon. A combination of the previously mentioned engineering organizations will be contracted to undertake road design, construction, and general project management. The construction of a summer access road will be completed as described above.

Well Site Access – Winter

Winter access will only be constructed if the ground and water bodies are frozen and if there is adequate snow coverage. The Proponent will ensure there is a minimum packed snow cover of 10 cm to the vegetation layer. Where required, an increased snow depth will be maintained to avoid disturbing surface vegetation and duff (i.e., tussock terrain).

The factors that will be considered while making the determination will be terrain features, vegetation present, and local topography. If this snow depth (minimum of 10 cm) is not sufficient in certain areas, additional snow depth will be ensured to provide adequate protection to surface vegetation and duff (i.e., tussock terrain). If this is required, snow will be removed from appropriate locations in the direct vicinity of the winter road (i.e., surrounding areas that have ample snow coverage) and added to the snow pack on the winter road. Vegetation will be cut, with no disturbances to the vegetation mat. Access routes will be constructed using equipment appropriate for packing snow.

Several water bodies may require ice bridges/snow construction. All water bodies will be treated as fish-bearing and will be constructed as per Fisheries and Oceans Canada's (DFO's) Operational Statement on Ice Bridges and Snowfill (http://www.pac.dfo-mpo.gc.ca/habitat/oseo /icebridge-pontsduglace-eng.htm) as well as the Safety Guide for Operations over Ice. As well, if water is required to be withdrawn from nearby water sources, adequately sized intakes will be used and screened to prevent debris blockage and fish mortality (refer to DFO's Freshwater Intake End-of-Pipe Fish Screen Guidelines (DFO 1995).

A minimum snowpack of 10 cm is required for the winter road. However, if the amount of snowfall in the area allows for a thicker snowpack (i.e. 15 cm to 20 cm) during initial road construction, a thicker snowpack will be used. As the winter progresses, the Proponent will continue to add to the snowpack.

If natural snowfall is below the minimum required to commence access and well site construction, the Proponent will consider artificially making snow to make up the shortfall. This is a contingent consideration and could require up to 300 m³ of water per day for a short period of time (several days to a week) if more than 1 access route is under construction at any given time. The sources of water are likely to include the

Eagle River, the Ogilvie River, and the water well at Chance's camp once proper treatment facilities are in place. The water to be used to make snow and ice the winter road(s) will be trucked from the source to the point of use. At maximum, between 20 and 30 truckloads per day would be needed. The actual number of trucks being used would be less since a truck can probably complete 4 to 6 deliveries per day. Generally low snowpack is only an issue during the early part of winter, so this provision would only apply on a contingent basis during the months of November, December, and January. The timing for making artificial snow will depend on how late in the winter season winter road construction begins. If, for example, in late December there is little or no snow fall or snow accumulation on the ground, snow making could ensure a sufficient snow base to commence winter road construction. Snow can only be made when the ambient temperature drops to 0 degrees (°) Centigrade.

Access Road Maintenance

Maintenance will involve grading and filling to ensure a smooth travelling surface, cleaning/maintenance of drainage structures, snow removal in winter, and to ensure signage remains suitable for service. Maintenance equipment will include a road grader, a mid-size (D6) dozer, trucks to haul aggregate, and an excavator for maintenance of drainage structures. Maintenance of winter access routes may include low-ground-pressure vehicles, a road grader equipped with a wing snow plow, some water application, and use of matting where required. Grading may be required over certain stretches of the routes, and depressions along the roads will be filled with snow to smooth the surface. If required, water will be withdrawn from approved water sources using adequately sized intakes and screened to prevent debris blockage and fish mortality; refer to DFO's Freshwater Intake End-of-Pipe Fish Screen Guidelines (DFO 1995). The Proponent will avoid using small streams as a water source. Should winter access roads convert to all-season roads, maintenance will be ongoing to ensure road safety and reliability. This will be especially valid when wells are transformed into extended flow sites and require constant year-round access for operational reasons. Road repair and maintenance for all-season roads will require additional machinery, specified and supplied by the selected qualified contractor.

Dust will be kept to a minimum by enforcing reduced speeds on access roads. Dust will also be kept to a minimum by spraying the road surfaces with water whenever they become too dry; some fine airborne dust may become deposited on the surrounding vegetation. The small quantities of fine dust should not cause vegetation to be affected but periodic visual inspections will be made to check for any visible changes to the surrounding areas.

1.3.3.2 Borrow Source Development

Borrow material will be required for the Project for activities such as road and well pad construction. Approximately 21,600 m^3 of borrow material will be needed per well site. The borrow material will come from the closest approved borrow site. In total, the Proponent anticipates requiring up to approximately 1.7 million m^3 of borrow material for the Project.

Borrow Pit locations will be confirmed throughout drilling proposed locations and are identified in **Figure 1.10** and **Table 1.4**. To eliminate any water pooling, borrow pit design and development will be done in the winter while ground is frozen. Borrow pit access roads will be built to the same standards as the main access roads. Timing of construction is for 2016 winter season.

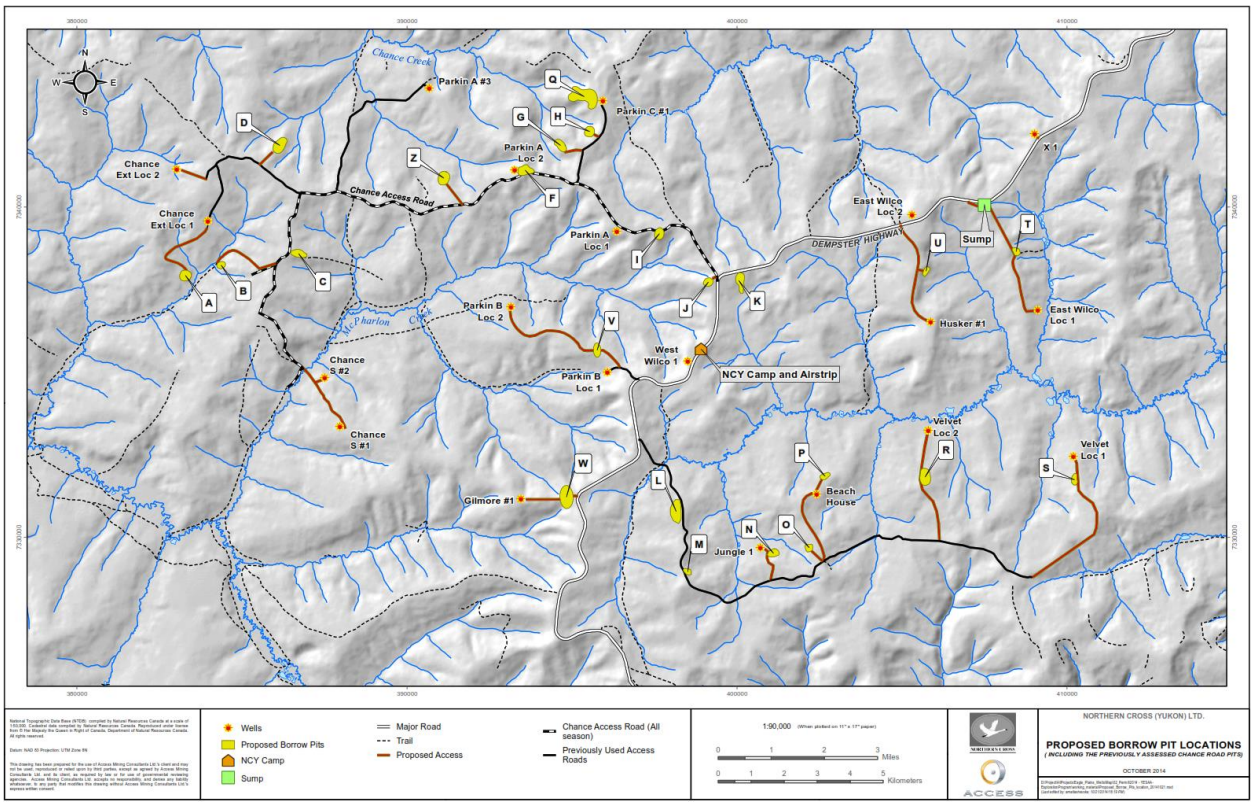

Figure 1.10 Borrow Pit Locations

The Proponent intends that initial access to each well site will be acquired through winter construction of an ice road and placement of rig matting for drilling the well. If the well is successful in finding testable hydrocarbons and it is determined that flow testing will take place, an all-weather road will be constructed. Design and construction of each all-weather access road will only occur once the well has been drilled and a determination has been made whether flow testing will take place. Details of the design of each specific access road including sources, volumes, lifespan, environmental conditions, and closure planning will be provided to regulators prior to construction.

Materials for construction of the access roads will be sourced by drilling the alignment of the proposed access road to each well site to determine the depth of overburden and the geotechnical properties of the bedrock (sand/silt stone, shale, etc.). The general trend has been that those areas higher in elevation along ridges and the crests of hills have less depth of overburden, so materials will be sourced in those locations. There may be a requirement (if the overburden is too deep along the alignment) to source materials from a borrow source off alignment. Access roads will require 15 m^3 per m of road constructed plus pullout and drill pad requirements.

The borrow site locations were determined using lithological data gathered from the shot holes drilled as part of the 2014 3D seismic program. Borrow sites will be accessed in March to April of 2021 when sufficient well results are known to merit access. Summer access could be anytime from May to October any year. Fill sources will be located along the road alignment at those locations identified through drilling at which

lesser amounts of overburden will be required to be excavated. The potential life span of the access will be determined by the drilling and any EFT results. The access life span has the potential to be as long as the life of the well. The closure plan will follow the previously submitted plan. Subject to road design, drill samples will be identified to determine the depth of bedrock of the borrow sources adjacent to the proposed road alignment, and information will be taken from the 3D seismic program.

Organic cover will be removed, and stockpiled for reclamation purposes, using a large crawler tractor. Underlying silts will be excavated by ripping and dozing with a large tractor and stock piled separately for reclamation purposes. Bedrock that consists of siltstone and sandstone or shale (depending on the difficulty of using large equipment, it may be necessary to drill and blast) will be excavated with large excavator and or dozer. The excavated material will be loaded directly from the borrow pit for use in the construction of roads. There will be no water pooling; borrow sources will be constructed to prevent water pooling. Any blasting will be performed by a certified experienced blaster according to all applicable Yukon regulations. The necessary metal sulphides required for acid rock drainage are not present because the borrow sites contain sedimentary rock. To date, acid rock is not known to exist in the Eagle Plains area.

For the purpose of the current assessment the following volumes are expected to be sourced, with the preference to source materials along the alignment. (See **Figure 1.10** and **Table 1.4**).

Borrow sources will be decommissioned when the Proponent deems them no longer useful or necessary for the Project. Decommissioning is described in **Section 1.3.4.2** and will be carried out in accordance with the Decommissioning Plan.

1.3.3.3 Central Processing Facility

The camp's Central Processing Facility (CPF) will comprise additional multi-stage and multi-phase separators, heater treaters (to help remove remaining amounts of emulsified formation water), vapour and gas collection system, and possibly central power generation facility to power all discrete well batteries. Separated water will be further treated to remove any hydrocarbons, scale, anaerobic bacteria, and other colloidal or suspended solids ready for disposal in a suspended well nearby following in a pre-approved process. The CPF will be located at the furthest (southernmost) point away from the camp for safety of the camp and its occupants. Having the CPF at the far end of the camp area will ensure trucks can turn around and exit safely without encroaching on any other activity or building. This should also ensure the camp remains upwind from the CPF.

The CPF will have enough storage to contain produced crude oil for loading onto longer distance trucks ("B" trains) and hauling to a pre-approved market site in British Columbia, Alberta, or possibly Alaska. It is estimated that the CFP will accommodate approximately 10 days of storage capacity for crude oil at an approximate daily rate of 2,000 barrels of oil per day or total 20,000 barrels. The volume (stored in up to 5 surface tanks in full compliance with Yukon and Canadian standards and regulations) also ensures the safe crude stabilization before loading onto southbound trucks. In terms of maintenance, the only treatments appearing necessary at this stage of design are fluid separation (to separate oil from gas and water into 3 distinct streams), heat treating the crude to remove water remnants from the separated crude, and gas dehydration to make the gas useable as a fuel.

1.3.3.4 Airstrip

The Proponent will construct an airstrip located along the existing Chance winter trail at a location approximately 4 km off the Dempster Highway. The airstrip will be approximately 1,500 m long and will be part of the road network west of the Dempster Highway. In the early years of the Project, this airstrip will likely be used only during the winter, but could graduate to year-round usage if discoveries support the investment. Until the Chance road airstrip becomes serviceable each winter, or at the end of the winter season operations when trail conditions deteriorate, the Proponent will continue to use the Dempster Highway adjacent to the camp as a periodic airstrip.

1.3.3.5 Transportation

For the majority of the exploration program, the Proponent will attempt to limit traffic on the winter access roads to authorized personnel. Traffic will include approximately 8 to 9 light-weight service trucks (for supplies and personnel), 1 water truck, and one fuel truck. The fuel and water trucks will come to the Project site approximately once per week or as demand dictates, and there will be occasional transport of drill cuttings from the well sites to the sump location. Air traffic estimated at 2 flights in/out per week (normal arrival times from approximately 10:30 a.m. to 12:00 p.m.).

A majority of the traffic volume will be related to mobilizing the drill rig and constructing the site infrastructure. As mentioned above, the setup of the well sites will take approximately 5 days to complete. Included in this amount, the drill rig will require 15 to 20 loads to mobilize. Unauthorized vehicles will not be permitted on the winter roads and the roads will be restricted from public access. The Proponent will be transporting crews using company vehicles; all vehicles will be equipped with radio communication and,

particularly during busy times (i.e., setup and demobilization), traffic will be radio controlled. For safety reasons, any personnel accessing the areas (i.e., winter roads) will be required to notify appropriate staff (i.e., security personnel and/or managers/supervisors) when they leave the Dempster Highway and when they arrive at the well sites. Access to the winter roads will be monitored by Chance staff hired as wildlife monitors/ security personnel.

A typical description of road traffic during the prime operating periods (January 1 to April 15; May 1 to December 1) is presented in **Table 1.5** below and road users will follow the Operations Activity Schedule introduced in **Section 1.4**.

Table 1.5 Typical Road Traffic during Prime Operating Hours

Table 3-4 Typical Road Traffic During Prime Operating

	Activity Description	Peak Traffic	Normal Traffic
1	Early Season Mobilization (Winter)	High	Medium
2	Rig Mobilization (Winter)	Very High	Medium
3	Winter Operating (Drilling)	Very High/High	Medium
4	Access Road Construction (Winter)	Very High	Medium
5	Summer Mobilization	Very High	Medium
6	Summer Rig Mobilization	Very High	Medium
7	Summer Normal Operating (Drilling)	Medium/High	Medium
8	Extended Testing Winter	High/Medium	Light
9	Extended Flow Testing Summer	Medium	Light

LEGEND:

Very High	More than 50 vehicles per 24 hour day
High Traffic	50 or more vehicles per 24 hour day
Medium Traffic	20-50 vehicles per 24 hour day
Light Traffic	Less than 20 vehicles per 24 hour day

The Proponent expects exploration drilling operations activities will range between medium and light traffic volumes. Crude oil produced during the flow-testing phases of exploration work, as described in this document, will be transported to an acceptable market.

Trucking of a stabilized crude cargo in specially constructed transporting tanks presents the same risk as transporting the diesel fuel required and used in Yukon. The process of loading and dispatching trucks at regular intervals will be planned and handled by professionals who will also maintain constant communication and GPS tracking of trucks as they travel down the Dempster and on other connecting routes to their destination. Trucking is by nature a very controlled process. Truck drivers are only permitted a fixed number of driving hours per 24-hour period and are expected to stop for refresher breaks at regular intervals. All their movements are accurately tracked through their onboard GPS, which can provide any truck's location to within a few metres anywhere in Canada or the USA.

The Proponent has practised Journey Management on its previous exploration drilling work at Eagle Plains. In this instance, any unit transporting materials to Chance's camp 325 will be called and tracked periodically by its company dispatcher. The exact location when reaching certain pre-determined check points will be relayed to Chance camp management and Logistics coordinator; this will ensure road safety for the truck driver and other road users and safety of the vital cargo and provides critical planning information for receiving staff to plan for offloading its cargo and possibly loading backhauls.

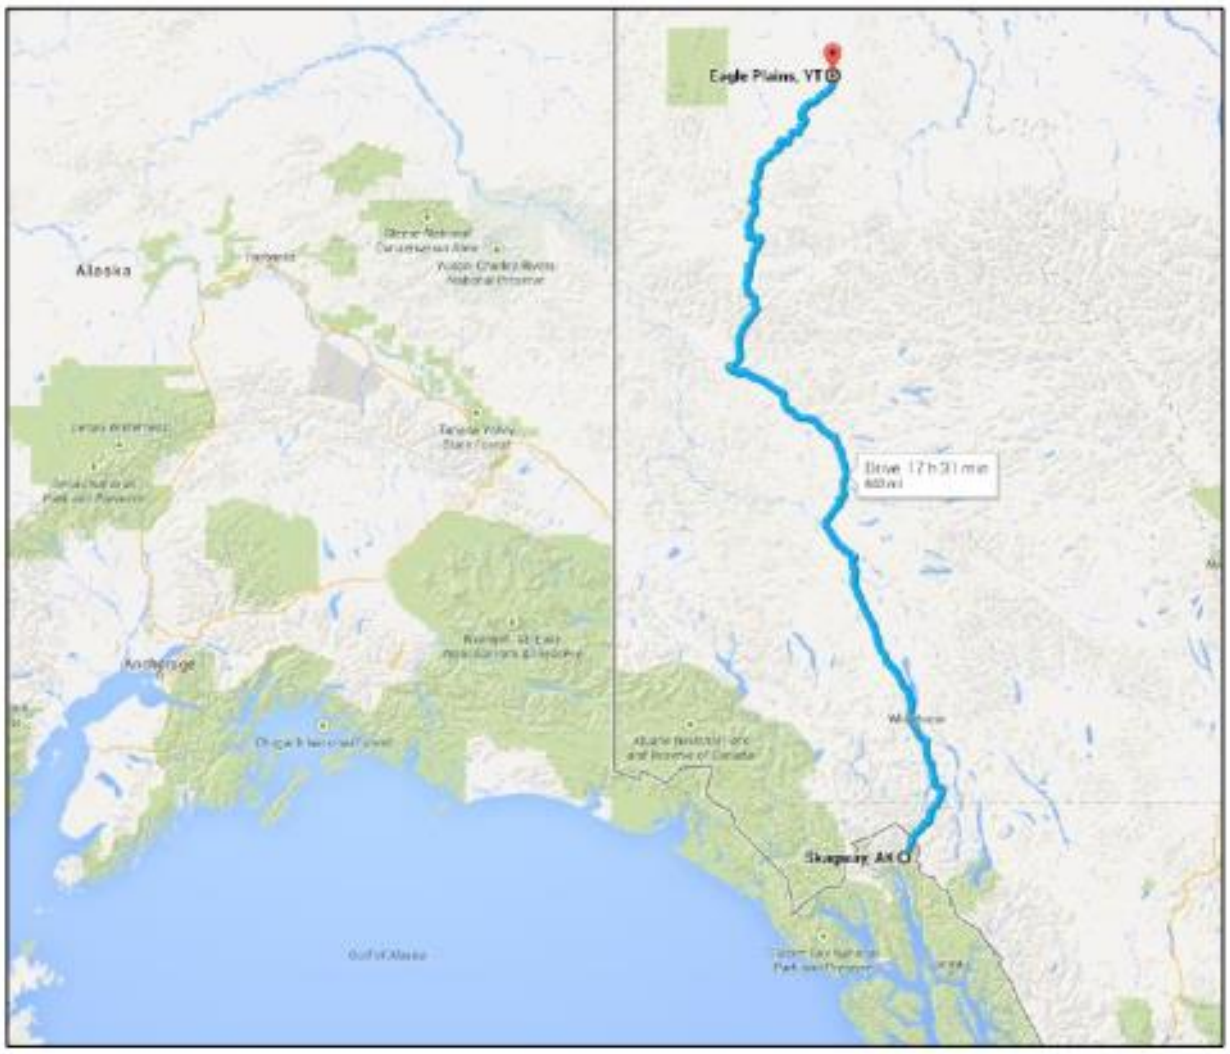

Figure 1.11 Typical Export Truck Route to Skagway, Alaska

Figure 1.11 illustrates one of the possible export truck routes to Skagway Alaska. The journey distance is 1,029 km from Eagle Plains to Skagway. The journey duration is approximately 17.5 hours driving at an average speed 59 km/hr. Other options exist, which include delivery by truck to terminals in Fort Nelson and Fort St. John, British Columbia, or Grand Prairie, Alberta. Depending on which of these options is used, the driving times will vary but the management procedures will remain the same.

The Proponent and its trucking contractor(s) will develop and Alert and Emergency Response Plan to address any incident or accident while in transit on Yukon roads and highways. The same plan will also address any other Provincial routes and routes within the United States border. All reputable trucking contractors versed with transporting flammable liquids and petroleum products in general are mandated to follow the Transportation of Dangerous Goods Federal Legislation. The legislation dictates such activities as how truck contents are identified on the outside of the tank; how the tank is installed on the truck body and strengthened; the level of knowledge and training the driver and any assistant travelling with them must

have to be eligible to operate the particular truck; and the spill response equipment needed to be readily available. Ensuring the truck is safety-checked and the drivers are qualified and adheres to their company's safety policies are the key means of preventing an incident or accident. Tracking the drivers to check on transit speed on a real-time basis means the truck's progress is never neglected and the driver is on notice to observe all road traffic rules at all times.

All incidents affecting the Proponent's trucking contractor are reported back to Chance Operations Management and form part of the Proponent's safety statistics. Every incident is investigated and the causes for each occurrence are closely analyzed and discussed with the truck owner. Should any trucking contractor exhibit an undue number of close calls/near misses or a series of incidents with the same causes, they would be removed from the contract without delay and replaced with a more competent and safety-minded contractor.

1.3.3.6 Workforce

Work force requirements will vary over the life of the Project and will ultimately be limited by the existing camp capacity. During past drilling and seismic exploration programs undertaken between 2012 and 2014, the Proponent had no more than 75 to 80 people onsite at any one time. During drilling, the Proponent operated on a 24-hour clock with a 20-day-on and 10-day-off crew rotation cycle, which means that one-third of the crew was off duty at any point in time. For the seismic exploration program, the Proponent operated on a 12-hour clock and cycled the various services through as the program unfolded with only limited crew changes, mostly connected with the camp catering operation.

The Proponent has an arrangement with Northern First Nation groups and will have time to define their involvement to participate during this exploration program. It is Chance's objective to provide all available work and contracts to its FN/Yukon partners as identified in sec. 68 of YOGA. Chance was successful during its last drilling/seismic program hiring a workforce from the communities from Old Crow, Fort McPherson, Dawson, Whitehorse, and Inuvik.

1.3.4 Reclamation and Closure

1.3.4.1 MBC Sump Site Reclamation

Before the MBC Sump disposal site is opened, the top soil and the vegetative layer will be removed and stored separately from the lower subsoils. This material will then be re-applied after the MBC Sump has been covered by the 1 m of unmixed subsoil. This will bring the disturbed area back to its equivalent land capability. No further reclamation plan is warranted. The standard Directive 050 Drilling Waste Management (D50) plan (AER 2016) of action entails the following:

- The environmental monitor must be onsite during drilling to conduct D50 sampling to ensure that drilling waste is compliant and accurate records are being kept and respond to any spills that may occur.
- The environmental monitor will sample pre- and post-MBC.
- Upon completion of the Project, remote disposal locations will be covered with a minimum of 1.0 m of capping material and contoured to meet background topography.

- A Phase 1 Environmental Site Assessment (ESA) will be completed for each well and corresponding remote MBC location to identify any potential areas of environmental concern.
- If the Phase 1 ESA triggers a Phase 2 ESA, soil samples will be collected and analyzed at an accredited laboratory.
- If contamination is identified, a Remediation Action Plan will be prepared and upon approval, the remedial program will be completed. Once all contamination is addressed either in the Phase 1 ESA, Phase 2 ESA, or Remediation, a surface program including soil and vegetation will be conducted.
- Once vegetation is established, a Detailed Site Assessment; comparing soil lithology and vegetation onsite to offsite) will be completed.

For clarification, environmental monitors will be sampling the following, as per ref AER DIR 50; table 13.1 of this directive lists the Testing Requirements (AER 2016):

1. Receiving soil
    a. Electrical conductivity and sodium adsorption ratio
2. Waste (solids or total waste)
    a. pH, electrical conductivity, sodium adsorption ratio, Sodium (Na)
    b. Nitrogen (N), if additives/products added to the drilling mud/waste system contain any amount of N or if N content was unknown
    c. metals, if concentrations exceeding limits were added to the drilling mud system or if the metal content of additives/products is not known
    d. hydrocarbons, if a hydrocarbon flag was encountered
    e. toxicity, if toxicity data are unknown for any of the mud additives/ products used in the drilling mud system or if concentrations used exceeded pass threshold for luminescent bacteria toxicity test
3. Waste/soil mix (post-disposal)
    a. EC, SAR, and Na, if drilling waste EC > 10 dS/m or Na > 3000 mg/L (saturated paste extract or filtrate from oversaturated waste)
    b. metals, if concentrations in drilling waste exceed concentrations listed
    c. hydrocarbons, if concentrations in the drilling waste exceed concentrations
    d. N, if the nitrogen concentration in the drilling waste (wet weight) is ≥6 mg/kg for disposals in coarse soil or ≥120 mg/kg for disposals in fine soil.

Furthermore, in terms of soil sampling, commencing operations in winter does not necessarily mean sampling would not be possible or even preferable. Sampling can also be accomplished from the surface snow deposits around the well site. The Proponent selected lease dimensions to ensure there is a sizable perimeter for full containment of generated or airborne wastes from the Project.

The first task on any well site would be to construct the well pad or prepare the surface on which matting could be safely placed. The next step is to lay the mats on previously densified/well-trodden surface to render the suface as flat as possible. The final process, before deploying the drilling equipment, would be to undertake a professional geotechnical check on the stability of the surface and its resultant ability to

support the maximum anticipated loads with a suitable safety factor. Finally, the geotechnical engineer will provide a signed/stamped report attesting to the stability and strength of the facility for the work contemplated.

1.3.4.2 Well Decommissioning and Abandonment

As previously mentioned, the 30 proposed wells are part of an exploration program to help determine the oil and gas potential of the region. Depending on the outcome of results, a given well may be tested and additional plans developed to bring into production or be determined to be unproductive and require decommissioning and abandonment. As the Operator, Chance will always carry the full responsibility for all wells deemed to be its property. This responsibility can never be delegated to any other party unless and until such time the Proponent relinquishes ownership according to YOGA and its regulations.

Wells required for further operational uses such as producing wells, water or gas injectors will be maintained in a suspended state with an ability to be converted for use in the future. The Drilling and Production Regulations under YOGA have specific actions required from an operator to maintain a well in a suspended state; key among these actions is to periodically conduct inspections to ensure that the integrity of the well is intact. While in a suspended status, the regulator requires a sum of money be placed on deposit to cover the cost of abandonment and remediation of the site. Once abandoned, the status becomes permanent and there would not be an option to re-enter such a well.

The normal stages before decommissioning/abandonment of a well are as follows:

- The well is first determined as unusable.
- The perforations are first cemented by placing a cement plug below and above them and squeezing some amount of cement into the formations to permanently isolate them within the wellbore. A mechanical shut-off device called a bridge plug may also be wireline set above the cement plug to add protection or isolation.
- Higher in the production casing and below the estimated permafrost maximum depth, a second cement plug would be set. This plug is normally set on top of a bridge plug to ensure it does not leak down in the casing. The plug is also “felt” with a drill bit to confirm its existence and hardness.
- The casing at surface is cut 1 m below the original ground and buried under the soil to finally remediate the location entirely.
- The lease is remediated by removing fill material to restore the location to original status. The surface location would be revegetated with what is normally growing there in the first place.

When appropriate, a decommissioning/abandonment plan for the well sites will be developed that will comply with Part 7 of the Yukon Government Oil and Gas Drilling Regulations (Sections 95, 96, 97, 99). Wells would require final well abandonment according to the YOGA Drilling and Production Regulations. Wells would be sealed with cement, and casings would be cut off below ground level. The casing stubs would be buried below ground surface as required by the Regulations and a surface-visible sign would be installed for identification. The entire site will then be cleared of all debris and refuse. Finally, the site will be contoured, seeded, and left to naturally reclaim.

An outline procedure prepared by the Proponent in compliance with the YOGA Regulations is presented as follows:

- Seal off all perforations in the casings that are not already sealed with cement squeezes.
- Pressure test the casings to 7000 kilopascals (kPa) to confirm formations are isolated and sealed.
- Cut off the wellhead and casings to 1 m below ground level and weld/install plates to cover each casing string at surface.
- Install well identification marker visible above ground level.
- Bury the cut casings to complete the abandonment.

If the entire Project had to be suspended but not completed, the infrastructure would be preserved and maintained until the Project resumes. If it is decided for whatever reason to terminate the Project, then the infrastructure would be decommissioned. While operations are temporarily suspended, the Proponent will ensure access from the Dempster Highway will be barricaded and visually inspected periodically.

1.4 Project Phases and Scheduling

1.4.1 Project Schedule

The Project plan is to have all necessary permitting and approvals in place by the end of 2021 and begin drilling in December 2021. The construction of winter roads, drilling and testing of the first few wells is anticipated to occur during the winter (December to April) and summer months (May 1 to October 31), commencing in December 2021 with the first winter locations.

In the early years it is assumed that all wells will be drilled in the winter. Summer drilling might happen in future locations that are in reasonably close proximity to yet to be developed all-season access. Well priorities and their drilling order can only be best determined after the program commences and in response to drilling results and Chance corporate exploratory information gathering requirements.

The construction of the 400 m all-season access road to the MBC sump location is anticipated to occur in March 2022 and take not more than 2 weeks to complete.

The Proponent anticipates a period to elapse between confirming a discovery worthy of further evaluation and commencing the EFTs to allow time to properly design, fabricate, install, and commission the extended flow testing facilities. This period could be up to 6 months. If drilling is successful and significant hydrocarbons are discovered, the access roads would be upgraded to year-round access to undertake the EFTs. Year-round access to flowing wells is critical to daily well inspections and safety assurance of all operations.

The previously summarized scope of the Proponent's exploration activity can be expected to start as early as December 2021 and continue over a period up to 10 years to cover the various stages of drilling and extended flow testing of the wells. The actual execution of the EFTs could be phased depending on the nature of the discovery (e.g. natural gas versus crude oil) and the capacity of the base camp and the Eagle Plains Hotel to accommodate the necessary crews. Until there is more information about discovered resources, it is impossible to predict with any precision the full duration of the flow testing program. At least 8 wells could be tested in each year.

In summary, the chronological activities can be best described as follows:

1. Complete 3D seismic processing & interpretation (Chance Exploration rank prospects and establish company exploration objectives to meet Yukon Government lease commitments and CHANCE corporate objectives for exploration)
2. All preparations completed by December 31, 2021 (Seismic, YESAB, Well Licences, Camp, rig upgrade & certify, consumables and services, geotechnical prep work)
3. Prepare first location to mobilize Chance Rig #1 (start January 1, 2022 or soon thereafter)
4. Drill & test winter wells (possibly as many as 4; suspend operations April 15th ±)
5. Prepare for summer drilling (contingent on positive drilling results); ready to construct all-season access to next drill and test targets on schedule. Subsequent wells may be predicated on encouraging well results influencing more follow-up appraisal drilling
6. Continue drilling exploration wells in the remaining prospects to build on positive previous drilling results.
7. Identify wells with positive results meriting extended flow testing to acquire in depth reservoir information.
8. Design order/fabricate well site battery processing equipment in preparation for extended flow testing of selected wells.
9. Re-enter selected wells; install completion tubulars and other accessories, Christmas trees and ready for extended flow testing.
10. Install surface pumping equipment (standard pump jack device to lift the well fluids to surface); hook up well Flowline to well site battery (separator, flare system, crude oil storage tank and water disposal tank).
11. Supervise and operate well pumping, transfer stabilized (crude that has been allowed to “age” in atmospheric storage tanks; made safer for trucking) crude from tanks to truck for transport to the camp’s Central Process Facility.
12. Construct the camp’s Central Process Facility.
13. All vapour and gas removed from the well fluids will either be used for fuel to prevent storage tanks contents from freezing, generating electricity, pumped downhole in an approved manner or flared at site.
14. Progressively more wells would be drilled and brought on stream while extended flow testing and contribute to the accumulated fluid to be removed by trucks to a suitable market.
15. During EFTs flowing information would be gathered including bottom hole pressure profiles to learn about the reservoir flow characteristics and understand more about the prospect’s full development potential.
16. Development would become the subsequent phase of continuing operations. The nature and details of that operation will be described in later submissions as per the YOGA and regulations derived from it.
17. To complete the life cycle of a well, wells drilled, evaluated, tested and completed as part of a field development plan, would be either worked over and recompleted in the event of, for example, water ingress; or, if deemed not having future production potential, would be abandoned according to the YOGA Drilling and Production Regulations. In this instance, all previously perforated producing zones would be cemented shallower cement plugs would be placed and the casing at surface cut

to 1 metre below the normal ground surface. The surface lease would be fully remediated and restored to its original state.

18. The Proponent's future operating schedule for exploratory drilling assumes a continual, year-round program in order to benefit from the economies of scale of uninterrupted operations involving several wells rather than discrete ones with breaks in between. This will also contribute to a stable employment and goods and services market for Yukon residents servicing and supplying operations at Eagle Plains.
19. EFTs involve the flowing of a well or wells. There is no human intervention while wells flow unimpeded for the duration required for the test. In a multi-well producing field, for example, a maximum of three persons can handle all the production operator tasks of a field with 50 or more producing wells (double that number if working a 24-hour day). Field production operators visit each well at least once daily unless there is a need for other demanding work. They record flowing well pressures, ensure fluid pumps operate properly, have enough fuel to continue operating and visually inspect the facility for anything out of the ordinary.
20. The Proponent plans to have three operators managing the EFT wells in any 12-hour cycle. A second set of three will form the cross-shift making a total number of operators 6.

The sequence of wells is dependent on drilling success, discovery, weather and road conditions. The Proponent is continuing the ongoing process of interpreting seismic data in order to better understand the geological setting and size/geometry of potential prospects. Each well drilled will add to that understanding.

In summary: the Proponent will drill up to 30 wells sequentially over a period of 10 years starting in 2022. If a well is successful (i.e., if there is a discovery of crude oil or natural gas in sufficient quantities) the Proponent will conduct an EFT for a period up to 2 years on that particular well. There may be EFTs on up to 20 wells depending on the success of each well. The Proponent will drill one well at a time and up to 5 wells per year. Assuming all wells are successful and EFTs are conducted for 2 years at each well, there may be up to 10 EFTs being conducted at one time.

The schedule illustrates the breakdown as it is known at this time. The maximum time is estimated to be 10 years. The schedule does not account for operations interruptions owing to weather, geological re-interpretation, equipment breakdown or other delays beyond the control of the operator. A normal rate of drilling would be to drill one well at a time during this exploratory phase.

1.4.2 Construction Phase

The mobilization and Construction Phase of the Project is expected to commence in Q4 of 2022. Key activities during the Construction Phase are summarized by Project component in **Table 1.6**.

Table 1.6 Summary of Key Construction Phase Activities

Project Activity	Key Construction Phase Activity
Tree Clearing and Grubbing	Salvage to be completed prior to construction of the well pads and portions of the access roads (winter and all-season)
Road Construction	Completed as roads are required to access facilities and well pads

Project Activity	Key Construction Phase Activity
Quarry Development	Quarries will be developed based on volume of material required to build leases and roads.
Lease Construction	Topsoil and subsoil salvage and local stockpiling
	Lease pads will be constructed on an as-needed basis using material from nearby quarries
Main Camp	Camp will be used to house drilling crew
	Construction of the Central Processing Facility
Accessory Activities	Road construction and upgrades to roads as required
	Construction of an airstrip
	Vehicle traffic related to drilling and construction activities
	Transportation of production fluids to Central Processing Facility and to market
	Follow Blasting Mitigation Plan
	Water use permit for lease and road construction
	Baseline data collection and environmental monitoring
	Monitoring and establishing erosion control features for roads, leases, and the Central Processing Facility
	Updating and following the Emergency Response and Risk Management Plans, as required
	Following a Weed Management Plan for soil stockpiles and leases
	Maintaining and snow-clearing roads and leases for all-season access

1.4.3 Operation Phase

The Operation Phase will begin in Q1 of 2022 and will continue through to the end of 2031. The key activities occurring during this phase are summarized in **Table 1.7**. This section describes the main operational activities that will occur during the Operation Phase.

Table 1.7 Summary of Key Operation Phase Activities

Project Activity	Key Operation Phase Activity
Road Construction	Upgrade roads to all-season roads, with water crossings, as required. Road maintenance will be conducted, as required
Drilling	Up to 30 pads will be constructed and drilled for oil and gas products
	Remote sump access for drilling fluid waste disposal
	Excess drilling mud to be disposed of offsite at the remote sump
	Completing drill stem tests
	Acid stimulation and completion of wells for testing
Well Testing	Facilities to be installed, as needed, for testing and extended well tests
	Routine maintenance of facilities, as needed

Project Activity	Key Operation Phase Activity
	Gas is to be flared off, and oil placed in storage tanks
	Production fluid transport to Central Processing Facility and market
Accessory Activities	Road Maintenance
	Energy may include switching power generation from diesel generators to natural gas produced from the wells
	Updating and following the Emergency Response and Risk Management Plans, as required
	Water permit use for boilers during winter drilling
	Following Weed Management Plan
	Central Processing Facility to handle production fluids, disposal fluids and fuels
	Maintaining and snow-clearing roads and leases for all-season access
	Environmental Monitoring

1.4.4 Reclamation, Abandonment and Closure Phase

Reclamation, abandonment and closure activities will be detailed in a Conceptual Reclamation and Closure Plan. A summary description of key activities is provided below for the Reclamation, Abandonment and Closure phase are described in **Table 1.8**.

Table 1.8 Summary of Key Reclamation Phase Activities

Project Activity	Key Reclamation Phase Activity
Well Abandonment	Wellheads will be abandoned when testing or production phases are complete
	Testing or production facilities are to be removed from each site
MBC Sump Site Reclamation	Site will be reclaimed as per Directive 50
Central Processing Facility	Upon complete field decommissioning activities, the removal of the Central Processing Facility will occur
Well Site Reclamation	Imported material will be removed, and area reclaimed to natural conditions, as much as possible
	Revegetation of disturbed areas to natural conditions and follow-up monitoring
Infrastructure Decommissioning	Water crossings will be removed
	Appropriate sloping and seeding to prevent erosion and scarification to encourage revegetation
Borrow Source Reclamation	To be reclaimed as soon as materials are exhausted or no longer required
	Revegetation to natural conditions and follow-up monitoring
List Accessory Activities	Discussions with YESAB (and other Regulators, as necessary) prior to reclamation work to determine whether there should be changes to the Plan
	Updating the Reclamation Plan to meet new criteria, if required
	Following Weed Management Plan until sufficient revegetation has occurred on reclaimed sites

Project Activity	Key Reclamation Phase Activity
	Annual monitoring until vegetation regrowth deemed satisfactory
	Soil Detailed Site Assessment prior to seeding
	Conduct a Phase 1 Environmental Site Assessment for each location
	Potential Phase 2 environmental assessments of soil and groundwater
	Obtain Regulatory Closure

GTC0220	07-Dec-23	Community Event	Fort McPherson	Residents of Fort McPherson	Community Event	Chance held a community open house event in Fort McPherson at the Tetlit' Zheh Fort McPherson Hamlet Chamber from 4:00 to 8:00 pm MST. Open house attendees were asked to sign in upon arrival and to complete a feedback form before leaving. Chance shared Project information on posterboards and a 1-page handout. Chance provided a catered dinner and presented Project information to the Open House attendees. The Open House event had door prizes that were drawn throughout the event which included 2 Air North gift cards, 2 Co-op grocery gift cards, and Ecofor packages.	N/A	Summary Report

APPENDIX 2-B-63. April 24, 2018 Letter

Meeting Title: Gwich'in Tribal Council, Tetlit Gwich'in Council, and Chance Oil and Gas Limited Meeting

Date: April 24, 2018

Location: Gwich'in Tribal Council Office, Inuvik, Northwest Territories

Attendees:

Gwich'in Tribal Council (GTC) and Tetlit Gwich'in Council (TGC)

Grand Chief [redacted]

[redacted], President of Tetlit Gwich'in Council

[redacted] Director of Lands and Resources (GTC)

[redacted], Transboundary Specialist (GTC)

[redacted], Director of Intergovernmental Relations (GTC)

[redacted] Chief Operating Officer (GTC)

Chance Oil and Gas

[redacted]

Hemmera

[redacted]

Introduction: Purpose and Objectives

Meeting Objectives:

- Introduce team members and discuss roles and responsibilities;
- Share information on Chance's exploration interests; and
- Allow opportunities for participants to share their views on what they would like this relationship and engagement and communication plan to look like.

Key Outcomes for Chance:

- Agreement to work together on an engagement and communication plan (plan);

DRAFT

- Identification of team members to lead on developing the plan;
- Identify next steps for completing the plan; and
- Understand the Gwich'in Tribal Council relationship with the Tetlit Gwich'in Council and the Teetl'it Gwich'in Council.

Action Items/Next Steps:

Action Item	Responsible Party	Date Required
GTC to update Chance when the GTC and Yukon Government Communications Protocol has been finalized	GTC	TBD
Send [redacted] the study on caribou done by [redacted]	C. Dickson	ASAP
Hemmera to send a draft Engagement and Communication Plan to the GTC and the TGC	K. Constable	ASAP

Meeting Outcomes:

Meeting Outcome	Responsible Party	Date Required
Chance to consider linear disturbance related to effects on wildlife and predator/prey interactions in a future project proposal	Chance	In the future should Chance pursue defining and assessing a project.
Chance, the GTC, and the TGC to work collaboratively on one Engagement and Communication Plan	All	Near future
Tetlit Gwich'in Council, the Designated Gwich'in Organization, is the appropriate party for Chance to engage and the Teetl'it Gwich'in Council is not; however, Chance should	Chance	Ongoing

DRAFT

inform them of updates as a courtesy.		

Discussion of Key Topics:

Chief [redacted] and [redacted] explain the Gwich'in Tribal Council (GTC) organizational structure and notes that [redacted] is the contact and president of Tetlit Gwich'in Council (TGC), not Chief [redacted] of Teetl'it Gwich'in Council. Teetl'it Gwich'in Council is the band under the Indian Act in Fort McPherson; the TGC is the Gwich'in Designated Organization (DGO) in Fort McPherson and is the body responsible for the Gwich'in land claim. [redacted] explains that this is the same for each Gwich'in community; there is one DGO and one Indian Act Band, and the GTC is working on a communications protocol with Yukon Government to help clarify this and other matters. [redacted] will update Chance when this protocol is finalized. [redacted] expresses Chance's appreciation for the explanations regarding the GTC and TGC, noting that Chance wants to make sure that engagement is respectful of the GTC and TGC's protocols.

[redacted] thanks the GTC and TGC for inviting Chance to meet with them and references the previous meeting that took place between Chance and the GTC, which was when Chance was in the Yukon Environmental and Socio-economic Assessment Board (YESAB) process. Chance is not in the YESAB process at this time and is looking to establish an engagement and communication protocol as a framework to support discussions about Chance's activities now and into the future. [redacted] describes the history of Chance and describes the historic wells that have been drilled for oil and gas exploration in the Eagle Plain basin by other companies, mainly in the 1960s. Chance has tested these historic wells as part of their previous oil and gas exploration work and the crude oil from these wells was used to power the Whitehorse Generator for about 18 hours. During the economic downturn, Chance was invested in by the Chinese National Offshore Oil Company and Chance performed a seismic program that covered 325 km^2. Information from this program contributed to Chance defining a 20 well exploration program, which was submitted to YESAB and did not complete the YESAB process. Chance will not be pursing this plan any longer.

[redacted] provides an overview of the Chance oil and gas dispositions map, explaining the difference between the significant discovery licenses in red and the and exploration permits in yellow; exploration permits have an expiry to the tenure, where permits 12 – 17 will expire in August 2018 unless they are extended, and permits 19 and 20 will expire in 2019 and 2020. Significant discovery licenses have indefinite tenure. R. Wyman explains that the work done to date by Chance has been within permits 20, 13, and 19, and it is likely that future work would be focused in those areas and perhaps in permits 14 and 12 as well. The Tetlit Gwich'in Primary and Secondary use areas are noted in respect to Chance's permits, as well as where the Peel Watershed is.

[redacted] describes how Chance is currently in the exploration phases of work and would need to understand the oil and/or natural gas resource in the region before progressing to the project phase.

The goal would be to support a local market and provide value-added services to what is extracted in the region. Yukon currently imports 200 – 300 million litres of diesel per year, so Chance has the goal to offset that. Currently, there is about 2/3rds of the diesel coming from America and 1/3rd of the diesel is coming from Alberta. Chance would not propose hydraulic fracking, as Chance would not pursue resources in the kinds of rock that would require fracking to extract it.

Chance is once again a 100% Canadian owned company, [redacted] notes, with [redacted] as the majority shareholder, who has also been involved with Chance for the past 12 years. [redacted] is an exploration geologist who has worked in the Mackenzie Delta and Eagle Plain region for many years, starting his career in these regions. [redacted] notes that Chance has established the Community Relations Committee of the Board, which is meant to provide a direct line of communication between the board and communities.

[redacted] notes that regarding tenue, the devolution process in the Northwest Territories that has occurred has resulted in changes to the tenure of old significant discovery licenses, which are usually indefinite tenure, where the cost of retaining the old significant discovery licenses is higher so that proponents must act on them and adds that Yukon might also be considering this.

[redacted] notes how Chance had submitted an application for 20 exploratory wells to YESAB and heard through the YESAB process that access was an issue, as YESAB was assessing the proposed work as all 20 sites being opened for access at once, but YESAB wanted Chance to only open up access to a few wells at a time; [redacted] asks if this is why the YESAB assessment of the 20 exploratory wells went awry? R. Wyman explains that YESAB's main reason for promoting Chance's proposed 20-well exploration project from a District Office level review to an Executive Committee Screening is due to the need to assess the effects of increased access on caribou, which was a key concern raised by Yukon First Nations. YESAB did not direct this concern in a straightforward manner to Chance, so the reason for decision came as a surprise to Chance. [redacted] notes that there is the North Yukon Land Use Plan (NYLUP) implemented in the area that Chance's dispositions are, which has zones of influence and best management practices associated with it.

[redacted] notes that Chance is in the Eagle Plain Basin region because of the NYLUP, and Chance's proposed works when they submitted to YESAB was in an area called Zone 4, which is designated for the highest level of development. Tr'ondëk Hwëch'in, the First Nation of Na-cho Nyak Dun, and Vuntut Gwitchin First Nation were very involved in the NYLUP development. [redacted] adds that Chance and Vuntut Gwitchin are on their second draft of an engagement and communication plan (plan) currently.

[redacted] explains the framework that Vuntut Gwitchin and Chance have developed for the engagement and communication plan, describing how the plan accounts for discussions that might need to happen in the future, but are too early to have now, such as capacity funding discussions or a Traditional Knowledge and Traditional Land Use Study. [redacted] notes that a Terms of Reference for the Community Relations Committee of the Board is being developed with Vuntut Gwitchin's input as well.

[redacted] notes that he thinks one committee is a good idea, as it is good for the community to have access to the Senior Board, and asks if Chance would have a Memorandum of Understanding with each affected Nation? [redacted] reply that it would be an engagement plan with each Nation that Chance is seeking to develop. [redacted] comments that Yukon Government is also pursing an engagement protocol with the Gwich'in Tribal Council and that there might be bilateral working groups.

[redacted] comments that Chance is sensitive to what is happening in Alaska as well and wants to make sure that everyone is heard. The YESAB District Office experience was not good for Chance in the past, and Yukon is very accustomed to mining projects but not to oil and gas projects, and YESAB's review and commenting process contributed to the public perception that Chance was proposing something that isn't allowed in the Yukon, when realistically, this is a planned activity in the Eagle Plain Basin per the NYLUP and in the Vuntut Gwitchin Final Agreement. [redacted] describes his experience as a Vuntut Gwitchin representative during the NYLUP development process, and this process resulted in over 60% of Vuntut Gwitchin Territory being protected. [redacted] notes that he is personally invested in making sure that anything Chance does is done right, including laying the information out properly for an effective YESAB review process and ensuring that the community is informed by Chance about what is being proposed, as in Chance's most recent YESAB experience, there were other organizations providing false information to community members and further perpetuating a negative perception of Chance's proposal.

[redacted] adds that it is important to Chance that they also work as a company to get communities to a place where they have the capacity to provide services to Chance. YESAB portrayed Chance's previously proposed exploration drilling program as large, but it is not large as the wells are proposed to be drilled in succession, not all at once. This way, if Chance were to drill a well that resulted in failure to produce a resource at that site, then Chance would not pursue nearby drilling targets and cross those off the plan. Chance's ultimate goals are to keep a future exploration drilling program small-scale and ongoing over a longer period of time; the general plan would be to drill a few exploration wells, analyze the results, then plan the next drill sites accordingly. This type of process means that there's more opportunity for building capacity over time and it means that the footprint is kept smaller as well.

[redacted] notes that the landscape itself is important to First Nations people, so any impacts to the landscape are felt. For example, the 325 km of seismic line that Chance did affects people, as they drive by the site on the Dempster Highway they see it and are shocked. [redacted] highlights the effects of linear disturbance on predator and prey interactions is a key concern for the community, which has been studied in Alberta, and asks that Chance consider how predators use linear disturbance in any future assessment and project. [redacted] replies that Chance's field crews did meandering seismic lines to minimize disturbance and the field crew noticed animals using the lines to move around. G. Charlie explains that Chance's wildlife experts are EDI Dynamics, based in Whitehorse, and that Chance recognizes that there will be a footprint that results from anything that Chance does on the land. [redacted] offers to send a study done by [redacted] on caribou. [redacted] notes that all of the GTC's points are well-taken, and that this is why having an Engagement and Communication Plan to provide a

framework for these discussions in the future will ensure that the information is flowing as easily as possible.

[redacted] discusses Chance's future employment and contracting sourcing, asking if there are skills and services more easily sourced from the south, and if the remaining skills and services can be capacity to be built within the communities? [redacted] replies that there are short-term services that will be needed, but it is not recommended that First Nations pursue building capacity there. The best opportunities for First Nations are to do camp maintenance, catering, and operations, as these last for a long period of time. Drilling would be an opportunity, but the rigs would need to be moved around after Chance's program concluded to BC or Alberta to pursue opportunities, so it would take those people away from their homes for work. Construction, building the winter trail and maintaining it, are also good opportunities for locals. R. Wyman goes on to explain more opportunities for steady, longer-term work. [redacted] notes that the GTC is interested in training and capacity building, and asks what time-frame the resource would have? [redacted] explains that there are a lot of factors that would feed into that, and there are many conditions that need to be satisfied before Chance can get to a point where they would know this. The dream is to have decades of resource pulled from multiple sites, and technology has changed so much that the environmental footprint of Chance's activities are greatly reduced compared to a few decades ago. [redacted] notes that he lived in Alberta and people cycled in and out of core activities, so this can be an opportunity for community members to do seasonal work as well. [redacted] notes that Canadian oil and gas work is seasonal, this is the nature of the landscape.

[redacted] asks about the 3000 km supply chain for drilling services, looking for more information. R. Wyman explains that many drills are in Leduc, some are in northern BC. The closer you get to the Yukon, the more broadly you will have to source the drilling services you need as a proponent. G. Charlie adds that most Yukon services are geared towards mining.

[redacted] goes on to describe how oil and gas development is not on the forefront of Yukon Governments mind, and that Chance has heard from other First Nations that they have met with that an all-party meeting is a good idea to discuss matters of oil and gas development in the Eagle Plain Basin. [redacted] notes that this potential meeting could be a good opportunity for all parties to learn together and better understand Chance's objectives of oil and gas development in the region. It would also be a good time to discuss the topic from a political perspective, and from a sustainability perspective regarding the Porcupine Caribou Herd. [redacted] reiterates that Chance wants to make sure that the right information is getting to communities and that the communities are receiving opportunities. [redacted] notes that especially as a Vuntut Gwitchin Citizen she sees the need for jobs in Old Crow, as young people do not have any opportunities unless they work for government. [redacted] adds that in Old Crow he hears Elders speak about how settlement land parcels R7 and R8 are "money in the bank" for the next generation, and that Vuntut Gwitchin need to be stewards of the land and they have done that through the NYLUP; [redacted] notes that he respects the GTC's responsibility to the land and their people as well.

DRAFT

[redacted] asks if the GTC has a mechanism for working with other First Nations? [redacted] explains that if there is an overall committee for a matter or with a proponent, then the GTC can be part of that for engagement on common issues; the GTC sees value in bilateral relationships and then working on specific issues in a different forum. [redacted] asks if there's a reporting requirement for Chance's dispositions? [redacted] explains that there's a reporting minimum in the Yukon Oil and Gas Act but Chance is looking to go above and beyond this requirement with the Community Relations Committee of the Board; [redacted] goes on to speak as a Gwich'in person that he would like to see a larger group with the GTC and other Gwich'in collaborating on opportunities. The Plan that Chance wishes to develop with the GTC and TGC will be a framework to support those conversations about economic opportunities as well. [redacted] notes that northern communities are well-positioned to provide services to Chance. [redacted] adds that the Plan will provide the framework for Chance and GTC, TGC to engage and build the relationship, as well as meet with communities.

[redacted] explains to Chance that [redacted] the contact for Tetlit Gwich'in Council, which is the appropriate body for Chance to engage with. [redacted] explains that Yukon Government directed Chance to speak with Chief [redacted], which was not correct, and Chance did try to discuss the difference between Teetl'it Gwich'in Council and Tetlit Gwich'in Council at the time. Grand Chief [redacted] notes for Chance to still pursue the meeting that Chance has in Fort MacPherson with Chief [redacted] and Teetl'it Gwich'in Council that evening and update them on this current meeting. [redacted] reiterates for Chance that when in doubt, go by the land claim – Gwich'in Tribal Council and the Designate Gwich'in Organizations are the bodies to work with as they represent the registered Gwich'in people, and confirms that the Ministerial Order is referring to the Designated Gwich'in Organization of Tetlit Gwich'in. [redacted] adds that Yukon Government's lawyers also have a different definition of Tetlit Gwich'in in their transboundary agreement, which may have contributed to confusion. [redacted] highlights that this further solidifies the need for an all-party meeting. Chief [redacted] agrees and notes that early engagement is also important because it allows time to work out these issues, and encourages Chance to engage early and consistently. Chief [redacted] notes that the GTC will participate in the North Yukon Chiefs meetings, but such a meeting hasn't been called in a while.

President [redacted] describes the changes to the board structure for Tetlit Gwich'in Council, noting that they have a new Executive Director and Community Coordinator, as well as a business development arm called the Rat River Development Corp. President [redacted] asks where in the development process Chance is, noting that he understands it as if there were a scale from 1 to 10, Chance sounds like it is at a 2. [redacted] notes that Chance isn't even at a 2 yet on [redacted] example scale and explains the history of the significant discovery licenses and what has been discovered in these locations. Based on those historic results, there could be resource elsewhere, and Chance needs at least one more phase of drilling to know if there's enough there to justify proposing production. G. Charlie adds that the vision is to provide local oil to the local market.

[redacted] asks where the potential consumer product would be produced in Chance's vision? [redacted] Replies that hopefully this is produced in the Yukon. Over 60% of the fuel used in Yukon is diesel

and the other portion is gasoline; gasoline is complex to make whereas diesel is simple to make. The diesel refining operation is essentially a still and the leftover products would be put back in the ground or used for industrial heating. There may also be natural gas in the Eagle Plain Basin. At this time, there is not enough to commercialize anything; part of exploration is to understand how the wells will form and how to maximize recovery though flow tests. [redacted] asks how many barrels of oil would need to be produced to make it economically feasible? [redacted] replies that it would be a few thousand barrels per day, adding the example of if 20 truckloads of diesel come into the Yukon per day, Chance would like to offset 10 truckloads.

[redacted] confirms that he and [redacted] are the main contacts for developing an Engagement and Communication Plan with Chance. [redacted] notes that Chance would like to have one collaborative plan with both the GTC and TGC; Grand Chief [redacted] and President [redacted] agree. [redacted] adds that it is the GTC's responsibility to keep other communities informed. [redacted] adds that there is an August 1 deadline for Chance on the Engagement and Communication Plan and that Chance is looking to work with GTC and TGC on this; [redacted] replies that Chance should send a draft for their review.

To Whom It May Concern,

Re: Eagle Plains Multi-Well Exploration Program - Northern Cross (Yukon) Ltd.

We have reviewed the above application against our heritage databases, and we have the following concerns.

1. There has been no Traditional Use/Traditional Knowledge study conducted, to the knowledge of the GSCI, with the Gwich'in participants who use this area or have knowledge of it. Without a traditional use study, the effects on traditional use cannot be assessed. In addition, integrating traditional and scientific knowledge into impact assessments is considered best practice, but traditional knowledge is held by land users and must be gathered in targeted studies. Traditional Use and Traditional Knowledge studies with Gwich'in participants are covered by a TK Policy (http://www.gwichin.ca/TheGwichin/traditional.html).
2. The GSCI has not been afforded the opportunity to fully review the development proposal against existing cultural and heritage data. This review would provide the proponent with more detailed information for use in planning and mitigation, and would be done at the cost of the proponent.
3. This project will contribute to climate change. Climate change is causing changes to the land (for example, retrogressive thaw slumps), the weather, and the animals upon which the Gwich'in depend for food. Climate change is affecting the ability of the Gwich'in to travel on and use the land for traditional pursuits.
4. The size of the project is of great concern to the GSCI. The high number of wells proposed, the establishment of new roads, in particular new all-season roads, are of particular concern.

As with any application, if archaeological or heritage materials are encountered during development within the Gwich'in Settlement Area, all work must cease immediately as required by law, and the appropriate authorities (including the GSCI) must then be contacted.

Sincerely,

[redacted]
Executive Director, GSCI

c.c.

APPENDIX 2-B-65. July 8, 2020 Memo

Hemmera
An Ausenco Company

MEMORANDUM

Date:	July 8, 2020
To:	[redacted], Gwich'in Tribal Council
From:	[redacted], Chance Oil and Gas [redacted], Hemmera
File:	104709-01
Re:	Response to Gwich'in Tribal Council Comments

Please see the Chance Oil and Gas response, outlined in the table below, to the Gwich'in Tribal Council comments and concerns on the Eagle Plain Well Maintenance Project sent on June 18, 2020. We would be happy to discuss if you have any further comments or concerns.

GTC Comments and Concerns	Chance Oil and Gas Comments and Approach
I – High environmental standards in the Peel River watershed and protection of scattered wetlands within the Land Management Unit (LMU) 7	
Part of the maintenance site is located in the northwest of the LMU 7 (Dalglish river) of the Peel watershed. And According to the Peel plan, Porcupine caribou use the entire unit, mostly as a migration route. It is also true for Moose as there are ribbons of high-value habitat along major creeks in the area. As such, GTC is concerned that the proposed maintenance activities will negatively affect the Porcupine Caribou migration and moose habitat. For this reason, GTC recommends hiring a wildlife monitor throughout the maintenance activities to ensure that Caribou migration is neither interrupted nor slowed by the structures which will be put in place.	Wildlife has been selected as a valued component for assessment in the project proposal. Chance will consider the effects of the well maintenance program on Porcupine caribou migration and moose habitat. In addition, Chance will have a wildlife monitor on-site during construction of winter roads and during maintenance activities.
Related, the existence of high-value waterbird habitat along riparian areas, coupled with significant pockets of species of conservation concern, makes it compulsory for the proponent to adopt best practices that will help minimize surface and vegetation disturbance adjacent to water bodies.	The well maintenance program will not have negative effects on riparian areas. The program is designed to happen in the winter during frozen conditions. The construction and use of winter roads will minimize any effects to surface vegetation. In addition, winter roads follow the height of land avoiding riparian areas and water bodies. All activity is happening well away from riparian settings and there are no stream crossings associated with the winter roads.
As there are many water bodies and wetlands in the proposed project location, GTC is concerned by the impact of these activities, especially the effect of the construction of the 11 km new winter road on the permafrost/terrain stability	As noted above, the program is designed to happen in the winter during frozen conditions. The construction and use of winter roads will minimize any effects

and the local ecology. As mitigation measures for this ecological concern, GTC strongly suggests that proponent explores the use of other access methods according to the research recommendation #7 of the Peel Plan which states that: *"In order to avoid unnecessary road (or rail) building, the following research recommendation is provided: Research Recommendation #7. The suitability of large airlift technology now being developed and tested in the marketplace to enable remote access for industrial activities (e.g., Boeing's SkyHook™ Technology) should be examined in advance of any new road construction."* Peel Watershed Regional Land Use Plan, 2019, PP63.	to surface vegetation and permafrost. There should be no negative effects to vegetation or permafrost Additionally, the winter road construction is not anticipated to affect terrain stability. The winter roads will follow the height of land and will not require any grading or clearing of surface soils. Rather, a minimum of 10 cm will be built up and compacted to support equipment.
The proponent did not list Off-Road Vehicles (ORV) as part of the vehicle fleet to be used on the project site. However, as an area of the project location is in the Peel watershed, GTC would like to underline that the choice of not using ORVs on-site, especially M-59 in the Northwest of the LMU7, is consistent with the Peel Plan. And this, in its policy recommendation #13 states that: *"To prevent impacts on wildlife, soil damage and land user conflicts, the use of wheeled ORVs (e.g. quads, motorbikes and Argo-like vehicles) for any purpose, should be restricted to the Hart River Trail, existing trails in areas immediately adjacent to the Dempster Highway, licensed camps, and existing facilities"* Peel Watershed Regional Land Use Plan, 2019, PP62	Chance is not planning to use wheeled Off-Road Vehicles for this project. Chance may use snowmobiles for initial reconnaissance for trail construction and for wildlife monitoring.
II – Protection of Wildlife and Wildlife Habitats	
GTC is concerned about clearings and vegetation disturbance that will occur during the execution of the project as it can negatively impact wildlife (change of dynamics in the food chain) and wildlife habitat (disintegration, and perturbation). GTC advises the proponent to i) help support collection of information on amount and state of surface disturbance before and after the project and ii) reduce the number of clearings to the minimum and iii) do the reclamation of disturbed areas after maintenance on well site.	This project will require minimal vegetation clearing. Some vegetation clearing (primarily willows and shrubs) will be required to re-establish the winter roads and at the well sites. Chance will consider the impacts of vegetation clearing on wildlife and wildlife habitat in the project proposal. The clearing of vegetation is restricted to the winter roads and the individual well sites.
Furthermore, GTC is concerned about the human land use-related disturbances such as noise, smell and light and would like to know what mitigation measures the proponent will put in place to reduce/avoid them. For example, bears and other wildlife can be attracted to the project camp due to food smell or other attractants. This situation might lead to wildlife encounters and the killing of wildlife. The training of project personnel about eco-responsible practices to adopt to respect and protect wildlife and wildlife habitats is strongly recommended.	The overall project will use the minimal amount of work to re-establish the winter roads and do the required maintenance work. This will reduce disturbances such as noise, smell and light. While the project should not attract bears due to all activities occurring during the winter, the Chance camp is constructed in order to minimize attractants. For example, food waste is stored in secure areas so as not to be accessible to wildlife. Incinerators are present at the camp to burn organic material and reduce wildlife attractants.
In terms of transportation of personnel and equipment, using primary vehicles, Pickup trucks, Water trucks and the eleven flatbed truckloads, GTC expects the project team to make commendable efforts to minimize traffic and avoid unnecessary degradation of the soil and destruction of wildlife habitat.	Chance will minimize traffic to the Project and on the Project site so as to avoid effects to wildlife (e.g., restricted access and speed limits). Additionally, the design of the Project (e.g., re-establishing winter roads and work during winter) is intended to minimize and/or eliminate potential effects to value such as soil, permafrost, vegetation, riparian areas, and wildlife habitat

On a broader level, with respect to the proposed activities, GTC requires that the evaluation of the potential impact of the mobilization and demobilization of equipment on riparian zone should be incorporated in the environmental assessment of this project.	The well maintenance program will not have negative effects on riparian areas. The program is designed to happen in the winter during frozen conditions. The construction and use of winter roads will minimize any effects to surface vegetation. In addition, winter roads follow the height of land avoiding riparian areas and water bodies.
As for access management (new winter roads and previously existing roads), GTC is concerned that gating alone might not be enough and recommends the combination of gating and signage.	Winter roads are designed as single lane roads with periodic pullouts to let opposing traffic pass. Access will be controlled using strategies such as gating and signage as necessary while traffic will be controlled by radio communication.
III – Protection of the Environment, water quality, quantity and Potential Spills	
Concerning the current additional project information, there is a lack of details about the type of fluids that will be used for the Pressure Test and Wellbore fluid test. This information is needed to help determine the potential impact of this use on the environment. At the outset, GTC is worried about spills and the effect of fluid injection in geological formations on groundwater. GTC is requesting that the project detail outlines the risk level of each well, based on the type of fluid to be used, and a response plan when a spill occurs.	Chance will list the fluids and materials necessary for the well maintenance program. In addition, Chance will develop a spill response plan in order to minimize potential effects related to spills. Drip trays and other catchment equipment will be readily available and used during the operation to prevent even small spills.
To protect wetlands, GTC recommends that all clearings and storage (food, water, wastewater, fluid and fuel) should be located, at least 100m away from water bodies. The presence of scattered wetlands in the project location is an overriding reason to consider this recommendation. All personnel should be trained on spill reporting, and any spill must be reported to YG and the Affected First Nations governments right away.	All of the well sites are located at least 100 m from any water bodies. Chance will not store any materials outside of the well sites or the existing Chance camp. All personnel will be required to be familiar with Chance's spill response plan. Personnel trained in spill response will be onsite for the duration of the Project. In addition to spill response and cleanup, the spill response plan will include details on reporting requirements.
Besides, the use of water from Ogilvie and Eagle rivers is great concern as these watercourses might get contaminated through the pollutants that the water trucks can bring into these fragile ecosystems. Added to that, is the risk of the introduction of invasive species and hydrocarbons into these water bodies. Furthermore, GTC is also concerned that the frequency of trips to these two rivers may disrupt the original balance and stability of the soil and ecosystem of their banks. For these reasons, GTC is cautions against such use, especially the Ogilvie river that is part of the Wilderness Area in the Peel Watershed.	Chance will use best practices when withdrawing water from the Ogilvie or Eagle rivers in order to minimize effects related to values such as water quality, fish and fish habitat, and soil stability. This includes ensuring that water withdrawals do not result in release of contaminants (e.g., hydrocarbons) into water bodies. In addition, Chance will only use existing access and withdrawal sites in order to minimize the risk of erosion and sedimentation. In addition, daily water use is generally very low (~ 10 to 20 m^3) and recycling of fluid from one well to the next is possible. The peak water demand will be contingent on natural snowpack. Low snowpack will require more water use to be able to make snow for building winter roads and well sites. In the latter case, perhaps between 100 and 300 m^3 per day for short periods of time may be needed.
IV – Protection of Cultural Heritage Resources/Values	
[redacted]	Chance will follow all applicable legislation and rules with regards to protection of cultural and heritage resources. Chance also has a "Chance Find Procedure" in the event that archaeological or paleontological materials are discovered.

[redacted]	However, Chance does not anticipate any effects to cultural or heritage resources. The Project is occurring in areas that have already been used for the intended purpose (i.e., re-establishment of winter roads and use of existing well sites and camp). In addition, by completing the project during the winter months, Chance does not intend to disturb the ground surface or move any soils and surface materials.
[redacted]	Wildlife has been selected as a valued component for assessment in the project proposal. Chance will consider the effects of the well maintenance program on wildlife and wildlife habitat and will ensure mitigation measures are included in the project proposal. In addition, Chance will have a wildlife monitor on-site during construction of winter roads and during maintenance activities.
The area in general is also known for bald eagles.	Chance does not anticipate any impacts to bald eagles as the Project is occurring during the winter when daylight is limited and eagles are not present.
V – Economic Development Opportunities	
Employment opportunities • GTC could offer to provide leads for the positions of wildlife monitor relating to LMU 7 (Dalglish river) of the Peel watershed. • GTC could also provide leads for those who can provide Traditional Knowledge in relation to ▫ high-value water bird habitat along riparian areas, coupled with significant pockets of species of conservation concern ▫ training of project personnel about eco-responsible practices to adopt to respect and protect wildlife and wildlife habitat [redacted]	Chance welcomes the opportunity to have further discussions with GTC to understand and potential economic development opportunities.

• GTC could offer to provide leads to the proponent to contact Gwich'in who have appropriate training to collect information on amount and state of surface disturbance before and after project, as GTC advises.	
Business opportunities • Construction & maintenance of roads and sites, and reclamation of disturbed areas could be carried out by several Gwich'in registered businesses qualified for such work. They include:  • Many of the above businesses provide equipment rental services. GTC could obtain from the proponent a list of required machinery/equipment. GTC could request that local businesses have the opportunity to provide such rental equipment. There may not be an overlap of equipment required/equipment available locally, but it could represent an opportunity.	Chance welcomes the opportunity to have further discussions with GTC to understand and potential economic development opportunities.

NORTHERN CROSS (YUKON) OPEN HOUSES

DATES AND LOCATION

Northern Cross (Yukon) Limited is hosting a series of information sessions across Yukon to present its plans for the next phase of exploration activities at Eagle Plains. These information sessions are open to the public to attend.

Using information obtained from the recently concluded 3D seismic program, the next phase of exploration activity is planned to be a targeted exploration drilling program. The format of the Open Houses will be a formal presentation by representatives of Northern Cross followed by a period of questions and answers. The entire management team at Northern Cross will be participating at the Open Houses.

June 16th	1PM - 2PM	Vuntut Gwitchin Beneficiaries Open House Venue: VGFN Whitehorse Office, 3A – 508 Hanson Street
June 16th	4:30 PM - 6PM	Whitehorse Open House Venue: Yukon Inn, Fireside South Room
June 17th	10AM - 12PM	Mayo Open House Venue: First Nation of Nacho Nyak Dun Multi-Purpose Room
June 17th	4 PM – 6PM	Old Crow Open House Venue: Old Crow Community Hall
June 18th	4 PM – 6PM	Dawson City Open House Venue: YOOP Hall

Calgary, AB T2P 3J4

Attention: Richard Wyman, President

Dear Mr. Wyman:

Re: Vuntut Gwitchin Government ("VGG") Engagement with Chance Oil and Gas Limited ("Chance")

Mahsi cho for your letter dated September 8, 2017 regarding an Engagement and Communication Plan.

We acknowledge and understand Order-in-Council 2017/37 which granted a 1-year extension to Chance's southern exploration permits subject to certain conditions, including the requirement for Chance to complete a First Nation engagement and communication plan before August 1, 2018. We note that the condition for a First Nation engagement and communication plan originated from Order-in-Council 2016/169 as a result of concerns, issues and shortcomings arising from Chance's past engagement with VGG.

We acknowledge the draft summary of such a First Nation engagement and communication plan was prepared and tabled by Chance in winter 2016 and the subsequent establishment of a Chance Community Relations Committee. While we appreciate your efforts and willingness in this regard, as a self-governing First Nation VGG is responsible for establishing and implementing our own governmental policies and processes for engaging with proponents wishing to carry out industrial activities that have the potential to adversely affect our rights, responsibilities and interests. To this end and as previously communicated to Chance, VGG has been developing and drafting an Oil and Gas Engagement Policy for the past several months. The Policy is now in its final stages of VGG review and approval. We fully expect that the Policy will be approved by December 31, 2017, and in any event, well before August 1, 2018.

We are confident that the Policy will provide a solid foundation for respectful, transparent and meaningful engagement while ensuring that any benefits and stewardship arrangements adhere to the objective of Sustainable Development as enshrined in the *Vuntut Gwitchin First Nation Final Agreement*. Moving forward, the Policy will be the framework for all engagement between VGG and Chance. As such, from VGG's perspective, the Policy *is* the engagement and communication plan that VGG will consider satisfactory for the purposes of Order-in-Council 2017/37. As we have previously

communicated, we would be pleased to meet and review the Policy with Chance upon its approval.

Yours truly,

Chief Bruce Charlie
Vuntut Gwitchin First Nation

[redacted] President
Chance Oil & Gas Limited
1000, 340-12th Avenue S.W.
Calgary, Alberta, T2R 1L5

RE: Relinquishment of Exploration Permit #5

Dear Mr. [redacted],

In the 2009 approved North Yukon Land Use Plan (NYLUP) referencing Land Management Unit #8 Whitefish Wetlands on page 6-20 it was recommended by the Commission that a protected area be created by the parties.

Thus as we began to implement NYLUP the parties began a management planning process in March of 2013 for what is now called the Ch'ihilii Chik Protection Area encompassing 468 square kilometers and made up of 75% Category A Settlement Land (R-2A), and the rest is Yukon public land.

The Ch'ihilii Chik working group is now prepared to submit a completed management plan to the parties that has had a rigorous public consultation.

In response to our request in September of 2018 we recognize your letter dated October 16th, 2018 surrendering your oil and gas Exploration Rights to your permit #0005 ("EP5") so that the working group may submit a "clean" Ch'ihilii Chik Habitat Protection Area Management Plan without any third party land interests to ourselves and the Minister of Environment which is viewed as a "good will gesture" of cooperation and respect.

On behalf of our people, we would like to express our appreciation and gratitude to yourself and Chance Oil & Gas for your prompt response in rectifying the 3.8 square kilometer overlap issue with our new protected area. We also recognize the fact that this is the first time Yukon Oil & Gas branch has dealt with such a request.

Mahsi' cho (Thank you very much),

[redacted]
Councilor
Vuntut Gwitchin Government

PO Box 94
Old Crow, Yukon Y0B 1N0

Attention: [redacted], Director of Natural Resources

Dear [redacted],

Re: VGG Oil and Gas Engagement Policy Stage 1

This purpose of this letter is to provide notice to the Director of Natural Resources, Vuntut Gwitchin Government (VGG), of the intention of Chance Oil and Gas Limited (Chance) to apply to the Yukon Government to extend the tenure of select oil and gas dispositions held by Chance in the Eagle Plain Basin. The following information is being provided to fulfill the requirements of Stage I, Article 23 of the Vuntut Gwitchin Government Oil and Gas Engagement Policy (the Policy).

1.0 INTRODUCTION TO CHANCE

Chance is an oil and gas exploration company that holds valid permits to perform oil and gas exploration activities in the Eagle Plain Basin of Yukon Territory within the Traditional Territory of the Vuntut Gwitchin First Nation (VGFN).

Chance was incorporated in Yukon on September 19, 1994. The company has its head office in Calgary, but also maintains an office in Whitehorse. The business plan of the company is to explore for and potentially develop oil and natural gas resources in the Eagle Plain Basin of northern Yukon to help meet the energy needs of Yukon and other markets depending on the scale and quality of commercially viable resources.

Chance and VGG Relationship
Chance and VGG have an ongoing relationship that has been recently formalized by the completion of a Communication and Engagement Plan (Plan) in May 2018. The Plan outlines a mutually agreed upon framework to guide communication and engagement in relation to all aspects of Chance's activities. The

VGG Oil and Gas Engagement Policy is appended to the Plan and Chance is committed to complying with the Policy.

The Plan was completed to fulfill Ministerial Order 2017/37. The subsequent Ministerial Order, 2018/042, requests that Chance report to Yukon Government annually on the implementation of Plan.

Additional details of Chance and VGG's recent relationship include a formal introduction of Chance to the new Chief and Council and the Natural Resources Committee in Old Crow on January 29, 2019. In addition, four VGG representatives attended the Chance All-Party Meeting held in Vancouver on February 1, 2019.

2.0 COMPANY PROFILE

2.1 Organizational Structure

Chance Oil and Gas Limited is a privately-owned company incorporated in Yukon with headquarters in Calgary, Alberta. Chance's team is based partly in Calgary, Alberta, partly in Whitehorse, Yukon, and partly in Vancouver, British Columbia.

2.2 Team Profile

[redacted] – Chairman and Chief Executive Officer

[redacted] – President and Director

[redacted] – Vice President Government and Community Relations

[redacted] – Regulatory, Environmental and Community Relations Coordinator

[redacted] – Corporate Secretary

2.3 Financial Statements

It is important that Chance have a signed Confidentiality Agreement with VGG before Chance discloses confidential information such as financial records. A draft Confidentiality Agreement, meant to cover the disclosure of all information either party considers to be confidential, has been previously provided to VGG representatives and can also be found in **Appendix I**. Chance requests that VGG review this draft confidentiality agreement, discuss its content with Chance if necessary, and return it for signing by both parties before Chance discloses their financial statements.

2.4 Compliance Record

Chance has always operated in compliance with applicable Yukon regulations. In **Appendix II** please find the Compliance Records, a list of the licenses and permits with which Chance has complied in the past.

3.0 DESCRIPTION OF OIL AND GAS DISPOSITIONS AND APPLICATION

Chance holds 14 oil and gas dispositions in the Eagle Plain basin all of which are on Vuntut Gwitchin Traditional Territory (See map Chance Oil and Gas Limited Dispositions and Wells in **Appendix III**). Of these dispositions, Chance is applying to extend the tenure of Permits, 0006, 0007, 0008, 0009 ,0010,

0011, and 0019 for the maximum allowed time of five years. With the extended tenure, Chance intends to pursue oil and gas exploration.

As previously discussed with Vuntut Gwitchin representatives at the All-Party Meeting on February 1, 2019 and with the Natural Resources Committee in Old Crow on January 29, 2019, Chance is in the early stages of planning an exploration project. Chance will further discuss the scope and details of their exploration project with VGG when more progress has been made on the exploration project description. Chance will submit notice of their proposed oil and gas activity to the Director of Natural Resources to comply with Article 24 of the Policy when this information ready.

PROJECT DESCRIPTION

This document presents the location of the proposed Eagle Plains Exploration Project (Project), the preliminary scope of the Project, the principal and accessory Project components, and Project phases and scheduling. The descriptions provided below are conceptual and intended to provide the level of detail necessary to initiate discussions with stakeholders on the Project Description.

Detailed design and implementation procedures will be developed following Project approvals. All design, methodology, or procedural changes will conform to the commitments made by Chance Oil and Gas Ltd. (Proponent), as well as the terms and conditions stated in any Decision Document resulting from the Yukon Environmental and Socio-economic Assessment Board (YESAB) Executive Screening process and permits, approvals, and authorizations once issued.

The development of this section is based on the *Proponent's Guide to Information Requirements for Executive Committee Project Proposal Submissions* (YESAB 2005), specifically Part 1, Section 5.0 Project Description.

The Proponent will develop a series of management plans to provide additional information on infrastructure design and phase-specific activities including monitoring. These management plans are referenced throughout this section where relevant.

1.1 Project Description Overview

The Proponent intends to conduct exploration drilling and flow testing of any discoveries over an area of approximately 2,400 square kilometres (km²) in the Eagle Plains area, located between the Ogilvie and Richardson mountain ranges along the Dempster highway in Yukon. The purpose of this exploration drilling and flow testing program is to confirm the quality, quantity, and areal extent of any accumulations of hydrocarbons. The Proponent will drill up to 30 wells sequentially over a period of up to 10 years. If a well is successful (i.e., if there is a discovery of crude oil or natural gas in sufficient quantities), the Proponent will conduct an extended flow test (EFT) for a period up to 2 years on that particular well. There is considerable uncertainty in terms of outcome from exploration drilling, so it is only possible at this stage to speculate on the number of discoveries that will be made. For the purposes of this assessment, the Proponent estimates that crews may conduct EFTs on up to 20 wells, depending on the drilling success. Due to the exploratory nature of the work, it is impossible to predict the timing of any discovery and therefore the timing of any EFTs.

The Proponent will drill one well at a time and up to five wells per year. Assuming all wells are successful and EFTs are conducted for 2 years at each well, there may be up to 10 EFTs being conducted at one time. The information obtained from the EFTs is critical to establishing the future development plan for each discovery.

If several wells reach successful outcomes and are identified for extended flow testing, the wells will have completion equipment installed within their wellbores, the casing will be perforated, and the wells will be flowed. This would require a completion or service rig to install the completion equipment and the tubing used to conduct produced well fluid to ground surface, at which point surface equipment would then be installed, which may include artificial lift equipment to help the fluid continue to flow.

Fluids produced during EFT will need to be measured, processed, and dealt with in an environmentally responsible manner. Depending on the nature of a discovery, the Proponent anticipates that some combination of natural gas, crude oil, and possibly formation water will be extracted during the EFTs. These fluids are separated and measured in facilities on the surface. Natural gas could be flared for short periods of time, but the Proponent prefers to conserve it to provide fuel for process heating, fuel for engines providing mechanical power, and possibly onsite power generation. If natural gas quantities are significant, the Proponent would consider re-injecting surplus natural gas into a compatible reservoir in the Eagle Plains basin using an existing suspended well. The Proponent currently has 8 suspended wells that were drilled in the past, which could be used for re-injection. Alternatively, some of the new wells, drilled as part of this 30-well Project, may be used.

Fluid transportation vehicles will be required to travel from site to site and transport the produced fluid back to the Central Process Facility for storage, further treatment, and transfer to trucks for transport to market or disposal. To the greatest extent possible, crude oil produced during the EFTs will be conserved instead of flared. This will require some processing to stabilize the crude oil for truck transport to a suitable, approved crude oil marketing point, such as terminals in the vicinity of Fort Nelson or Fort. St. John, British Columbia or Grand Prairie, Alberta. All these locations are ready to receive and utilize crude oil produced from Yukon sources in the absence of such destinations existing within Yukon. The Proponent may also consider trucking crude oil produced during the EFT to ports in Alaska such as Skagway, Haines, or Valdez for onward shipping to suitable markets elsewhere in North America.

Formation water produced in conjunction with crude oil or natural gas will be separated from the hydrocarbon streams and disposed of underground into a compatible and approved geological formation at Eagle Plain using one of the suspended wells or one of the wells drilled as part of this Project. These procedures to process, transport, and dispose of various fluids produced are common practice using proven technologies and equipment in every oil and gas province in Canada.

The Proponent also intends to conduct a seismic exploration program consisting of up to 1,500 km² of three-dimensional (3D) seismic and up to 2,000 km² of two-dimensional (2D) seismic to identify and map oil and gas geological structures in the area.

Additional activities are required to support the drilling and seismic exploration, including:

- Mix Bury Cover (MBC) sump area to dispose of drill cuttings
- Construct winter and all-season access roads
- Construct airstrip
- Advance borrow source developments
- Transport equipment and supplies to the site and within the Project area
- Use existing camp at kilometre (km) 325 of the Dempster Highway and periodic use of the Eagle Plains Hotel.

The Proponent is planning to begin exploration activities as early as the end of 2021 and continue for a period of 10 years to cover the various stages of drilling and extended flow testing of the proposed wells. The execution of the EFTs will likely be phased, depending on the nature of the discovery (e.g., natural gas versus crude oil) and the capacity of the 75-person base camp and the Eagle Plains Hotel to accommodate

the necessary crews. Until there is more information about the resources discovered, it is difficult to accurately predict the full duration the complete flow testing program.

1.2 Project Location

The Project is located within the southern part of Eagle Plain Sedimentary Basin in northern Yukon (**Figure 1.1)**. The main camp is located at km 325 of the Dempster Highway, with one MBC sump area located at km 336. **Figure 1.1** illustrates the overall Project area.

The proposed Project area overlaps with the following three First Nation Traditional Territories:

- Vuntut Gwitchin First Nation
- First Nation of Na-Cho Nyäk Dun
- Tetlit Gwich'in Council Secondary Use Area.

The proposed Project area is north of the Tr'ondëk Hwëch'in First Nation Traditional Territory and Settlement Land. The Traditional Territories and Settlement Land blocks in the vicinity of the Project are detailed on **Figure 1.1**.

The proposed Project is located within the boundaries of the North Yukon Planning Region and is therefore subject to the North Yukon Land Use Plan (Plan). A main purpose of the Plan is to address oil and gas development in North Yukon. The locations of proposed well sites are within the region of the Plan designated for the highest level of development. In the Plan, this designation is described as Lower ecological and heritage/cultural values within a moderately sensitive biophysical setting.

1.3 Project Components and Activities

This section describes the principal Project components, along with accessory components that are necessary to support Project activities. Information provided below for each Project component includes its location, key design features, and, where applicable, the results of any relevant investigations to establish site conditions (e.g., seismicity, geotechnical parameters). The three main components of the Project are described as follows:

1. Exploration well program – comprising 30 wells within an area of approximately 2,400 km². Wells will be located within areas identified in **Figure 1.1**. The program includes drilling, drill stem testing, and extended flow testing of the wells. Hydraulic fracturing is not being proposed as part of the Project. See **Section 1.3.2** for details.
2. Construction of access roads to each proposed well location – roads required for the Project will be a combination of winter and all-season access roads. Details regarding road construction and location are provided in **Section 1.3.3.1**.
3. Construction of a new MBC sump area and all-season access road – (approximately 400 metres (m) long) at km 336 of the Dempster Highway, and construction of additional MBC sumps in other suitable areas. Details are provided in **Section 1.3.2.7**.
4. Seismic exploration program (**Section 1.3.2.9**) consisting of up to 2,000 km² of 2D seismic exploration and up to 1,500 km² of 3D seismic exploration.

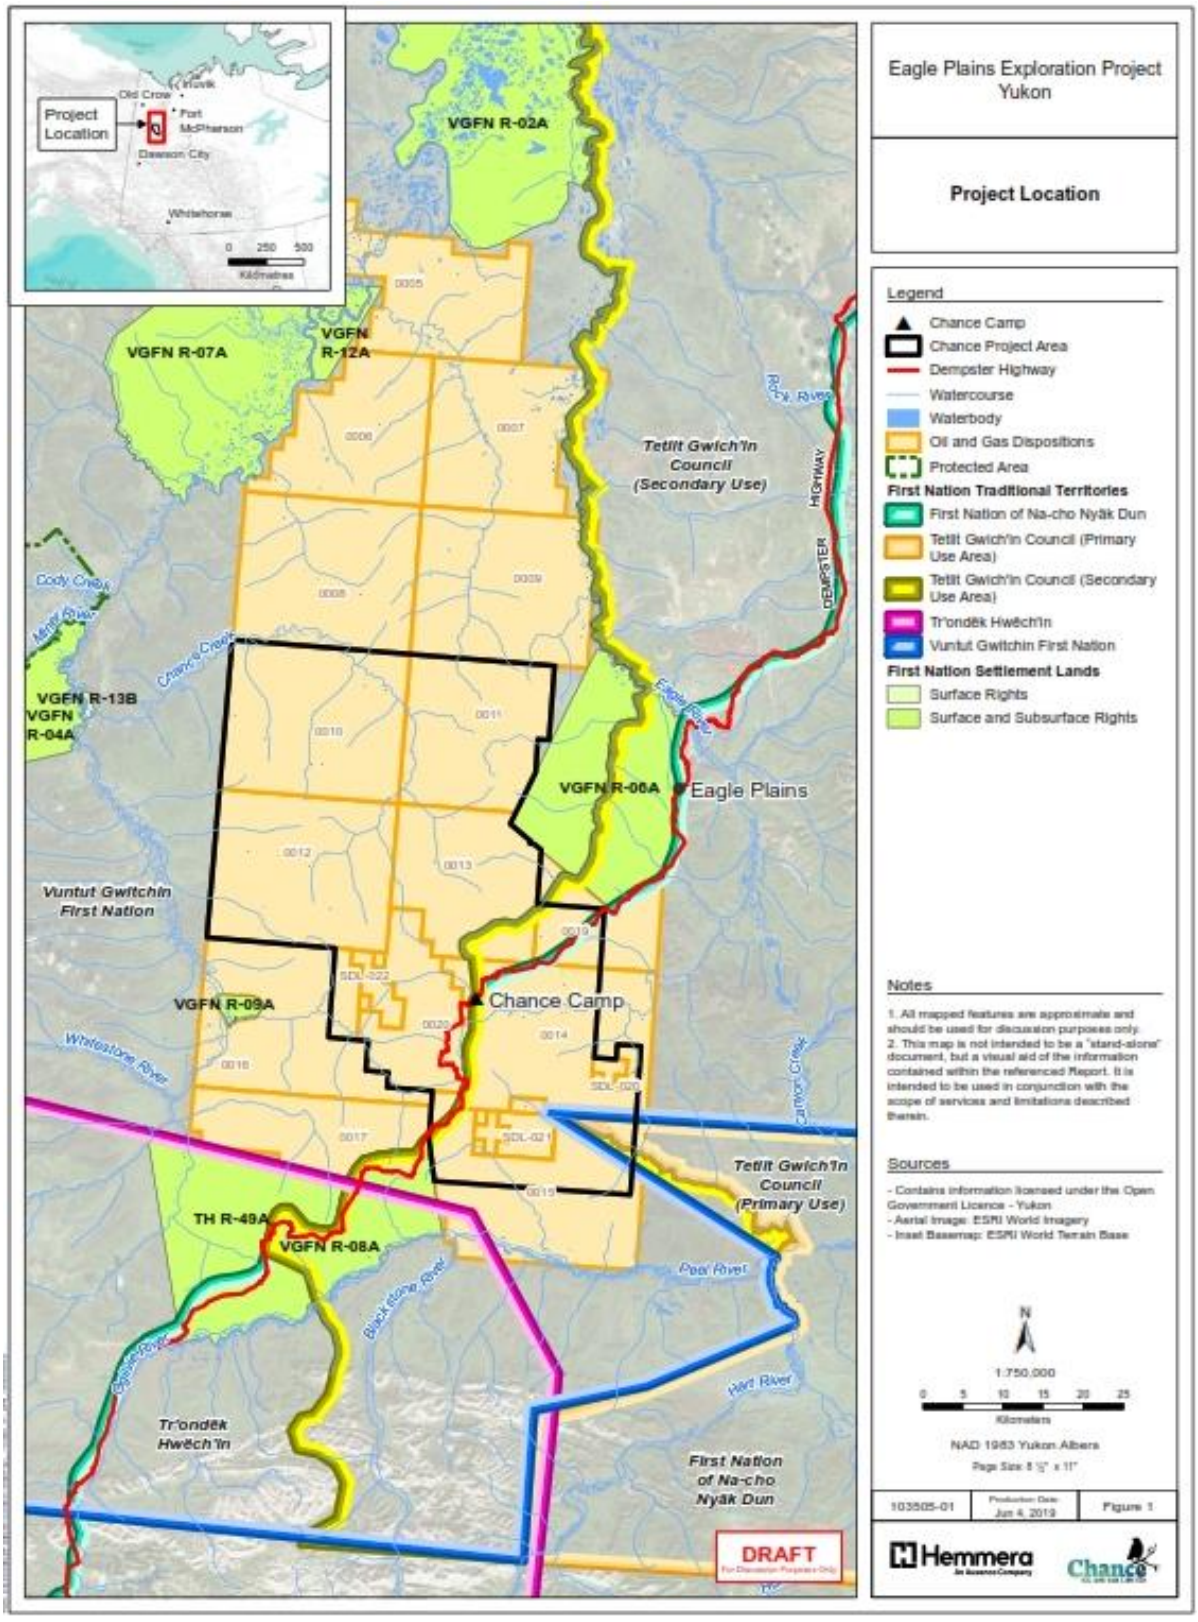

Figure 1.1 Project Location

Details related to the project components and activities are provided in **Section 1.3 Project Components and Activities** noting that the development of some Project components occurs in both phases. That is, once a well site has been prepared, drilling and well development will occur at that site, and additional well sites may be prepared simultaneously. Reclamation activities are described in **Section 1.4.4 Reclamation, Abandonment, and Closure Phase**.

1.3.1 Preliminary Scope of the Project

The preliminary scope of each Project component is described in **Table 1.1**.

Table 1.1 Preliminary Scope of Project

Project Component	Activities
General Project	• Exploration activities for oil and gas in the Eagle Plains area ▫ Exploration well drilling, testing, suspension, decommissioning, and abandonment ▫ Successful wells will be suspended and may be brought forward in future development project proposals ▫ 2D and 3D seismic exploration • Project phases will occur sequentially over a 10-year period and include ▫ Initial mobilization of equipment to the Project site ▫ Construction of required infrastructure ▫ Well development, testing, decommissioning, and abandonment ▫ Progressive reclamation ▫ Final closure and reclamation • The Project will occur over an area covering approximately 2,400 km² located at approximately km 325 of the Dempster Highway
Exploration Well Drilling	• Establishment of up to 30 well sites each, approximately 1.44 hectares (ha) in size within the overall Project area (approximately 2,400 km²) ▫ Site levelling using gravel, packed snow or ice and rig matting as required • Installation of surface infrastructure on drill sites including: ▫ Drill rig ▫ Mud tanks, pumps, and mud processing systems ▫ Power generators ▫ Boilers ▫ Blowout preventer accumulator system ▫ Fuel storage ▫ Flare tank and flare stack ▫ Cement mixing and storage ▫ Storage bins for rock cuttings ▫ Trailers for offices, first aid, rig crew sleeping quarters, water storage and treatment, sewage storage, and food waste incinerator • Drilling of up to 30 wells to a depth up to approximately 2,500 m ▫ Wells will be drilled sequentially, one well at a time, up to four wells per year • Use of low-toxicity, water-based mud system • Use of up to 15 cubic metres (m³) of water per operating day for drilling

Project Component	Activities
Drill Stem Testing	• One or more drill stem tests (DSTs) on each well to analyze prospective/productive formation areas • Potential acid stimulation using a weak concentration (10% to 20%) of hydrochloric acid approximately 5 to 10 m3 per well • Flaring natural gas • Production of crude oil and transport from the site to markets outside of Yukon
Extended Flow Testing	• Conduct EFTs on up to 20 successful wells ▫ May be conducted within a month for a predominantly natural gas well or up to 2 years for a predominately crude oil well ▫ Up to 10 EFTs conducted at the same time • Installation of surface and subsurface equipment and facilities to enable EFT including: ▫ Casing of entire wellbore and perforation of casing at zone or zones of interest ▫ Packer, tubing, and downhole gauges ▫ Wellhead valving assembly ▫ Flare systems ▫ Separator vessel, treating vessel, and storage tanks ▫ Appropriate artificial lift systems ▫ Heaters ▫ Dehydrators ▫ Flow lines ▫ Metering equipment ▫ Portable generators • Separation of natural gas, crude oil, and formation water • Flaring natural gas for a period of several days to several weeks • Production of crude oil and transportation of produced crude oil from the site to markets outside of Yukon • Use of natural gas on site for power generation, tank heating, fuelling artificial lifting to assist crude oil production, or compression for re-injection of natural gas • Disposal of formation water underground in existing suspended wells, or wells suspended as part of this exploration Project
Drilling Waste Disposal	• Construction of MBC sump approximately 6.4 ha in area to dispose of drill cuttings • Disposal of drill cuttings in MBC pods approximately 300 m^3 over an area of 800 square metres (m^2) (estimated volume of drill cuttings for one well) • Disposal of approximately 200 m^3 of drilling mud in MBC and drilling fluid underground in existing suspended wells, or wells suspended as part of this exploration Project • Disposal of the following liquid waste in existing suspended wells, or wells suspended as part of this exploration Project: ▫ Formation water ▫ Saline fluids ▫ Liquid fraction of drilling fluids ▫ Rig wash
Seismic Exploration	• Up to 1,500 km^2 of 3D seismic

Project Component	Activities
	• Up to 2,000 km² of 2D seismic • Establishment of seismic survey lines • Air hammer drilling • Receiver stations and source stations • Storage (in magazines), transportation, and use (1 kg per source station) of dynamite
Well Maintenance (Workovers)	• Mobilization and installation of a service rig to the well site • Conduct maintenance to: ▫ Install, change, or modify the production flow control equipment ▫ Perforate zones of interest for EFTs ▫ Seal some or all perforations made across productive zones ▫ Re-perforate a zone or zones elsewhere in the wellbore ▫ Other routine maintenance practices to ensure optimal production performance of the producing formation
Access Roads	• Use of permitted Chance Road all-season road for Project activities • Construction of all-season access roads to well sites requiring EFT and borrow source locations ▫ Approximately 7 m in width with pullouts on average every 750 m ▫ Up to approximately 87 km total in length ▫ Clearing and mulching of vegetation ▫ Removal and stockpile of organic cover material for use in reclamation • Construction of winter access to well sites for initial well drilling and DST
Borrow Source Development	• Quarrying of approximately 1,800,000 m³ of aggregate for use in Project activities, including: ▫ Winter development of up to 23 quarries ▫ Use of approximately 450,000 m³ of aggregate for well pads ▫ Use of approximately 1,350,000 m³ of aggregate for access road construction ▫ Use of aggregate for airstrip construction ▫ Use of aggregate for Central Processing Facility construction ▫ Use of explosives • Removal and stockpile of organic cover material and silts for use in reclamation
Central Processing Facility	• Construction of central processing facility adjacent to camp • Processing facility ▫ Multi-stage and multi-phase separators ▫ Heater treaters ▫ Vapour and gas collection system to flares or to provide fuel for camp use ▫ Processing of crude oil to stabilize and meet market specs for truck transport ▫ Storage of approximately 3,180 m³ of produced crude oil ▫ Storage of approximately 119 m³ of produced (formation) water • Fuel storage facility ▫ 151 000 litres (L) diesel fuel ▫ 24 000 L propane

Project Component	Activities
	• Storage and use of chemicals and reagents: ▫ Hydrochloric acid (10% to 20% concentration) ▫ Methanol ▫ Additives to prevent corrosion ▫ Demulsifiers • Bulk explosive compound to store dynamite for use in construction of borrow sources and for seismic exploration
Airstrip	• Construction of airstrip approximately 1,500 m long at km 4 of the Chance winter road • Use of airstrip during all phases of the Project approximately 2 flights in/out per week • Storage of aviation fuel
Water Use	• Use of up to 300 m³ of water per day for making snow to build winter trails, ice roads and temporary well sites, not exceeding 10% of instantaneous flow from the following extraction points: ▫ Year-round extraction from the Eagle River and Ogilvie ▫ Seasonal extraction from Glacier Creek and Fly Camp • Use of up to 300 m³ of water per day for camp from existing onsite groundwater water well. • Construction of portable water reservoir at the camp for water storage and use during low water periods
Transportation	• Use of Dempster Highway, North and South Klondike Highway, and Alaska Highway to access Project site and to transport crude oil to potential markets • Approximate offsite traffic on public roads between the site and supply points • Onsite traffic on Proponent-controlled roads ▫ 15 to 20 truckloads over approximately 5-day period to mobilize the drill rig to each well site
Camp and Workforce	• Workforce up to 75 people during all phases of the Project • Continued use of existing permitted 75-person camp located at km 325 of the Dempster Highway ▫ Municipal waste management and disposal ▫ Sewage treatment facilities
Reclamation and Closure	• Progressive abandonment of unsuccessful wells ▫ Installation of cement plugs across all porous/permeable zones, across the base of each casing string and at surface ▫ Cutting of well casing(s) off 1 m below ground level and weld steel plates across each string ▫ recontouring and revegetation of area • Progressive decommissioning and reclamation of borrow source and quarry areas when they are no longer useful or necessary ▫ Recontouring of area and replacement of stockpiled silts and organic cover material • Well suspension and abandonment at end of Project

1.3.2 Principal Project Components

1.3.2.1 Overview

The principal Project activities are the drilling program, well testing, and seismic exploration program. The goal of the proposed drilling program is to obtain the maximum amount of information to determine the geological settings and evaluate oil and gas reserves in the Eagle Plains area. During operation, drilling will occur 24 hours per day, and 7 days per week. Chance will drill 1, possibly 2, wells at a time and up to 5 wells per year.

Initial drill stem tests (DSTs) will occur on any or all of the 30 proposed wells. Up to 5 wells could be tested each year. Chance will conduct EFT on successful wells, where hydrocarbon resources are discovered, to gather important information about the nature of the resource accumulation and its productive capability. EFT for wells with a primarily natural gas discovery may take place over a maximum period of 1 to 2 months maximum. EFT for wells with a primarily crude oil discovery may take place over a period up to 2 years. Chance may conduct up to 10 EFTs concurrently and EFTs on up to 20 wells over the life of the Project. The information obtained from the EFTs is critical to determining the future development plan for each discovery. **Table 1.2** outlines the sequence of activities in developing the well site areas.

The Proponent also intends to conduct a seismic exploration program consisting of up to 1,500 km² of 3D seismic and up to 2,000 km² of 2D seismic to identify and map oil and gas geological structures in the area. The 3D seismic program is likely going to be undertaken in a series of smaller projects, each of approximately 400 km². The 2D seismic program could be done either as one project or as a series of smaller projects. Details on the Project components and activities are provided in the following sections.

Table 1.2 Sequence of Well Development Activities

Initial Exploration Drilling		
Develop winter access trail to well site		
Develop well site approximately 1.44 ha in area		
Install surface infrastructure on well site necessary for drilling and testing exploratory well		
Drill well		
Transport and dispose of drill cuttings in MBC sump		
Conduct DSTs to determine whether successful or not in order to move on to EFT		
Move drill rig to next well site area		
If not successful	**If successful**	
	Primarily Natural Gas Discovery	**Primarily Crude Oil Discovery**
Abandon well (cement all perforated producing zones, install shallow cement plugs, and cut surface casing 1 m below normal ground surface).	Complete well (finish casing, perforate the casing, and install production flow control devices, steel tubing, and wellhead components).	Complete well (finish casing, perforate the casing, and install production flow control devices, steel tubing, and wellhead components).
Remove all surface infrastructure.	Install required surface facilities (separator vessel, heaters, dehydrators, stock tanks, flow lines,	Construct all-season access to well site.

Initial Exploration Drilling		
	metering equipment, portable generators, and flare stack).	
Remediate well site area (remove mats and gravel fill material).	Conduct EFT over period of 1 – 2 months	Install required surface facilities (separator vessel, heaters, dehydrators, stock tanks, flow lines, metering equipment, portable generators, and flare stack).
Recontour well site area and revegetate disturbed areas to natural conditions.	Measure natural gas and water from wells.	Conduct EFT over period up to 2 years
Recontour access roads and revegetate disturbed areas to natural conditions.	Conduct maintenance on well as required (work over).	Measure, store, and process crude oil, natural gas, and water from wells.
	Once EFT is, complete either 1. develop a new proposal to bring into production, or 2. decommission and abandon well.	Conduct maintenance on well as required (work over).
	Abandon well (cement all perforated producing zones, install shallow cement plugs, and cut surface casing 1 m below normal ground surface).	Transport crude oil from EFT to central processing facility then to acceptable market.
	Remove all surface infrastructure.	Once EFT is complete, either 1. prepare development plans for future assessment and regulatory review to bring into production, or 2. decommission and abandon well.
	Remediate well site area (remove mats and gravel fill material).	Abandon well (cement all perforated producing zones, install shallow cement plugs, and cut surface casing 1 m below normal ground surface).
	Recontour well site area and revegetate disturbed areas to natural conditions.	Remove all surface infrastructure.
	Recontour access roads and revegetate disturbed areas to natural conditions.	Remediate well site area (remove mats and gravel fill material).
		Recontour well site area and revegetate disturbed areas to natural conditions.
		Recontour access roads and revegetate disturbed areas to natural conditions.

1.3.2.2 Exploration Well Drilling Program

Establishment of Well Sites and Drilling

Chance will establish up to 30 well sites, each approximately 1.44 ha in size within the overall Project area (approximately 2,400 km²). Total approximate disturbance for well site locations will be up to 43.2 ha if all 30 wells are drilled. Exact well locations and sequencing cannot be determined at this time as they are dependent on seismic data interpretation, drilling results, EFT results, weather, and local surface conditions and other environmental factors. The Proponent is continuing the ongoing process of interpreting seismic data to better understand the geological setting, size, and geometry of potential prospects. Each well drilled will add to that understanding.

Generally, well sites will be located on the heights of land. Criteria for well site locations include the following:

- Avoidance of areas with challenging permafrost conditions and ecologically sensitive areas such as riparian corridors, wetlands, steep slopes, old growth forest, and critical wildlife habitat and permafrost features.
- No drilling within 45 m of a perennial watercourse
- Avoidance of areas identified with heritage values (noted as “avoidance areas”) in the Heritage Resource Overview Assessment and Heritage Resource Impact Assessment (Matrix 2013).
- Requirements from the Yukon *Oil and Gas Act*, SY 2019, c.6 (YOGA) and the Oil and Gas Drilling and Production Regulations.

Drill Program

The first of the exploratory wells will be drilled in winter commencing around mid-January 2021. Pre-drilling preparation will entail building winter trails to gain access to the first selected well sites and to build access roads and the leases to accommodate the mobilization and setup of the drilling rig. Winter road and lease building can only commence once there is the 10 cm of snow cover required to facilitate construction. Based on historical trends, this could occur as early as December or as late as mid- to late January in any year.

Summer well sites may be established if there is already a year-round access road built nearby to service a well or wells undergoing EFT. Summer well sites will allow the Proponent to extend the drilling season into the summer if new wells can be drilled within a few kilometres of an existing road. A summer well site will require all-season access to the site.

Once established, the well site will contain the drill rig, flare stack, rig trailers, and office trailers and will provide sleeping capacity for the required number of key people to stay at the rig full time. Each well site will be approximately 1.44 ha in size to facilitate drilling and any subsequent EFTs. The amount of clearing will be kept to a minimum.

The well site dimensions should be adequate for advancing to a possible production operation in the future and therefore should accommodate all field production equipment.

Winter Matting Use

Matting for winter operations will be used when a) the ground is too uneven, b) it may not be possible to level the lease using earth-moving equipment and when the ground may not be competent enough to support the heavy rig loads, or c) when it is not possible to level the ground by laying down a base of gravel or soils. Matting may be used in drilling operations to reduce ground surface disturbance and distribute the ground pressure of equipment. Matting may also be used to stabilize the drill rig to provide insulation and protection to the snow and ground surface. Matting will not be used on the proposed roads.

The Proponent intends that well sites would be built with fill material from other well sites or from borrow sources. Should matting be used, it may cover the entire well site area (several locations of 1.44 ha) or the area immediately adjacent to where a drilling rig may be placed.

Well sites will be levelled by bringing in material such as gravel, or possibly snow for packing and then icing. An impermeable liner will then be laid on top of the pad, followed by wooden rig mats that interlock. Rig mats are approximately 16 feet by 8 feet in area, though there is some variance from one manufacturer to another.

Any matting used for this Project will be designed to support heavy loads and distribute the weight over large surface areas. The use of matting is a common practice for oil and gas drilling operations in northern locations. Any matting used for this Project will be placed on the frozen ground with snowpack and removed before spring melt.

The well site area adjacent to where the rig is situated and the road access will be matted if an unprecedented early melt occurs. In the event of an unprecedented early melt, rig equipment will be “leapfrogged” along the access road to support equipment and protect the vegetative mat as the rig is being demobilized and on its way out from the well site location. If leases are not constructed from densified fill material, equipment will remain on matted surfaces at all times in the event of early melt conditions.

Mats currently placed on previous well locations are periodically inspected for any movement or deterioration that could affect their ability to support intended loads. All matted well sites are maintained as much as possible because suspended wells must be usable by Chance in future exploratory and appraisal programs.

Summer Matting Use

The laying of matting in summer first requires the frozen level ground to be insulated with an impermeable textile layer. Laying matting early, before the thaw, ensures vegetation is not yet active and may be covered by a layer of snow or frozen soil. The Proponent plans to drill summer wells (following early exploratory successes from the winter wells) by constructing gravel pads of sufficient thickness to facilitate levelling and a firm base to support drilling loads.

The Proponent will likely use double-matting procedures where required to provide a stable, level surface on a summer location if the terrain is uneven. If double matting is used, the upper layer of mats can be lifted independently while the lower mats are left in place if frost adhesion is evident.

The Proponent expects future leases for well sites will be constructed from a more durable borrow site fill material of a suitable thickness to protect and insulate the permafrost and provide a safe and stable working surface for the drilling and subsequent extended flow testing. Should any well also become a long-term producer, the lease condition will be expected to endure for a longer term of several more years.

Geotextile membrane would only be applied over the vegetation surface as an option for locally levelling terrain. This would be necessary if double matting techniques were not possible as a solution for stabilizing mats on the vegetation surface. Geotextile will be used when:

- Levelling using fill material on top of natural vegetation could compromise the stability of the surface under loads.
- Levelling by double matting is not the best solution in the circumstances.
- Geotextile use would help protect vegetation or be a valuable aid in site clean-up.

Geotextile may be used prior to application of fill to level part of the drill site or access route, which could involve applying a minimal thickness of granular material (local rock or soil fill).

The Proponent retained EBA Engineering Consultants Ltd. (EBA) in 2008 to provide permafrost, soil, and vegetation expertise to evaluate the proposed use of industrial wooden mats for summer access. Tetra Tech/EBA (the successor company to EBA) or a similarly qualified individual or firm will be required to perform site-specific geotechnical pre-drilling investigations to confirm amounts of fill required and the proper placement of fill material to support the anticipated rig loads in accordance with good engineering practices.

Well Site Surface Infrastructure

The Proponent plans to use a drill rig with similar characteristics to Chance Rig #1 as presented in past assessments. The rig is capable of drilling to depths of up to 2,500 m. A normal rate of drilling would be to drill 1 well at a time during this exploratory phase.

Figure 1.2 illustrates the general layout of the proposed well site. The rig is designed to fit on a much smaller layout, but the planned 1.44 ha (120 m × 120 m) square layout is designed to accommodate not only the drilling operation but also the well completion and EFT equipment, and to preserve setback distances from surrounding vegetation and from personnel working and sleeping quarters. Note that the final area may not be square since the area will depend on topographical constraints. However, the total area for a well site will be approximately 1.44 ha. The rig layout depicted would likely be for a winter drilling operation distinguished by the number of boilers onsite. Boilers are used extensively in very cold or Arctic climates for preventing equipment and drilling fluids from freezing Arctic temperatures. **Table 1.3** provides a description of the drill rig components identified in **Figure 1.2**.

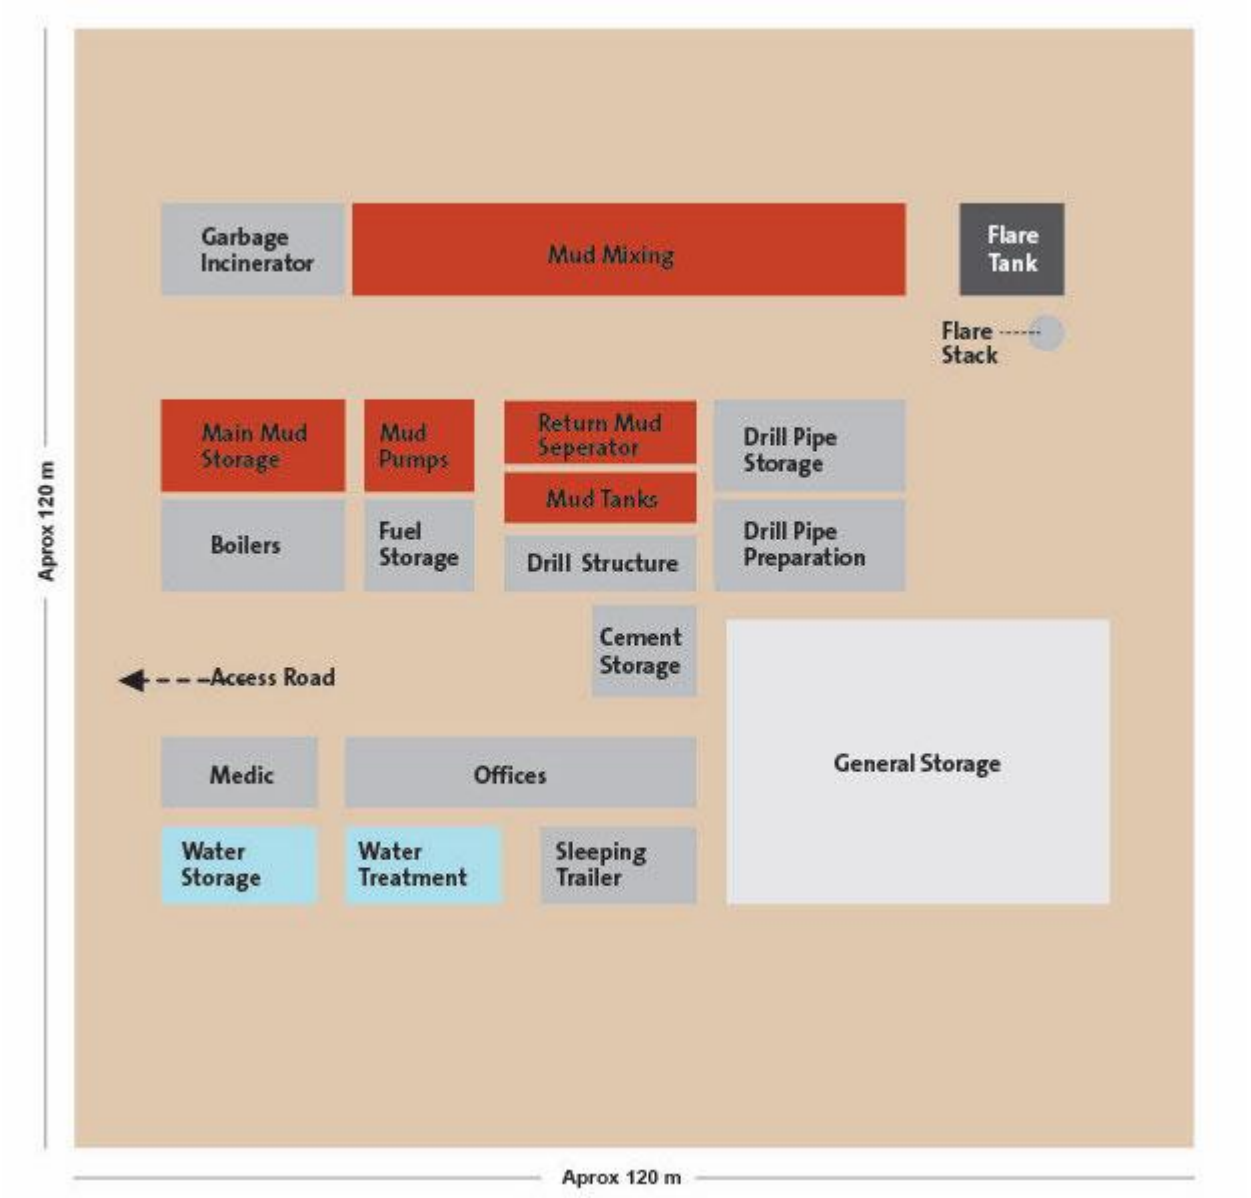

Figure 1.2 General Layout of a Well Site

Table 1.3 Well Site Components Shown on Figure 1-3

Component	Description
Boilers	Used extensively in very cold and Arctic climates for preventing equipment and drilling fluids from freezing Arctic temperatures.
Cement	Cement storage and mixing for use in wells.
Medic, Offices, and Sleeping Trailer	Essential personnel trailers which serve as offices as well as sleeping quarters and include a multi-room sleeper for some of the rig crew.

Component	Description
Flare Tank and Flare	Flare used to incinerate combustible fluids from the well. The flare tank is a reservoir to ensure the flare does not starve of combustible fluids.
Fuel Storage	Fuel for use on well site for equipment including drill rig, pumps, generators, etc.
Garbage and Incinerator	Storage area for waste and incinerator to dispose of food waste.
General Storage	Storage and laydown area for equipment needed onsite.
Mud Tanks	Tanks where all the surface mud volume is stored. Section 31 of the Drilling and Production Regulations under YOGA (Government of Yukon 2004) stipulates that the "combined capacity of the drilling fluid tanks of every fluid system must not be less than the greater of 120 m^3 and 50% excess of the volume of the wellbore."
Main Mud Storage	Location where all the mud materials are stored. Normally these materials are delivered on pallets neatly stacked and shrink wrapped to protect them during the truck journey north.
Drill Pipe Storage	Receptacle in which drill pipe is stored until required to be run in the hole.
Mud Mixing	Tank in which certain mud products are first hydrated to render them miscible with the fluid phase of the mud. Products such as bentonite clay, for example, require a caustic soda solution to neutralize the ionic attraction forces between clay flakes, allowing the water to lose its surface tension and to completely wet the flakes.
Mud Tanks	Large tanks, normally upright, fully enclosed and pressurized, where cement or bulk mud products are stored. Cement or barite (drilling mud weighting material) are pneumatically pumped from the P Tank into a smaller surge tank and then to the cementing unit or, alternatively, to the mixing or premix tank to enter the mud system.
Mud Pumps	Pumps used to circulate the drilling mud down the drill pipe, around the drill bit, and up the annular space between the drill pipe and the open hole or casing to surface.
Return Mud Separator	Area where the return mud separator known as a shale shaker is housed. The CF is the centrifuge that uses centrifugal force through high-speed rotation to separate the fluid part of the mud from the solids.
Drill Structure	Components required to drill the well, including: • Sub-structure, or base, to which the derrick is fixed • Derrick that supports the draw works and top drive • Top drive that is a mechanical, electrically powered linking device that attaches to the pipe in the hole and rotates it when drilling while simultaneously pumping drilling mud through the drill pipe and out of the drill bit at the bottom end • Draw works that lifts and lowers the travelling block in the derrick/mast to run pipe in and out of the hole • Blowout preventers, which are a series of closing valves that can hydraulically shut in a well in the event of unplanned influxes of formation fluids into the wellbore
Water Storage and Water Treatment	Water storage tank and treatment containers to provide potable water for the rig crew and personnel.

Any well site is an industrial area and therefore has restricted entry requirements, allowing entry to only authorized personnel wearing personal protective equipment (coveralls, steel-toed boots, hard hat, gloves, and safety glasses).

Figure 1.3 and **Figure 1.4** show the rig set up at the Chance camp located at km 325 of the Dempster Highway.

Figure 1.3 Chance Rig #1

Figure 1.4 Chance Rig #1 and Chance Camp at km 325 of the Dempster Highway

Drilling Operations

Well sites will be designed and constructed to support the rig and ancillary equipment positioned on them. The well site locations will be determined based on geotechnical assessments. Because construction will use borrow source fill, the well sites will be able to accommodate the drilling, EFT, and eventual production phases of well operating life. The lease area will be sized to fully accommodate a purpose-designed well pad, process facilities, and possible service rig equipment spreads that may follow in the future. Eagle Plains well sites and well design will incorporate the following key features to enhance efficiencies and reduce waste and general impact to the surroundings:

- The rig will use the minimal number of casings necessary to reach the projected total depth of approximately 2,500 m. The schematic well profile shown in Figure 1.5 illustrates a cross-section of the casing run, including annular cementation and other well features together with drilling equipment. For reference, the well casing program will typically comprise the following elements:
  - Conductor of 13-3/8-inch diameter to approximately 25 m below ground level, cemented to surface.
  - Surface casing of 9-5/8-inch diameter to approximately 400 m below ground level, cemented to surface.
  - Production casing of 7-inch diameter either to total depth or to just above the top of the Hart River formation at circa 1600 m, to comply with Yukon's Drilling and Production Regulations requirement of not more than 25% of open hole remaining uncased at any time (Drilling and Production Regulations Section 55-(1) (c) (i)). This casing will also be cemented to surface.
  - 4-1/2-inch liner to total depth at 2,200 m, cemented with a minimum 100 m overlap into the previous casing.
- The nominal diameter of the casings (all selected to remain industry standard dimensions) will reduce the size of holes drilled and of drill cuttings generated. For example, a 3,500 m exploratory well would typically produce 400 to 500 metric tons of cuttings. Less than 150 metric tons will be produced for the typical exploratory well depth of 2,200 m proposed at Eagle Plains.
- A water-based mud system will be developed and managed by a specialized service contractor with comprehensive knowledge of the Alberta Energy Regulator (AER) Directive 50 requirements as they pertain to the Yukon jurisdiction being operated in.
- All requirements in Sections 26 to 65 of the Drilling and Production Regulations (covering well design, casing design, groundwater protection, mud products, blowout prevention and choke/kill systems, fire detection and gas detection systems, safety of personnel, mitigation of operations impact, and more) will be either met or exceeded in the design, selection, and deployment of materials.
- The Yukon Oil & Gas drilling and production regulator will review proposed drilling design and planned operations procedures, as well as the health, safety, and environment policies and manual; oil spill contingency plans; and emergency response plans. Any perceived or identified deficiencies will be discussed, addressed and reported back to the regulator to confirm what action had been or needs to be taken before operations can proceed.
- The Proponent will enforce compliance on all third-party service suppliers to ensure that (1) their health, safety, and environment management systems address all regulatory requirements in personnel training and skill development; (2) personal protection equipment provided to workers

meets all Canadian Standards Association and international safety standards; and (3) supervisors are knowledgeable about operational standards related to health, safety, and environment. Periodic inspections and audits will be performed by Chance company representatives while operations are mobilized and ongoing at well sites.

- All wells will be drilled as "keepers" to facilitate EFTs and/or to become early producers in the event the Project advances to a full development. The only wells likely to be abandoned would be unsuccessful (dry) wells with no potential to be used as water or gas disposal wells.
- Leases will be designed and constructed to contain any fluid runoff into purpose-built collection ditches for recovery and disposal. A non-permeable layer will be laid during lease / well pad construction to prevent any seepage into the natural ground layer below the fill material pad.
- Rig deployment will ensure any rig wash; drilling, cementing, or DSTs fluids will be contained and recovered at all times.
- The standard and proven drilling method proposed has many advantages, including the following:
  - Large volumes of water will not be required for the drilling process because of the use of solids control equipment allows recycling of the majority of drilling fluid. Chance Rig #1 normally consumes approximately 15 m³ water per operating day averaged over the duration of the well being drilled.
  - Minimal volumes of water are expected to be lost into the formation. The Proponent's experience drilling to these depths confirms this. Studies of other offset/nearby wells also confirm this expectation.
  - In the event that hydrocarbons are encountered, they will be controlled by the drilling mud contained in the hole; as a secondary barrier, the blowout preventer system will comprise two or more rams to fully close in the well within seconds of detecting an influx into the wellbore.
  - In the unlikely event that abnormally pressured zones are encountered (all formations to be encountered in the proposed program have been previously drilled in past wells A-25, H-28 and B-73 and no overpressures have been experienced or detected), the Proponent has designed a comprehensive drilling fluids management, casing, and blow-out prevention system to control such occurrences. Well conditions and all pressure parameters are constantly monitored and detected first by the frontline drill crew members (driller constantly on the drilling control brake, mudman aided by the well monitoring personnel constantly viewing and responding to sensor responses). As an added backup, electronic detection alarms are set to trip when very small influxes occur.

Chance Rig #1 is approved to have a Class IV BOP system, which in Yukon Drilling and Production Regulations Section 33 (1) (d) permits the rig to drill wells between 1,800 m and less than 3,600 m and is rated for 21,000 kilopascals (kPa) (3,000 psi) working pressure (Drilling and Production Regulations Section 33 (2) (c)).

Drill crews, by professional training and enforced by regulatory requirement, must be fully trained and certified in blowout prevention and well control. Crews undergo simulated drills at each shift on a 2-shift, 24-hour work rotation. During these drills, the response and efficiency of drill crews are evaluated. The equipment is also evaluated, and any deficiencies are corrected immediately following the drills. Drill crew

and well supervisor well control / blowout prevention / hydrogen sulphide certificates are normally inspected by a visiting inspector to confirm compliance at all times when operating.

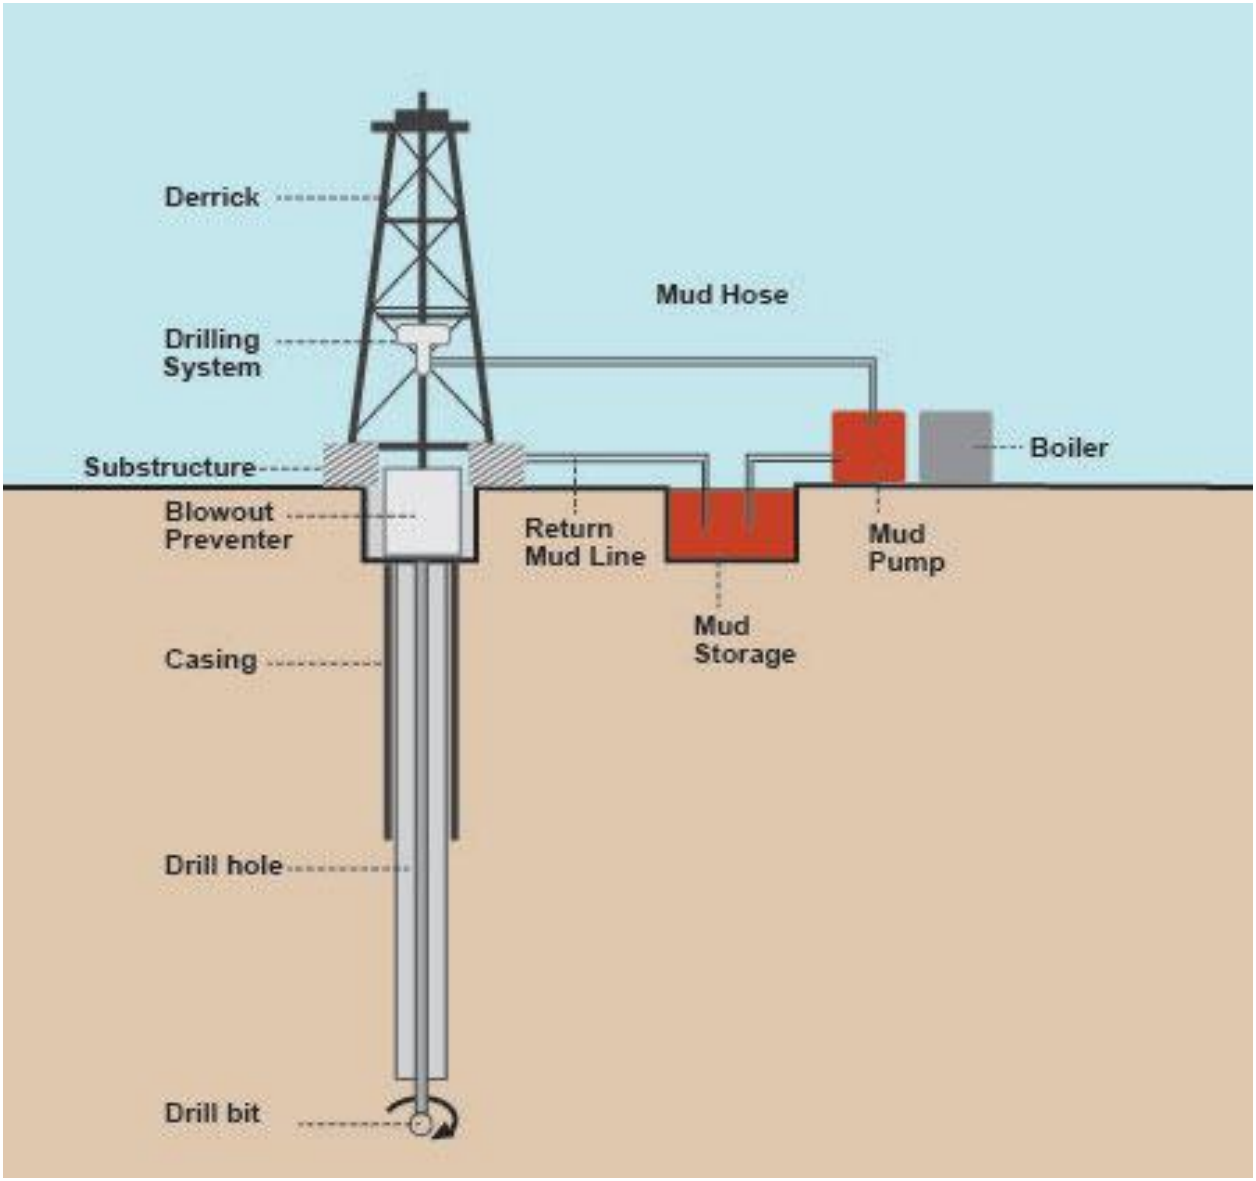

Figure 1.5 Well Profile

Drilling Fluids

Drilling fluid (or mud) is a vital component used in drilling oil, gas, and water wells. The drilling fluid system being currently researched for evaluation will be low-toxicity water-based drilling system similar to those in extensive use in other parts of western Canada. The supplier of any system will be assessed on previous comparative experience and required to pay great attention to mud system drilling performance and enhance ease of disposal to the highest standards demanded by AER Directive 50 for chemical constituents, dissolved salts, minimal oils, miscibility with native soils, and other characteristics.

A typical water-based mud system may be one of the following:

- Weighted (low-solids, non-dispersed) mud
- Glycol/glycerol mud system
- Saturated salt water mud (using sodium chloride, i.e., common salt)
- Calcium-based mud.

The list of typical mud formulations above covers a wide range of basic muds suitable for drilling in relatively benign (non-active clay), low-temperature environments. Simple muds comprise bentonite clay, caustic soda, shale inhibitors (common salt, hydrated gypsum, or lime) all well mixed together to help lift drill cuttings as well as minor additives to prevent drilling equipment corrosion, balance acidity or pH, permit the removal of drilled solids, and keep the ingredients in a slurry rather than separating or flocculating.

The Proponent has used a gel/chemical system on E-78, a relatively shallow well (approximately 1,000 m total depth). This system is used extensively in western Canada and exhibits the low-toxicity features desired for the proposed exploratory program. However, there remains the need to perform compatibility tests or analyses to confirm its suitability for drilling to 2,200 metres at Eagle Plains.

The Proponent is undertaking interviews and expanded discussions with a select number of well-established medium-sized mud services suppliers in conjunction with cuttings disposal specialists, all very active in other drilling jurisdictions. A mud services scope of work will emerge from these discussions to request proposals for providing the service for all exploratory wells. Once the system is designed and validated, all drilling mud characteristics, , such as mineralogy, lithology, pH levels, and others, will be known and can be disseminated to Yukon regulators.

The main function of drilling fluid is to over-balance the well pressure to ensure that the pressure in the wellbore is higher than the pressures expected to be encountered from the various geological formations as the drill bit penetrates them. The drilling fluid prevents formation fluids from entering the wellbore, keeps the drill bit cool and lubricated, circulates out drill cuttings, and keep in fluid suspension the drill cuttings during periods when drilling is paused or when the drilling assembly is cycled in and out of the hole. Drilling fluid is selected to provide operational efficiency, minimize formation damage, reduce corrosion, and minimize environmental impact for handling and disposal.

Project operations will utilize drilling practices that minimize the volume of drill cuttings and drilling waste generated. This minimization will in large part be due to drilling smaller-diameter holes to what will be a relatively shallow total depth. Drilling waste is composed of rock chips and cuttings and the drilling fluid that is recirculated. The drill fluid returned to the surface is sent through a shale shaker and centrifuge where the drill cuttings are separated and have most of the mud removed. The liquid fraction from the separation will be returned to the active tankage system for reuse.

Flaring

Flaring of gases during the drill stem testing part of well evaluation is a widely applied activity. The process, however, can only be undertaken in compliance with rigid regulatory controls. The requirements establish that the flare line must originate downstream of the choke manifold, must be designed to prevent the accumulation of any fluid within the line, and must be properly installed and anchored. Any amount of gas

encountered would be circulated through the rig degasser system to remove it from the drilling mud, thereby rendering the mud safe to pump back into the wellbore. Larger volumes of gas may be control-burned through the flare stack according the flare permit issued by Yukon Oil & Gas.

An example of a typical well site flare layout is illustrated below (**Figure 1.6**). Normally the flare line from the Choke Manifold is connected to the Flare Stack inlet to permit the directing of the gas to the flare until total control in terms of flow rate and flow pressures.

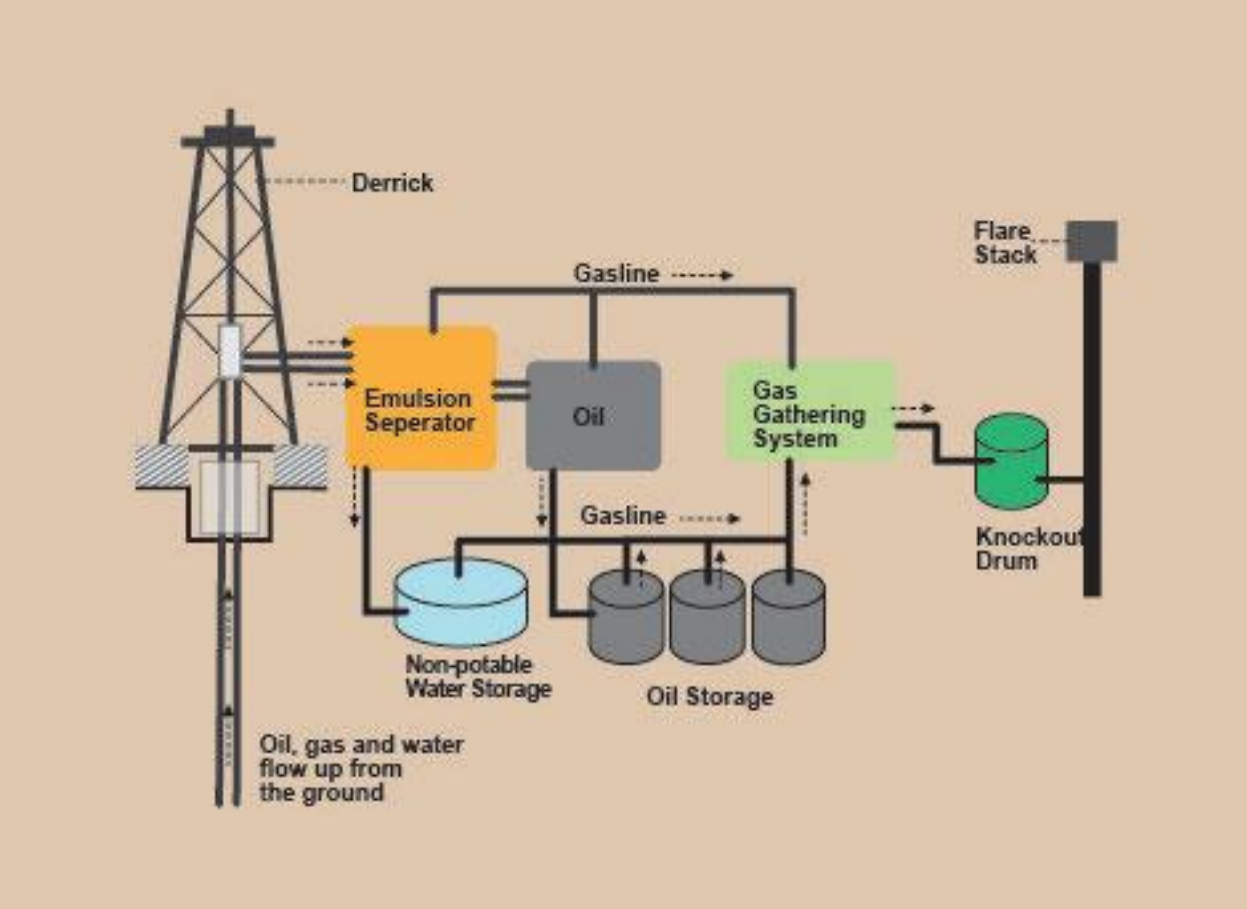

Figure 1.6 Typical Flare Stack and Gas/Vapour Recovery Flowsheet

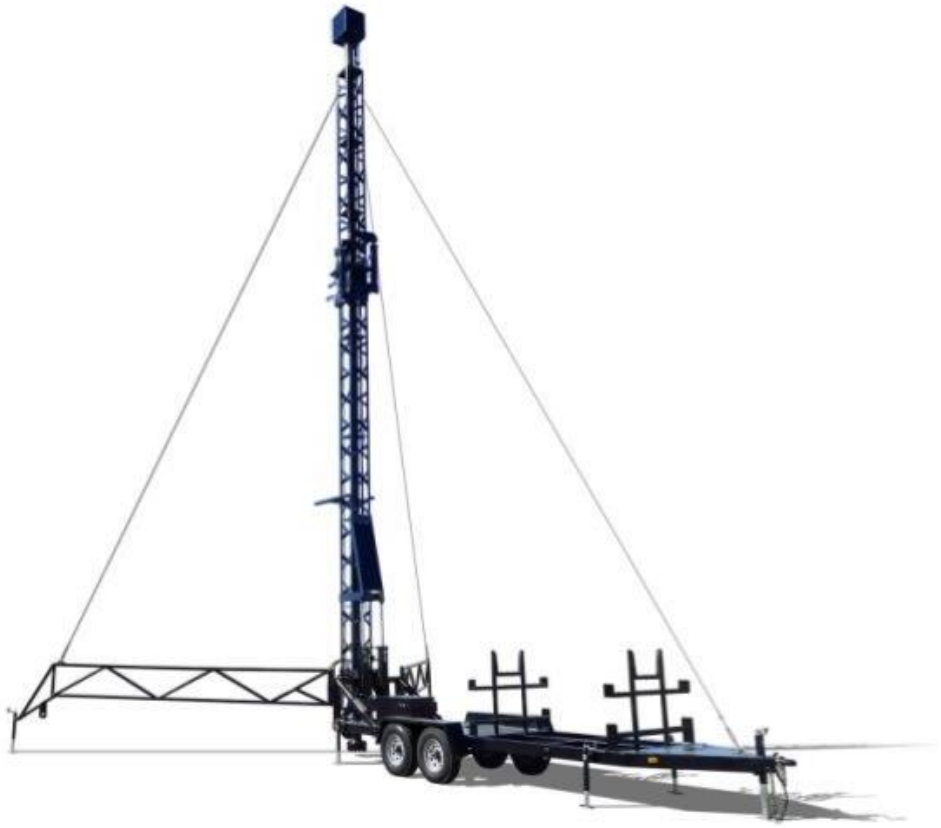

Figure 3-11 Typical Portable Rig Flare Stack Unit

Figure 1.7 Typical Flare Stack Unit on a Portable Rig.

It is expected that the targeted formations will produce less gas than in the past. Newly drilled wells will not contain the anaerobic bacterial contamination present in some of the older wells which may have caused small amounts of H_2S to be present.

The Proponent has not flared gases during the previous exploration programs; however it is likely to occur during some of the flow test operations until a use is found for the gas (heating, power generation, re-injection in a formation etc.).

In the event flaring is necessary, the flare will be higher than the surrounding area and designed to be well above vegetation or trees for example (both specific references made in the YOGA Drilling and Production Regulations quoted earlier). Noise from flaring normally only occurs when very large volumes of high pressure natural gas are being flared.

Flaring would only occur over a period of a maximum 1 day while conducting a DSTs at the end of a drilling program of one well. During extended flow testing, flaring may be necessary for between a few days to a few weeks. After that time actions would be taken to utilize the gas for power generation, tank heating or

possibly, gas lifting to assist crude oil production or re-injection. It would be the intent to eliminate gas flaring and reduce gas emissions to very small amounts when unavoidable.

The Oil and Gas group of Yukon Government's Department of Energy, Mines and Resources has adopted the AER Directive 50 – Drilling Waste Management (as recently amended and updated) procedures for the disposal of drilling wastes within the Yukon. The Proponent will manage the operation in accordance with the MBC requirements of AER Directive 50 – Drilling Waste Management for the remote sump locations and/or Alberta Forestry's "Drilling Waste Management, Disposal on Licence of Occupation" for the LWD disposal method (AER 2016).

It is not anticipated that significant levels of residue chemicals will be deposited on terrestrial and aquatic environmental components. The flare stack will be at 10 m high to assist in air dispersal of combustible end products and will be positioned on the well site in accordance with the regulated spacing requirements. All flaring processes will be in accordance with the air emission permit regulations and best practices.

To ensure that vegetation and soil are not be impacted by residual chemicals, the site design will include an appropriate spacing between the flare stack and any vegetation. Vegetation and soil samples will be taken adjacent and downwind (prevalent) and analyzed for identified chemicals of concern. These lab results will be compared to results obtained from control vegetation and soil samples taken at a similar ecosite, but not near the influence of flaring. Visual monitoring will occur throughout flaring period to ensure safety and protection of nearby vegetation.

YOG Drilling & Production Regulations specify these parameter in Part 9 of the Regulations: In summary the flarestack has to meet the following requirements (Note: operations when flaring will be conducted in full compliance with these requirements):

Flare requirements

128. Unless otherwise approved or directed by the Chief Operations Officer, any gas that is flared will be discharged from a flare stack that:

(a) is at least
    (i) 50 metres from any well, treater, separator, compressor, crude oil storage tank or any other unprotected source of ignitable vapours
    (ii) 80 metres from any right-of-way, easement, road, public utility, building, installation, works, place of public concourse or any reservation for national defence, except only when there may exist special circumstances that, in the opinion of the Chief Operations Officer, justify the positioning of the stack at a greater or lesser distance
(b) is adequately anchored and suitably protected against freezing
(c) is designed to ensure flame stability and efficient combustion
(d) is of sufficient height and diameter to ensure
    (i) that the average concentrations of hydrogen sulphide and sulphur dioxide in the ambient air do not exceed limits specified under the Occupational Health and Safety Act
    (ii) that vegetation combustion is prevented by maintaining an area free of vegetation and combustible debris around the base of the flare stack or the end of the flare line to the following minimum distances:

(A) 10 metres or 1.5 times the stack height, whichever is greater, in cultivated areas

(B) 30 metres or 2.5 times the stack height, whichever is greater, in forested areas

(C) 1.5 times the stack height, in any other area

(ii) that a minimum stack height of 2.5 times the height of the highest third party building located within a distance equal to 5 times the height of the building is maintained

(iii) that any heat generated around the base of the stack does not exceed the manufacturer's specifications for any equipment situated there, to a maximum of 4.73 kW/m²

(e) (e) has a sufficient exit velocity and is provided with guards or other features to prevent extinction of the flame

(f) (f) if the gas flow is intermittent, is provided with an ignition device to ensure continuous ignition of any gases.

Cement Plugs and Permafrost

Cement is a chemical mixture which reacts with and changes form when mixed with water. The reaction gives off heat when mixed with water. As the reaction progresses, the cement hardens. Cementing casing to attain the desired minimum hardness to withstand 500 psi (approximately 3,500 kPa) takes 6-8 hours depending on the amount of accelerator or retarder compound is mixed with the cement. This setting pressure permits the pressure testing of the casing within 12 hours of the cement job concluding to reach 80% of the casing internal yield pressure to confirm pressure integrity. Production casing for example, has an internal yield strength of 56,260 kPa (8160 psi); so 80 % test pressure would be 6525 psi or 45,000 kPa.

Permafrost cement (also named Arcticset or Polarset Cement by different suppliers) is manufactured reduce the amount of heat released during the reaction caused by mixing cement with water by adding Silica Flour mainly. When the cement is mixed with water the reaction proceeds with minimal heat generation and therefore does not contribute to permafrost degradation.

Typical oilfield cements, when mixed with water and begin to set, produce substantial levels of heat, known as the heat of hydration. This heat can melt the permafrost in the near wellbore region. Permafrost cements are a specific mixture of typical oilfield cement (Portland Cements) with additives such as gypsum and/or Calcium sulphate. This blend is specifically designed to create cement that, when mixed with water and begins to set, produces no increase in temperature of the slurry (no additional heat of hydration). This eliminates any permafrost degradation.

Permafrost cement is normally only used for the Surface Casing which is installed to protect any shallow aquifers and permafrost. The Proponent plans to install Surface Casing to a depth of 400 metres at minimum.

1.3.2.3 Drill Stem Testing

All well testing will be performed with the Guidance of AER, Directive 034: Well Testing, Theory and Practice and in consultation with Yukon Government's Energy, Mines and Resources- Oil and Gas Branch. As well, the Proponent will follow related non-discretionary legislations, such as the Drilling and Production Regulations. Part 5 of this Regulation provides detail on well evaluation and testing requirements.

Depending on analysis of rock cuttings, fluid measurements made during the drilling operation, and the well log results, it may be desirable to test prospective zones prior to drilling deeper or running casing. In these cases, a DST is commonly done. Drill stem testing or well flow tests are conducted through a special string of drill pipe anchored at the bottom of the well just above the target zone. The drill pipe would be made up to a packer that isolates the zone from the rest of the well and which would be mechanically fixed to the side wall of the wellbore A special annular pressure operated valve is placed above the packer and with either a small amount of fluid (e.g. water, diesel or other light density fluid) or with the pipe mostly empty of liquid to promote immediate flow from the formation in a controlled manner.

The surface end of the pipe would be connected to a well head made up of a series of valves to control flow and direct it where the operator requires but always with complete control. From the well head, the fluids from the well are carried by surface flow lines to a test separator. The separator splits the fluid mixture into its component elements which could be some combination of crude oil, natural gas and formation water, each stream of which is accurately measured by flow meters, to confirm the volume, pressure, temperature and rate of flow. From the separator, the crude oil stream is sent to a holding tank, the natural gas flows to the choke manifold to the approved flare or other pre-determined place (e.g. burned for heat, power or injected into an appropriate formation below ground) and the water would be filtered or treated in some manner to make is usable elsewhere or pumped back into an approved disposal well (most likely an existing suspended well in the area) in a similar manner as natural gas being injected in a suitable formation.

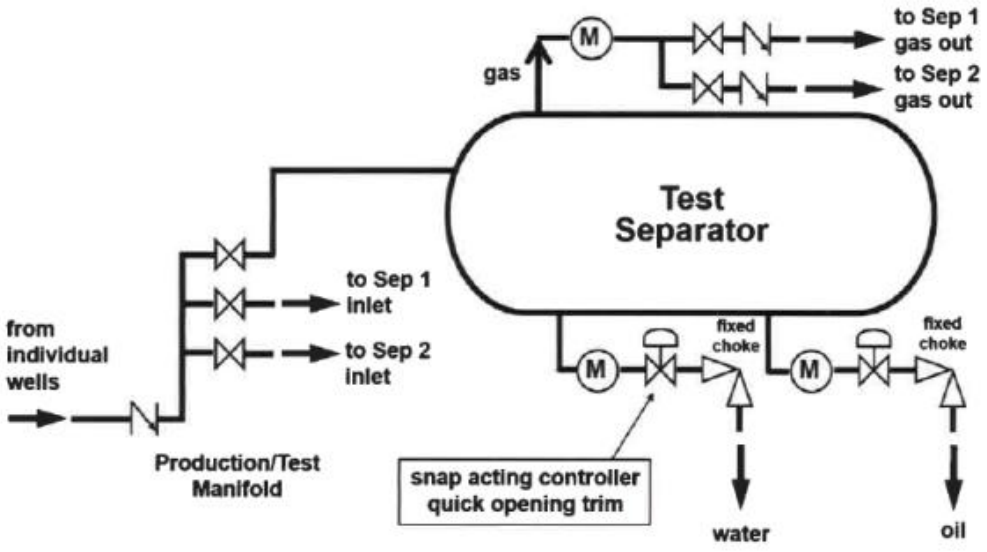

Figure 1.8 Typical Test Separator Schematic

The test separator (**Figure 1.8**) is kept operational permanently in every processing facility. This enables plant operators to assess the performance of the operation periodically. Outflow from the test separator normally is directed to a Central Processing Facility to join production from other wells. Separated natural gas may be piped to a dehydration vessel for future use as fuel or for injection downhole in a suitable well formation.

A typical operational sequence of DST is:

- Well is logged using various diagnostic tools and intervals for testing are selected.
- Test equipment is connected to the end of drill string and run into the well bor. The test equipment, generally consists of one or two packers for isolating the perforated intervals (to be tested), an annular pressure controlled downhole valve to open and shut in the well test and pressure gauges to measure the bottom flowing and shut-in pressures.
- Surface flow lines carry the fluids produced during the test from the wellhead (or surface test tree) to a test separator, where any natural gas is separated and either flared or utilized as fuel and any crude oil is separated and stored in tanks located onsite.
- A cushion of fluid contained in the drill pipe to initially ensure back pressure on the formation, which may be required to control initial flow rates.
- Once the test string is positioned at the zone to be tested, the packer is set and the down hole valve is opened to allow formation fluids to flow into the drill string.
- Initially, the well flows for relatively short period of time to clean up the wells (normally, this period may be a few hours). Following this period, flow is temporarily shut in downhole and a pressure buildup is recorded (with the initial shut-in period lasting for a period lasting 2 or 3 times the initial flow period).
- The test zone is now ready to be flowed at constant or variable rates, with each constant flow period normally followed by a shut-in period.
- Before concluding the series of test rates, bottom hole and surface samples are collected.

At the conclusion of the test, the tools are closed, packers unset and any samples within the drill pipe reverse circulated to surface. Formation fluids that may be produced during a successful test are piped into a test separator with produced gas being metered then flared and oil and/or water stored in sealed tanks.

Samples are taken of all fluids for analysis (both Pressure Volume Temperature samples under the flowing reservoir pressure, temperature conditions and atmospheric samples to check for “base sediments and water characteristics of the produced fluid”). A normal DST duration is approximately a few hours, not including the time required to make up the tools and run pipe to depth and do the reverse on completion. In addition to the time required to flow the well is an even longer period with the well shut in to determine the time it takes for the formation pressure to fully recover to pre-tests levels.

Depending on well log results, sample analysis and potential DST results, the decision is made either to abandon or case the well for further evaluation. In the former event, cement plugs are run using open-ended drill pipe across all porous/permeable zones, across the base of each casing string and at surface, the well casing(s) are cut off 1 m below ground level and steel plates welded across each string, a well sign is erected and the well site returned to original contours and re-vegetated, all pursuant to various oil and gas and land use regulations (all actions in compliance with Sections 90 to 96 of the YOGA Drilling and Production Regulations).

For each DST (minimum one per successful well unless several discrete zones require testing) one well flow should be sufficient and 30 in total days for 30 well DSTs would be typical. Should there be more than one prospective/productive formation which is separate from the other, a second (or more) DST will be

conducted on that formation. In some cases, a DST may need to re-done if there is a misrun. In addition, the DSTs may or may not be done in a steady sequence. Sequencing will depend on where the zones of interest are found in relation to the various casing strings that could be set as the well is being drilled.

Further Testing Details

The DST guidelines outlined in Enform IRP 4 are intended to ensure that safe work procedures are in place and to "minimize the probability of either the mechanical or human systems failing during a test, as well as establishing minimum health, safety and operating standards". In addition, they are "designed to allow flexibility and must be used in conjunction with competent technical judgment".

The exploration wells to be drilled may encounter hydrocarbon bearing zones that could be evaluated by conducting a DST (or DSTs). If DSTs are conducted a plan and testing procedures program will be in place, prior to conducting the test. The plan will be specific to the formation to be tested and the wellbore conditions existing at that time. The plan will be designed to ensure the safety of personnel and equipment and will provide for handling of any fluids that may be recovered. Enform IRP 4 guidelines are one of the sources that will be referenced in preparation of the plan.

Although the Proponent is the only operator currently active in the Eagle Plains basin, there have been several other operators in the past. The records of the historic wells in the basin are available on the website of Yukon Oil and Gas Resources. Nearly 200 DSTs were conducted on approximately 28 wells in the Eagle Plains during the period from 1960 to 2005. To our knowledge, there were no incidents where these tests had any adverse impact on the environment or presented any operational problems. Drill stem tests are a common method of evaluating potential hydrocarbon intervals in exploration wells and have been performed for over 60 years. They are usually of short duration. Flow periods are usually only 1 to 4 hours in duration, and seldom more than one day. The procedures for handling any produced hydrocarbons, and other fluids are the same as for any other operations conducted on the wells.

Three of the wells drilled in the Eagle Plains basin have had one, or more, acid stimulation treatments performed. One of these treatments was conducted by the Proponent. Records of these treatments are available on the Yukon Oil and Gas Resources website. These treatments are usually of small volume where the acid required for the stimulation treatment is transported in a single truck, and the treatment is performed in a single day. The fluid management practices utilized, as for other operations conducted on the well, prevent the release of any fluids to the environment.

Specific details of past drilling experiences can be found on the Yukon Oil and Gas Online Information Site: (http://maps.gov.yk.ca/imf.jsp?site=OilandGas_wells). For reference: the Proponent's comprehensive casing designs and rig and blow-out prevention system conforms fully to the YOGA (http://www.emr.gov.yk.ca/oilandgas/pdf/unofficial_office_consolidation_oil_and_gas.pdf), and the Drilling and Production Regulations (Sections 33- 61) (http://www.gov.yk.ca/legislation/regs/oic2004_158.pdf).

Further details of the Proponent's system configuration are confidential as per Section 176 (4) of the Yukon Oil and Gas Regulations. This section outlines what information is required to be non-confidential.

In consideration of the above text, it is not possible to accurately determine the number of DSTs that may be conducted at a well site. A more accurate estimation can only be determined after initial work occurs

which will inform Chance personnel of the geology, potential of oil and gas reserves. Plans for all DSTs will be based on well results and will be discussed with the Oil and Gas Resources branch of the Yukon Department of Energy, Mines and Resources.

Swabbing

There is the possibility that any well may be swabbed (normally a service/work over operation). Swabbing is a procedure to unload wellbores of heavier fluids thereby permitting the formation fluids to enter the wellbore and be circulated to surface. Wells will only be swabbed if the well is drilled, cased and a potential reservoir is:

- Identified,
- Perforated; and,
- Testing reveals that reservoir pressure is insufficient to flow liquids to surface; or,
- If well stimulation results in wellbore liquids that prevent flow to surface.

If the above criteria are met, swabbing is an accepted practice to reduce the pressure preventing a potentially productive formation from flowing to surface naturally. The same regulations affecting the handling and disposal of these fluids apply to fluids produced by swabbing as to recovery by any other means.

Acid Stimulation

Previous formation analyses have indicated small volume acid stimulation treatments would work well to clean up wells, remove scale and other impedances from formation pore throats to allow or improve flow into the wellbore. Acid stimulation entails the pumping of discrete amounts of normally hydrochloric acid at varying concentrations of 10%, 15% or 20%. The acid is trucked to location in specially sealed tanks in compliance with Transport of Dangerous Goods regulations and transferred to the cement pumping unit for pumping downhole. Treatment batches of 10 to 25 barrels (approximately 1.60 to 4 cubic metres) are pumped slowly controlled pressure until the entire batch is pumped. The relatively weak acid serves to dissolve scale (calcium Carbonate) deposited in flow paths over time. Successful stimulation is when the well flows at increased daily rates which could be +30 to 150 % of pre-stimulation rates.

The toxicity limits for oilfield hydrochloric acid are described in the Environment Canada documents and the Material Safety Data Sheets for the products. Hydrochloric acid is a gas dissolved in water to form hydrochloric acid. If heated the gas evaporates from the aqueous phase and water will be left. The chemical reaction of acid with carbonates renders the carbonates to form a harmless Calcium Chloride salt and water as by-products.

Oilfield concentrations are normally 10%, 15%, or 20% concentration hydrochloric acid. 5ppm (5mg/cubic metre) is considered safe concentration from an environmental perspective. Acid stimulation is normally only used once per well operation. The acid is transported in a special truck mounted tank that are designed and constructed for safe acid transport according to Transport Canada and Department of Transport regulations. A small quantity of relatively weak acid (10%, 15% or 20% concentration) is used on any occasion normally 5 to 10 cubic metres maximum. The acid is pumped from the truck into the pumper unit and from there downhole and never actually “sees daylight”. In winter, if acid is spilled as with water, it

would freeze and can be recovered from the surface snow or a thin surface soil layer. In summer, immediately flushing the spill with water would neutralize the acid and render it harmless (less damaging than vinegar). Flowing the well to “clean it up” would return the “spent acid solution” as Calcium Chloride, Carbon Dioxide and water.

In summary, acid stimulation is a common practice and an economic means to enhance well flow and reduce if not remove the materials impairing the ability of the formation to allow fluids to flow into the wellbore.

1.3.2.4 Extended Flow Testing

As noted above, all well testing will be performed with the Guidance of AER, Directive 034: Well Testing, Theory and Practice and in consultation with Yukon Government’s Energy, Mines and Resources- Oil and Gas Branch. As well, the Proponent will follow related non-discretionary legislations, such as the Drilling and Production Regulations. Part 5 of this Regulation provides detail on well evaluation and testing requirements.

In addition to drilling, any discoveries identified through DST are expected to undergo extended flow testing in order to gather important information about the nature of the resource accumulation and its productive capability. Given the remoteness of the region, the limited infrastructure to support oil and gas industry activities and the very early stage of oil industry evolution at Eagle Plains, the duration of these EFTs at each discovery could be up to 2 years. The information obtained from EFTs is critical to determining the future development plan for each discovery. The planned wells are exploratory; any flow testing will be contingent on discovery of formations potentially containing hydrocarbons. Part 8, Section 103 (1) of the Yukon Drilling and Production Regulations requires:

> *“The Licensee of a well shall obtain sufficient well tests, formation flow tests, wireline logs, analyses, surveys, conventional cores, cuttings and samples during the drilling of the well to ensure that a comprehensive geological and reservoir evaluation can be made.”*

EFTs will be undertaken if preliminary results from DST are encouraging and the following criteria have been met:

1. The well is drilled and cased; and,
2. A potential reservoir is:
    a. Identified
    b. DST has been conducted and
    c. Test analysis of the DST concludes sufficient hydrocarbons present to proceed to further evaluation of the hydrocarbon bearing formation.

In such a case, an EFT will be conducted to obtain more extensive information on reservoir characteristics and potential reserves. The same regulatory constraints apply to fluids produced by extended flow testing as to recovery by any other means.

EFT operates in a similar principal to DST. The main difference is that EFTs are undertaken after the well has been cased. To allow the zone of interest to flow into the wellbore, the casing has to be perforated

which is a routine procedure carried by either using a wireline from surface or attached the end of the production tubing from the surface to the zone of interest. The well, in this case, is first completed with a packer attached to a tubing string and have special downhole gauges to record flowing temperatures and pressures in real time. The surface would have the proper “Christmas Tree” wellhead equipment and be flow line connected to the test separator through a choke manifold. Well fluids (gas, oil and water) would then be handled in a similar manner as described previously. In an EFT however, the drilling rig would be removed to drill another well while the drilled well is prepared for testing.

Depending on drilling success several wells in different prospects would be flow tested simultaneously. As each well is drilled and drill stem tested to evaluate its candidacy for extended testing, it is left in a safe, secure state for further testing to take place after the drilling rig has been removed. It may become necessary to mobilize a small service rig to perform the completion work before turning the well to extended testing, but Chance Rig #1 could also perform this task and the solitary drilling/service unit at Eagle Plains. A well service rig has very similar capabilities and equipment as a drilling rig except that it generally has fewer modules and is also lighter equipment. If a service is required, it would be incremental equipment to the drilling rig.

Well testing is normally performed by specialized experts who would provide the specialized equipment, operating and safety procedures and the certification to be able to perform the associated tasks. Extended flow testing however would be handled in the same fashion as production operations and still be conducted by trained professional operators under the direct supervision of a Production Superintendent.

EFTs will require the installation of surface and subsurface equipment and facilities at each well site to measure, store and process produced fluids before it can be safely consumed, transported out of the operating area, or disposed at an approved location. The specific details of this equipment is subject to the nature of the discovery and could include:

- Casing of entire wellbore and perforate casing at zone of interest
- Packer, tubing and downhole gauges
- Wellhead valving assembly
- Flare systems
- Separator vessel
- Treater to do additional phase separation of the fluids
- Storage tanks
- Appropriate artificial lift systems
- Heaters
- Dehydrators
- Flow lines
- Metering equipment
- Portable generators

The Proponent anticipates a period of time to elapse between confirming a discovery worthy of further evaluation and commencing the EFT to allow time to properly design, fabricate, install, and commission the extended flow testing facilities.

The Proponent will conduct EFT on up to 20 successful wells. EFT may be completed within a month for a predominantly natural gas well or up to 2 years for a predominately crude oil well. There may be up to eight EFTs conducted at the same time.

Fluids produced during extended well flow testing will need to be measured, processed and dealt with in an environmentally responsible manner. Depending on the nature of a discovery, the Proponent anticipates that some combination of natural gas, crude oil and possibly formation water will be extracted during the EFTs. These fluids are separated and measured in facilities on the surface.

Natural gas could be flared for short periods of time. However, the Proponent may conserve natural gas and use it to provide fuel for process heating and possibly onsite power generation. Heaters are burners in a contained system of firetubes and the heat given off from combustion is used to provide heat to vessels treating the produced fluids or keeping stored fluids warm. The design of heaters can include heating an intermediate fluid such as glycol at the heater and circulating the glycol in a network of pipes to the places where heat is required. The generators are likely going to be small engines fuelled with natural gas and sized according to the power needs of the location.

Crude oil produced during the EFTs will also be conserved instead of flared to the greatest extent possible. This will require some processing at the well site or the central processing facility to stabilize the crude oil for truck transport to a suitable, approved crude oil marketing point, such as terminals near Ft. Nelson or Ft. St. John in British Columbia or Grand Prairie in Alberta. All of these locations are ready to receive and utilize crude oil produced from Yukon sources in the absence of such destinations within the Yukon. The Proponent may also consider trucking crude oil produced during the EFTs to ports in Alaska such as Skagway, Haines or Valdez for onward shipping to suitable markets elsewhere in North America.

Formation water produced in conjunction with crude oil and/or natural gas will be separated from the hydrocarbon streams and disposed of underground into a compatible and approved formation at Eagle Plains using one of the suspended wells. These procedures to process, transport and dispose of various fluids produced are common practice in every oil and gas province in Canada.

While water injection as a means to replace produced crude oil in the underground reservoir to maintain pressure in the reservoir is universally used in the oil and gas industry. The Proponent does not feel there is enough reservoir information data to predict the need for water injection in the future life of an Eagle Plains producing oilfield. The normal ratio of produced oil to injected water is 1:1. That is for every barrel of oil produced, there will be a requirement for a barrel of water to be injected following an initial period without water injection. The need for and the design of a water injection operational procedure will accompany and be part of a full field development plan should one transpire. One of the objectives of EFT is to gauge whether reservoir pressure maintenance occurs naturally or whether it needs to be done artificially using water or natural gas injection. This information will in turn support any longer term, development plan.

An EFT of any well can only be accomplished when year-round access to the each well is established. Producing wells require periodic inspection by field personnel to ensure the operation is proceeding within design parameters and safely. The well fluids have to be trucked out periodically as well.

During an EFT, all produced fluids will be separated into fluids that can safely be disposed of in the area (clean water) and fluids that must be transported to distant markets or safe disposal sites (crude oil, condensates). The natural gas element will, as previously stated, metered to accurately determine its volume/production rate and likely flared onsite, unless a local use can be identified (or burned for heating, gas lifting and/or power generation).

The average production rate experienced from previous well testing on the Proponent's old wells, 200 barrels of oil per day is expected to be the average per well production and less than 5% water cut is planned for. Therefore 4,000 barrels per day is likely the upper limit and a design limit of 2,000 barrels per day is more realistic for the daily maximums.

1.3.2.5 Well Maintenance (Workovers)

Any well completed for EFT or longer-term production may require workovers during its lifetime. A work over entails the manipulation of the wellbore production equipment (pumps, tubing, packers, etc.) using a suitably sized service rig or occasionally a drilling rig. In this activity the objective would be to change the condition of a well to improve productivity, replace faulty components or extend the well's productive life in some manner.

Over time, a reservoir depletes in such a way at to permit the water interface with crude oil or natural gas in the formation to rise to a point where only water flows from the wellbore. Producing too much water over a period of time could impair the ultimate recovery of crude oil or natural gas and possibly shorten the life of a producing well. Measures are needed to reduce or shut off the water flow to allow continued recovery of crude oil or natural gas. These include plugging some or all of the perforations and perforating at different section of the wellbore casing. Other factors that impair production of crude oil and natural gas include scale buildup, asphaltene (a constituent of some crude oils) plugging, etc. need remediation and this work is done using service rigs, wireline services and so on. These practices are commonly used by the oil and gas industry and conforms to the regulatory requirements to optimize the recovery of the resources from the reservoir.

The well completion design and installation phase is critical in ensuring the well maintains a longer period of uninterrupted production. To this end completions are designed to require minimal intervention for many years by installing simple less mechanically operated systems, superior corrosion protection, erosion protection, possible use of internally coated production tubing etc. All such actions are focused on making product flow as smoothly as possible. Furthermore, the actual tubular components are selected to minimize changes in internal diameter, prevent areas where turbulence is generated and reduce if not eliminate leakage paths.

The completion is also designed to make its installation as trouble free and time saving as possible (have components which could assist in pressure testing the tubing internally while being run to eliminate leaks. The simplest completion should comprise of tubing and perhaps a tubing anchor or packer. Seating or landing nipples are installed to enable internal pressure testing of a completion string as well as land

downhole pressure gauges while flowing, permit circulation of kill fluids from the annulus into the tubing bore or reverse and possibly plug a well at a certain depth. The term “kill fluid” describes a fluid of sufficient density that creates a hydrostatic pressure at the bottom of the fluid column that is equal to or great than the formation pressure and prevents formation fluid from flowing into the wellbore.

Work overs nearly always start with “killing the well” to prevent further flow and circulating the wellbore contents to be replaced with a stable, non-flammable fluid. The kill fluid is normally weighted brine with corrosion inhibitive features. Salt dissolved in water (Brine) makes the water “heavier” (denser) and therefore an over balance medium fluid to keep formation fluids in the formation and not allow then to enter the casing/well. Normal completion brines are Sodium Chloride, Potassium Chloride and Calcium Chloride depending on the bottom hole pressures encountered. Eagle Plains conventional wells can be completed with Sodium Chloride (common salt) brine mediums. Only additives that may be added to the workover brine is corrosion inhibitors and/or biocide.

Following that activity, the wellhead is removed and a blowout preventer is installed to provide additional control of the well during the work over. The production tubing is recovered to surface for reuse or disposal if it is too eroded or corroded for future use. The wellbore would be cleaned of debris accumulating over a production period (normally a bit and casing scraper run accomplishes this). The remedial work is done to the well to fix whatever problems were encountered and the well is returned to a condition that allows production to resume.

1.3.2.6 Drilling By-Products

Within the described drilling program, two forms of drilling by-products will be produced. The following sections will describe and detail their creation and industry wide solutions for dealing with these by-products.

Please note, the Proponent is drilling within a sedimentary basin. Drill cuttings consist of sandstone, shale, and carbonate rock and are therefore, not significantly sulphide bearing. These rocks have been examined by Chance geologists and do not contain the materials that cause acid creation and as such the potential for acid rock drainage caused by the disposal of drill cuttings is remote to non-existent.

Naturally occurring radioactivity will be measured by gamma ray or spectral gamma ray wireline logs, which is a regulatory requirement in the Yukon Government Drilling and Production Regulations. GR is a radioactivity detection device (similar to a Geiger Counter) and therefore detects any existence of radioactive Uranium, Thorium and/or Potassium isotopes in the rock formations drilled. To date no abnormal detections have been made other than that attributed to natural rock formation radioactivity and therefore, radioactivity appears absent or undetectable in the fluid of the Eagle Plains sedimentary formations.

Solid Drill Cuttings

When drilling a well, cuttings are produced. These cuttings are a direct by-product of the drilling action caused by the bit grinding rock. After being drilled, these cuttings are brought to surface with the drilling fluid and separated from the drilling fluid using sophisticated equipment (e.g., shale shakers and centrifuges). These cuttings are stored onsite in metal bins referred to as shale bins. Close attention is

given to the dryness of the cuttings coming across the shale shakers and collected in the shale bins. It is important that as much fluid as possible be recovered from the cuttings for a few reasons:

- Less total weight in the cuttings, hence less cost associated with future handling of the drill cuttings.
- In the winter, it is easier to handle and move dry cuttings as they do not freeze and create large blocks of material.
- Reduces the need for additional make-up drilling fluid by recycling more fluid that is separated from the cuttings.

Drilling Fluid

The Proponent is proposing to use water-based drilling fluid systems. It is not uncommon that after drilling a few wells using the recycled drilling fluids, a mud system may need to be partially or fully reconstituted (disposal of the current system and mixing of fresh water and new drilling fluid products). This ensures the drilling fluid is fresh and capable of drilling through the different rock types found in the proposed wells. It is unclear how often a reconstitution process will be needed. The Proponent has had success with re-using drilling fluid systems across multiple wells to reduce the overall need for make-up water and reduce ultimate disposal of material at the conclusion of its use. As drilling is likely confined to a winter drilling season, the Proponent will likely re-use drilling fluid throughout one drilling season.

The first stage of fluid and material management is called ‘Stripping’; this is the process of running the drilling fluid as it returns to surface through centrifuges multiple times to separate the water from any solids suspended in the fluid stream. The fluid is then either recycled back into the mud system or used elsewhere on the rig

The disposal options outlined for the drilling program have been directly influenced by both the proposed drilling system and the site conditions present at the drilling locations and in the Eagle Plains area generally.

- Accordingly, the following conditions were established for selection of the drilling mud system: a low-toxicity mud system confirmed through laboratory analysis; and
- Meet operational requirements (maintain formation stability, hole cleaning and well control, etc.)
- The following conditions were established for selection of a cutting disposal method:
  - minimize the extent of surface disturbance; and
  - minimize transporting the material off-site for disposal.

In response to both these sets of conditions, the Proponent plans to select a water-based mud system as generally described which has been previously proven suitable for the MBC disposal process in an approved nearby site.

Any drill fluid selected will first have to satisfy Section 32 “Approved Drilling Fluid” of YOGA Drilling and Production Regulations. The type and chemistry of the drilling fluid will be a key part of the drilling Program issued in application for a Well Licence. This is explained and described further in this section.

1.3.2.7 Mix Bury Cover Sump

The Yukon has accepted AER Directive 50 as the governing regulation to determine the eligibility and applicability of various disposal alternatives for various drilling by-products and mud systems. Mix-bury-cover, as described and detailed in AER Directive 50 Section 13, is a method of disposing of drilling waste (both drill cuttings and drilling fluid or just drill cuttings) by which the by-products and spent mud is mixed with a local receiving soil at a specific mix ratio, then deposited into a sump, and then covered with clean subsoil.

A typical MBC sump design consists of three distinct layers:

- A clean subsoil layer 1 to 1.5 m in depth. This layer acts as an insulator between the subsoil/drill cutting mix and the vegetative layer to ensure that, after final reclamation, the site is returned to its original state.
- The subsoil/drill cutting mix layer is where the receiving subsoil is mixed at a specified mix ration with the disposed material (e.g., drill cuttings, spent drilling mud, etc.).
- Clayey material exceeding 1 m in depth, or alternative impermeable liner, acting as a hydraulic isolator.

Sump Suitability

Initial investigation into sump locations is required. AER Directive 50 Section 6.3 specifies the procedures and parameters for sump site investigation. Any proposed location will have cores drilled and the subsoil will be analyzed to confirm the following for a proposed sump:

- Sump soil has appropriate deposits of clayey soils.
- Must have appropriate clayey material of 1 m beyond the horizontal and vertical dimensions of the sump to ensure hydraulic containment.
- Absence of hydraulic defects or ways for fluid to leak out of sump.
- A composite sample, made up of five subsamples, is required for every 3 000 m² proposed to be used for MBC.

In the instance where the subsoil is found to be saline, special care will be taken when these sumps are excavated to ensure the non-saline active layer and subsurface materials are returned to the surface allowing the site to return to its equivalent land capability.

The Proponent has begun a sump suitability study of chosen locations throughout the area proposed in this application. Core samples, from existing and potential future locations for MBC style disposal, are being examined and analyzed by qualified experts. The results of this work will determine the course the Proponent will pursue for MBC at Eagle Plains.

The actual drilling fluid system that the Proponent plans to use has not yet been determined due to the exploratory nature of the drilling program (uncertainty of lithology), more information about this can be found in the Environmental Conditions report (Appendix D) describing the geology in the area. Before the Proponent begins the drilling of a well, a test sample of the drilling fluid will be prepared. The properties of

this fluid will be analyzed and compared against the receiving soils at the MBC site(s) to estimate the soil/waste mix ratio to ensure the final soil composition complies with AER Directive 50 section 3.

The Proponent intends to assign cuttings disposal management and direction to a competent individual representing an organization with the most experience operating under the terms and conditions of AER Directive 50.

MBC is not a viable disposal option if:

- Suitable sump site that meets all of the requirements established under AER directive 50 cannot be found.
- Drilling fluid that is incompatible with receiving soils or prohibited for MBC under AER Directive 50 is used.
- Drilling by-products/receiving-soil properties require a mix ratio greater than 7.

In order to minimize the potential for deep permafrost exposure during summer exploratory drilling program, the following mitigating procedures will be adopted:

- The sump will be excavated as disposal volume is required, in order to minimize the area of basal and wall permafrost exposure at any time. This may be in the form of narrow compartments oriented E-W to maximize shading of the basal permafrost surfaces or any other field procedure determined superior at the time.
- The top of the open area of the sump may be covered if environmental/geotechnical monitoring indicates degradation of wall structures in the sump trench due to thaw.

While an MBC sump is actively being used, the Proponent will monitor and inspect the site to evaluate sump integrity, volumes of material involved and to assess if further work is needed to the sump location. The drilling operations will utilize practices that minimize the volume of drill cuttings and drilling by-products generated.

The Proponent will arrange for full-time disposal expertise, provided from the selected mud services contractor, who will be available for Project management and consultation regarding disposal operations.

As noted above, all materials to be disposed of in the sump will meet AER Directive 50. If materials to be disposed of do not meet AER Directive 50, the disposal material will be transported to an appropriate permitted facility for disposal consistent with the practice employed in previous exploratory wells drilled at Eagle Plains. The Proponent has used permitted facilities that can accept specified waste in Whitehorse and northeast British Columbia.

Drill cuttings and fluids will be held in containers for minimal periods before disposal. After drill cuttings are circulated out of the hole, they are separated from the drilling fluid and stored in 3-sided metal bins. For final disposal, the cuttings are transported to the proposed MBC site for mixing with the subsoil. After the three-sided bins have been emptied, they will be moved, along with the rig, to the next drilling location. Disposal will take place as and when required during drilling or when the shale bins contain a full truck load of material.

For the proposed Project, drill cuttings will be transported to and disposed of at the MBC sump site, while fluids will be reused until the end of the Project. The Proponent plans to construct a new MBC sump adjacent to the Devon sump area to the same specifications to dispose of drill cuttings from the proposed 30 wells (see **Figure 1.9**). The Proponent has not used the Devon site for any drill cuttings or drilling fluid disposal to date and does not intend to use the site for disposal in the future. The Proponent's preferred disposal site is separate from where Devon drill cuttings and drilling fluid were buried but in an adjacent, previously undisturbed area,The Proponent has not monitored or inspected any of the Devon sumps. The proposed exploration drilling program will be performed under a comprehensive drilling fluids management process managed by a services supplier competent in AER Directive 50 and fully versed in safe MBC techniques in use in western Canada.

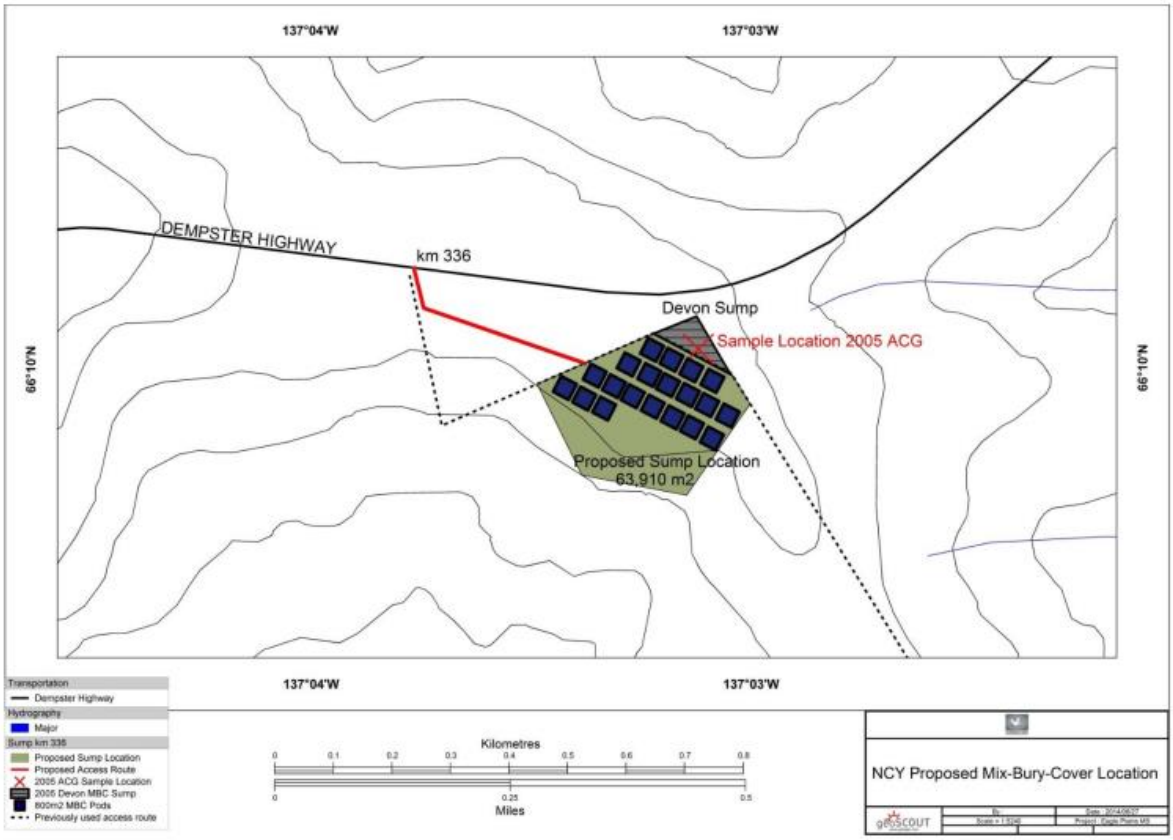

Figure 1.9 General Location and Typical Plan of MBC Sump Site

Figure 1.9 shows the 63,910 m² area proposed for MBC disposal. This area was determined based on the estimated area required for disposal. Each 800 m² MBC pod signifies an estimate of how much area would be required to dispose of one well's drill cuttings. The additional area, a rough estimate, would allow for spacing between MBCs for truck access and to pile excavated material before MBC commences. All estimated calculations, as required by Yukon Government Drilling and Production Regulations (Government of Yukon 2004), were made in accordance with the requirements of AER Directive 50. Typical operational practice is to have only one MBC open at a time.

MBC pods will be sized based on the anticipated volume of drill cuttings disposal required per well. This will ensure that the MBC opening time is minimal. As mentioned previously, a typical well would produce up to 300 m³ of drill cuttings and require an area of approximately 800 m² to dispose the drill cuttings. The Proponent proposes to only use the site described in **Figure 1.9** for the MBC sump. The section of area where the Devon 2005 MBC was located and whose exact location is known, will not be disturbed by any of the proposed operations. The Proponent aims to minimize surface disturbance by using a single previously disturbed area for multiple MBC pods. The site is adjacent to an already disturbed site used by previous oil and gas activity (Devon access road 2004) and it has already proven to have the soil characteristics required as stated in AER Directive 50 Section 6.3. There is no operational need to establish other discrete MBC locations.

1.3.2.8 Injection Well

DIR 50 covers the disposal of drilling fluid. In this case the fluid would be added to the drill cutting and then mixed with the required amount of soil in accordance with AER Dir 50. Drilling fluid may also be stripped back to just the clear portion and disposed of using an approved water injection well.

Well choice requires further injectivity and suitability investigations. This cannot occur until the wells are re-entered and made ready for the investigation trials. Chance Candidate wells could be one or more of the following suspended well(s): Chance J-19, Chance M-08, Chance G-08, Blackie M-59 and Chance E-78 all located within the Chance licence areas. Any well that is not a preferred EFT or future production candidate could be an injection well if strategically located in close proximity to a usable well or wells and if it exhibits the required characteristics for injecting fluids.

The YOGA Drilling and Production Regulations require reservoir produced water not be disposed of at the surface unless its quality and/or salinity is equal to or better than the quality limits set out in producing filed facility licence.

Any plans or intention to dispose of produced water from reservoir fluids separation have to be submitted to the regulatory authority and must meet the pertinent environmental standards as well the oilfield waste disposal standards and limits (reference YOGA Drilling and Production Regulations Sections 122. 123. 124, 130 and 165). The YOG regulator will only authorize produced water disposal when the operator demonstrates all legislation in force requirements have been met and that good oilfield exploitation and reservoir management practices are satisfied.

Once their disposal suitability is established, the following liquid materials (all treated with bactericide) and their volumes may be disposed of:

- Produced water per well (water cut 20% to 60% for 200 BOPD) = 40 to 120 barrels water/day
- Workover fluids: Maximum 7” casing volume full= 276 barrels
- Rig wash: hose flowing at 5gpm water for one hour = ±7 barrels per day in summer
- Saline fluids (completion brines) same as workover fluids = 276 barrels
- Liquid fraction of drilling fluids = approximately 200 cubic metres at end of Project

The zone must have an impermeable barrier above it to prevent migration of the injected fluid and be deeper than 750 metres. Permeability and porosity of the rock must permit pumping of the fluid at low surface pressure and especially well below formation breakdown pressure. Testing will also have to determine injection fluid compatibility between the rock and native reservoir before injection.

The injection pressure and rate, and the pressure in the casing tubing annulus will be monitored at all times. Accurate/calibrated surface pressure gauges will continually monitor pressure readings and any fluctuations. The conditions are injectivity rate, porosity and permeability of the formation being injected into.

Disposal of highly saline produced water at surface disposal sites may be greatly restricted in quality and quantity. To this end and to support best reservoir management practices, it may at times be mandatory to re-inject reservoir produced water back downhole as the only viable and environmentally safe option.

1.3.2.9 Seismic Exploration

The seismic program will consist of approximately 1,500 km² of 3D and 2,000 km² of 2D reflection seismic exploration. Actual final seismic survey location, design and layout will be dependent on drilling outcomes as they progress. Utilization of the low-impact seismic methodology will result in very low impact on the environment. Source lines are limited to 3 metres in width and receiver lines limited to 2 metres in width. The Proponent intends to leave a small amount of snow on the lines so that the tundra and permafrost are not disturbed. The low-impact seismic drills are outfitted with air hammers and as a result will not require water for drilling.

The Proponent plans to deploy a wireless recording system. This wireless system is preferred since a cabled system could present a hazard for migrating animals and requires a larger hand cut line than is necessary for a cable-less system where the layout crew only requires a path 2 metre or less through the land. A cable-less system is also less impactful on the environment as it is easier to carry down the receiver lines and requires fewer personnel on the recording crew.

Preflagging (Cruising)

Prior to line preparation, a detailed line by line spatial analysis (area examination) is performed utilizing a combination of air photos (2011 vintage with 2 m resolution), LIDAR (Light Detecting and Ranging), field scout information, GIS information, First Nation cultural inputs, and any information identified by the preflagging/cruising phase. This greatly helps reduce time spent in the field dealing with localized line preparation issues.

Preflagging (cruising) will be conducted to identify and mark line locations, areas containing riparian areas, difficult terrain, historical/archaeological areas, animal sites and facilities. This is done by having personnel on the ground marking the line locations and areas of concern for the mulchers and chainsaw operators to follow or avoid. These areas will be added to the Project map. Handheld Global Positioning Systems (GPS) units ensures accurate line placement and automatic notifications are sent to management when the mechanical equipment is approaching a “Hot Spot”, or stations that are encroaching any buffered zones or areas.

Line Preparation

A combination of low-impact seismic mulchers and chainsaw operators will be utilized to prepare source and receiver lines. Both source and receiver lines will be slashed to ensure there are no pokers or leaning trees for safety reasons. On board GPS on all mulching equipment ensures accurate line placement and automatic notifications are sent to management when the mechanical equipment is approaching an area of concern, or stations that are encroaching any buffered zones or areas. Lines will be doglegged or bent from any access point to avoid creation of a line of site and will meander to avoid disturbance of any timber larger than 20 to 30 centimetres in diameter. Source lines will be 3.0 metres wide to accommodate vehicles. A minimum of 20 centimetres of packed snow will be left on line to avoid possible damage to vegetation or permafrost. Receiver lines will be 1.75 metres wide to accommodate personnel.

Survey

After source and receiver lines are prepared, surveyors travel the source lines to mark the location of where the low-impact seismic drills will create the source points, and the receiver lines to mark where the recording crew will place the wireless recording equipment. They do this using GPS which allows for meandering and narrow lines.

Source Point Preparation

Source point holes 9 m in depth and 10 cm in diameter will be drilled every 60 m along the source lines using a small, low-impact seismic air hammer drill. A charge of one kilogram of dynamite is then loaded into the hole to be detonated by the recording crew. Dynamite is transported and stored at one of the staging sites in a federally regulated Explosives Magazine.

Recording

With the use of a long line and helibags, a helicopter will place and retrieve recording equipment at pre-determined intervals along the receiver lines. Recording personnel will access the equipment in the helibags and will place a series of geophones every 60 m along the receiver lines. The recording crew will be using a cable-less recording system. Cable-less recording systems are ideal for gathering seismic data because they reduce the constraints on geophone placement, eliminate downtime for cable repair, and reduces the impact on the environment. The geophones record the vibration created by the charges being detonated on the source lines. The data that is recorded is relayed to the observer truck. Once the data is relayed, personnel and helicopter return to retrieve the equipment and any debris used to mark the surveyed receiver and source locations.

The helicopter will be based out of the camp and the use of the helicopter will be minimal. The Proponent will follow the Flying in Caribou Country guide. Helipads will be built for safety and medevac reasons.

Access Trails/Creek Crossings

For safety reasons, vehicular and personnel movement a minimal amount of access trails will be required within the program area. This will be done on existing trails, historical seismic lines or lines that will also be used for source lines and receiver lines. The width of the access trails will be a maximum width of 5.5 metres wide and will also have a minimum of 20 centimetres of packed snow.

1.3.3 Accessory Project Components

The following activities are expected to be completed, as required, to support the principal activity of drilling completing, and testing exploration wells:

- Well site(s) preparation
- Other Project Facilities (i.e., camps and fuel storage)
- Some surface facilities (e.g., storage, processing, injections)
- Airstrip construction and operations, and 2 fixed-wing aircraft flights per week
- Building and maintenance of access roads (all-season and winter roads)
- Development of borrow sources for airstrip and roads
- Water use for drilling and camp

For drilling: Camp 325 will be the main accommodation facility for the exploration program. The Chance Rig #1 will also have a smaller mobile camp, occupied 24 hours per day, 7 days per week, to house essential personnel (rig supervisors, medic, geologist, etc.).

1.3.3.1 Access Roads

Assuming all wells are successful, all-season roads will then be required to access all 30 wells. Access to wells that are proximate to the Dempster Highway , drilled in proximity, or enroute to a successful well will have all-season access built to them. Wells undergoing EFTs, including the legacy suspended wells located on the Chance Significant Discovery Licence, will require all-season access. The Chance Road will be established as an all-season road regardless of the results of the drilling program.

After drilling several wells and depending on success in discovering hydrocarbon-bearing formations, access roads will be upgraded to all-season roads constructed from rock material from borrow fill sites. The diagram below, prepared by Boreal Engineering Ltd., illustrates a typical road construction design. The pad will be constructed to be approximately 7 m in width, sufficient for safely accommodating a transport truck, but also having roadside passing areas to allow 2 trucks to pass beside one another. Passing bays will likely have frequency of 1 approximately every 750 m allowing vehicles coming from opposite directions to have a clear view and prepare to enter the nearest passing area on their side of the road.

The estimated distance between pull outs to be 1 km; however, they should occur as/when required when the roads winds and visibility for oncoming traffic is impaired. Pullouts will be 150 m long, at inter-visible locations and identified with signs indicating the km / station. It is intended that the maximum distance between pullouts will be 1 000 m; however, they may be as close as 300 m to provide a passing lane to ensure that pullouts are inter-visible. The purpose is that if a vehicle were on the road without radio control, a widened road would be available for passing transport trucks. For the purpose of volume calculations, it is estimated that average distance between pullouts will be 750 m. Well site access roads would, in turn, also be constructed using a similar design.

The base road pad will be ultimately covered with a sandy material for protection of the road surface and endurance. All-season roads will require periodic maintenance as surface material is removed or eroded by the elements or vehicular traffic.

Winter road construction will utilize similar techniques as previously applied. Once snow cover equals or exceeds 10 cm there should be adequate snow to build winter roads. Well site access roads will also be constructed in a similar fashion using accumulated snow to construct berms on the road margins and filling the space between with amounts of snow and water trucked from approved sources. All roads will be supervised by a competent and qualified geotechnical engineer to ensure their ability to safely support the drilling rig and other similar heavy loads that will be transported across them.

Water Crossings

The access routes are designed to have as few water crossings as possible by following previously travelled trails and roads located on ridges or higher areas well above the water drainage valleys in between. The normal techniques applied when constructing water crossings is to lay a culvert of a sufficient outside diameter as to not reduce or obstruct the water flow, nor impeded fish movement along the water course. To this end, the Proponent has directed that water crossings must meet all the Yukon Government land use and transportation requirements.

Culverts will be installed per the Yukon Government Highways and Public Works standard drawing for culverts in permafrost conditions. Culverts will be installed using standard engineering practice in permafrost areas and per the attached Yukon Government standard drawing 06010-5. Culverts will be sized following a hydrological assessment by a Professional Engineer registered in Yukon to determine flow volumes. Culverts will be sized accordingly to the 100-year return event. Minimum culvert size will be 600 millimetres (mm). Culvert installation methods will follow those methods provided by *Best Management Practices for Contractors and Inspectors* handbook. The hydrological assessment is necessary to determine the stream flow for culvert sizes of each water crossing. The Alaska document urges the understanding and appreciation for the thermal effects of standing and running water because water can initiate thaw settlement and erosion that can destroy the road.

It is recommended that “the velocity and volume of water running beside the toe of a road should be carefully evaluated, providing for a series of culverts, rather than large culverts at discrete intervals rather than large culverts at great distances” (Author year) The Guidelines further recommend “Culverts should be considered in three distinct phases: 1) during the original deployment, 2) during the first summer after snow is gone and actual drainage cane be seen and reassessed and 3) in subsequent summers when perhaps the roadway and culverts have settled or other factors have influenced their effectiveness” (Author year).

The Proponent will commission a fully qualified road Arctic construction organization currently operating in Yukon who are versed in the construction techniques applied to remote areas as Eagle Plains.

Water courses will not be diverted. A culvert will be installed within the flow path of the stream. Following completion of the culvert installation, water will be directed through the culvert prior to placement of fill for road construction. Following closure of the road, the culvert will be removed and the water course will be returned to its natural state.

MBC Sump Access Road

The Proponent also proposes to construct a 400 m all-season access road to MBC sump area (Error! Reference source not found.). This road will be constructed as early in Project as possible (soon after mid-

January as snow and weather permit) and will take approximately 2 weeks to complete. The minority of the road follows an existing access trail, and no major clearing will be required. Please see photos of access and terrain. The road does not span any waterways and is 800 m away from the nearest water drainage. The road dimensions will be approximately 400 m long by 6 m wide. The material used for road construction will be approximately 3,000 m³ of locally sourced granular material.

Well Site Access – Summer

All material used for road construction will be locally sourced granular material. Materials utilized will be those approved for use as a road construction material. Several identified borrow sites have been cored and evaluated for quality and quantity of fill material by geotechnical engineers from Tetra Tech/EBA and Yukon Engineering Services. Kryotek Engineering and Boreal Engineering have also been consulted for expert advice regarding Arctic road construction techniques in Yukon. A combination of the previously mentioned engineering organizations will be contracted to undertake road design, construction, and general project management. The construction of a summer access road will be completed as described above.

Well Site Access – Winter

Winter access will only be constructed if the ground and water bodies are frozen and if there is adequate snow coverage. The Proponent will ensure there is a minimum packed snow cover of 10 cm to the vegetation layer. Where required, an increased snow depth will be maintained to avoid disturbing surface vegetation and duff (i.e., tussock terrain).

The factors that will be considered while making the determination will be terrain features, vegetation present, and local topography. If this snow depth (minimum of 10 cm) is not sufficient in certain areas, additional snow depth will be ensured to provide adequate protection to surface vegetation and duff (i.e., tussock terrain). If this is required, snow will be removed from appropriate locations in the direct vicinity of the winter road (i.e., surrounding areas that have ample snow coverage) and added to the snow pack on the winter road. Vegetation will be cut, with no disturbances to the vegetation mat. Access routes will be constructed using equipment appropriate for packing snow.

Several water bodies may require ice bridges/snow construction. All water bodies will be treated as fish-bearing and will be constructed as per Fisheries and Oceans Canada's (DFO's) Operational Statement on Ice Bridges and Snowfill (http://www.pac.dfo-mpo.gc.ca/habitat/oseo /icebridge-pontsduglace-eng.htm) as well as the Safety Guide for Operations over Ice. As well, if water is required to be withdrawn from nearby water sources, adequately sized intakes will be used and screened to prevent debris blockage and fish mortality (refer to DFO's Freshwater Intake End-of-Pipe Fish Screen Guidelines (DFO 1995).

A minimum snowpack of 10 cm is required for the winter road. However, if the amount of snowfall in the area allows for a thicker snowpack (i.e. 15 cm to 20 cm) during initial road construction, a thicker snowpack will be used. As the winter progresses, the Proponent will continue to add to the snowpack.

If natural snowfall is below the minimum required to commence access and well site construction, the Proponent will consider artificially making snow to make up the shortfall. This is a contingent consideration and could require up to 300 m³ of water per day for a short period of time (several days to a week) if more than 1 access route is under construction at any given time. The sources of water are likely to include the

Eagle River, the Ogilvie River, and the water well at Chance's camp once proper treatment facilities are in place. The water to be used to make snow and ice the winter road(s) will be trucked from the source to the point of use. At maximum, between 20 and 30 truckloads per day would be needed. The actual number of trucks being used would be less since a truck can probably complete 4 to 6 deliveries per day. Generally low snowpack is only an issue during the early part of winter, so this provision would only apply on a contingent basis during the months of November, December, and January. The timing for making artificial snow will depend on how late in the winter season winter road construction begins. If, for example, in late December there is little or no snow fall or snow accumulation on the ground, snow making could ensure a sufficient snow base to commence winter road construction. Snow can only be made when the ambient temperature drops to 0 degrees (°) Centigrade.

Access Road Maintenance

Maintenance will involve grading and filling to ensure a smooth travelling surface, cleaning/maintenance of drainage structures, snow removal in winter, and to ensure signage remains suitable for service. Maintenance equipment will include a road grader, a mid-size (D6) dozer, trucks to haul aggregate, and an excavator for maintenance of drainage structures. Maintenance of winter access routes may include low-ground-pressure vehicles, a road grader equipped with a wing snow plow, some water application, and use of matting where required. Grading may be required over certain stretches of the routes, and depressions along the roads will be filled with snow to smooth the surface. If required, water will be withdrawn from approved water sources using adequately sized intakes and screened to prevent debris blockage and fish mortality; refer to DFO's Freshwater Intake End-of-Pipe Fish Screen Guidelines (DFO 1995). The Proponent will avoid using small streams as a water source. Should winter access roads convert to all-season roads, maintenance will be ongoing to ensure road safety and reliability. This will be especially valid when wells are transformed into extended flow sites and require constant year-round access for operational reasons. Road repair and maintenance for all-season roads will require additional machinery, specified and supplied by the selected qualified contractor.

Dust will be kept to a minimum by enforcing reduced speeds on access roads. Dust will also be kept to a minimum by spraying the road surfaces with water whenever they become too dry; some fine airborne dust may become deposited on the surrounding vegetation. The small quantities of fine dust should not cause vegetation to be affected but periodic visual inspections will be made to check for any visible changes to the surrounding areas.

1.3.3.2 Borrow Source Development

Borrow material will be required for the Project for activities such as road and well pad construction. Approximately 21,600 m^3 of borrow material will be needed per well site. The borrow material will come from the closest approved borrow site. In total, the Proponent anticipates requiring up to approximately 1.7 million m^3 of borrow material for the Project.

Borrow Pit locations will be confirmed throughout drilling proposed locations and are identified in **Figure 1.10** and **Table 1.4**. To eliminate any water pooling, borrow pit design and development will be done in the winter while ground is frozen. Borrow pit access roads will be built to the same standards as the main access roads. Timing of construction is for 2016 winter season.

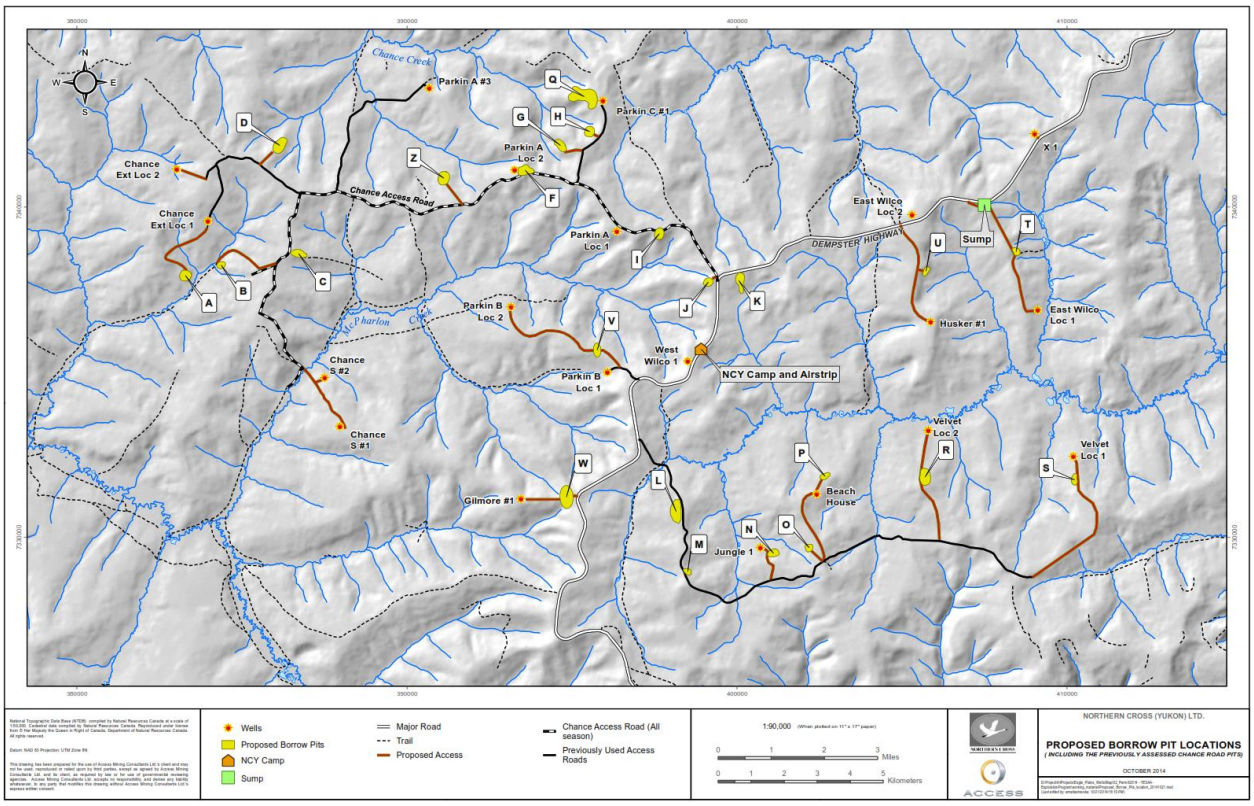

Figure 1.10 Borrow Pit Locations

The Proponent intends that initial access to each well site will be acquired through winter construction of an ice road and placement of rig matting for drilling the well. If the well is successful in finding testable hydrocarbons and it is determined that flow testing will take place, an all-weather road will be constructed. Design and construction of each all-weather access road will only occur once the well has been drilled and a determination has been made whether flow testing will take place. Details of the design of each specific access road including sources, volumes, lifespan, environmental conditions, and closure planning will be provided to regulators prior to construction.

Materials for construction of the access roads will be sourced by drilling the alignment of the proposed access road to each well site to determine the depth of overburden and the geotechnical properties of the bedrock (sand/silt stone, shale, etc.). The general trend has been that those areas higher in elevation along ridges and the crests of hills have less depth of overburden, so materials will be sourced in those locations. There may be a requirement (if the overburden is too deep along the alignment) to source materials from a borrow source off alignment. Access roads will require 15 m^3 per m of road constructed plus pullout and drill pad requirements.

The borrow site locations were determined using lithological data gathered from the shot holes drilled as part of the 2014 3D seismic program. Borrow sites will be accessed in March to April of 2021 when sufficient well results are known to merit access. Summer access could be anytime from May to October any year. Fill sources will be located along the road alignment at those locations identified through drilling at which

lesser amounts of overburden will be required to be excavated. The potential life span of the access will be determined by the drilling and any EFT results. The access life span has the potential to be as long as the life of the well. The closure plan will follow the previously submitted plan. Subject to road design, drill samples will be identified to determine the depth of bedrock of the borrow sources adjacent to the proposed road alignment, and information will be taken from the 3D seismic program.

Organic cover will be removed, and stockpiled for reclamation purposes, using a large crawler tractor. Underlying silts will be excavated by ripping and dozing with a large tractor and stock piled separately for reclamation purposes. Bedrock that consists of siltstone and sandstone or shale (depending on the difficulty of using large equipment, it may be necessary to drill and blast) will be excavated with large excavator and or dozer. The excavated material will be loaded directly from the borrow pit for use in the construction of roads. There will be no water pooling; borrow sources will be constructed to prevent water pooling. Any blasting will be performed by a certified experienced blaster according to all applicable Yukon regulations. The necessary metal sulphides required for acid rock drainage are not present because the borrow sites contain sedimentary rock. To date, acid rock is not known to exist in the Eagle Plains area.

For the purpose of the current assessment the following volumes are expected to be sourced, with the preference to source materials along the alignment. (See **Figure 1.10** and **Table 1.4**).

Borrow sources will be decommissioned when the Proponent deems them no longer useful or necessary for the Project. Decommissioning is described in **Section 1.3.4.2** and will be carried out in accordance with the Decommissioning Plan.

Table 1.4 Borrow Source Material Required and Areas of Disturbance

*All volumes, areas and distances are in metres

1.3.3.3 Central Processing Facility

The camp's Central Processing Facility (CPF) will comprise additional multi-stage and multi-phase separators, heater treaters (to help remove remaining amounts of emulsified formation water), vapour and gas collection system, and possibly central power generation facility to power all discrete well batteries. Separated water will be further treated to remove any hydrocarbons, scale, anaerobic bacteria, and other colloidal or suspended solids ready for disposal in a suspended well nearby following in a pre-approved process. The CPF will be located at the furthest (southernmost) point away from the camp for safety of the camp and its occupants. Having the CPF at the far end of the camp area will ensure trucks can turn around and exit safely without encroaching on any other activity or building. This should also ensure the camp remains upwind from the CPF.

The CPF will have enough storage to contain produced crude oil for loading onto longer distance trucks ("B" trains) and hauling to a pre-approved market site in British Columbia, Alberta, or possibly Alaska. It is estimated that the CFP will accommodate approximately 10 days of storage capacity for crude oil at an approximate daily rate of 2,000 barrels of oil per day or total 20,000 barrels. The volume (stored in up to 5 surface tanks in full compliance with Yukon and Canadian standards and regulations) also ensures the safe crude stabilization before loading onto southbound trucks. In terms of maintenance, the only treatments appearing necessary at this stage of design are fluid separation (to separate oil from gas and water into 3 distinct streams), heat treating the crude to remove water remnants from the separated crude, and gas dehydration to make the gas useable as a fuel.

1.3.3.4 Airstrip

The Proponent will construct an airstrip located along the existing Chance winter trail at a location approximately 4 km off the Dempster Highway. The airstrip will be approximately 1,500 m long and will be part of the road network west of the Dempster Highway. In the early years of the Project, this airstrip will likely be used only during the winter, but could graduate to year-round usage if discoveries support the investment. Until the Chance road airstrip becomes serviceable each winter, or at the end of the winter season operations when trail conditions deteriorate, the Proponent will continue to use the Dempster Highway adjacent to the camp as a periodic airstrip.

1.3.3.5 Transportation

For the majority of the exploration program, the Proponent will attempt to limit traffic on the winter access roads to authorized personnel. Traffic will include approximately 8 to 9 light-weight service trucks (for supplies and personnel), 1 water truck, and one fuel truck. The fuel and water trucks will come to the Project site approximately once per week or as demand dictates, and there will be occasional transport of drill cuttings from the well sites to the sump location. Air traffic estimated at 2 flights in/out per week (normal arrival times from approximately 10:30 a.m. to 12:00 p.m.).

A majority of the traffic volume will be related to mobilizing the drill rig and constructing the site infrastructure. As mentioned above, the setup of the well sites will take approximately 5 days to complete. Included in this amount, the drill rig will require 15 to 20 loads to mobilize. Unauthorized vehicles will not be permitted on the winter roads and the roads will be restricted from public access. The Proponent will be transporting crews using company vehicles; all vehicles will be equipped with radio communication and,

particularly during busy times (i.e., setup and demobilization), traffic will be radio controlled. For safety reasons, any personnel accessing the areas (i.e., winter roads) will be required to notify appropriate staff (i.e., security personnel and/or managers/supervisors) when they leave the Dempster Highway and when they arrive at the well sites. Access to the winter roads will be monitored by Chance staff hired as wildlife monitors/ security personnel.

A typical description of road traffic during the prime operating periods (January 1 to April 15; May 1 to December 1) is presented in **Table 1.5** below and road users will follow the Operations Activity Schedule introduced in **Section 1.4**.

Table 1.5 Typical Road Traffic during Prime Operating Hours

Table 3-4 Typical Road Traffic During Prime Operating

	Activity Description	Peak Traffic	Normal Traffic
1	Early Season Mobilization (Winter)	High	Medium
2	Rig Mobilization (Winter)	Very High	Medium
3	Winter Operating (Drilling)	Very High/High	Medium
4	Access Road Construction (Winter)	Very High	Medium
5	Summer Mobilization	Very High	Medium
6	Summer Rig Mobilization	Very High	Medium
7	Summer Normal Operating (Drilling)	Medium/High	Medium
8	Extended Testing Winter	High/Medium	Light
9	Extended Flow Testing Summer	Medium	Light

LEGEND:

Very High	More than 50 vehicles per 24 hour day
High Traffic	50 or more vehicles per 24 hour day
Medium Traffic	20-50 vehicles per 24 hour day
Light Traffic	Less than 20 vehicles per 24 hour day

The Proponent expects exploration drilling operations activities will range between medium and light traffic volumes. Crude oil produced during the flow-testing phases of exploration work, as described in this document, will be transported to an acceptable market.

Trucking of a stabilized crude cargo in specially constructed transporting tanks presents the same risk as transporting the diesel fuel required and used in Yukon. The process of loading and dispatching trucks at regular intervals will be planned and handled by professionals who will also maintain constant communication and GPS tracking of trucks as they travel down the Dempster and on other connecting routes to their destination. Trucking is by nature a very controlled process. Truck drivers are only permitted a fixed number of driving hours per 24-hour period and are expected to stop for refresher breaks at regular intervals. All their movements are accurately tracked through their onboard GPS, which can provide any truck's location to within a few metres anywhere in Canada or the USA.

The Proponent has practised Journey Management on its previous exploration drilling work at Eagle Plains. In this instance, any unit transporting materials to Chance's camp 325 will be called and tracked periodically by its company dispatcher. The exact location when reaching certain pre-determined check points will be relayed to Chance camp management and Logistics coordinator; this will ensure road safety for the truck driver and other road users and safety of the vital cargo and provides critical planning information for receiving staff to plan for offloading its cargo and possibly loading backhauls.

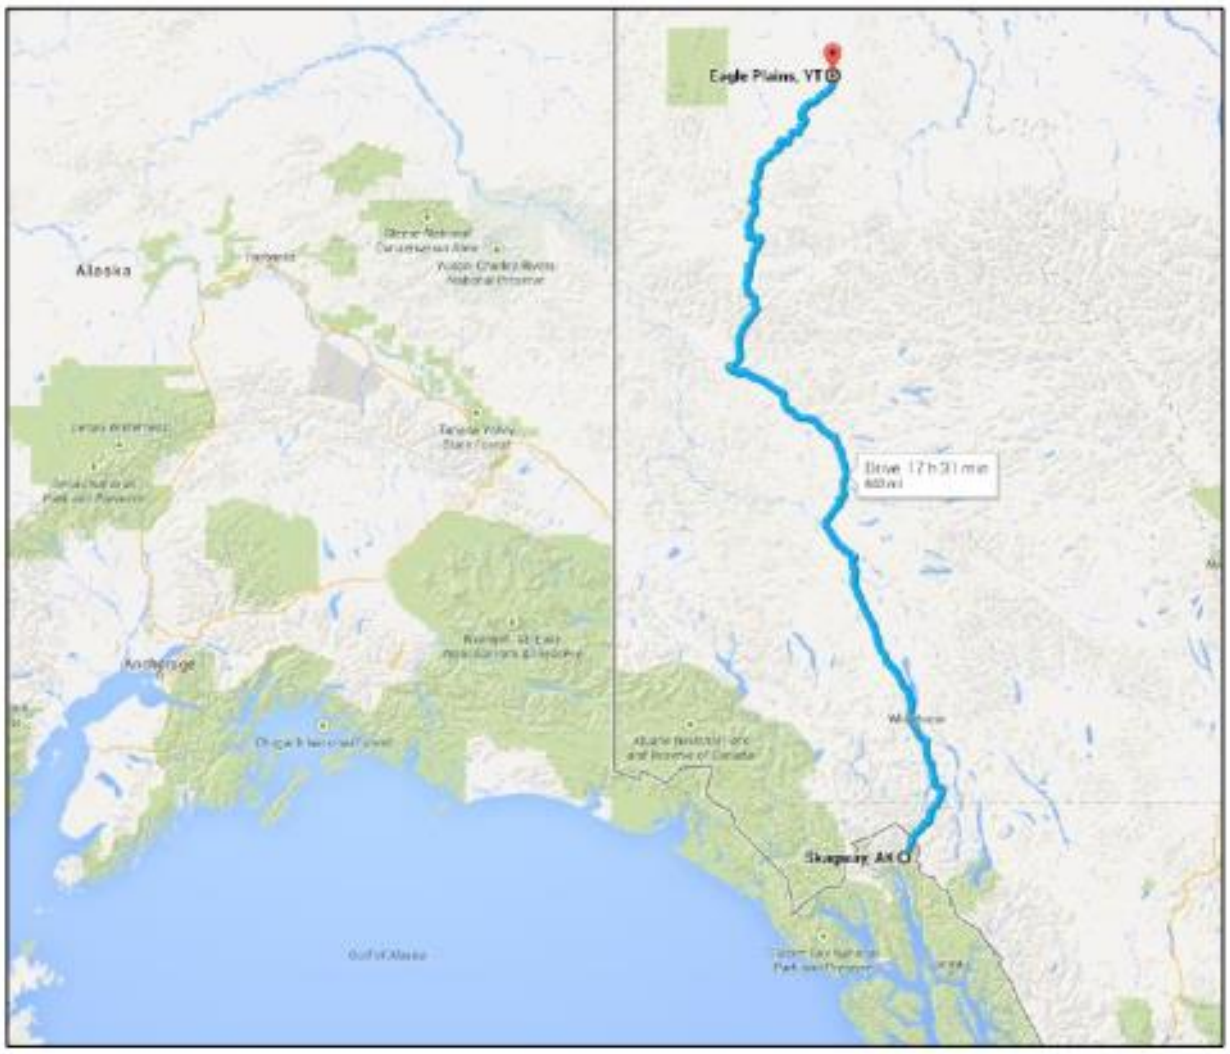

Figure 1.11 Typical Export Truck Route to Skagway, Alaska

Figure 1.11 illustrates one of the possible export truck routes to Skagway Alaska. The journey distance is 1,029 km from Eagle Plains to Skagway. The journey duration is approximately 17.5 hours driving at an average speed 59 km/hr. Other options exist, which include delivery by truck to terminals in Fort Nelson and Fort St. John, British Columbia, or Grand Prairie, Alberta. Depending on which of these options is used, the driving times will vary but the management procedures will remain the same.

The Proponent and its trucking contractor(s) will develop and Alert and Emergency Response Plan to address any incident or accident while in transit on Yukon roads and highways. The same plan will also address any other Provincial routes and routes within the United States border. All reputable trucking contractors versed with transporting flammable liquids and petroleum products in general are mandated to follow the Transportation of Dangerous Goods Federal Legislation. The legislation dictates such activities as how truck contents are identified on the outside of the tank; how the tank is installed on the truck body and strengthened; the level of knowledge and training the driver and any assistant travelling with them must

have to be eligible to operate the particular truck; and the spill response equipment needed to be readily available. Ensuring the truck is safety-checked and the drivers are qualified and adheres to their company's safety policies are the key means of preventing an incident or accident. Tracking the drivers to check on transit speed on a real-time basis means the truck's progress is never neglected and the driver is on notice to observe all road traffic rules at all times.

All incidents affecting the Proponent's trucking contractor are reported back to Chance Operations Management and form part of the Proponent's safety statistics. Every incident is investigated and the causes for each occurrence are closely analyzed and discussed with the truck owner. Should any trucking contractor exhibit an undue number of close calls/near misses or a series of incidents with the same causes, they would be removed from the contract without delay and replaced with a more competent and safety-minded contractor.

1.3.3.6 Workforce

Work force requirements will vary over the life of the Project and will ultimately be limited by the existing camp capacity. During past drilling and seismic exploration programs undertaken between 2012 and 2014, the Proponent had no more than 75 to 80 people onsite at any one time. During drilling, the Proponent operated on a 24-hour clock with a 20-day-on and 10-day-off crew rotation cycle, which means that one-third of the crew was off duty at any point in time. For the seismic exploration program, the Proponent operated on a 12-hour clock and cycled the various services through as the program unfolded with only limited crew changes, mostly connected with the camp catering operation.

The Proponent has an arrangement with Northern First Nation groups and will have time to define their involvement to participate during this exploration program. It is Chance's objective to provide all available work and contracts to its FN/Yukon partners as identified in sec. 68 of YOGA. Chance was successful during its last drilling/seismic program hiring a workforce from the communities from Old Crow, Fort McPherson, Dawson, Whitehorse, and Inuvik.

1.3.4 Reclamation and Closure

1.3.4.1 MBC Sump Site Reclamation

Before the MBC Sump disposal site is opened, the top soil and the vegetative layer will be removed and stored separately from the lower subsoils. This material will then be re-applied after the MBC Sump has been covered by the 1 m of unmixed subsoil. This will bring the disturbed area back to its equivalent land capability. No further reclamation plan is warranted. The standard Directive 050 Drilling Waste Management (D50) plan (AER 2016) of action entails the following:

- The environmental monitor must be onsite during drilling to conduct D50 sampling to ensure that drilling waste is compliant and accurate records are being kept and respond to any spills that may occur.
- The environmental monitor will sample pre- and post-MBC.
- Upon completion of the Project, remote disposal locations will be covered with a minimum of 1.0 m of capping material and contoured to meet background topography.

- A Phase 1 Environmental Site Assessment (ESA) will be completed for each well and corresponding remote MBC location to identify any potential areas of environmental concern.
- If the Phase 1 ESA triggers a Phase 2 ESA, soil samples will be collected and analyzed at an accredited laboratory.
- If contamination is identified, a Remediation Action Plan will be prepared and upon approval, the remedial program will be completed. Once all contamination is addressed either in the Phase 1 ESA, Phase 2 ESA, or Remediation, a surface program including soil and vegetation will be conducted.
- Once vegetation is established, a Detailed Site Assessment; comparing soil lithology and vegetation onsite to offsite) will be completed.

For clarification, environmental monitors will be sampling the following, as per ref AER DIR 50; table 13.1 of this directive lists the Testing Requirements (AER 2016):

1. Receiving soil
    a. Electrical conductivity and sodium adsorption ratio
2. Waste (solids or total waste)
    a. pH, electrical conductivity, sodium adsorption ratio, Sodium (Na)
    b. Nitrogen (N), if additives/products added to the drilling mud/waste system contain any amount of N or if N content was unknown
    c. metals, if concentrations exceeding limits were added to the drilling mud system or if the metal content of additives/products is not known
    d. hydrocarbons, if a hydrocarbon flag was encountered
    e. toxicity, if toxicity data are unknown for any of the mud additives/ products used in the drilling mud system or if concentrations used exceeded pass threshold for luminescent bacteria toxicity test
3. Waste/soil mix (post-disposal)
    a. EC, SAR, and Na, if drilling waste EC > 10 dS/m or Na > 3000 mg/L (saturated paste extract or filtrate from oversaturated waste)
    b. metals, if concentrations in drilling waste exceed concentrations listed
    c. hydrocarbons, if concentrations in the drilling waste exceed concentrations
    d. N, if the nitrogen concentration in the drilling waste (wet weight) is ≥6 mg/kg for disposals in coarse soil or ≥120 mg/kg for disposals in fine soil.

Furthermore, in terms of soil sampling, commencing operations in winter does not necessarily mean sampling would not be possible or even preferable. Sampling can also be accomplished from the surface snow deposits around the well site. The Proponent selected lease dimensions to ensure there is a sizable perimeter for full containment of generated or airborne wastes from the Project.

The first task on any well site would be to construct the well pad or prepare the surface on which matting could be safely placed. The next step is to lay the mats on previously densified/well-trodden surface to render the suface as flat as possible. The final process, before deploying the drilling equipment, would be to undertake a professional geotechnical check on the stability of the surface and its resultant ability to

support the maximum anticipated loads with a suitable safety factor. Finally, the geotechnical engineer will provide a signed/stamped report attesting to the stability and strength of the facility for the work contemplated.

1.3.4.2 Well Decommissioning and Abandonment

As previously mentioned, the 30 proposed wells are part of an exploration program to help determine the oil and gas potential of the region. Depending on the outcome of results, a given well may be tested and additional plans developed to bring into production or be determined to be unproductive and require decommissioning and abandonment. As the Operator, Chance will always carry the full responsibility for all wells deemed to be its property. This responsibility can never be delegated to any other party unless and until such time the Proponent relinquishes ownership according to YOGA and its regulations.

Wells required for further operational uses such as producing wells, water or gas injectors will be maintained in a suspended state with an ability to be converted for use in the future. The Drilling and Production Regulations under YOGA have specific actions required from an operator to maintain a well in a suspended state; key among these actions is to periodically conduct inspections to ensure that the integrity of the well is intact. While in a suspended status, the regulator requires a sum of money be placed on deposit to cover the cost of abandonment and remediation of the site. Once abandoned, the status becomes permanent and there would not be an option to re-enter such a well.

The normal stages before decommissioning/abandonment of a well are as follows:

- The well is first determined as unusable.
- The perforations are first cemented by placing a cement plug below and above them and squeezing some amount of cement into the formations to permanently isolate them within the wellbore. A mechanical shut-off device called a bridge plug may also be wireline set above the cement plug to add protection or isolation.
- Higher in the production casing and below the estimated permafrost maximum depth, a second cement plug would be set. This plug is normally set on top of a bridge plug to ensure it does not leak down in the casing. The plug is also “felt” with a drill bit to confirm its existence and hardness.
- The casing at surface is cut 1 m below the original ground and buried under the soil to finally remediate the location entirely.
- The lease is remediated by removing fill material to restore the location to original status. The surface location would be revegetated with what is normally growing there in the first place.

When appropriate, a decommissioning/abandonment plan for the well sites will be developed that will comply with Part 7 of the Yukon Government Oil and Gas Drilling Regulations (Sections 95, 96, 97, 99). Wells would require final well abandonment according to the YOGA Drilling and Production Regulations. Wells would be sealed with cement, and casings would be cut off below ground level. The casing stubs would be buried below ground surface as required by the Regulations and a surface-visible sign would be installed for identification. The entire site will then be cleared of all debris and refuse. Finally, the site will be contoured, seeded, and left to naturally reclaim.

An outline procedure prepared by the Proponent in compliance with the YOGA Regulations is presented as follows:

- Seal off all perforations in the casings that are not already sealed with cement squeezes.
- Pressure test the casings to 7000 kilopascals (kPa) to confirm formations are isolated and sealed.
- Cut off the wellhead and casings to 1 m below ground level and weld/install plates to cover each casing string at surface.
- Install well identification marker visible above ground level.
- Bury the cut casings to complete the abandonment.

If the entire Project had to be suspended but not completed, the infrastructure would be preserved and maintained until the Project resumes. If it is decided for whatever reason to terminate the Project, then the infrastructure would be decommissioned. While operations are temporarily suspended, the Proponent will ensure access from the Dempster Highway will be barricaded and visually inspected periodically.

1.4 Project Phases and Scheduling

1.4.1 Project Schedule

The Project plan is to have all necessary permitting and approvals in place by the end of 2021 and begin drilling in December 2021. The construction of winter roads, drilling and testing of the first few wells is anticipated to occur during the winter (December to April) and summer months (May 1 to October 31), commencing in December 2021 with the first winter locations.

In the early years it is assumed that all wells will be drilled in the winter. Summer drilling might happen in future locations that are in reasonably close proximity to yet to be developed all-season access. Well priorities and their drilling order can only be best determined after the program commences and in response to drilling results and Chance corporate exploratory information gathering requirements.

The construction of the 400 m all-season access road to the MBC sump location is anticipated to occur in March 2022 and take not more than 2 weeks to complete.

The Proponent anticipates a period to elapse between confirming a discovery worthy of further evaluation and commencing the EFTs to allow time to properly design, fabricate, install, and commission the extended flow testing facilities. This period could be up to 6 months. If drilling is successful and significant hydrocarbons are discovered, the access roads would be upgraded to year-round access to undertake the EFTs. Year-round access to flowing wells is critical to daily well inspections and safety assurance of all operations.

The previously summarized scope of the Proponent's exploration activity can be expected to start as early as December 2021 and continue over a period up to 10 years to cover the various stages of drilling and extended flow testing of the wells. The actual execution of the EFTs could be phased depending on the nature of the discovery (e.g. natural gas versus crude oil) and the capacity of the base camp and the Eagle Plains Hotel to accommodate the necessary crews. Until there is more information about discovered resources, it is impossible to predict with any precision the full duration of the flow testing program. At least 8 wells could be tested in each year.

In summary, the chronological activities can be best described as follows:

1. Complete 3D seismic processing & interpretation (Chance Exploration rank prospects and establish company exploration objectives to meet Yukon Government lease commitments and CHANCE corporate objectives for exploration)
2. All preparations completed by December 31, 2021 (Seismic, YESAB, Well Licences, Camp, rig upgrade & certify, consumables and services, geotechnical prep work)
3. Prepare first location to mobilize Chance Rig #1 (start January 1, 2022 or soon thereafter)
4. Drill & test winter wells (possibly as many as 4; suspend operations April 15th ±)
5. Prepare for summer drilling (contingent on positive drilling results); ready to construct all-season access to next drill and test targets on schedule. Subsequent wells may be predicated on encouraging well results influencing more follow-up appraisal drilling
6. Continue drilling exploration wells in the remaining prospects to build on positive previous drilling results.
7. Identify wells with positive results meriting extended flow testing to acquire in depth reservoir information.
8. Design order/fabricate well site battery processing equipment in preparation for extended flow testing of selected wells.
9. Re-enter selected wells; install completion tubulars and other accessories, Christmas trees and ready for extended flow testing.
10. Install surface pumping equipment (standard pump jack device to lift the well fluids to surface); hook up well Flowline to well site battery (separator, flare system, crude oil storage tank and water disposal tank).
11. Supervise and operate well pumping, transfer stabilized (crude that has been allowed to “age” in atmospheric storage tanks; made safer for trucking) crude from tanks to truck for transport to the camp’s Central Process Facility.
12. Construct the camp’s Central Process Facility.
13. All vapour and gas removed from the well fluids will either be used for fuel to prevent storage tanks contents from freezing, generating electricity, pumped downhole in an approved manner or flared at site.
14. Progressively more wells would be drilled and brought on stream while extended flow testing and contribute to the accumulated fluid to be removed by trucks to a suitable market.
15. During EFTs flowing information would be gathered including bottom hole pressure profiles to learn about the reservoir flow characteristics and understand more about the prospect’s full development potential.
16. Development would become the subsequent phase of continuing operations. The nature and details of that operation will be described in later submissions as per the YOGA and regulations derived from it.
17. To complete the life cycle of a well, wells drilled, evaluated, tested and completed as part of a field development plan, would be either worked over and recompleted in the event of, for example, water ingress; or, if deemed not having future production potential, would be abandoned according to the YOGA Drilling and Production Regulations. In this instance, all previously perforated producing zones would be cemented shallower cement plugs would be placed and the casing at surface cut

to 1 metre below the normal ground surface. The surface lease would be fully remediated and restored to its original state.

18. The Proponent's future operating schedule for exploratory drilling assumes a continual, year-round program in order to benefit from the economies of scale of uninterrupted operations involving several wells rather than discrete ones with breaks in between. This will also contribute to a stable employment and goods and services market for Yukon residents servicing and supplying operations at Eagle Plains.
19. EFTs involve the flowing of a well or wells. There is no human intervention while wells flow unimpeded for the duration required for the test. In a multi-well producing field, for example, a maximum of three persons can handle all the production operator tasks of a field with 50 or more producing wells (double that number if working a 24-hour day). Field production operators visit each well at least once daily unless there is a need for other demanding work. They record flowing well pressures, ensure fluid pumps operate properly, have enough fuel to continue operating and visually inspect the facility for anything out of the ordinary.
20. The Proponent plans to have three operators managing the EFT wells in any 12-hour cycle. A second set of three will form the cross-shift making a total number of operators 6.

The sequence of wells is dependent on drilling success, discovery, weather and road conditions. The Proponent is continuing the ongoing process of interpreting seismic data in order to better understand the geological setting and size/geometry of potential prospects. Each well drilled will add to that understanding.

In summary: the Proponent will drill up to 30 wells sequentially over a period of 10 years starting in 2022. If a well is successful (i.e., if there is a discovery of crude oil or natural gas in sufficient quantities) the Proponent will conduct an EFT for a period up to 2 years on that particular well. There may be EFTs on up to 20 wells depending on the success of each well. The Proponent will drill one well at a time and up to 5 wells per year. Assuming all wells are successful and EFTs are conducted for 2 years at each well, there may be up to 10 EFTs being conducted at one time.

The schedule illustrates the breakdown as it is known at this time. The maximum time is estimated to be 10 years. The schedule does not account for operations interruptions owing to weather, geological re-interpretation, equipment breakdown or other delays beyond the control of the operator. A normal rate of drilling would be to drill one well at a time during this exploratory phase.

1.4.2 Construction Phase

The mobilization and Construction Phase of the Project is expected to commence in Q4 of 2022. Key activities during the Construction Phase are summarized by Project component in **Table 1.6**.

Table 1.6 Summary of Key Construction Phase Activities

Project Activity	Key Construction Phase Activity
Tree Clearing and Grubbing	Salvage to be completed prior to construction of the well pads and portions of the access roads (winter and all-season)
Road Construction	Completed as roads are required to access facilities and well pads

Project Activity	Key Construction Phase Activity
Quarry Development	Quarries will be developed based on volume of material required to build leases and roads.
Lease Construction	Topsoil and subsoil salvage and local stockpiling
	Lease pads will be constructed on an as-needed basis using material from nearby quarries
Main Camp	Camp will be used to house drilling crew
	Construction of the Central Processing Facility
Accessory Activities	Road construction and upgrades to roads as required
	Construction of an airstrip
	Vehicle traffic related to drilling and construction activities
	Transportation of production fluids to Central Processing Facility and to market
	Follow Blasting Mitigation Plan
	Water use permit for lease and road construction
	Baseline data collection and environmental monitoring
	Monitoring and establishing erosion control features for roads, leases, and the Central Processing Facility
	Updating and following the Emergency Response and Risk Management Plans, as required
	Following a Weed Management Plan for soil stockpiles and leases
	Maintaining and snow-clearing roads and leases for all-season access

1.4.3 Operation Phase

The Operation Phase will begin in Q1 of 2022 and will continue through to the end of 2031. The key activities occurring during this phase are summarized in **Table 1.7**. This section describes the main operational activities that will occur during the Operation Phase.

Table 1.7 Summary of Key Operation Phase Activities

Project Activity	Key Operation Phase Activity
Road Construction	Upgrade roads to all-season roads, with water crossings, as required. Road maintenance will be conducted, as required
Drilling	Up to 30 pads will be constructed and drilled for oil and gas products
	Remote sump access for drilling fluid waste disposal
	Excess drilling mud to be disposed of offsite at the remote sump
	Completing drill stem tests
	Acid stimulation and completion of wells for testing
Well Testing	Facilities to be installed, as needed, for testing and extended well tests
	Routine maintenance of facilities, as needed

Project Activity	Key Operation Phase Activity
	Gas is to be flared off, and oil placed in storage tanks
	Production fluid transport to Central Processing Facility and market
Accessory Activities	Road Maintenance
	Energy may include switching power generation from diesel generators to natural gas produced from the wells
	Updating and following the Emergency Response and Risk Management Plans, as required
	Water permit use for boilers during winter drilling
	Following Weed Management Plan
	Central Processing Facility to handle production fluids, disposal fluids and fuels
	Maintaining and snow-clearing roads and leases for all-season access
	Environmental Monitoring

1.4.4 Reclamation, Abandonment and Closure Phase

Reclamation, abandonment and closure activities will be detailed in a Conceptual Reclamation and Closure Plan. A summary description of key activities is provided below for the Reclamation, Abandonment and Closure phase are described in **Table 1.8**.

Table 1.8 Summary of Key Reclamation Phase Activities

Project Activity	Key Reclamation Phase Activity
Well Abandonment	Wellheads will be abandoned when testing or production phases are complete
	Testing or production facilities are to be removed from each site
MBC Sump Site Reclamation	Site will be reclaimed as per Directive 50
Central Processing Facility	Upon complete field decommissioning activities, the removal of the Central Processing Facility will occur
Well Site Reclamation	Imported material will be removed, and area reclaimed to natural conditions, as much as possible
	Revegetation of disturbed areas to natural conditions and follow-up monitoring
Infrastructure Decommissioning	Water crossings will be removed
	Appropriate sloping and seeding to prevent erosion and scarification to encourage revegetation
Borrow Source Reclamation	To be reclaimed as soon as materials are exhausted or no longer required
	Revegetation to natural conditions and follow-up monitoring
List Accessory Activities	Discussions with YESAB (and other Regulators, as necessary) prior to reclamation work to determine whether there should be changes to the Plan
	Updating the Reclamation Plan to meet new criteria, if required
	Following Weed Management Plan until sufficient revegetation has occurred on reclaimed sites

Project Activity	Key Reclamation Phase Activity
	Annual monitoring until vegetation regrowth deemed satisfactory
	Soil Detailed Site Assessment prior to seeding
	Conduct a Phase 1 Environmental Site Assessment for each location
	Potential Phase 2 environmental assessments of soil and groundwater
	Obtain Regulatory Closure

APPENDIX 2-C-18. *Eagle Plains Environmental Studies 2018*

Eagle Plains Environmental Studies 2018

Chance Oil & Gas is conducting environmental studies in summer 2019 to collect data on fish, water, permafrost, vegetation and wildlife to support its proposal to conduct exploration activities in the Eagle Plains project area. Chance welcomes participation of local First Nation citizens and traditional knowledge holders in these programs.

All projects will require varying degrees of hiking in steep, rugged terrain and thick bush under production-oriented work conditions. Participants will require average to above average fitness to participate in the work, depending on the survey.

Chance regrets that opportunities for participation in the field studies are limited due to safety and logistical considerations, and all interested citizens may not be able to participate. The logistics of participation in the studies are still being finalized, however, there will be approximately spots for two participants from each First Nation with Traditional Territory overlapping the project area. Travel to and from Eagle Plains Hotel will need to be coordinated by each First Nation.

In addition to these field programs, Chance will be holding a number of community meetings, to provide an opportunity for First Nation citizens, who cannot participate in the field programs to be able to comment on the proposed program.

Access to all work sites will primarily be by helicopter out of Eagle Plains. A small number of sites will be accessed off the Dempster Highway.

A short description of each survey is provided, below.

Bird Surveys

Bird surveys will follow standard 'point count' methods that involve recording all the birds the observers hear and see from an observation station during a 10-minute survey period. Stations are located 500-1500 m apart and are accessed via hiking. This work is very production oriented in order to meet sample size requirements during the relatively short 'dawn chorus' when birds are singing and requires above average fitness to hike quickly between stations. Total hiking distance of 5-10 km per day through rugged terrain and thick bush will be required. The daily work shift is 2:30 am to noon. Participants should have a set of binoculars to get the most out of the survey, but they are not absolutely required.

Vegetation Surveys

Vegetation surveys are being conducted to verify ecosystem/habitat maps and to survey for rare plants. Work will be split over 2 shifts. The daily shift in round 1 will be from 4am to 3pm, to coordinate helicopter use with bird surveys. The shift during the second round is a more civilized 7am-6pm. The work will consist of 15-45-minute vegetation plots where the surveyors record plant occurrences, site conditions, and wildlife sign and habitat. Successive plots will be accessed by a combination of hiking and heli bumps. Participants will need to hike 3-6 km per day through rugged terrain and thick bush, requiring average fitness. No special gear is required.

Seismic Line Study

The purpose of the seismic line study is to document the degree of vegetation regeneration on old lines from past exploration programs 1950-2000's and to characterize the characteristics of new lines (i.e. from 2014) and how they may affect wildlife. The details of survey methodology are still being developed but will likely consist of ~15 minute vegetation plots at multiple spots along different seismic lines. Successive plots will be accessed by a combination of hiking and heli bumps. Participants will need to hike 3-6 km per day through rugged terrain and thick bush, requiring average fitness. No special gear is required.

Aquatic Surveys

Fish and water surveys are being conducted to improve knowledge of fish distribution and water conditions across the proposed project area. Surveys at each site will include electrofishing, stream site descriptions, and water sampling. Each site will take 45-90-minutes to complete. Access to most sites will be via helicopter with a relatively short walk to the stream (i.e. <300m). However, some sites may require hikes of up to 1km to get into.

Chest waders are required to participate in the fish and water surveys.

Required Field Gear for all projects includes:

- Sturdy hiking boots (second pair for when the first get wet is recommended)
- Rain gear
- Appropriate layers of clothes
- Personal first aid/survival kit
- Bug hat/insect repellent
- Hat
- Backpack or cruisers vest
- Bear spray (*Note that EDI does not permit firearms to be carried in the field or brought to a work site).

APPENDIX 2-C-19. Fieldwork Email

Subject: Chance Field Surveys
Date: June 17, 2019 5:15:06 PM
Attachments: image001.jpg
Chance FN participant information.docx

Hello,

We have dates set for participation in the Field Surveys that are being conducted in Chance's project area this summer. We are proposing the following logistics for First Nations participation:

- Each First Nation with Traditional Territory overlapping the project area can have up to two members participate in the Field surveys
- This work will be physically demanding requiring hiking in steep, rugged terrain and thick bush under production oriented work conditions. Participants require average to above average fitness to participate and must meet the requirements in the attached role profiles
- There are limited spots for participants to join field surveys due to helicopter constraints and availability at the Eagle Plains Hotel. As such, we are making two spots available to each First Nation with Traditional Territory overlapping the project area. Please respond as soon as possible with the name of the participant, the field survey they would like to take part in, and the dates they would like to attend and Emily and Calista (Hemmera) will confirm availability.
- Participants are encouraged to arrive on the day that the field survey starts, but it is not mandatory that they stay for the duration of the field survey. For example, a participant could join Vegetation Survey #1 from June 25-28 if those are the dates the participant is available.
- All travel, including flights, vehicle travel to Eagle Plains Hotel, and stay in the Eagle Plains Hotel must be booked by the First Nation and billed to Chance.

This table shows the type of survey, details of the work and the number of spots available to participants

Survey	Lead Consultant	Date	Shift	# EDI crews	Participation Opportunities
Vegetation surveys (#1)	EDI	June 25- June 29 July 1 – July 7	4am-3pm	1	1 participant June 25 – June 29 AND 1 Participant July 1 – July 7
Vegetation surveys (#2)	EDI	July 25- 29 Aug 1 - 6	7am-6pm	1	1 participant July 25-29 AND 1 participant Aug 1-6
Seismic line study	EDI	July 25- 29 Aug 1 - 6	7am-6pm	1	1 participant July 25-29 AND 1 participant Aug 1-6
Fish and Water	EDI	July 25- 29	7am-6pm	1	1 participant July 25-29

The purpose of participation will be to observe the fieldwork and gain a firsthand understanding of the research that will inform Chance's project proposal. As space is limited to only a few participants

from each First Nation, there will be future site visit opportunities that will be made available to more participants. Hemmera will approach First Nations about planning these site visits later in the summer.

We apologise for the late notice in getting the above dates sorted.
To participate in Vegetation Survey #1 (starting June 25), the deadline for informing Hemmera is Wednesday June 19 at 5:00pm. Then we can coordinate the logistics on Thursday. For all the other field surveys, please let Hemmera know as soon as possible.

If you have any questions please direct them to Emily or Calista at Hemmera.

Best,

APPENDIX 2-C-20. Consultation and Engagement Letter

Chance
OIL AND GAS LIMITED

December 1, 2021.

Chief and Council
Vuntut Gwitchin Government
P.O. Box 94
Old Crow, YT
Y0B 1N0

sent via email

Attention: Chief [redacted]

Dear Sir:

I am writing to follow up my letter to you dated October 27, 2021 and my subsequent phone calls October 31 and November 1 to both your office phone and your cell phone. I left a voicemail each time in hopes we could schedule a call. As of today's date, I have not received any response.

As expressed in our correspondence to you, Chance Oil and Gas Ltd ("COGL") is asking for a meeting with you, your council, and potentially citizens of Old Crow, to overcome the current engagement impasse and to discuss the exploration project and Cooperation Agreement. COGL is very interested in building partnerships with indigenous communities so they can benefit from opportunities created by proposed exploration activities and potential resource development. We would like to work with you to overcome the termination of discussions you initiated last March to allow fulsome engagement to proceed with the Vuntut Gwitchin Government ("VGG").

At several community presentations hosted by COGL in Old Crow in the past six or seven months, it is clear that the citizens of Old Crow are interested in learning about the planned exploration activities, providing feedback to COGL on issues of concern, and taking advantage of the opportunities.

COGL is continuing to develop its project description and its submission document for the

Fax (403) 699-0044

Executive Committee of the Yukon Environmental and Socio-Economic Assessment Board. More community presentations are planned to happen in Old Crow and in the communities of all affected First Nations. COGL hopes that VGG will be able to engage in these presentations and meetings in the future.

Please contact me at your earliest convenience so we can talk about the topics above and discuss next steps.

Yours truly,
Chance Oil and Gas Limited

Sent via email

Attention: Chief [redacted]

I am writing in follow up to your letter dated March 31, 2021, and to my subsequent response dated April 12, 2021.

As you are aware, Chance Oil and Gas Limited (COGL) held open houses in Old Crow in the spring of this year. Following a hiatus due to COVID, we have started holding events again this fall. It is evident that citizens of Old Crow are interested in hearing about COGL's activities, but perhaps more importantly, they have expressed an interest in planning and providing feedback to COGL to help design the project and mitigate its potential impacts. COGL's ability to comprehensively and effectively meet the expectations of the community are intimately linked with COGL's commitments under the Vuntut Gwitchin Oil and Gas Engagement Policy (Policy).

Early this year negotiations under the Policy in relation to the Cooperation Agreement were ceased at your direction. COGL would now like to revive these negotiations and work with Vuntut Gwitchin Government (VGG) to repair and enhance our working relationship.

In particular, I want to again extend the offer for [redacted] and me to meet with you and your Council at your earliest convenience. At this time, we would like to propose late November/early December and that we meet to discuss the proposed Exploration Project and the Cooperation Agreement. In accordance with your March 31st direction, Chance would be more than happy to meet in Old Crow in an open forum where VGFN Citizens may attend.

As always, COGL remains very interested in building partnerships with Indigenous communities in order for them to benefit from opportunities created by exploration and potential future resource development. COGL is keenly interested in working with you to overcome the impasse that currently prevails between ourselves and to meaningfully re-engage in a cooperative and collaborative manner in full recognition of the interests of all parties.

With these goals in mind, I will follow-up with you via telephone in the next few days in hopes that we can find a way to work together to move this Project forward in a mutually agreeable and beneficial manner.

Thank you for your consideration of this request.

Yours truly,
Chance Oil and Gas Limited

1.0 INTRODUCTION

This report demonstrates implementation of the Vuntut Gwitchin Government (VGG) and Chance Oil and Gas Limited (Chance) Communications and Engagement Plan (Plan) since it was finalized on May 22, 2018. The following sections summarise the discussions held between VGG and Chance, including the purpose, key discussion points, outcomes, and action items of each discussion, to fulfill the requirements of Ministerial Order (MO) 2018/ 42 issued to Chance on August 30, 2018. Please see **Appendix A** for a copy of the Plan and **Appendix B** for MO 2018/ 42.

2.0 BACKGROUND

The development of communications and engagement plans began with Order in Council (OIC) 2016/ 169 that required Chance to file a First Nations communication and engagement plan with the Minister of Energy, Mines and Resources in order to extend tenure on their Northern permits, 0005, 0006, 0007, 0008, 0009, 0010, and 0011 (see map in **Appendix C**). Chance complied with OIC 2016/ 169 and received their tenure extension.

Upon applying for tenure extension on six of Chance's eight Southern permits, 0012, 0013, 0014, 0015, 0016, and 0017, Chance received MO 2017/ 37 that required Chance to revise the consultation and engagement plan filed under OIC 2016/ 169 with each affected First Nation. The affected First Nations listed in MO 2017/ 37 were Vuntut Gwitchin First Nation, Tr'ondëk Hwëch'in (TH), First Nation of Na-Cho Nyak Dun (FNNND), Gwich'in Tribal Council (GTC) and Tetlit Gwich'in Council (TGC).

VGG and Chance developed the Communications and Engagement Plan (the Plan) collaboratively through a series of in-person meetings and conference calls. Hemmera was retained by Chance in November 2017 to facilitate the development and completion of the communications and engagement plans with each of the abovementioned First Nations and facilitated all discussions on the Plan between VGG and Chance. VGG and Chance submitted their finalized Plan to Minister [redacted] on May 22, 2018. To complete their obligations under MO 2017/ 37, Chance filed four communications and engagement plans which were approved by the Minister and resultantly Chance received a five-year tenure extension on the six Southern permits.

The completed Plan includes the VGG Oil and Gas Engagement Policy (the Policy). The Policy, developed by VGG and reviewed by Chance, provides structure to engagement between VGG and oil and gas proponents. Chance is following the stages outlined in the VGG Policy with the implementation of the Plan.

3.0 ENGAGEMENT AND COMMUNICATION PLAN IMPLEMENTATION SUMMARY

Since completing the Plan, VGG and Chance have continued to build their relationship, discussed advancing Chance's proposed oil and gas exploration project in Eagle Plain Basin, and formally initiated Stage 1 of the Plan. In the following section, a summary is provided of engagement activities that have occurred since the completion of the Plan.

Chance has had six in-person meetings or teleconferences with VGG, hosted 1 community dinner, and had numerous less formal phone calls and emails since completing the Plan. In addition, Chance hosted an All-

DRAFT

Party meeting to bring together the affected First Nations listed above along with Yukon Government to discuss their proposed Oil and Gas exploration project in Eagle Plains Basin. The main themes of discussion between VGG and Chance have been the following:

- Exploration project scope
- Cooperation Agreement
- VGG Policy
- Yukon Environmental and Socio-Economic Assessment Board (YESAB) process
- Explanation and understanding of oil and gas activities

July 10, 2018 – In-person Meeting

Location: Old Crow, Sarah Abel Chitze Building

Attendees: VGG Chief and Council and technical staff, Chance management, Hemmera facilitators

The purpose of this meeting was to establish a general understanding of Chance's project plans and communication pathways going forward, as well as to collaboratively decide on next steps in engagement.

Regarding Chance's project plans, Chance explained that they know of oil and gas potential in Eagle Plains but must do more exploration to better understand the resources and hopefully discover commercial quantities. Chance explained the history of exploration in the area that involved seismic data acquisition and exploratory well drilling. The exploration that Chance has planned would involve doing more seismic and drilling, as well as nurturing local capacity building in the form of partnerships, training and jobs. VGG asked about the exploration and development of shale resources and Chance replied they would not be focusing on shales and therefore will not use hydraulic fracturing.

Chance explained their land tenure status, explaining the land tenure extension application that was under review at the time of this meeting, as well as the expiration dates on their permits. Receiving the maximum allowed land tenure is critical to Chance as they need time to go through the YESAB process and undertake the field programs once regulatory approvals are granted.

Regarding communication going forward, VGG and Chance agreed that they need clear flows of information. A good relationship between VGG and Chance would allow them to design a project that meets the needs of the community and technical advisors.

The key outcome of this meeting was that VGG expressed their support for Chance's tenure extension application that was under review at the time of this meeting. In addition, VGG presented a Draft Cooperation Agreement to Chance. VGG explained that this was meant to facilitate conversation moving forward and that more specific project information was needed prior to completing the agreement.

September 11-12, 2018 – Two day In-person Meeting

Location: Whitehorse, Hemmera's Office

DRAFT

Attendees: VGG Council members and technical staff, Chance management, Hemmera facilitators

The purpose of this meeting was to discuss near-term community engagement and consultation, the Draft Cooperation Agreement, establish key objectives and common goals for the Cooperation Agreement, and discuss project development scenarios.

It was agreed that near-term community engagement and consultation should focus on the following:

- Community understanding of Chance's project and the oil and gas industry in general
- Vuntut Gwitchin Culture and Landscape
- Employment and capacity building
- Traditional Knowledge and Traditional Land Use
- Legislation and regulations

VGG expressed its Cooperation Agreement objectives as they were outlined in the Draft Cooperation Agreement and highlighted important clauses. Chance also expressed its objectives for the Cooperation Agreement and both parties outlined items for future negotiation. Knowledge and information sharing protocols were also discussed along with the topic of having common vs. independent technical advisors for the preparation of the project proposal. Chance and VGG discussed a process for completing the Cooperation Agreement and key contacts for future discussion. The next step was for Chance to review the Draft Cooperation Agreement and provide feedback to VGG.

Chance outlined two project development scenarios and both parties discussed their preferred scenario. Chance was actioned with preparing a brief write-up of exploration project scenarios including the scale, scope, and pace of planned activity.

October 4, 2018 – Teleconference Meeting

Location: Teleconference

Attendees: VGG technical staff, Chance management, Hemmera facilitators

The purpose of this meeting was to review the latest draft of the Cooperation Agreement (Agreement) and discuss how to finalize this; as well as to discuss Chance's exploration project scenarios as they were explained in a word document sent via email.

VGG and Chance decided that, because of the VGG election, it would be best to complete negotiations on the Cooperation Agreement after the new Chief and Council was instated in February 2019. This would also allow time for community consultation on the Cooperation Agreement.

VGG and Chance considered how to align the completion of the Cooperation Agreement, required in Stage II of the Policy, with other project activities. Both parties agreed that a meeting to review the Policy would be beneficial in informing how the parties would implement the stages of the Policy.

DRAFT

In addition, VGG and Chance discussed Chance's amendments to the Draft Cooperation Agreement and did not come to an agreement on changes. VGG was to provide written feedback on Chance's amendments to the Cooperation Agreement after the meeting.

December 12, 2018, In-person and Teleconference Meeting

Location: Hemmera's Office and teleconference

Attendees: VGG technical staff, Chance Management, Hemmera facilitators

The purpose of this meeting was to have an in-depth discussion on the Policy, increase both party's understanding of how to apply the Policy to Chance's project, and the actions required by each party to comply with each stage of the Policy.

VGG provided background information on the Policy explaining reference documents used to develop the Policy, and the purpose of the Policy for VGG. Community involvement throughout the stages of the Policy was also explained. A Natural Resources Committee (Committee) was being established as per the Policy, and Chance and VGG agreed to schedule a meeting in January in Old Crow to introduce Chance to the Committee and the new Chief and Council.

Chance and VGG discussed agenda items for the proposed February 1, 2019 All Party Meeting.

January 29, 2019 – In-person Meeting

Location: Old Crow, Sarah Abel Chitze Building

Attendees: VGG Chief and Council and technical staff, VGG Natural Resources Committee, Chance management, Hemmera facilitators

The purpose of this meeting was to introduce Chance to VGG's new Chief and Council and the Committee. The meeting was an unstructured conversation in which Chance explained their permits and exploration intentions and provided the opportunity for Chief and Council as well as the Committee to share their thoughts on the Project and ask questions.

The Committee members communicated what they see their role being in the project and what they would like to see in terms of community involvement in the project. The Committee also communicated what they understand to be the Elder's and community's general concerns around the project.

Key meeting outcomes were an introduction of Chance to the new Council and Committee, and an increased understanding of Chance's exploration project and timing, oil and gas industry options and products, disposition tenure, and *Yukon Environmental and Socio-economic Assessment Act (YESAB)*.

DRAFT

February 1, 2019, All-Party Meeting

Location: Vancouver, Fairmont Waterfront Hotel

Attendees: VGG Chief and Council and technical staff, FNNND Deputy Chief and technical staff, GTC Grand Chief and technical staff, Minister of Energy Mines and Resources and Oil and Gas Department staff, Chance Management, and Hemmera facilitators. The TGC President, and TH Chief and Council and technical staff were invited to the meeting and could not attend.

The purpose of the All-Party Meeting was to bring together VGG, GTC, TGC, FNNND, TH, and YG to discuss future plans and opportunities for collaboration on Chance's proposed exploration project.

An overview of the development of the Communications and Engagement Plans and an update on implementation was provided. All parties were introduced to the VGG Policy, discussed the general format of the policy and the involvement of VGG Chief and Council and Old Crow community.

Chance discussed potential exploration project scenarios, discussing the sequence of exploration, the potential number of exploration wells they would like to drill, the roads this would require, and the approximate number of people they could employ.

The First Nations in attendance requested time within the agenda to have an in-camera session in which they discussed project matters without Chance, Yukon Government, or Hemmera in the room.

Hemmera presented the YESAB process and other regulatory processes outlined in the *Yukon Oil and Gas Act* (YOGA) and the *Water Act*. Hemmera explained the YESAB Designated Office and executive committee processes and how these sequence with other permitting requirements. YESAB is introducing a Pre-Submission Engagement (PSE) process, anticipated to be rolled out in late 2019, which facilitates an iterative process for proponents to develop their project description and valued components with feedback from YESAB prior to submitting their project description. Chance does not anticipate following the PSE process, but has not heard a final answer from YESAB.

The groups discussed next steps which would include the following:

- Chance and First Nations developing confidentiality agreements
- Chance defining their project scope and communicating this with the First Nations
- The First Nations discussing the possibility of shared technical consultants
- Forming adaptive management measures
- Yukon Government hosting Oil and Gas 101 sessions
- Chance and VGG would discuss the completion of stages of the Policy in parallel with other regulatory requirements, or sequentially with other regulatory requirements.

June 6, 2019 – In-person Meeting

Location: Old Crow, Sarah Abel Chitze Building

DRAFT

Attendees: VGG Chief and Council, VGG Natural Resources Committee, Chance management, Hemmera facilitators

The purpose of this meeting was for Chance to present the Draft Project Description of exploration activities proposed for the Eagle Plain Basin as per the VGG Policy as well as to discuss the annual reporting required for the Plan.

The Draft Project Description Presentation included descriptions of the oil and gas activities involved in exploration and the anticipated scope of these activities. There were questions and discussion regarding the project activities, decision making processes, impacts to environmental and socio-economic values, and remediation.

Hemmera presented the anticipated YESAB process, explaining that Chance is going to submit a project proposal to the Executive Committee of YESAB to screen. The anticipated consultation schedule was presented for discussion along with how this could align with the stages of the Policy.

Key meeting outcomes were Chance's presentation of a package of information to comply with Stage I, Paragraph 24 of the Policy.

June 6, 2019 – Community Dinner

Location: Old Crow, Community Hall

Attendees: 35 Community Members including members of VGG Chief and Council and VGG Natural Resources Committee, Chance management, Hemmera facilitators

Chance provided the community with background information on the company and their work in Eagle Plain Basin. Chance also provided the community with an overview of the project scope and the exploration activities that Chance is proposing to undertake.

Hemmera provided the community with a review of the YESAB process, explaining the community consultation component of the executive committee level screening, and that Hemmera will be conducting the consultation program with Chance for their exploration project.

The engaged audience asked questions and the Chance team and Hemmera provided responses.

4.0 PLANS FOR ONGOING ENGAGEMENT AND NEXT STEPS

VGG and Chance will continue to hold discussions at regular intervals as Chance develops their project proposal for YESAB. Chance will comply with the stages of the Policy while developing the corresponding project proposal information. Upcoming engagement activities are expected to involve the following:

- Meetings between VGG technical staff and technical consultants preparing the project proposal
- Negotiation of a final Cooperation Agreement (Stage II of the Policy)

DRAFT

- Negotiation of a Stewardship and Benefits Agreement (Stage III of the Policy)
- Community consultation events in Old Crow

5.0 APPROVAL OF IMPLEMENTATION SUMMARY

VGG and Chance have reviewed this report and agree to its contents as an accurate summary of the engagement and consultation meetings executed since the completion of the Plan.

APPENDIX A

Vuntut Gwitchin Government and Chance Oil and Gas Limited Communication and Engagement Plan

DRAFT

Vuntut Gwitchin Government

Chance OIL AND GAS LIMITED

May 22, 2018

[redacted]
Minister of Energy, Mines and Resources
Government of Yukon
Box 2703
Whitehorse, Yukon Y1A 2C6

Dear [redacted]

Re: Submission of the Vuntut Gwitchin Government and Chance Oil and Gas Limited Communications and Engagement Plan

Ministerial Order 2017/037 of the Yukon Oil and Gas Act states the following in clause 5:

> *5 It is a condition of this Order that Chance Oil and Gas Limited must, in consultation with each affected First Nation, revise the first nations communications and engagement plan filed under O.I.C. 2016/169 to the satisfaction of the Minister on or before August 1, 2018.*

Vuntut Gwitchin Government (VGG) and Chance Oil and Gas Limited (Chance) are pleased to inform you of our collaborative efforts to develop a mutually agreeable framework to facilitate effective and meaningful communications and engagement between VGG and Chance. The framework captured in the enclosed Communications and Engagement Plan (Plan), and its collaborative development, establishes a solid foundation for a respectful relationship that both parties will implement and enjoy as we continue to work together now and into the future.

Please accept the enclosed Plan for the purposes of Ministerial Order 2017/037. We trust that the Plan will be of satisfaction to the Minister, as it meets the needs of VGG and Chance at this time.

[redacted]

Director of Natural Resources
Vuntut Gwitchin Government

Vice President of Government and External Relations
Chance Oil and Gas Limited

Enclosed: Communications and Engagement Plan

COMMUNICATION AND ENGAGEMENT PLAN

VUNTUT GWITCHIN GOVERNMENT & CHANCE OIL AND GAS LIMITED

MAY 17, 2018

1. Background

Chance Oil and Gas Limited ("Chance") is an oil and gas exploration company that currently holds valid permits to perform oil and gas activities in the Eagle Plain basin within the Traditional Territory of the Vuntut Gwitchin First Nation ("VGFN").

As a condition of order-in-council 2016/169 dated August 30, 2016 concerning the return of work deposits to Chance in relation to oil and gas permits nos. 0005 to 0011, Chance was required to file a communication and engagement plan (the "Plan"). The Plan, as it was submitted, was not mutually agreed upon between Chance and the Vuntut Gwitchin Government ("VGG").

As a condition of ministerial order 2017/37 dated August 29, 2017 concerning a one-year extension for oil and gas permit nos. 0012 to 0017, Chance is now required to revise the Plan in consultation with VGFN on or before August 1, 2018.

2. Purpose

The purpose of this document is to revise the Plan in a manner that establishes a mutually agreed upon framework between Chance and VGG to guide communication (i.e. the exchange of information) and engagement (i.e. meaningful participation in planning, problem-solving and decision-making) in relation to all aspects of Chance's activities, including but not limited to, community information programs; existing or proposed oil and gas dispositions; and existing or proposed oil and gas activities.

Nothing in this Plan is intended to address or satisfy any duties or responsibilities of the Government of Yukon that exist or may arise in relation to Chance's exploration program.

3. Application of Oil and Gas Engagement Policy

The *Vuntut Gwitchin Government Oil and Gas Engagement Policy* attached to this Plan as Appendix A (the "Policy") will be the overarching framework that guides engagement between VGG and Chance in relation to Chance's activities. Chance will comply with the Policy and any other applicable VGG policies. To the extent that there may be any inconsistency between this Plan and the Policy, the Policy will prevail.

4. Communication and Engagement

The communication and engagement between Chance and VGFN in relation to Chance's exploration program activities is anticipated to encompass communication and engagement between: (a) Chance and VGG; and (b) Chance and VGFN Citizens.

4.1 Communication and Engagement between Chance and VGG

The VGG committee mandated under part two of the Policy will be the VGG body responsible for managing communications and engagement between Chance and VGG, including informing and seeking views of VGFN Citizens, with the exception of any communications related to any

negotiations of towards a Cooperation Agreement or Benefits and Stewardship Agreement which will occur directly between Chance and Council as set out under the Policy.

Table 1.

Subject Matter	VGG Contact(s)	Chance Contact(s)
Communications related to Chance's exploration program activities, other than those communications excepted below.	• Director of Natural Resources • Chair of the Standing Committee on Natural Resources, Heritage, Tourism and Economic Development	• Management Team
Communications related to the negotiation of a Cooperation Agreement or Benefits and Stewardship Agreement.	• Council	• Management Team

4.2 Communication and Engagement between Chance and VGFN Citizens

VGG does not serve a gatekeeping role with respect to any communications and engagement that Chance may wish to undertake with VGFN Citizens in relation to Chance's exploration program activities; however, VGG and Chance will seek to coordinate communication and engagement efforts with VGFN Citizens to the extent such joint communication and engagement is possible or appropriate. As detailed in the Policy, Chance will submit a written notice to the Director of Natural Resources within a reasonable time prior to any proposed public meetings with VGFN Citizens in order to facilitate coordination between Chance and VGG.

Table 2.

Subject Matter	VGG Contact(s)	Chance Contact(s)
Written notice of proposed meetings with VGFN Citizens in relation to Chance's exploration program activities.	• Director of Natural Resources	• Vice President of Government and Community Relations

4.3 Communication and Engagement Methods and Content

Chance and VGG will use the following methods for carrying out communication and engagement in relation to Chance's exploration program activities:

- In-person meetings;
- Public meetings (for communication and engagement with VGFN Citizens in Old Crow and Whitehorse);

- E-mail correspondence;
- Telephone correspondence (teleconferences and less formal phone calls);
- Power Point presentations (to support in-person meetings);
- Reports (as requested and as required);
- Social media;
- Newsletters; and
- Official websites.

The information exchanged in communication and engagement between Chance and VGFN is anticipated to address the following key items:

- Information programs regarding VGFN culture and history;
- Information programs regarding the oil and gas industry, including its history and regulation in Yukon;
- Any existing or proposed Chance oil and gas dispositions;
- Any existing or proposed Chance oil and gas activities;
- Items set out in the Policy that must be addressed in any Cooperation Agreement and Benefits and Stewardship Agreement between VGFN and Chance; and
- Implementation of the Policy.

5. Records Management

Chance and VGG will use the following records management protocols in relation to communications and engagement between Chance and VGG.

5.1 Records Subject to Disclosure to Regulators and Assessors

Subject to the records management protocols in this Plan, Chance may disclose the following types of relevant records to regulators and assessors:

- meeting agendas;
- meeting minutes;
- meeting participant lists;

- records log which includes summaries of the following: in-person meetings; e-mail and telephone correspondence between Chance and VGG, including supporting materials shared or discussed in the correspondence;

- reports provided by either VGG or Chance to one another; and

- Power Point presentations provided by either VGG or Chance to one another.

5.2 Records Management Procedures and Confidentiality Protocols

Records of communications between VGG and Chance will be made, and any support services retained by either Chance or VGG to those records will be conducted in a fair and unbiased manner. Should VGG and Chance choose not to retain records management support services, VGG and Chance will jointly decide on an individual or individuals from either or both parties to be responsible for records keeping and management.

Chance, VGG and any person or party retained to assist in records management will comply with the following procedures for records management:

- Meeting agendas will be developed collaboratively between VGG and Chance and mutually agreed upon prior to the outset of the meeting.

- Meeting minutes will be taken by a designated records management person or party and sent to Chance and VGG within 2 weeks via e-mail. VGG and Chance may review and provide comment to the records management person or party on these meeting minutes within 30 days of both parties receiving the meeting minutes. Should either party require more time to review the meeting minutes, the party will notify the records management person or party by e-mail within 2 weeks of receiving the minutes. No response by VGG or Chance to meeting minutes will be interpreted as general acceptance of the meeting minutes by that party.

- Action items and key outcomes will be logged during meetings and will be reviewed by both parties at the end of the meeting to ensure that there is general agreement on the list of actions and parties responsible for those actions and on the list of key outcomes from the meeting. The list of action items and the list of key outcomes will be recorded within the meeting minutes.

- Any reports or Power Point presentations provided by either VGG or Chance to one another will be considered final upon delivery unless otherwise specified as drafts.

- A record log will be jointly reviewed and approved by Chance and VGG for accuracy, completeness, and compliance with this Plan prior to being disclosed to any regulator and assessor.

Chance and VGG will comply with the following confidentiality protocols for records management and the disclosure of records to regulators and assessors:

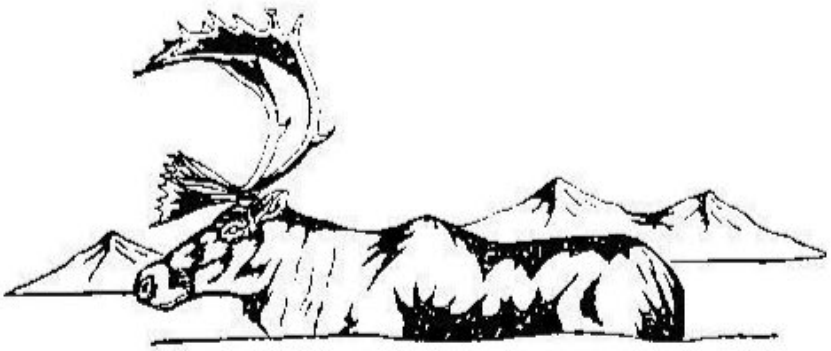
Table 3.

Type of Record	Confidentiality Assumption	Process for Establishing Confidentiality
Meeting Agendas	• Not confidential.	• Should confidential matters need to be discussed, a separate agenda will be created for these matters and remain confidential.
Meeting Minutes	• Not confidential.	• Confidential discussions/content will be identified before the meeting begins, during the meeting, or as part of the minutes review process.
Meeting Participant List	• Not confidential.	• Unless otherwise specified during the meeting, these items are not considered confidential.
Records Log	• Not confidential.	• Should correspondence need to be confidential, it is the responsibility of each party to notify the other when a meeting, e-mail, phone call, or attachment is confidential at the time it occurs or immediately thereafter.
Reports provided by either VGG or Chance to one another	• Not confidential. • Note: Any reports containing traditional knowledge or traditional land use will be subject to separate protocols agreed upon by VGG and Chance.	• Should a report shared between parties need to be confidential, it is the responsibility of each party to notify the other of this when the report is shared.
Power Point presentations provided by either VGG or Chance to one another	• Not confidential.	• Unless otherwise specified during the meeting, these items are not considered confidential.

6. Plan Review and Amendment

Chance and VGG will review and assess this Plan and its implementation on a quarterly basis. Following any review and assessment of the Plan, the Plan may be amended upon the mutual agreement of Chance and VGG.

SCHEDULE A
VUNTUT GWITCHIN GOVERNMENT OIL AND GAS ENGAGEMENT POLICY



VUNTUT GWITCHIN GOVERNMENT
OIL AND GAS ENGAGEMENT POLICY

MAY 2018

PART ONE
GENERAL PROVISIONS

Title

1. This policy may be cited as the *Vuntut Gwitchin Government Oil and Gas Engagement Policy*.

Definitions

2. In this policy:

"**Application**" means an application made by a Proponent in relation to an Oil and Gas Disposition pursuant to the *Oil and Gas Act*, R.S.Y. 2012, c. 162;

"**Benefits and Stewardship Agreement**" means the agreement required in relation to any oil and Gas Activity as set out at Stage III of the Engagement Process under part three of this policy.

"**Board**" means a designated office, executive committee or panel of the Yukon Environmental and Socio-Economic Assessment Board.

"**Citizen**" means a citizen of the Vuntut Gwitchin First Nation pursuant to Appendix II of the Constitution (Citizenship Code).

"**Citizen Representative**" means a Citizen appointed to the Committee by the Council.

"**Committee**" means the lands and resources committee of the Vuntut Gwitchin First Nation as mandated under part two of this policy.

"**Constitution**" means the Constitution of the Vuntut Gwitchin First Nation.

"**Cooperation Agreement**" means the agreement required in relation to any Oil and Gas Activity as set out at Stage II of the Engagement Process under part three of this policy.

"**Council**" means the branch of the Vuntut Gwitchin Government established by the Constitution consisting of the Chief, Deputy Chief and all Councillors.

"**Director of Natural Resources**" means the Director of the Vuntut Gwitchin Government's Natural Resources Department.

"**Elders Representative**" means a member of the Vuntut Gwitchin First Nation Elders Council appointed to the Committee by the Elders Council.

"**Engagement Process**" means the process commencing under part three of this policy for engagement between the Vuntut Gwitchin Government and a Proponent in relation to any Application or Oil and Gas Activity and continuing for so long as required.

"**Intergovernmental Process**" means any engagement process between the Vuntut Gwitchin Government and Government of Yukon on matters related to Oil and Gas Activities, Oil and Gas Dispositions and their regulation.

"**Oil and Gas Activity**" or "**Oil and Gas Activities**" means any existing or proposed oil and gas activity or activities as defined by Section 1 of the *Oil and Gas Act*, R.S.Y. 2012, c. 162 that affects, or has the potential to affect, any rights, responsibilities or interests of the Vuntut Gwitchin First Nation whether or not the oil and gas activity or activities are situated within the Vuntut Gwitchin First Nation Traditional Territory.

"**Oil and Gas Disposition**" or "**Oil and Gas Dispositions"** means any existing or proposed oil and gas disposition or dispositions as defined by as defined by Section 1 of the *Oil and Gas Act*, R.S.Y. 2012, c. 162 that affects, or has the potential to affect, any rights, responsibilities or interests of the Vuntut Gwitchin First Nation whether or not the oil and gas disposition or dispositions grants rights to lands situated within the Vuntut Gwitchin First Nation Traditional Territory.

"**Proponent**" means any proponent of an Oil and Gas Activity or holder of an Oil and Gas Disposition.

"**Proposal**" means a proposal required to be submitted by a proponent to the Board pursuant to Section 50(1) of the *Yukon Environmental and Socio-economic Assessment Act*, S.C. 2003, c. 7.

"**Sustainable Development**" means beneficial socio-economic change that does not undermine the ecological and social systems upon which communities and societies are dependent as defined in Chapter 1 of the *Vuntut Gwitchin First Nation Final Agreement*,.

"**Standing Committee Chair**" means the Chair of the Vuntut Gwitchin Government Standing Committee on Natural Resources, Heritage, Tourism and Economic Development.

"**Vuntut Gwitchin First Nation"** means the legal entity established pursuant to Article 9 of the *Vuntut Gwitchin First Nation Self-Government Agreement*.

"**Vuntut Gwitchin First Nation Law**" means any law enacted by the Vuntut Gwitchin First Nation in accordance with its law-making powers under Article 13 of the *Vuntut Gwitchin First Nation Self-Government Agreement*.

"**Vuntut Gwitchin Government**" means the government of the Vuntut Gwitchin First Nation.

"**Youth Representative**" means a Citizen between the ages of 14 and 21 appointed to the Committee by the Council.

Purpose

3. The purpose of this policy is to establish a respectful, transparent and meaningful framework to guide the engagements of the Vuntut Gwitchin Government in relation to Oil

and Gas Activities and Oil and Gas Dispositions in a manner that supports and upholds the objective of Sustainable Development.

Application

4. This policy applies to any engagement between the Vuntut Gwitchin Government and a Proponent in relation to any to Oil and Gas Activities and Oil and Gas Dispositions.

Conflict of Law and Policy

5. In the event of a conflict or inconsistency between this policy and the Constitution, the Constitution shall prevail to the extent of the conflict or inconsistency.

6. In the event of a conflict or inconsistency between this policy and any Vuntut Gwitchin First Nation Law, the Vuntut Gwitchin First Nation Law shall prevail to the extent of the conflict or inconsistency.

General

7. Nothing in this policy is to be construed as abrogating or derogating from the *Vuntut Gwitchin First Nation Final Agreement*.

8. Nothing in this policy is to be construed as providing consent or authorizing any past, existing or proposed Oil and Gas Activity or Oil and Gas Disposition.

9. Nothing in this policy shall be construed as limiting, affecting, fulfilling or discharging the honour of the Crown and the Crown's constitutional duty to consult and accommodate the Vuntut Gwitchin First Nation.

10. This policy may be amended from time to time by the Vuntut Gwitchin Government and will make best efforts to notify any Proponent potentially affected by an amendment.

PART TWO
ADMINISTRATION

Committee

11. The Vuntut Gwitchin Government shall establish the Committee with a mandate to fulfill the following roles and responsibilities in accordance with this policy:

    (a) reviewing information about Oil and Gas Activities, Oil and Gas Dispositions and their regulation;

    (b) informing and seeking views from Citizens on Oil and Gas Activities, Oil and Gas Dispositions, the Engagement Process and/or Intergovernmental Process as necessary;

(c) assisting and providing recommendations to the Council throughout the Engagement Process; and

(d) providing recommendations to the Council throughout the Intergovernmental Process if requested by Council.

12. The Committee shall be made of 5 members consisting of the:

(a) Standing Committee Chair;

(b) Director or Natural Resources;

(c) Elders Representative;

(d) Youth Representative; and

(e) Citizen Representative.

13. The Committee shall meet as regularly as may be necessary to fulfill its roles and responsibilities.

14. The Committee shall have a quorum of 3 members.

15. The Standing Committee Chair and Director of Natural Resources shall serve as co-chairs of the Committee.

16. The Committee shall make best efforts to fulfill its roles and responsibilities by consensus.

17. The Committee may at any time request the support of employees or contractors of the Vuntut Gwitchin Government to assist it in carrying out its roles and responsibilities under this policy.

18. The Committee may invite any persons, including any Proponent, to attend or participate in a meeting of the Committee.

19. The Committee shall not use or disclose to any person confidential information except as may be required to fulfill its roles and responsibilities.

Citizen Consultation

20. The Director of Natural Resources shall be responsible for organizing and carrying out any consultation between the Vuntut Gwitchin Government and Citizens regarding Oil and Gas Activities and Oil and Gas Dispositions with the assistance and participation of the Committee as necessary.

21. In that event that a Proponent wishes to organize and carry out any public consultation with Citizens related to any Oil and Gas Activities or Oil and Gas Dispositions, the Proponent shall submit a notice in writing to the Director of Natural Resources within a reasonable time prior to the proposed meeting date in order to facilitate coordination between the

Proponent and Vuntut Gwitchin Government if appropriate. The written notice shall contain:

(a) proposed dates and location;

(b) proposed agenda;

(c) description of the purpose of the consultation; and

(d) any materials to be relied on by the Proponent during the consultation.

22. Any consultations with Citizens related to any Oil and Gas Activities or Oil and Gas Dispositions that are organized and carried out by the Proponent shall not be construed as consultation with the Vuntut Gwitchin Government.

PART THREE
ENGAGEMENT PROCESS

Stage I – Notice Period

23. Proponents shall provide notice in writing to the Director of Natural Resources of any Application in relation to any Oil and Gas Disposition at the earliest possible opportunity. The written notice of the Application shall contain:

(a) letter of introduction;

(b) company profile including organizational structure, profiles of directors and management team members, financial statements for the previous five fiscal years and compliance record;

(c) detailed description of the Oil and Gas Disposition and Application including any relevant maps, plans or schedules; and

(d) designated Proponent spokesperson.

24. Proponents shall provide notice in writing to the Director of Natural Resources of any Oil and Gas Activity at the earliest possible opportunity in the planning phase and prior to submitting a Proposal to the Board. The written notice shall contain:

(a) letter of introduction;

(b) company profile including organizational structure, profiles of directors and management team members, financial statements for the previous five fiscal years and compliance record;

(c) detailed description of the proposed Oil and Gas Activity, including any relevant maps, plans or schedules;

(d) administration fee in the amount of $1,000.00 made payable to the Vuntut Gwitchin First Nation; and

(e) designated Proponent spokesperson.

25. Upon receipt of any written notice from a Proponent in relation to any Application or Oil and Gas Activity, the Director of Natural Resources shall immediately refer the notice to the Committee. The Committee shall meet to review the notice and:

(a) if the Committee determines the notice is incomplete or insufficient the Committee may request in writing further or better information from the Proponent, and the Proponent shall provide such further or better information upon receipt of the written request; or

(b) if the Committee determines the notice is complete and sufficient then:

(i) in the case of a notice regarding an Application, the Director of Natural Resources may provide written comments to the Proponent or request a meeting with the Proponent to discuss the Application; and

(ii) in the case of a notice regarding an Oil and Gas Activity, the Committee shall notify the Proponent of the determination in writing and the Engagement Process shall proceed to Stage II.

Stage II – Cooperation on any Oil and Gas Activity

26. After completion of Stage I and prior to submitting a Proposal to the Board, a Proponent shall negotiate in good faith and enter into a Cooperation Agreement with the Council for the purpose of establishing a meaningful, respectful and transparent process for engagement.

27. Prior to entering into a Cooperation Agreement, the Council shall refer the agreement to the Committee for review. The Council may enter into a Cooperation Agreement on behalf of the Vuntut Gwitchin First Nation if the Committee determines that the terms and conditions adequately consider and address the following items:

(a) compliance with this policy;

(b) capacity funding for the Engagement Process;

(c) communications and correspondence;

(d) information sharing; and

(e) commitment to negotiate a Benefits and Stewardship Agreement.

Stage III – Benefits and Stewardship on any Oil and Gas Activity

28. After the completion of Stage II and prior to submitting a Proposal to the Board, a proponent shall negotiate in good faith and enter into a Benefits and Stewardship Agreement with the Council for the purpose of establishing appropriate stewardship measures and maximizing any potential benefits for the Vuntut Gwitchin First Nation.

29. Prior to entering into a Benefits and Stewardship Agreement, the Council shall refer the agreement to the Committee for review. The Council may enter into a Benefits and Stewardship Agreement on behalf of the Vuntut Gwitchin First Nation if the Committee determines that the terms and conditions adequately consider and address the following items:

    (a) detailed description of the Oil and Gas Activity;

    (b) capacity funding for participation in the Board's regulatory process;

    (c) compliance with the objective of Sustainable Development;

    (d) compliance with applicable land use plans;

    (e) compliance with Vuntut Gwitchin First Nation General Assembly Resolution No. 2013-01 regarding hydraulic fracturing;

    (f) adequate education and training opportunities;

    (g) adequate employment and procurement opportunities;

    (h) adequate revenue sharing or equity arrangements;

    (i) adequate stewardship measures including but not limited to:

        (i) baseline data collection measures;

        (ii) information sharing measures;

        (iii) joint monitoring of environmental and socio-economic effects, and of the effectiveness of mitigation measures;

        (iv) joint advisory and reporting processes;

        (v) joint fish and wildlife management plan;

        (vi) joint heritage resource protection plan;

        (vii) joint access management plan;

        (viii) joint water quality and quantity management plan;

(ix) joint waste management plan;

(x) joint remediation and reclamation plan;

(xi) adaptive management measures in relation to the foregoing stewardship measures, including adaptability to address any recommendations from the Board;

(j) potential socio-economic effects which includes effects on economies, health, culture, traditions, lifestyles and heritage resources;

(k) potential cumulative effects which includes effects to the environment that are caused by an action in combination with other past, present and future human actions;

(l) potential effects on any Vuntut Gwitchin First Nation rights, responsibilities and interests under the *Vuntut Gwitchin First Nation Final Agreement* and *Vuntut Gwitchin First Nation Self-Government Agreement*;

(m) compliance and enforcement measures;

(n) dispute resolution mechanisms; and

(o) Vuntut Gwitchin First Nation approval and ratification process.

30. In addition to a Benefits and Stewardship Agreement, the Council may enter into a separate agreement with a Proponent and other parties for the purpose of addressing the limited requirements under section 68 of the *Oil and Gas Act*, R.S.Y. 2012, c. 162.

APPENDIX B

Ministerial Order 2018/ 42

DRAFT

YUKON

CANADA

MINISTERIAL ORDER 2018/ 42

OIL AND GAS ACT

Pursuant to the *Oil and Gas Act*, the Minister of Energy, Mines and Resources orders

1 In this Order

"subject permit" means each of the following oil and gas permits held by Chance Oil and Gas Limited:

(a) oil and gas permit No. 0012,

(b) oil and gas permit No. 0013,

(c) oil and gas permit No. 0014,

(d) oil and gas permit No. 0015,

(e) oil and gas permit No. 0016,

(f) oil and gas permit No. 0017. « *permis visé* »

2 The renewal term of each subject permit is extended by five years (so that it ends on August 30, 2023).

3 The resulting total length of the initial term and the renewal term of a subject permit is 16 years.

YUKON

CANADA

ARRÊTÉ MINISTÉRIEL 2018/42

LOI SUR LE PÉTROLE ET LE GAZ

Le ministre de l'Énergie, des Mines et des Ressources, conformément à la *Loi sur le pétrole et le gaz*, arrête :

1 La définition suivante s'applique au présent arrêté.

« permis visé » Les permis suivants de pétrole et de gaz détenus par Chance Oil and Gas Limited :

a) permis de pétrole et de gaz nº 0012;

b) permis de pétrole et de gaz nº 0013;

c) permis de pétrole et de gaz nº 0014;

d) permis de pétrole et de gaz nº 0015;

e) permis de pétrole et de gaz nº 0016;

f) permis de pétrole et de gaz nº 0017. "*subject permit*"

2 La durée du renouvellement de chaque permis visé est prolongée de cinq ans, de façon à ce qu'elle se termine le 30 août 2023.

3 La durée totale d'un permis visé, y compris la durée initiale et la durée du renouvellement, est de 16 ans.

4(1) In this section

"first nations communications and engagement plan" means the plan filed under O.I.C. 2016/169 and revised in accordance with M.O. 2017/37. *« plan de participation et de communication avec les premières nations »*

(2) It is a condition of this Order that Chance Oil and Gas Limited must file annual reports with the Division Head, in accordance with subsection (3) and to the satisfaction of the Division Head, about the implementation of the first nations communications and engagement plan.

(3) For the purposes of subsection (2), Chance Oil and Gas Limited must file

(a) the first annual report on or before July 31, 2019, in respect of the period beginning on September 1, 2018, and ending on May 31, 2019; and

(b) each subsequent annual report on or before July 31 of each year in respect of the period beginning on June 1 of the preceding year and ending on May 31 of the year in which the report is to be filed.

4(1) La définition suivante s'applique au présent article.

« plan de participation et de communication avec les premières nations » Le plan déposé en vertu du Décret 2016/169 et révisé en conformité avec l'Arrêté 2017/37. *"first nations communications and engagement plan"*

(2) À titre de condition du présent arrêté, Chance Oil and Gas Limited dépose des rapports annuels auprès du chef de division, en conformité avec le paragraphe (3) et à la satisfaction du chef de division, concernant la mise en œuvre du plan de participation et de communication avec les premières nations.

(3) Pour l'application du paragraphe (2), Chance Oil and Gas Limited dépose :

a) le premier rapport annuel au plus tard le 31 juillet 2019, pour la période débutant le 1er septembre 2018 et se terminant le 31 mai 2019;

b) chaque rapport annuel subséquent, au plus tard le 31 juillet de chaque année pour la période débutant le 1er juin de l'année précédente et se terminant le 31 mai de l'année au cours de laquelle le rapport doit être déposé.

Dated at Whitehorse, Yukon,
~~30~~ August 30th 2018.

Fait à Whitehorse, au Yukon,
le August 30th 2018.

Dear [redacted]:

RE: Chance Oil and Gas Limited ("COGL") Correspondence

I am writing to confirm our receipt of recent correspondence from COGL.

We acknowledge COGL's letter and enclosures dated April 9, 2020 regarding the Cooperation Agreement discussions with you under our *Oil and Gas Engagement Policy*. We also acknowledge COGL's letter dated April 20, 2020 regarding COGL's request to extend oil and gas permit no. 20 and we confirm our acceptance of this as sufficient notice under our *Oil and Gas Engagement Policy*.

These matters remain under our consideration. Due to the exceptional circumstances currently being experienced by our community and government as a result of the COVID-19 pandemic, including the closure of non-essential government offices and limited non-essential government activities, our consideration may be prolonged or delayed. A more substantive response to your correspondence will be forthcoming as soon as practicable.

We appreciate your understanding during these times.

Sincerely,

[redacted]
Director of Natural Resources Department

APPENDIX 2-C-26. *Gap Analysis of YESAB Project Proposal based on VG registry comments*

MEMORANDUM

Date:	January 24, 2020
To:	Chance Oil and Gas
From:	Hemmera Envirochem Inc.
File:	103545-01
Re:	Gap Analysis of YESAB Project Proposal based on VG registry comments

1.0 INTRODUCTION

Northern Cross (Yukon) Ltd. (now Chance Oil and Gas Ltd.) submitted a Project proposal to the Dawson Designated Office of the Yukon Environmental and Socio-economic Assessment Board (YESAB) for assessment on July 20, 2014. The proposed Project included drilling and conducting extended flow tests on up to 20 exploratory oil and gas wells in the Eagle Plain region. The Dawson Designated Office initiated the assessment which included several opportunities for stakeholders and the public to provide comments on the Project.

The outcome of the Dawson Designated Office assessment was to recommend that the Project be referred to the Executive Committee of YESAB for a Screening. As such, Chance Oil and Gas Ltd. (Chance) is required to prepare a new Project proposal to be submitted to the Executive Committee. Chance has developed and circulated a revised Project description (dated June 5, 2019) and is now in the process continuing consultation with affected First Nations in order to prepare a Project proposal for submission to the Executive Committee of YESAB.

1.1 Approach

Hemmera reviewed available information submitted by Vuntut Gwitchin First Nation (VG) to the Dawson Designated Office for the assessment of the Eagle Plains Multi-well Exploration Program (YESAB Project number 2014-0112) in order to identify concerns, gaps and recommendations. Among other communications, VG provided three comment submissions to the Dawson Designated Offices (YESAB YOR document numbers 123-1, 157-1, and 250-1). These submissions outlined:

- Background information
- Values and interests in the Project area
- Issues and concerns with the Project and activities
- Gaps in information contained in the Project proposal
- Questions and recommendations to address concerns and gaps

Hemmera reviewed the three submissions to identify issues/concerns and questions/recommendations raised by VG. This analysis was conducted in order to identify concerns and information requirements to be addressed in preparing a new Project proposal for submission to the Executive Committee of YESAB. Hemmera has also identified approaches that Chance may take in order to address the concerns and gaps raised in developing the Project description and Project proposal for submission to YESAB. This analysis is provided below in **Table 1**.

1.2 Further Consideration

The analysis in **Table 1** does not include comments from other parties received by the YESAB Designated Office in relation to their assessment. These comments will be reviewed and taken into consideration when developing the new Project Proposal.

Currently, Chance is preparing a new Project proposal to be submitted to the YESAB Executive Committee. There are additional information and process requirements for Project proposals to be submitted to the YESAB Executive Committee; one of which is the requirement to consult with potentially affected First Nations and residents of communities under Section 50(3) of the *Yukon Environmental and Socio-economic Assessment Act*.

Chance has taken the opportunity to re-evaluate the proposed activities they would like to undertake. A revised Project description was developed and distributed on June 5, 2019. Chance anticipates that this Project description will be refined as consultation with VG and other affected First Nations progresses and as the new Project proposal is developed.

It is acknowledged that comments submitted by VG to the YESAB Designated Office for the previous assessment were based on prior Project description being undertaken at a DO level evaluation. While the concerns and recommendations identified as well as the proposed approach to addressing concerns will be a good starting point in developing the new Project proposal, the list in **Table 1** below should not be considered a complete list of gaps for a future Project Proposal submission. Additionally, Chance is expecting to consult and engage with VG and other affected First Nations at various stages through the process. Furthermore, there will be several opportunities for participation during the YESAB Executive Committee Screening process.

2.0 GAP ANALYSIS

The first 3 columns of **Table 1** present the information submitted by VG in their comment submissions to the Dawson Designated Office. Columns 1 and 2 identify the document number and the page number for reference back to the specific issue raised by VG. Columns 3 and 4 are copied from the submissions and identify issues and concerns as well as questions and recommendations to address those concerns. Column 5 outlines potential next steps suggested by Hemmera to address the issues and concerns identified by VG. The suggested next steps are based off:

- VG concerns, questions and recommendations to address those concerns
- Understanding that a new Project proposal will be developed for submission to the Executive Committee of YESAB
- Understanding that the Project has been significantly modified, and will likely be further refined through the consultation process, from the Project presented in the Designated Office assessment
- Consultation with VG and other affected First Nations conducted to date, and anticipated future consultation processes.

It is expected that Hemmera's suggested next steps to addressing concerns may change as consultation efforts progress and the new Project proposal is being developed. This may be as a result of consultation activities and input from VG and other affected First Nations, as well as engagement with assessors and

regulators; refinement of the Project Description; conducting the effects assessment, development of mitigation measures, and creation of management plans.

Table 1 – VG Gap Analysis of YESAB Designated Office Project Proposal

Vuntut Gwitchin Comment Submissions to YESAB				Hemmera Proposed Next Steps to Addressing Concerns Raised
YOR Doc #	**Page #**	**Issues and Concerns**	**Questions and Recommendations**	
123-1	3	The proposal outlines NCY environmental objectives, but does not adequately describe the activities necessary to achieving these goals; how these activities will be monitored for compliance and effectiveness, and how they will be reported. For example: Appendix L Blasting Plan for Wildlife Environmental/Wildlife monitors will survey the surrounding area for any sign of focal wildlife species: moose, caribou and bears. They will look for high value habitat features, such as dens, raptor nests, mineral licks and wallows (Monitors may need special training to detect bear dens, best to discuss with Regional Biologist). If high value wildlife feature (s) are found more detailed mitigation plans will be made in consultation with Regional Biologist. If focal species are found during surveys avoid blasting till they move further than 1km from site.	• A monitoring protocol is required that describes the survey design: when wildlife surveys will take place in relation to a planned activity, the size of the area surveyed, frequency of survey, general survey effort etc. Use of a reporting form that indicates the survey took place and showing results and mitigations/actions taken, if any, would demonstrate compliance and capture information useful for future management decisions.	Chance will develop a Wildlife Mitigation and Monitoring Plan (WMMP). A conceptual WMMP will be developed for discussion with VG and will be submitted with the YESAB Project proposal. The WWMP will be finalized based on input from VG and other affected First Nations and stakeholders. The WMMP will include details such as required monitoring (e.g., species, survey areas, and frequency of surveys), mitigation requirements and options, reporting, and communication with First Nations and stakeholders. Chance anticipates developing the WMMP based on the new Project description and baseline date collected for the new Project proposal. In addition, Chance will consult with VG and other affected First Nations on the development of the WMMP. Chance will also develop a detailed description of activities and required mitigation measures. For example, Chance will provide details on blasting activities related seismic exploration and will ensure that wildlife mitigations in relation to blasting are well described and understood.
123-1	3	The project, as described, may be within the cumulative effects indicator levels (surface and linear disturbance) outlined in the NYRLUP, but general management direction, recommended management strategies and best management practices recommended in the plan are often not incorporated into the project design. For example, Special Management Consideration for LMU #9 Eagle Plains: Potential new all-season access roads into LMU #9 from Dempster Highway corridor require careful assessment and management.	• Was this management direction taken into consideration by NCY, with six new, all-season access roads from the Dempster Highway proposed? • Careful assessment and management of access points should include evaluation of the number of access points - are they all necessary? • Are they all necessary at any one time, or could they be limited to three or less, with decommissioning/reclamation required before new access points are developed? • Is there a plan for monitoring access? • How will NCY restrict public access when gates prove ineffective?	Chance will incorporate the North Yukon Regional Land Use Plan (NYRLUP) in refining the Project description and Project proposal for submission to YESAB. Chance will work to understand the cumulative effects indicator levels (surface and linear disturbance) and determine whether the proposed Project falls within those levels or not. This includes consideration of winter and all-season access roads, access points to the Dempster Highway, infrastructure locations footprints, and seismic exploration work. Further consideration will be given to phases and scheduling of the Project activities (e.g., when activities are required and progressive decommissioning and reclamation). Chance will implement recommendations from the NYRLUP including general management direction, recommended management strategies and best management practices, in

Vuntut Gwitchin Comment Submissions to YESAB				Hemmera Proposed Next Steps to Addressing Concerns Raised
YOR Doc #	**Page #**	**Issues and Concerns**	**Questions and Recommendations**	
				refining the Project description and Project proposal for submission to YESAB. Additionally, Chance will develop an Access Management Plan (AMP) to monitor access to the site. A conceptual AMP will be developed for discussion with VG and will be submitted with the YESAB Project proposal. The AMP will be finalized based on input from VG and other affected First Nations and stakeholders. Additional access management mitigation measures will be considered and included in the Project proposal as needed. Chance will consider and develop effective measures to restrict access if gates prove ineffective.
123-1	4	The role of monitors, is confusing and ambiguous. Throughout the proposal, reference is made to 'wildlife monitors', 'environmental monitors', 'environmental technicians' and, to the 'NCY technical team (wildlife monitors)'. Are these one and the same, with a single job description? Similarly, the reporting mechanism by which the monitors convey information to NCY managers, YG Regional Biologist and Conservation Officer, to the First Nations and others is poorly described. For example, Section 6.4 Mitigations and Conclusions (Wildlife) NCY technical team (wildlife monitors) will communicate with members of the PCMB, affected FN, and Regional Biologists to discuss issues concerning caribou and caribou habitat during operations. Issues concerning caribou and caribou habitat are of utmost importance to VGG. NCY has not adequately described how communication 'concerning caribou and caribou habitat during operations' will take place. In several instances, project details are poorly described as the specific work undertaken by NCY will not be known until individual well test results are known. NCY has not described how post-assessment decisions will be communicated to VGG, and how concerns of VGG will be incorporated into project planning, monitoring and mitigations.	• What would trigger these discussions, and what is the intended outcome? • NCY is proposing 'to discuss', which implies two-way communication of information, issues and concerns. How will NCY incorporate the outcome of these discussions into management actions and decisions? How will these discussions be recorded? • It would be helpful to understand future needs for baseline data as development of the Eagle Plains oil and gas basin proceeds, for example air quality monitoring and air dispersion modeling and to begin these programs immediately.	Chance will develop a WMMP. A conceptual WMMP will be developed for discussion with VG and will be submitted with the YESAB Project proposal. The WWMP will be finalized based on input from VG and other affected First Nations and stakeholders. The WMMP will include details such as required monitoring (e.g., species, survey areas, and frequency of surveys), mitigation requirements and options, reporting, and communication with First Nations and stakeholders. Chance anticipates developing the WMMP based on the new Project description and baseline date collected for the new Project proposal. In addition, Chance will consult with VG and other affected First Nations on the development of the WMMP. This includes discussions on communications protocols with First Nations and stakeholders which will be included in the WMMP. Chance is reviewing baseline data requirements for the Project and identifying areas where additional data is required. Chance anticipates engaging with VG and other affected First Nations to discuss baseline data requirements, reports, and future needs for baseline.

Vuntut Gwitchin Comment Submissions to YESAB				Hemmera Proposed Next Steps to Addressing Concerns Raised
YOR Doc #	**Page #**	**Issues and Concerns**	**Questions and Recommendations**	
		The fact that NCY is proposing to advance a 20 well drill program without adequate baseline data to determine effects is concerning. It's difficult to understand why NCY did not initiate collection of baseline data earlier.		
123-1	4	[redacted]	• Improved communication and transparency in describing, monitoring and evaluating what is expected to happen on the landscape and what is currently happening • Opportunities to improve VGG and VGFN citizen involvement in project monitoring and adaptive management mitigations: ▫ integration of TK ▫ capacity development re. environmental monitoring ▫ rigorous monitoring protocol and transparent reporting	Chance will work with VG in developing the Project proposal through the implementation of the Oil and Gas Engagement Policy. This includes developing a Cooperation Agreement and completing a Benefits and Stewardship Agreement, before submitting a Project Proposal to YESAB. Chance will consult with VG and other affected First Nations in developing the Project description and the YESAB Project Proposal. This includes: • Providing details on the proposed Project activities (i.e., June 2019 Project Description) • Seeking input on Project activities, areas of concern, and what people value in the Project area • Providing opportunities for VG and other affected First Nations to provide their input • Considering any input received when developing the YESAB Project Proposal. Chance will also work with VG to identify opportunities where VG and VG Citizens can be involved in monitoring and adaptive management activities. Chance will work with VG to determine the most appropriate approach to conducting a TK study for the project footprint area and incorporate the results into all aspects of the effects assessment. In the scoping stage and through the identification of valued components the Project proposal team can also discuss selecting VCs such as "Traditional Economy" or "Sense of Place" to further integrate VG values into the effects assessment in a more holistic way.

Vuntut Gwitchin Comment Submissions to YESAB				Hemmera Proposed Next Steps to Addressing Concerns Raised
YOR Doc #	**Page #**	**Issues and Concerns**	**Questions and Recommendations**	
123-1	6	[redacted]	• The future development of an access management plan for this area should encompass potential conflicts between industrial and subsistence harvest (trapping) use of the area. • Long term subsistence and licenced harvest (caribou) in the vicinity of the project area should be monitored to determine how the project affects harvest activities. This information would inform future management decisions.	Additionally, Chance will develop an Access Management Plan (AMP) to monitor access to the site. A conceptual AMP will be developed for discussion with VG and will be submitted with the YESAB Project proposal. The AMP will be finalized based on input from VG and other affected First Nations and stakeholders. Additional access management mitigation measures will be considered and included in the Project proposal as needed. Chance will consider implications of subsistence and licensed harvesting (trapping and caribou) in the area when developing the AMP and identifying effective mitigation measures. Trapping and other land-based activities will be incorporated into the socio-economic VCs of the effects assessment, typically as part of a land use VC. Also as noted above, the intangible cultural aspects of land use by VG citizens can be incorporated in other culturally based VCs holistically.
123-1	6	[redacted]	• Evaluation of potential conflicts between proposed borrow pit locations with heritage resource potential should be completed prior to extraction of gravel resources. • Heritage assessment of First Nation traditional land use of the area should be undertaken. • Heritage identification training should be mandatory for all NCY employees working in the field.	Chance will consider potential impacts to heritage resources and identify required mitigation measures in developing the Project description and Project proposal for submission to YESAB. A new Heritage Resources Overview Assessment (HROA) may be required based on a revised Project description and footprint. Hemmera will review the existing HROA to determine what additional work needs to be completed. Hemmera will also develop a Chance Find Procedure for the Project to be included as a mitigation measure.

Vuntut Gwitchin Comment Submissions to YESAB				Hemmera Proposed Next Steps to Addressing Concerns Raised
YOR Doc #	**Page #**	**Issues and Concerns**	**Questions and Recommendations**	
		[redacted]		
123-1	7	[redacted]	• Actions to prevent contamination of water for activities completed above ground, and mitigative measures to be taken in case of accidental contamination should be described. • The quality of produced water, and the handling, temporary and long-term storage and the disposal of produced water should be described. • Long-term effects modeling to determine the impacts of test wells on permafrost and resulting effects on the water cycle should be developed. • Baseline monitoring for a period of 2 years is required. • Water monitoring programs should be reviewed and updated annually based on proposed and approved activities. • A community based water monitoring program that addresses the priorities of Vuntut Gwitchin people should be implemented by VGG and YG through the Yukon Water Strategy.	Chance will consider potential impacts to water quality and quantity and identify required mitigation measures in developing the Project description and Project proposal for submission to YESAB. Hemmera will identify and describe potential pathways of effects to water quality and quantity. This may include pathways such as stream crossings with winter roads, water withdrawal for use in exploration activities, and disposal of waste water produced from drilling. Potential pathways of effects will be assessed and mitigation measures will be developed to ensure the Project will not result in adverse effects surface and groundwater quality and quantity. Additionally, water monitoring requirements will be identified and monitoring programs developed.

Vuntut Gwitchin Comment Submissions to YESAB				Hemmera Proposed Next Steps to Addressing Concerns Raised
YOR Doc #	**Page #**	**Issues and Concerns**	**Questions and Recommendations**	
		[redacted]		
123-1	8	The Porcupine Caribou Herd (PCH) is the most important and valued ecological and socio- cultural resource in the Vuntut Gwitchin Traditional Territory (NYRLUP). The dynamic and unpredictable behaviour of the PCH necessitates an adaptive approach to management decisions as they apply to this project. Key to achieving this objective is the development of a management and communications framework in advance of needing one. The PCH Technical Working Group, tasked with determining what would be considered a 'significant number' of caribou to warrant moving or even shutting down the 3D seismic project last winter was unable to accomplish this task, nor was the group able to come to consensus on the need for a census flight to determine the number of caribou in the area. These failures are due in part to the impossibility of completing these tasks mid-season, when the consequences of these decisions had deep ramifications to the economic status of the project. Apart from assurances that, 'the most current information or caribou distribution and habitat is used during planning and implementation' NCY proposal is not explicit in how	• An Environmental Management and Monitoring Plan should be developed for this project. A comprehensive environmental monitoring plan and communications framework would • As work on an access management plan advances, the contribution of NCY in an advisory role to the plan development should be explored. • As work on 'caribou guidelines' advances, the contribution of NCY in an advisory role should be explored. These management tools should be adopted by NCY when complete.	It is likely that Wildlife, including caribou, will be selected as a Valued Component in the effects assessment, depending on the results of consultation. If selected as a VC a more thorough discussion and evaluation of the potential impacts of the project on the PCH can be undertaken. Chance will develop numerous plans including WMMP and an AMP. A conceptual WMMP and AMP will be developed for discussion with VG and will be submitted with the YESAB Project proposal. The WWMP and AMP will be finalized based on input from VG and other affected First Nations and stakeholders. Chance will also coordinate with various parties such as the Porcupine Caribou Herd Technical Working Group and the NYRLUP implementation parties to incorporate appropriate information in the YESAB Project proposal. A specific subsection in the WMMP related to caribou can be created in order to address the management approaches for this species specifically as it relates to project operation. Specific adaptive management and communications protocols

Vuntut Gwitchin Comment Submissions to YESAB				Hemmera Proposed Next Steps to Addressing Concerns Raised
YOR Doc #	**Page #**	**Issues and Concerns**	**Questions and Recommendations**	
		management decisions will be made if large numbers of caribou over-winter or migrate through the project area. Implementation parties to the NYRLUP (VGG and VG) have begun work on an access management plan for Eagle Plains (Fall 2014). The group is currently working on establishing a terms of reference and determining the scope of work. In response to the above, and the YESAB recommendation to determine 'significant numbers' (Eagle Plains 3D Seismic Survey 2013-0067) NYRLUP implementation parties (VG and YG) are currently working on establishing 'caribou guidelines'.		can be developed to ensure that predictions are being evaluated in real time with project operations.
123-1	11	The NYRLUP outlines several management recommendations regarding access: 1. As a general guideline, in order to minimize potential impacts to valued ecological and heritage/cultural resources it is recommended that where road access is required, winter roads, ice roads and other temporary access techniques be utilized preferentially over all- season roads. 2. Best Management Practices - Transportation and Access Reclamation requirements and decommissioning strategies should be considered during planning and assessment of new road and access features.		Chance will incorporate the North Yukon Regional Land Use Plan (NYRLUP) in refining the Project description and Project proposal for submission to YESAB. If needed, Chance will implement management recommendations from the NYRLUP including general management direction, recommended management strategies and best management practices, in refining the Project description and Project proposal for submission to YESAB. Additionally, Chance will develop an Access Management Plan (AMP) to monitor access to the site. A conceptual AMP will be developed for discussion with VG and will be submitted with the YESAB Project proposal. The AMP will be finalized based on input from VG and other affected First Nations and stakeholders.
123-1	11	3. Best Management Practices - Wildlife/General When new access creation is necessary: • Non-permanent winter access routes should be developed and utilized versus all-season access routes. • Gate or otherwise restrict hunting along new access routes. • Where possible, direct new access routes through less significant wildlife habitats. • Section 5.2.1 Ecological Resources/Wildlife Habitat (page 5-7)	• development of all-season roads should not occur until a resource is proven (at the extended flow testing stage as originally proposed) • a strategy for decommissioning roads that clearly outlines when roads will be decommissioned and/or reclaimed is required • requirements for temporarily decommissioning access points from the highway and other access routes should be in place when the road is not actively being used	Chance will incorporate the NYRLUP, including general management direction, recommended management strategies and best management practices, in developing the Project description and Project proposal for submission to YESAB. In addition, Chance will develop numerous plans including WMMP and an AMP. A conceptual WMMP and AMP will be developed for discussion with VG and will be submitted with the YESAB Project proposal. The WWMP and AMP will be finalized based on input from VG and other affected First Nations and stakeholders. Considerations in identifying mitigation measures and developing the WMMP and AMP will include winter vs. all-season access roads, decommissioning and reclamation,

Vuntut Gwitchin Comment Submissions to YESAB				Hemmera Proposed Next Steps to Addressing Concerns Raised
YOR Doc #	**Page #**	**Issues and Concerns**	**Questions and Recommendations**	
		NCY has structured a summer drilling program requiring all season roads to areas with unknown resource potential, and has not provided adequate information regarding how access will be restricted (gates are not adequate).	• information regarding how access will be limited and how effectiveness of restrictions will be monitored and adjusted is required • describe how construction of all-season access roads built to access exploratory drilling locations, candidate summer wells will mitigate destruction of wildlife habitat (nest birds etc) required snow depth of 10cm will not offer enough protection to tussock-y ground, or at staging areas • Environmental Monitors should be tasked with monitoring compliance with regulatory requirements for access road construction • Reclamation of roads should include the removal and reuse of gravel resources.	points of access form the Dempster Highway, specific measures to address access management, and monitoring requirements.
123-1	12	Cumulative effects of this project may affect the following VGFN values: 1. landscape (soils, vegetation, permafrost) - surface and linear disturbance, particularly as it affects the PCH and VGFN sense of place; loss of permafrost, destruction, contamination and alteration of soils and vegetative layer 2. water - use, diversion and contamination 3. fish and wildlife - destruction, fragmentation and alienation of habitat; disruption of migratory routes and behaviour 4. cultural and spiritual values - incremental increases in perceived threat of loss and change effects of climate change An Environmental Management and Monitoring Plan is needed for this project because: 1. A robust and comprehensive monitoring plan will address potential environmental impacts and cumulative effects, compliance monitoring, and the collection of necessary baseline data. 2. A single framework will track the numerous environmental monitoring commitments made by NCY; although some will	• VGG recommends that an Environmental Management and Monitoring Plan is developed for this project. A comprehensive environmental monitoring plan and communications framework would set forth a clear protocol for monitoring changes to the environment over the long term and will establish a feedback loop whereby data collected through the monitoring program becomes meaningful to subsequent decision making and mitigations. • Develop an Environmental Management and Monitoring Plan to record and track environmental goals and monitoring activities required for this project.	Chance will develop an Environmental Monitoring Plan (EMP). A conceptual EMP will be developed for discussion with VG and will be submitted with the YESAB Project proposal. The EMP will be finalized based on input from VG and other affected First Nations and stakeholders. The EMP will include details such as required monitoring, mitigation options, reporting, and communication with First Nations and stakeholders. Chance will consider potential impacts to values identified by VG such as: • Soils, vegetation and permafrost • Water quality and quantity • Fish and wildlife • Cultural and spiritual values Hemmera will identify and describe potential pathways of effects to these values. Potential pathways of effects will be assessed and mitigation measures will be developed to ensure the Project will not result in adverse effects to these values. This assessment will be used in developing the Project description and Project proposal for submission to YESAB.

Vuntut Gwitchin Comment Submissions to YESAB				Hemmera Proposed Next Steps to Addressing Concerns Raised
YOR Doc #	**Page #**	**Issues and Concerns**	**Questions and Recommendations**	
		appear as permit requirements, numerous others would otherwise remain buried in various source documents. Additional environmental monitoring requirements are anticipated following the YESAB assessment and Water Board licencing process. 3. An Environmental Management and Monitoring Plan will provide clear oversight and direction to Environmental Monitors and will help managers easily determine the success of mitigative measures, and recognize when further corrective actions are required. 4. An Environmental Management and Monitoring Plan will serve as a communication tool, effective in delivering information about the Eagle Plains environment and the work of NCY to maintain valued ecosystem components, both internally and as the basis of a public record.		
123-1	13	Environmental Monitors have been under-utilized in previous NCY projects. Responsible for baseline, compliance and effects monitoring, fully empowered Environmental Monitors serve a key role in the achieving the project's environmental requirements and meeting corporate objectives. Adequate reporting though field data and compliance sheets, and record of this data keeping in the annual report made public to VGG would be in keeping with objectives of an Environmental Management and Monitoring Plan.	• Develop the role of Environmental Monitors to meet the objectives of the Environmental Management and Monitoring Plan.	Chance will use Environmental Monitors during various stages of the Project. Chance will work with VG and other affected First Nations to define the role of Environmental Monitors which will then be outlined in the EMP.
123-1	14	The purpose of a communications framework is to identify roles and procedures required to meet the objectives of the Environmental Management and Monitoring Plan. This includes developing a two-way dialogue between NCY and the FN's concerning adaptive management issues and decisions, and establishing how information provided by the FN's (including TK) will be incorporated at the technical level. The Project Oversight Committee, established through the Benefits Agreement with NCY, is another aspect of a communications framework. The role of the Project Oversight Committee is to provide higher level review of project activities, and to respond to issues that require quick remediation, such	• A communications framework is an essential component to a Environmental Management and Monitoring Plan. • The PCH Technical Working Group was established to serve as a conduit for technical information (including Traditional Knowledge) between NCY, FN's and others. The need for a formalized group to discuss adaptive management decisions remains a relevant and essential component of an effective communications framework. Preparation of a Terms of Reference and Statement of Purpose would contribute to the ongoing success and usefulness of this group.	Chance is committed to ongoing constructive and effective communications and consultation with VG and other affected First Nations. Chance will continue consultation efforts as they develop their Project description and various components of the YESAB Project proposal. As needed, Chance will develop communications protocols which will form parts of various management plans such as the WMMP or the AMP. Further discussion with VG can flesh out the specific role and responsibilities and membership of a Project Oversight Committee. It would be prudent to discuss if this body is still needed based on how this project has evolved over the years and the creation of the Oil and Gas Policy and the NRC identified within that.

Vuntut Gwitchin Comment Submissions to YESAB				Hemmera Proposed Next Steps to Addressing Concerns Raised
YOR Doc #	**Page #**	**Issues and Concerns**	**Questions and Recommendations**	
		as a fuel spill. Within the Adaptive Management, Communications Framework, the Project Oversight Committee addresses issues at the senior policy and inter- governmental levels.		
157-1	1	Access Management Planning (YESAB Question#25) The North Yukon Regional Land Use Plan (NYRLUP) recommends the development of an access management plan for the Eagle Plains LMU, and parties to the NYRLUP (VGG and YG) are currently in the initial stages of developing this plan. While VGG and several other agencies raised numerous concerns with the access described in the NCY proposal, requiring NCY to develop an access management plan may lead to confusion with the broader access management planning process undertaken by the parties, and could potentially establish precedent for the development of future access management plans. It would be more appropriate to require NCY to develop mitigations for the potential effects of access development. If NCY is not prepared to provide this information at this stage of project assessment, YESAB project assessment recommendations should include specific mitigation measures enforceable as permit requirements.	• Mitigations should address potential conflicts between industrial use and subsistence harvest (specifically trapping) by VGFN citizens in the area.	Chance will develop an Access Management Plan (AMP) to monitor access to the site. A conceptual AMP will be developed for discussion with VG and will be submitted with the YESAB Project proposal. The AMP will be finalized based on input from VG and other affected First Nations and stakeholders. Additional access management mitigation measures will be considered and included in the Project proposal as needed. Chance will consider the potential conflicts between the Project and subsistence and licensed harvesting (trapping and caribou) in the area when developing the AMP and identifying effective mitigation measures.
157-1	2	Wildlife Monitoring (YESAB Question #27) The NCY response to this question does not acknowledge that a change in monitoring regime is what is recommended. Incidental wildlife observations based on NCY staff being in the vicinity does not address monitoring objectives as described in the VGG and other comment submissions, and does not meet NCY's own wildlife mitigation objectives. If NCY is not prepared to provide information as to how these objectives will be achieved at this time, specific details as to how these objectives will be achieved should be detailed as YESAB project assessment recommendations. Porcupine Caribou Herd Technical Working Group (YESAB Question #29)		Chance will develop a WMMP. A conceptual WMMP will be developed for discussion with VG and will be submitted with the YESAB Project proposal. The WWMP will be finalized based on input from VG and other affected First Nations and stakeholders. The WMMP will include details such as required monitoring (e.g., species, survey areas, and frequency of surveys), mitigation requirements and options, reporting, and communication with First Nations and stakeholders. Chance anticipates developing the WMMP based on the new Project description and baseline date collected for the new Project proposal. In addition, Chance will consult with VG and other affected First Nations on the development of the WMMP.

Vuntut Gwitchin Comment Submissions to YESAB				Hemmera Proposed Next Steps to Addressing Concerns Raised
YOR Doc #	**Page #**	**Issues and Concerns**	**Questions and Recommendations**	
		While a Terms of Reference is required to ensure the success of a technical working group, a common understanding of the role and objectives of this group is paramount and should be clearly described by YESAB. Based on the difficulties that arose through implementation of the PCH Technical Working Group established through the 3D seismic project, VGG does not feel comfortable leaving this task to NCY to undertake post-assessment. As stated in the VGG comment submission, 'The dynamic and unpredictable behaviour of the PCH necessitates an adaptive approach to management decisions as they apply to this project. Key to achieving this objective is the development of a management and communications framework in advance of needing one.'		
157-1	2	Heritage Resource Assessment (YESAB Question #34) [redacted] The VGG response to other questions encompassed in YESAB Question #34 are directly related to VGFN use of the area for trapping, and are answered below, in response to YESAB Question #35.		Chance will consider potential impacts to heritage resources and identify required mitigation measures in developing the Project description and Project proposal for submission to YESAB. A new Heritage Resources Overview Assessment (HROA) may be required based on a revised Project description and footprint. Hemmera will review the existing HROA to determine what additional work needs to be completed. Hemmera will also develop a Chance Find Procedure for the Project to be included as a mitigation measure. With permission, Chance will consider the submission from VG (Van Tat & Dagoo use of Eagle Plains area, compiled from Vuntut Gwitchin Oral History Interview Database, December 2014).
157-1	2	Trapping (YESAB Question #35) The NCY statement that, ' No trapping has been observed on NCY operated lands to date.' is not entirely factual. The GEOTIR - Eagle Plains 3D Seismic Project 2013-14, Environmental and Wildlife Monitoring Report (April 2014) stated that, 'Several traps [trap boxes] were found throughout the project area; all of them were left undisturbed.'		Chance will consider potential impacts to subsistence harvesting, including trapping, and identify required mitigation measures in developing the Project description and Project proposal for submission to YESAB, as described above. Hemmera will identify and describe potential pathways of effects to subsistence harvesting. Potential pathways of effects will be assessed and mitigation measures will be developed to ensure the Project will not result in adverse effects subsistence

Vuntut Gwitchin Comment Submissions to YESAB				Hemmera Proposed Next Steps to Addressing Concerns Raised
YOR Doc #	**Page #**	**Issues and Concerns**	**Questions and Recommendations**	
		[redacted]		harvesting. As noted above – the effects assessment can consider a variety of VCs to more fulsomely address tangible and non-tangible cultural impacts. Chance will consult with VG and other affected First Nations to identify potential pathways of effects, impacts and mitigation measures.
157-1	3	Cultural and Economic Significance [redacted]	• Access to trapping areas along existing routes and roads must be ensured for VGFN citizens, regardless of upgrades and usage by NCY. • A communication strategy is needed to address uncertainty and confusion that exists regarding subsistence harvest and trapping rights within and in close proximity to the project area. • Wildlife monitoring protocols and management actions that effectively mitigate local effects of the project on furbearers and other wildlife, and communication of this information to VGG for dissemination to citizens.	Chance will develop numerous plans including WMMP and an AMP. A conceptual WMMP and AMP will be developed for discussion with VG and will be submitted with the YESAB Project proposal. The WWMP and AMP will be finalized based on input from VG and other affected First Nations and stakeholders. Considerations in identifying mitigation measures and developing the WMMP and AMP will include access to trapping areas, communications, monitoring requirements, and mitigation options. Consideration will be given to furbearers and other wildlife. As noted above – the effects assessment can consider a variety of VCs to more fulsomely address tangible and non-tangible cultural impacts.

Vuntut Gwitchin Comment Submissions to YESAB				Hemmera Proposed Next Steps to Addressing Concerns Raised
YOR Doc #	**Page #**	**Issues and Concerns**	**Questions and Recommendations**	
250-1	2	Caribou Mitigations The hierarchy of caribou mitigation measures described in the WMMP does not adequately acknowledge the range of effects project activities may have on displacing and disturbing caribou, and appears to focus on active drilling sites only. Level 2 caribou mitigations apply when 1 collared caribou is known to be within 6km of an active drill site; with approximately 50 GPS collars on a herd size estimated at 197,000 animals, (2003 survey results) detection of one collar could mean thousands of caribou in the area. Level 2 mitigation measures call for restrictions of "non-essential activities on Project roads to reduce disturbance" and deferment of "non-essential Project activities" to "a later time", but does not adequately describe what is a considered a "non-essential activity". Blasting and construction are identified as activities that will cease under Level 3 mitigations, implying they are considered essential activities that would not be affected under Level 2 mitigations. This sets up a situation where road, pad and infrastructure construction and/or blasting could take place during peak times of caribou migration, displacing and disturbing thousands of caribou. The reliance on collar data alone to trigger Level 2 and Level 3 mitigations is not adequate as there are not enough collars on the herd to estimate local caribou abundance at the scale required for this mitigation plan. Furthermore, most collars are on female animals and may not accurately represent the location or travel patterns of the herd as a whole, particularly at such a small geographic scale. The WMMP does not provide for contingencies when collar data may not be available or when collar data does not reflect what is observed on the ground.	• Caribou mitigations apply to quarry sites, areas undergoing road construction and maintenance, and other project activities, as well as active drill sites. • Level 2 and Level 3 mitigations apply when "significant numbers" of caribou are observed in close proximity to the job site, regardless of collar data. • Level 2 mitigations will trigger an over-flight to determine if Level 3 mitigations are required. • Level 2 mitigations will restrict all project activities that are likely to cause disruption to the herd, including blasting and construction, except in situations when ceasing activities is unsafe.	It is likely that Wildlife, including caribou, will be selected as a Valued Component in the effects assessment, depending on the results of consultation. If selected as a VC a more thorough discussion and evaluation of the potential impacts of the project on the PCH can be undertaken. Chance will develop a WMMP. A conceptual WMMP will be developed for discussion with VG and will be submitted with the YESAB Project proposal. The WWMP will be finalized based on input from VG and other affected First Nations and stakeholders. The WMMP will include details such as required monitoring (e.g., species, survey areas, and frequency of surveys), mitigation requirements and options, reporting, and communication with First Nations and stakeholders. Chance anticipates developing the WMMP based on the new Project description and baseline date collected for the new Project proposal. In addition, Chance will consult with VG and other affected First Nations on the development of the WMMP. A specific subsection in the WMMP related to caribou can be created in order to address the management approaches for this species specifically as it relates to project operation. Specific adaptive management protocols can be developed to identify mitigation measures and conditions which would trigger action and implementation of mitigations. Chance will also develop a detailed description of activities and required mitigation measures. For example, Chance will provide details on blasting activities related seismic exploration and will ensure that wildlife mitigations in relation to blasting are well described and understood.
250-1	3	Adaptive Management Oil and gas exploration activities and caribou use periods in the Eagle Plains area are not temporally separated. The North Yukon Regional Land Use Plan (NYRLUP) recommends significant numbers of caribou as a management tool to guide the appropriate level of industrial activity allowable on the landscape when caribou are present. This NYRLUP	• NCY will formalize the establishment of a technical advisory group through a memorandum of understanding and terms of reference with affected First Nations • NCY will meet with the technical advisory group on an annual basis to review project activities, field data and compliance sheets, and monitoring results. This	Chance will develop numerous plans including WMMP and an AMP. A conceptual WMMP and AMP will be developed for discussion with VG and will be submitted with the YESAB Project proposal. The WWMP and AMP will be finalized based on input from VG and other affected First Nations and stakeholders.

Vuntut Gwitchin Comment Submissions to YESAB				Hemmera Proposed Next Steps to Addressing Concerns Raised
YOR Doc #	**Page #**	**Issues and Concerns**	**Questions and Recommendations**	
		implementation task is outstanding, and NCY skirts the issue by relying on collar data as a vague indicator of caribou abundance. The Porcupine Caribou Herd Technical Working Group established during the NCY 3D Seismic Program was tasked with determining significant numbers, but was unable to do so. Understandably, this is a difficult task, and a stakeholder group representing the interests of both industry and conservation would require more time and cooperation to reach consensus. Determining significant numbers is further compounded by the complexity of barren ground caribou herd dynamics, and the large population fluctuations that can occur within a relatively short timeframe. Acceptable levels of disturbance would presumably vary with herd size and composition, and activity (migration vs overwintering). NCY is at the exploratory stage, and VGG is not suggesting the need for an environmental monitoring agency, but there are common themes emerging across Canada with regard to the effective participation of Aboriginal groups in the environmental monitoring/adaptive management framework1 that could inform this project. Actions that have been shown to work include: developing a formal agreement with affected FNs; establishing a committee; ensuring the opportunity to review and comment on all permits, licenses and authorizations, and on the design of environmental management and monitoring plans; providing funding; and formalizing a dispute resolution process.	information will form the basis for an annual review of the WMMP. • NCY will contact the technical advisory group when triggers identified in the WMMP indicate revisions to described mitigations are required. • Traditional Knowledge will be included in the development of mitigation measures. • Duties of the Environmental Monitor will include monitoring and reporting all relevant proponent commitments as appended to the Decision Document. • Standardized survey protocols will be developed for each survey/monitoring activity described in the WMMP. • Standardized field data collection and monitoring compliance forms will be used by the Environmental Monitor, and shared periodically with the technical advisory group.	Chance will also coordinate with various parties such as the Porcupine Caribou Herd Technical Working Group and the NYRLUP implementation parties to incorporate appropriate information in the YESAB Project proposal.
250-1	4	Roads NCY's proposed approach to project roads, as described in the WMMP and Access Management Plan, raises several concerns: exclusion of VGFN trappers from historically used routes; ineffective measures to limit and monitor public access; and, development and use of all season roads for exploratory drilling. NCY plans to exclude VGFN citizens from the Chance Road and other access routes commonly used by VGFN citizens who trapped the area in the past. Measures to limit public access (caribou harvesters from other user groups) on project roads are inadequate as described.	• VGFN citizens will be granted access on project roads (including the Chance Road) for the purposes of trapping and trapping related activities. • NCY will work with VGG and Yukon Government to establish a process by which VGFN citizens will be able to access to the project site using project roads. • Low impact winter roads will be used for all exploratory drilling. All season roads (including existing routes) will be used only if required for extended flow testing (i.e. when resource is proven).	Chance will develop numerous plans including WMMP and an AMP. A conceptual WMMP and AMP will be developed for discussion with VG and will be submitted with the YESAB Project proposal. The WWMP and AMP will be finalized based on input from VG and other affected First Nations and stakeholders. Chance will also coordinate with various parties including VG and Yukon Government to incorporate appropriate information in the YESAB Project proposal. Additional access management mitigation measures will be considered and included in the Project proposal as needed. In addition, Chance will consult with VG on their recommendations

Vuntut Gwitchin Comment Submissions to YESAB				Hemmera Proposed Next Steps to Addressing Concerns Raised
YOR Doc #	**Page #**	**Issues and Concerns**	**Questions and Recommendations**	
		Gates are not successful in restricting public access over the long term, especially when the roads they are barring are not actively used for project activities. NCY has not described an adequate regime for monitoring public access to project roads that are gated, or, on the longer term, to project roads that have been decommissioned. NCY's intended use of low impact winter roads is limited to "as much as possible" (WMMP) with contradictory language in the access management plan referring to the development of all season roads, "when initial drilling results are sufficiently encouraging to undertake extended flow testing" or "to meet the Project's seasonal drilling or permitting schedules" creating uncertainty with what is intended and what will actually happen on the ground. This approach does not correspond with recommendations of the NYRLUP and is problematic for numerous reasons identified in YESAB submissions by various parties. Exploratory drilling should utilize winter roads, with all-season access developed and/or used only when required for extended flow testing.	• All project roads that lead off the Dempster Highway will be monitored for public access on a daily basis when caribou are in the area. • NCY will develop alternative mitigations when gates prove ineffective. The trigger to implement alternative mitigations will be when one gate or decommissioned road is circumvented. • All project roads (not just new roads) that lead from the Dempster Highway or branch from an actively used road that leads from the Dempster Highway will be decommissioned and made impassable when wells are suspended, capped, or abandoned. • All roads and clearings will be decommissioned to state of functional habitat restoration as soon as practical. • Reclamation of roads will include the removal and reuse of gravel resources, when practical. • Snow embankments and windrows will be limited to 1.5m in height, with breaks every 500m to facilitate caribou movement. Breaks will be established opposite one another, not offset. • Environmental Monitors will monitor compliance with regulatory requirements for access road construction and maintenance.	in developing mitigations in relation to access management, access development and reclamation.
250-1	6	Connection to Dagoo ancestral homeland • Exclusion from the area • Destruction of the area	• Gwitchin culture and language presence on site (Gwitchin signage, cultural orientation etc.) • Site visits	Chance will consider potential impacts to various socio-economic valued components in relation to the Project and identify required mitigation measures in developing the Project description and Project proposal for submission to YESAB. As noted above – the effects assessment can consider a variety of VCs to more fulsomely address tangible and non-tangible cultural impacts. Chance will consult with VG and other affected First Nations on VC selection.

Vuntut Gwitchin Comment Submissions to YESAB				Hemmera Proposed Next Steps to Addressing Concerns Raised
YOR Doc #	**Page #**	**Issues and Concerns**	**Questions and Recommendations**	
250-1	6	Long-ago physical evidence of Gwitchin Ancestors • Unintentional destruction of artifacts • Destruction of elements that are used in traditional practices	• Mandatory heritage identification training for all NCY employees working in the field	Chance will consider potential impacts to heritage resources and identify required mitigation measures in developing the Project description and Project proposal for submission to YESAB. A new Heritage Resources Overview Assessment (HROA) may be required based on a revised Project description and footprint. Hemmera will review the existing HROA to determine what additional work needs to be completed. Hemmera will also develop a Chance Find Procedure for the Project to be included as a mitigation measure. Chance will ensure that all NCY employees working in the field will implement the Chance Find Procedure.
250-1	6	Cultural preservation • Negative impacts of increased accessibility on ability of culture to preserve values	• Gwitchin cultural orientation • Minimize development of all season access roads	Chance will consider potential impacts to various socio-economic valued components in relation to the Project and identify required mitigation measures in developing the Project description and Project proposal for submission to YESAB. As noted above – the effects assessment can consider a variety of VCs to more fulsomely address tangible and non-tangible cultural impacts. Chance will consult with VG and other affected First Nations on VC selection.
250-1	6	Vuntut Gwitchin unique sense of place and relationship with the land • Anxiety about development - specifically that destruction and contamination of land, water and wildlife will destroy strong and enduring, spiritual and cultural connections	• VGFN citizen involvement in project monitoring and adaptive management mitigations • Site visits	Chance will develop an EMP. A conceptual EMP will be developed for discussion with VG and will be submitted with the YESAB Project proposal. The EMP will be finalized based on input from VG and other affected First Nations and stakeholders. The EMP will include details such as required monitoring, mitigation options, reporting, communication with First Nations and stakeholders, and the role of Environmental Monitors. Chance anticipates developing the EMP based on the new Project description and baseline date collected for the new Project proposal. In addition, Chance will consult with VG and other affected First Nations on the development of the EMP. This includes discussions on communications with stakeholders which will be included in the EMP.

Vuntut Gwitchin Comment Submissions to YESAB				Hemmera Proposed Next Steps to Addressing Concerns Raised
YOR Doc #	**Page #**	**Issues and Concerns**	**Questions and Recommendations**	
250-1	6	Subsistence reliance on wild food sources (caribou, moose, salmon and other fish, berries etc.) • Destruction/degradation of ecological values resulting in disruption of the life cycle of migratory mammals such as caribou and salmon • Increased harvest pressure resulting from increased access • Loss of access to immediate vicinity for subsistence harvest • Negative effects of harvest pressure pushed to other areas Trapping • Exclusion from established trapping areas and trapping • infrastructure (trails and cabins etc.) • Destruction, degradation and fragmentation of furbearer habitat	• Adaptive management model that allows for the inclusion of VGFN values, and knowledge, in project design and implementation • Harvest monitoring and access management • Inventory of existing trapping infrastructure and trails • Access agreement between VGFN trappers and NCY • Management actions to reduce impacts to furbearers	Chance will develop numerous plans including WMMP and an AMP. A conceptual WMMP and AMP will be developed for discussion with VG and will be submitted with the YESAB Project proposal. The WWMP and AMP will be finalized based on input from VG and other affected First Nations and stakeholders. Considerations in identifying mitigation measures and developing the WMMP and AMP will include potential impacts to subsistence harvesting in the Project area and identify required mitigation measures in developing the Project description and Project proposal for submission to YESAB.
250-1	7	Human resources • Depletion of workforce in Old Crow • Overshadowing of the value of the traditional economy • Diminished health and wellbeing of oil field employees	• Collect baseline data of social determinants of health, and track ongoing effects • Work with Yukon College and VGG to create ongoing education and training opportunities in the community of Old Crow • Provide scheduling flexibility to allow for traditional pursuits (e.g. special leave) • Expedite transportation between worksite and community of Old Crow Establish an employee support program that addresses financial management and includes an employee assistance program • Establish and enforce zero tolerance policy for drugs and alcohol, and work place drug and alcohol testing	Chance will consider potential impacts to various socio-economic valued components in relation to the Project and identify required mitigation measures in developing the Project description and Project proposal for submission to YESAB. As noted above – the effects assessment can consider a variety of VCs to more fulsomely address tangible and non-tangible cultural impacts. Chance will consult with VG and other affected First Nations on VC selection.

Vuntut Gwitchin Comment Submissions to YESAB				Hemmera Proposed Next Steps to Addressing Concerns Raised
YOR Doc #	**Page #**	**Issues and Concerns**	**Questions and Recommendations**	
250-1	7	Eco/cultural tourism • Negative impact of industrial landscape • Increased accessibility of industrial activity • Negative impacts of increased road access to wilderness areas	• Preserve view-scape to ensure marketable for eco/cultural tourism • Access management plan that includes monitoring and enforcement	Chance will develop an AMP to monitor access to the site. A conceptual AMP will be developed for discussion with VG and will be submitted with the YESAB Project proposal. The AMP will be finalized based on input from VG and other affected First Nations and stakeholders. Additional access management mitigation measures will be considered and included in the Project proposal as needed. Chance will consider potential impacts to tourism in the Project area and identify required mitigation measures in developing the Project description and Project proposal.

APPENDIX 2-C-27. Chance Oil and Gas Limited Intention to Submit Proposal Letter

VIA E-MAIL – [redacted]

[redacted] President
Chance Oil and Gas Limited
Suite 1000, 340 – 12th Avenue SW
Calgary, AB T2R 1L5

Dear President [redacted]:

RE: Chance Oil and Gas Limited ("COGL") Intention to Submit Proposal

This letter is provided in response to our discussions with COGL on February 10, 2020 and the subsequent correspondence received from COGL regarding the intention to submit a proposal for a multi-well oil and gas exploration program ("Proposal") to the Yukon Environmental and Socio-economic Assessment Board ("YESAB") in June 2020.

The Committee has carefully considered COGL's request for a waiver of the requirement under the Vuntut Gwitchin Government's Oil and Gas Engagement Policy ("Policy") for the negotiation and ratification of a Benefits and Stewardship Agreement with the Vuntut Gwitchin First Nation prior to the submission of the Proposal to YESAB. This consideration has included meeting with community members in Old Crow, the Elders Council and Council. Based on the feedback and input received by the Committee, COGL's request for a waiver cannot be granted. The engagement process set out under the Policy must be respected and adhered to by COGL.

COGL has been aware of the Policy since its development in the fall of the 2017 where it was communicated to COGL that, once approved, the Policy would be the framework for all engagement with the Vuntut Gwitchin Government. In January 2018, prior to the approval of the Policy, it was shared with COGL for review. In May 2018, following the approval of the Policy, COGL agreed in the Communication and Engagement Plan required by Ministerial Order 2017/37 that it would comply with the Policy in relation to any oil and gas activities within the Vuntut Gwitchin First Nation Traditional Territory.

On numerous occasions both prior to and following COGL's formal notice of the Proposal submitted on June 6, 2019 pursuant to section 24 of the Policy, the Vuntut

Gwitchin Government has met with COGL to discuss in good faith the Policy, including the staged requirements for a Cooperation Agreement and a Benefits and Stewardship Agreement. This has included a meeting with Minister Pillai, Energy, Mines and Resources on February 1, 2019 at which our Policy requirements were discussed together and most recently a two-day facilitated dialogue between the Committee and COGL in November 20-21, 2019 where the importance of terms under a Cooperation Agreement that ensure compliance with the Policy was discussed and mutually endorsed.

After over two years of good faith engagement with COGL, the notice that it is prepared to submit the Proposal to YESAB in less than three months and in non-compliance with the Policy is deeply disappointing to the Committee. It is contrary to the guiding purposes of the Policy which we are mandated to fulfill: "to establish a respectful, transparent and meaningful framework to guide the engagements of the Vuntut Gwitchin Government in relation to Oil and Gas Activities and Oil and Gas Dispositions in a manner that supports and upholds the objective of Sustainable Development." We acknowledge receipt of the Cooperation Agreement delivered by COGL on February 22, 2020; however, in the absence of terms that ensure compliance with the Policy in relation to the Proposal, the Committee cannot recommend it to Council for approval under section 27 of the Policy.

In the event that COGL chooses to proceed with its intention to submit the Proposal to YESAB in non-compliance with the Policy, Vuntut Gwitchin Government will not be in a position to support the Proposal. As we have discussed extensively with COGL, the engagement process under the Policy is informed by our experiences with past YESAB proposals, the shortcomings in the existing territorial oil and gas regulatory regime, emerging best practices for Indigenous-led assessments in the Arctic environment and the minimum international human rights standards for the survival, dignity and well-being of Indigenous peoples. To advance the Proposal contrary to the Policy undermines the fundamental objective of sustainable development enshrined under the Final Agreement and North Yukon Regional Land Use Plan.

Notwithstanding a lack of support for the Proposal from the Vuntut Gwitchin Government that will arise in the event of non-compliance with the Policy, the Committee will continue to fulfill its mandate to inform and seek the views of Vuntut Gwitchin First Nation citizens in relation to the Proposal. Nothing in the Policy prevents COGL from carrying out consultation activities with Vuntut Gwitchin First Nation citizens in relation the Proposal as may be required by YESAB; however, it is expected that COGL will adhere to the notice requirement under section 21 of the Policy. In this regard, the Committee has considered COGL's notice to meet in Old Crow on March 5, 2020 for the purposes of consultation with Vuntut Gwitchin First Nation citizens. The Elders Council has recommended instead that COGL schedule its consultation meeting after the

community meeting with the YESAB Executive Committee scheduled for March 24, 2020 in Old Crow. The Committee supports this recommendation.

We ask that any communications regarding any of the foregoing be directed to me as Co-chair of the Committee.

Sincerely,

[redacted]

Director of Natural Resources and Co-chair of the Natural Resources Committee

Cc: Chief and Council
Elders Council
Mike Chernoff

APPENDIX 2-C-28. Consultation and Engagement Letter

Chance
OIL AND GAS LIMITED

March 10, 2020.

Natural Resources Committee
Vuntut Gwitchin Government
P.O. Box 94
Old Crow, Yukon
Y0B 1N0

Attention: [redacted] Co-Chair of the Natural Resources Committee

Dear Ms. [redacted]

I am responding to your correspondence dated February 27, 2020. Chance Oil and Gas Limited ("COGL") is disappointed that the Natural Resources Committee ("NRC") was not able to provide the waiver requested by COGL to accommodate a parallel process of undertaking the Yukon Environmental and Socio-Economic Assessment Board ("YESAB") process and negotiating the Benefits and Stewardship Agreement in place of the sequence processes described in the Oil and Gas Engagement Policy.

COGL is however interested in continuing discussions related to the Cooperation Agreement and wishes to meet with the NRC, possibly the Chief and Council and the community at large. Based on your letter of February 27, 2020, a meeting after March 24, 2020 would work for the NRC. COGL requests a meeting or a series of meetings, as may be appropriate, between April 1 and April 8, 2020 in Old Crow. I suggest some topics to discuss at the meeting(s) are:

1. Continuation of the Cooperation Agreement negotiations and scheduling future discussions, if needed;
2. Tenure management and the application to extend the tenure of Exploration Permit 0020 beyond the current expiry deadline of August 30, 2020;
3. Upcoming YESAB Designated Office application for well maintenance work as requested by the Yukon Government Oil and Gas Operations Manager
4. Discussions related to the information gathering processes needed to support a submission to YESAB Executive Committee;
5. Other consultation related to anticipated YESAB Executive Committee assessment of the proposed exploration drilling and seismic data gathering project ("Project"); and
6. Initiating discussions related to the Benefits and Stewardship Agreement connected to the Project including discussions about the timeline needed to reach agreement.

COGL is also interested in hosting a community dinner to provide an update about the Project while in Old Crow for meeting(s) with the NRC.

Depending on the topic, COGL would like representatives of Hemmera to attend for some of the discussions given its expertise in YESAB submissions for both Executive Committee and the Designated Office in Dawson. From COGL, attendees will likely include [redacted] and me.

COGL is interested in working in a constructive, cooperative and collaborative way with the NRC, the Chief and Council and the citizens of the Vuntut Gwitchin First Nation. I look forward to hearing from you as soon as possible regarding the requested meeting or meetings.

Yours truly,
Chance Oil and Gas Limited

[redacted]
President

Cc: [redacted]

APPENDIX 2-C-29. Chance Oil and Gas Limited Meeting Request Letter

VUNTUT GWITCHIN GOVERNMENT
Government of Vuntut Gwitchin First Nation

VIA E-MAIL – [redacted]

[redacted], President
Chance Oil and Gas Limited
Suite 1000, 340 – 12th Avenue SW
Calgary, AB T2R 1L5

Dear President [redacted]

RE: Chance Oil and Gas Limited ("COGL") Meeting Request

Thank you for your letter dated March 10, 2020 requesting a meeting to discuss a number of suggested topics. The Natural Resources Committee ("Committee") requests further clarity on COGL's request and proposed topics of discussion in keeping with Committee's role under the Vuntut Gwitchin Government's ("VGG") Oil and Gas Engagement Policy ("Policy") in ensuring a respectful, transparent and meaningful engagement process.

With respect to COGL's requests to discuss the continuation of Cooperation Agreement discussions and the initiation of Benefits and Stewardship Agreement discussions, it is unclear if COGL still intends to submit a proposal for a multi-well oil and gas exploration program ("Proposal") to the Yukon Environmental and Socio-economic Assessment Board ("YESAB") irrespective of the requirements under the Policy. As the Committee is not able to recommend a Cooperation Agreement or a Benefits and Stewardship Agreement to Council that does not address the Policy requirements, we request clarity on COGL's commitment to compliance with the Policy in relation to the Proposal prior to any further discussions on these topics. This clarity is also required in order to understand the purpose and focus of any meeting with the Committee or community regarding Proposal-related information gathering and consultation activities as may be required by the *Yukon Environmental and Socio-economic Assessment Act* ("*YESAA*").

With respect to COGL's requests to discuss its application to extend permit no. 0020 under the *Oil and Gas Act (Yukon)* and its proposal to YESAB to conduct well maintenance work, the Committee requests COGL submit sufficient notice as required under sections 23 and 24 of the Policy in advance of any discussions with the Committee on these topics.

With respect to the request to hold a community consultation meeting related to the Proposal, as we have previously stated, nothing in the Policy restricts COGL from carrying out consultation activities with community members in relation to the Proposal or any other oil and gas activities; however it is expected that COGL will adhere to the notice requirement under section 21 of the Policy by providing a description of the purpose of the community consultation and any materials that will be relied upon for community consultation purposes. This notice, which is consistent with the nature of COGL's consultation obligations under *YESAA*, is important for the Committee to have in advance so that it can best ensure community members will be properly informed in the community consultation process.

For clarity, and as previously stated, in the event that COGL chooses to proceed with its intention to submit the Proposal to YESAB in non-compliance with the Policy, VGG will not be in a position to support the Proposal and will avail itself of all opportunities available under YESAA to bring any concerns or issues with the Proposal forward to regulators and decision-makers as necessary to uphold the fundamental objective of sustainable development enshrined in the Final Agreement and North Yukon Regional Land Use Plan.

The Committee awaits clarification from COGL on the matters outlined in this letter before a meeting can be planned. However, it should also be noted that precautions around COVID-19 have led to the cancellation of community meetings in Old Crow, and we do not know at this time when they will resume. Teleconferences remain a safe and expedient, although not perfect, means of communicating in the interim.

Finally, we kindly ask again that any communications regarding any of the foregoing be directed to Erika-Tizya-Tramm who as Director of Natural Resources is mandated by VGG as the sole contact person for proponents as part of ensuring a respectful, transparent and meaningful engagement process. COGL communications to other Committee members and Council should cease in relation to its Proposal or any other oil and gas activities or dispositions.

Sincerely,

[redacted]

Councillor and Co-Chair of the Committee

APPENDIX 2-C-30. Cooperation Agreement Letter

sent via email: [redacted]

Attention: [redacted]**, Co-Chair of the Natural Resources Committee**

Dear Ms. [redacted]:

This letter responds in part to the letter dated March 18, 2020 from Councillor and Co-Chair of the Natural Resources Committee, [redacted] to help clarify the status of the Cooperation Agreement ("CA") discussions as it relates to the proposed multi-well exploration drilling and seismic data acquisition project ("Project"). In separate correspondence to come to you soon, the topics of extending tenure of Exploration Permit 0020 and well maintenance work will be addressed.

Chance Oil and Gas Limited ("Chance") is writing to advise you that it will comply with the Vuntut Gwitchin Government's Oil and Gas Engagement Policy ("Policy"). To help move this process along, a draft CA is enclosed with this letter for your consideration. As in previous drafts, this draft includes explanatory notes in various clauses to provide context. There are still areas of the draft that need to be completed or upgraded and we look forward to working with you in as timely a manner as possible to get this CA finalized and executed.

Given the impact of COVID 19, it is anticipated that some combination of electronic exchange of correspondence, holding web based meetings and teleconferencing will be needed to continue negotiations since travel restrictions, social distancing requirements, and other preventative measures to control the spread of the corona virus make face to face meetings impossible until the pandemic has run its course. Once you have had some time to consider the attached documents, please contact [redacted] to arrange a virtual meeting to continue discussions.

APPENDIX 2-C-31. Tenure Extension of Exploration Permit 0020 Letter

Chance
OIL AND GAS LIMITED

April 20, 2020.

Natural Resources Committee
Vuntut Gwitchin Government
P.O. Box 94
Old Crow, YT
Y0B 1N0

sent via email: [redacted]

Attention: [redacted]**, Co-Chair of the Natural Resources Committee**

Dear [redacted]:

As previewed in my letter of April 9, 2020, this letter confirms what had already been mentioned in emails, correspondence and conversations of the past several months regarding tenure extension of Exploration Permit 0020 ("Permit"). On March 12, 2020, Chance Oil and Gas Limited ("Chance") applied to the Yukon Government to extend tenure of the Permit that will otherwise expire on August 30, 2020, unless extended. Chance requested the maximum permissible tenure extension of five years to allow sufficient time to continue engagement with affected First Nation Governments and communities, undergo Yukon Environmental and Socio-Economic Assessment Board Executive Committee impact assessment of proposed exploration activities as described in the project description ("Project Description") delivered to the Vuntut Gwitchin Government ("VGG") on June 5, 2019, and ultimately to undertake exploration activities. In the interest of transparency, this letter highlights the importance of this Permit to Chance and the reasons for the tenure extension request.

The application sets in motion a consultation process between the VGG, other affected First Nation Governments, and the Yukon Government in accordance with the Yukon Oil and Gas Act and associated disposition regulations. This letter is simply a courtesy to both alert you to the pending consultation and also share with you the rationale for the tenure extension request.

It is important to Chance that this Permit be continued for several reasons. First of all, there is a suspended well, McParlon A-25, that has significant value either as a potential producing well, a potential disposal well for water and other by products that may be produced in association with oil or natural gas, or as an observation well to periodically monitor permafrost changes. Secondly, part of a significant shale oil discovery made in 2012 is located throughout this Permit. Under the moratorium preventing hydraulic

Fax (403) 699-0044

fracturing, this resource is stranded, and forms part of the claim made by Chance against Yukon for compensation for the damages caused by the moratorium. Thirdly, the Permit has significant conventional oil and natural gas resource potential (i.e. hydraulic fracturing is NOT required to produce any discovered resources) that could be evaluated as part of the program described in the Project Description. Fourthly, Chance has good 3D seismic data covering most of the permit to support future exploration work to define prospects to drill.

In closing, Chance would like the support of the VGG so Chance can get the requested tenure extension and continue exploring. If you have any questions or comments about this letter, please feel free to contact any of [redacted] or me. Please forward this letter and the attachments to [redacted] for his review.

Yours truly,
Chance Oil and Gas Limited

Sent via Email.

Dear [redacted]:

Re: Communication and Engagement

I am writing this letter to respond to your letter dated March 31, 2021 regarding communication and engagement proceedings between the Natural Resources Committee (NRC) and Chance Oil and Gas Limited (COGL). Before I get into my response to the specifics of your letter, I would like to provide a personal perspective.

My History and Goals in the Eagle Plain Sedimentary Basin
I am in my 85th year and have a long history exploring for oil and gas in the Eagle Plain Sedimentary Basin. Starting in 1959, the year that oil was first discovered in Yukon at Chance M-08, I had boots on the ground doing geological mapping and rock sampling at Eagle Plain. I love the north Yukon and that love continues to lure me back year after year.

All of my exploration geologist peer group long ago abandoned any hope that the Eagle Plain Sedimentary Basin could host economically recoverable amounts of crude oil and natural gas. This explains why COGL is the only company exploring in Eagle Plains. No other operator is interested. In 2007 when we first acquired our Exploration Permits (Permits), we were aware of this consensus and that is the primary reason why we, initially, pursued an exploration program to assess the unconventional resource potential of the basin which would require the use of hydraulic fracturing subsequently banned in 2015.

But I have a dream to prove all of my peers wrong. A very well-known geologist, Wallace E. Pratt, was a very successful finder of oil. He once said: "Where oil is first found is in the minds of men." For over 60 years, I have dedicated my exploration work at Eagle Plains to identifying resource opportunities worthy of testing by drilling. Pratt is my inspiration, and I am not about to give up on Eagle Plain like so many others have already done.

CHANCE OIL AND GAS LIMITED

☐ **Whitehorse Office:**
Suite 202, 208 Main Street
Whitehorse, YT Y1A 2A9
Telephone (867) 456-7805

☒ **Calgary Office:**
Suite 1000, 340 - 12th Ave S.W.
Calgary, AB T2R 1L5
Telephone (403) 699-0055
Fax (403) 699-0044

As further testament to our resolve, COGL has been in Yukon, focused exclusively on exploration to crystallize the value of the oil and natural gas resource potential of the Eagle Plain Basin, since 1994. We are not about to abandon this effort now.

As I have explained at various meetings with you and your colleagues on Council and in government, COGL seeks to build partnerships with Indigenous communities, allowing them to benefit from the opportunities created by our exploration work and with luck, future resource developments.

Responding to the Letter of March 31, 2021

Let me now turn to my response to your letter of March 31, 2021. I disagree with your accusation that COGL failed to adhere to the Communication and Engagement Plan (Plan) dated May 17, 2018 and the Vuntut Gwitchin Government (VGG) Oil and Gas Industry Engagement Policy (Policy). COGL has done its utmost to follow both the Plan and the Policy.

COGL believes it has been very cooperative, respectful, and transparent in all its dealings with VGG in respect of both the proposed exploration program and the suspended well maintenance program. The communication and engagement log that COGL is required to maintain and present to the Yukon Government (YG) on an annual basis demonstrates the effort that COGL has made to engage with the VGG, the NRC and the citizens of the Vuntut Gwitchin First Nation (VGFN). [redacted]

[redacted]

a. COGL's Efforts at Collaboration

COGL has shared a lot of information with the NRC regarding these projects and has commissioned expert consultants such as Hemmera, Environmental Dynamics, Palmer Environmental, Boreal Engineering, Vertex, and Peer Solutions to variously assist with engagement activities, prepare submissions, and undertake a variety of environmental and technical assessments of the project area to inform the design and routing of access routes, the design of seismic programs, and the design of drilling and well maintenance programs. As represented recently, COGL is arranging meetings to share the information that these consultants have prepared in the coming months with the hope that the knowledge of the VGG and its citizens can be shared with COGL to inform the scopes of the exploration and maintenance projects and to help address any concerns or issues.

I am concerned that the VGG has not reciprocated COGL's good faith efforts, and that the VGG has not demonstrated an interest in partnering with COGL during the next phase of exploration work.

b. COGL's Regulatory Requirements

As has been represented to VGG and the NRC on numerous occasions, COGL has to comply with various laws and policies operating in Yukon, particularly the Yukon Oil and Gas Act (YOGA) and

Yukon Environmental and Socio-Economic Assessment Act (YESAA) among others, and the North Yukon Regional Land Use Plan. The Permits issued under YOGA carry obligations to undertake work in specified time periods. In acknowledgment of the time required to undertake consultation processes with affected First Nations, complete impact assessments, obtain regulatory permissions and eventually execute work plans, at COGL's request, YG has extended the timelines on these Permits several times, but it is very uncertain whether future extensions will be granted notwithstanding the diligence of COGL to continue with its exploration work. As hard as COGL has tried to operate under the Plan and associated Policy, there is an obvious disconnect between the lengthy experience to date and the deadlines imposed by land tenure of the Permits. **COGL invites any suggestions as to how this disconnect can be resolved in a timely way and in a manner that equitably addresses the interests of the parties.**[1]

Now faced with acute time pressure, COGL is compelled to prepare and complete a submission document to the Executive Committee (ExCom) of the Yukon Environmental and Socio-Economic Assessment Board (YESAB) in respect of the proposed exploration project. The timing for this submission is planned to be around the end of September or into October. A proposed schedule of meetings in Old Crow which are needed to be able to complete the ExCom submission was shared with the NRC a couple of weeks ago. We invite NRC's engagement with COGL in the preparation of this submission within the time frame outlined.

c. Opportunities to Work Together

COGL is disappointed with the steps VGFN has taken to terminate further engagement with us in respect of the proposed exploration project. COGL wants the VGFN to be its partner in the planned exploration work. We are aware of successful partnerships created across Canada's oil industry for procuring goods and services from Indigenous businesses and hiring Indigenous citizens. The Canadian oil industry is the single largest industry in Canada when it comes to procuring goods and services from Indigenous businesses, exceeding Indigenous procurement by the Canadian government and more than all of the other sectors in the Canadian economy combined. COGL hopes to see the experience of other First Nations elsewhere in Canada replicated in north Yukon.

When COGL committed to the Plan three years ago, it was with high hopes that we would develop a great relationship and work cooperatively, constructively and in a timely manner to advance the exploration project. In meetings with you since that time, we heard your endorsement of the arrangement and your encouragement to work together. VG citizens have told us they want the oil and gas industry to provide opportunities to their families and the community. Sadly, progress has been very slow under the Plan and the Policy and has put these goals at risk.

[1] As an aside, I point out that in the VGFN Final Agreement in Chapter 1 – Definitions, subclause (b) under the definition of Consult or Consultation means: "a reasonable period of time in which the party to be consulted may prepare its views on the matter, and an opportunity to present such views to the party obliged to consult." COGL has been providing information about its projects for almost three years and we are still awaiting the VGG and/or the NRC to present its/their views in accordance with the Plan and the Policy.

a. COGL's Next Steps

For COGL, time is of the essence given the steady ticking of the land tenure clock and the anticipated time frame to complete the ExCom assessment. COGL intends to submit the exploration project to the ExCom of YESAB this Fall. Notwithstanding your decision to terminate engagement, COGL will continue to share information with the NRC and will welcome its input in the future in respect of the project scope and scale, management plans, and sharing local knowledge that will help guide the project design and its execution. COGL will always respect the VGFN Land Claim Agreement and will be guided by Chapters 11, 12, 13, 16 and 22 which relate to economic, environmental, cultural and heritage interests of the VGFN. Despite your termination of negotiations, we leave our door open for the VGG and NRC to resume engagement at any time. In the meantime, we will proceed with the steps needed to preserve our tenure interests and advance our projects. We look forward to the day when we can again work together cooperatively and collaboratively in full recognition of the interests of all parties.

Should you have an interest in information about the oil and gas industry and the projects we are undertaking, please contact any of Richard Wyman, Greg Charlie, Cindy Dickson, or me. We would be pleased to re-engage with you at your convenience.

In closing, I suggest that Richard and I have a meeting with you and your Council at your earliest convenience to share plans, answer any questions and perhaps overcome this impasse.

Yours truly,

Chance Oil and Gas Limited

Attention: [redacted] **Director of Natural Resources**

Dear [redacted]

Re: VGG Oil and Gas Engagement Policy Stage 1 (Policy) regarding Well Maintenance Work (Project)

This letter follows up the letter dated May 22, 2020 from Greg Charlie to provide additional information and payment in accordance with the Policy in order to complete the requirements of Section 24. Enclosed with this letter is a copy of the Audited Financial Statements of Chance Oil and Gas Limited for the year ended December 31, 2019. This information is marked "Confidential." Also enclosed with this letter is a cheque in the amount o[redacted]as payment for the administration fee.

We look forward to collaborating with you on this Yukon Government mandated Project as soon as possible. In order to be able to ensure that the necessary oil field services are contracted to be able to do the work during the winter of 2020-2021, a submission to the YESAB Designated Office in Dawson will need to be submitted in the first part of June. A benefits agreement will be needed since the project is likely going to exceed $[redacted]in expenditures. Please contact Greg Charlie to set up a virtual meeting to address any questions or comments you may have regarding the Project.

I hope you and your family are well and looking forward to summer in Old Crow.

Yours truly,
Chance Oil and Gas Limited

[redacted]

APPENDIX 2-C-34. Follow Up to Stage 1 Notification: Draft Project Description for Proposed Well Maintenance Work Letter

Chance
OIL AND GAS LIMITED

1000, 340 – 12th Avenue SW
Calgary, AB T2R 1L5

June 10, 2020

Natural Resources Committee
Vuntut Gwitchin Government
PO Box 94
Old Crow, Yukon
Y0B 1N0

Attention: [redacted], **Director of Natural Resources**

Dear [redacted]

Re: Follow Up to Stage 1 Notification: Draft Project Description for Proposed Well Maintenance Work

This purpose of this letter is to follow up correspondence Chance Oil and Gas Limited (Chance) sent on May 25, 2020 and May 27, 2020. In an effort to fulfill Vuntut Gwitchin Government (VGG) requirements under Stage I, paragraph 24 of the VGG Oil and Gas Engagement Policy (the Policy), Chance has provided notice to VGG of its proposed project for Eagle Plain Well Maintenance. If there are any questions or issues with respect to the notification package, please let me know as soon as possible so they can be addressed or rectified.

The proposed well maintenance work is the result of direction from Government of Yukon, Department of Energy, Mines and Resources, Oil and Gas Resources Branch. Government of Yukon has directed Chance to assess the integrity of, and conduct maintenance on, eight suspended wells: M-59, M-08, J-19, G-08, A-25, B-73, H-28, and E-78. This maintenance work is required in order for Chance to receive an extension of the suspended status of those eight wells.

Chance is aiming to submit its proposal for Yukon Environmental and Socio-economic Assessment Board (YESAB) Designated Office (DO) evaluation at the end of June or in early July. This timeline takes into consideration multiple factors: DO evaluation timelines, securing essential equipment, seasonal working constraints, and tenure extension timelines. Subsequent to the YESAA process, Chance will be required to seek a number of other licenses, permits and authorizations from various departments of Yukon Government, such as a Land Use Permit from Energy Mines and Resources, and Well Licenses from the Chief Operations Officer as designated under the Drilling and Production Regulations of the Yukon *Oil and Gas Act* (YOGA). Finally, in accordance with Section 68 of YOGA, a Benefits Agreement is required for this project. As a result of this comprehensive set of permits and approvals processes, in addition to the VGG Oil and Gas Policy, we feel confident that we can work with VGG to collaboratively address any issues

or concerns with the Well Maintenance Program throughout the next few of months. In order to commence these discussions, Chance hopes to schedule a meeting, via video or conference call, to discuss any issues or concerns you may have specifically related to the Well Maintenance Program. Moving forward, to facilitate timely communication and engagement, and consistent responses to the YESAB DO in Dawson in respect of this Well Maintenance Program submission, please use Hemmera as the principal point of contact. I have copied this letter to Shena Shaw at Hemmera as the primary contact for future correspondence and to set up next steps.

We look forward to working with you and interested Vuntut Gwitchin citizens.

Yours truly,
Chance Oil and Gas Limited

Vice President Government and Community Relations

[redacted]

Cc : [redacted]

APPENDIX 2-C-35. *COVID-19 Community Engagement and Consultation Procedures*

COVID-19 COMMUNITY ENGAGEMENT AND CONSULTATION PROCEDURES

1.0 OVERVIEW

The following procedures have been developed to address COVID-19 exposure risks while conducting community engagement sessions. It should be noted that COVID-19 is a global pandemic and is a rapidly changing situation. Local Health Authority guidance must be consulted prior to every engagement program and checked daily during field programs to confirm exposure control measures are in accordance with the most recent requirements and advice.

2.0 BACKGROUND

Coronaviruses are a large family of viruses found mostly in animals. In humans, they can cause diseases ranging from the common cold to more severe diseases such as Severe Acute Respiratory Syndrome (SARS) and Middle East Respiratory Syndrome (MERS). The disease caused by the new coronavirus has been named COVID-19.

While many of the characteristics of COVID-19 are still unknown, mild to severe illness has been reported for confirmed cases. Common symptoms for COVID-19 are:

- Fever
- Cough
- Sneezing
- Sore throat
- Difficulty breathing

Coronavirus is transmitted via larger liquid droplets when a person coughs or sneezes. The virus can enter through these droplets through the eyes, nose or throat if you are in close contact. The virus is not known to be airborne (e.g. transmitted through the particles floating in the air) and it is not something that comes in through the skin. It can be spread by touch if a person has used their hands to cover their mouth or nose when they cough.

Droplet Contact: Some diseases can be transferred by large infected droplets contacting surfaces of the eye, nose, or mouth. For example, large droplets that may be visible to the naked eye are generated when a person sneezes or coughs. These droplets typically spread only one to two metres and are too large to float in the air (i.e. airborne) and quickly fall to the ground. Influenza and SARS are two examples of diseases capable of being transmitted from droplet contact. **Currently, health experts believe that coronavirus can also be transmitted in this way.**

Airborne transmission: This occurs when much smaller evaporated droplets or dust particles containing the microorganism float in the air for long periods of time. **Currently, health experts believe that coronavirus cannot be transmitted through airborne transmission.**

2.1 Vulnerable Populations

Most people with COVID-19 recover; however, some people are more vulnerable to developing severe illness or complications from COVID-19 including older people and those with chronic health conditions such as diabetes, heart disease, lung disease, and kidney disease, anyone with a suppressed immune system, and anyone receiving cancer treatment.

3.0 LOCAL HEALTH AUTHORITY GUIDANCE

The following information is from the Yukon Government (YG) and BC Centre for Disease Control.

3.1 Travel within Yukon

- Intra-territorial travel is currently permitted within Yukon with recommendations that travellers limit unnecessary travel and follow the guidelines of YG and First Nation governments.

3.2 Physical Distancing

- Physical distancing involves remaining 2 metres away from anyone who is not withing a person's social bubble.

3.3 Hand hygiene

In addition to physical distancing, handwashing is very important in reducing the spread of COVID-19

- Wash your hands often with soap and water for at least 20 seconds. Using soap and water is the single most effective way of reducing the spread of infection.
- If a sink is not available, hand sanitizer can be used to clean your hands if they are not visibly soiled. If they are visibly soiled, use a wipe and then hand sanitizer to effectively clean them.
- Do not touch your face, eyes, nose or mouth with unwashed hands.
- Cover your mouth and nose with a disposable tissue or the crease of your elbow when you sneeze or cough.
- Do not share food, drinks, utensils, etc.

3.4 Cleaning

- Regularly clean and disinfect frequently touched surfaces.

3.5 Gatherings

- Gatherings of 10 people indoors and 50 people outdoors while maintaining physical distancing is allowed.

3.6 Self Isolation

Self isolation is required for:

- Anyone who has returned to Yukon from somewhere other than British Columbia, Nunavut, or Northwest Territories
- Anyone who has been in contact with someone diagnosed with COVID-19.

4.0 PRE-MEETING REQUIREMENTS

Our response to COVID-19 requires additional measures not normally required for many community engagement sessions-based assignments. When planning the work liaise with the client or site representative to confirm the local site response to the pandemic. Specifically, the following questions maybe helpful to understand the mitigation measures implemented at the worksite:

1. Have any members of the team experienced any impacts to-date (illness or self-isolation) as the result of COVID-19?
2. Does the meeting anticipate any disruptions as a result of COVID-19? If so, what are the anticipated nature of the disruptions (if known)?
3. What measures have been implemented at the meeting to reduce the risk of COVID-19 transmission on site (e.g. Increased attention to hygiene, availability of cleaning and disinfectant products, social distancing, etc.)?

Availability of personal protective equipment (PPE) such as nitrile gloves, safety glasses, and face masks, hand sanitizers, cleaning solutions, and disinfectants should also be confirmed in advance of mobilisation to site.

4.1 Fit for Duty – Field Team Selection

All team members must answer the following information prior to mobilising to the site:

1. In the last 10 days have you experiencing any of the following symptoms: cough, fever and /or shortness of breath?
2. Are you caring for, or have you been in contact with, someone who has a confirmed or probable diagnosis of COVID19?
3. Have you been recommended to quarantine, self-isolate, or received medical attention due to a concern with COVID19 in the last 14 days?
4. Have you been at a gathering of 50 people or more in a small space?
5. Have you returned from international or domestic (outside of the BC/YT/NWT/Nu bubble) travel within the past 14 days or do you share a household with someone that returned from international or domestic (outside of the BC/YT/NWT/Nu bubble) travel within the past 14 days? Travel includes passing through an airport.

The same questions must be answered again once onsite. Field team members must answer “No” to all questions otherwise the work cannot continue. Prior to transportation to the field all project team members are required to take their temperature and if it is above 37.6C they will not be permitted to travel.

5.0 TRANSPORTATION CONSIDERATIONS

5.1 Land Transport

Wherever possible, field team members should travel to and from the project site in their own personal vehicle. Public transport must not be used, and taxis or other services such as Uber should be avoided. Car-share transportation is less preferred than personal vehicle use, however this option is permitted if the

Car-share cleaning protocols are confirmed in advance. Passengers are not permitted in personal vehicles or Car-share transportation options.

5.2 Air Transport

Currently there are many restrictions placed on air transportation. A risk analysis must be completed prior to using air transportation and the need for air transportation must be assessed on a case by case basis. Sign off by the business line president may be required.

6.0 ACCOMMODATIONS

6.1 Hotels

Maintain social distancing and keep touch points in your room clean. Other considerations include:

- Booking a room with a kitchen so you can cook your own food
- Re-cleaning high touch points or eating tools.
- Ask your room not to be cleaned daily; only as often as you require it. Only you in/out will reduce the possibility of transmission.
- If you must eat out, get takeout.

7.0 COMMUNITY MEETING REQUIREMENTS

7.1 Pre-Start Health and Safety Meetings

Pre-start meetings must be held outside, social distancing requirements must be maintained, and participants should be limited to those that are directly involved with the Project. One person should be designated to complete meeting documentation, and the same person should sign off on behalf of all meeting attendees. Items such as clipboards, pens, and meeting documents must not be passed along to other meeting attendees. During the meeting, the location(s) of handwashing and washroom facilities must be confirmed.

7.2 Personal Hygiene Practices

The following best practices must be reviewed with field team members and monitored for compliance:

- Avoid touching surfaces such as handrails, tables, tools, and equipment unless required and consider the use of hand protection such as nitrile gloves.
- Keep your hands at your side when possible.
- Avoid all hand to face contact
- Designate a separate area for eating and breaks.
- Wash hands with soap and water (preferred) or use alcohol-based hand rubs frequently (e.g. after removal of PPE, prior to breaks, prior to eating, at the end of the day, etc.).

7.3 Public Safety

Attendees of the meeting will also be required to follow the guidelines described in this document and should be instructed on how to do so through easy to read information posted at the event.

Guidelines for hosting a public event include:

- The event should be hosted outdoors where possible and set up to allow for physical distancing (poster board and chairs spaced at least 2 meters apart).
- Hand sanitizer must be available to all visitors and will be required for admission to the event.
- A sign in sheet will be required in order to facilitate contact tracing if necessary. Sign in sheets and comment sheets will require attendees use a new, clean pen each time. Two piles of pens should be created, one labelled “clean” and one labelled “used”. Used pens should be cleaned periodically by a gloved member of the Project team.
- Food or drinks provided to attendees must be pre-packaged and handed out by a gloved member of the Project team.
- Take home information must be handed out by a gloved member of the Project team.
- Masks will be provided for anyone who chooses to wear one. Project team members are required to wear a mask.
- All commonly touched surfaces, tools, and equipment must be cleaned and disinfected after use. Hand protection must be donned when cleaning and disinfecting.
- Washroom facilities will be assessed on a case by case basis and arrangements to ensure social distancing and cleaning will be determined at the pre-start meeting. Multi-stall washroom facilities may be limited to one person at a time.
- Hand sanitizing stations must be set up at the entrance to the public event, and placed near any potential commonly touched areas
- Signs near poster boards will encourage social distancing, such as “one person per poster” and “please wait here until the area is clear” and “ensure physical distancing” the frequency and distribution of the signage will be location dependant and determined by the Project manager at the pre-start Health and Safety Meeting.

1.0 INTRODUCTION

This report demonstrates implementation of the *Vuntut Gwitchin Government and Chance Oil and Gas Limited Communications and Engagement Plan* (Plan) (see **Appendix A**) finalized on May 22, 2018. It summarizes discussions held between Vuntut Gwitchin Government (VGG) and Chance Oil and Gas Limited (Chance) since the *2019 Annual Report: Implementation of the Vuntut Gwitchin Government and Chance Oil and Gas Engagement and Communication Plan* was submitted July 31, 2019. The purpose, objectives, and outcomes of each discussion are explained below to fulfill the requirements of Ministerial Order (MO) 2018/ 42 (See **Appendix B**) issued to Chance on August 30, 2018.

2.0 BACKGROUND

The development of communications and engagement plans began with Order in Council (OIC) 2016/169. OIC 2016/169 required Chance to file a First Nations communication and engagement plan with the Minister of Energy, Mines and Resources in order to extend tenure on their northern permits: 0005, 0006, 0007, 0008, 0009, 0010, and 0011 (see **Appendix C**). Chance complied with OIC 2016/169 and received their tenure extension.

Chance subsequently received MO 2017/37 when applying for tenure extension on six of eight southern permits: 0012, 0013, 0014, 0015, 0016, and 0017. MO 2017/37 required Chance to revise, in consultation with affected First Nations, the consultation and engagement plan filed under OIC 2016/169. The affected First Nations listed in MO 2017/37 were Vuntut Gwitchin First Nation, Tr'ondëk Hwëch'in, First Nation of Na-Cho Nyäk Dun, Gwich'in Tribal Council, and Tetlit Gwich'in Council.

VGG and Chance collaboratively developed their Plan through a series of in-person meetings and conference calls. Hemmera was retained by Chance in November 2017 to facilitate the development and completion of the communications and engagement plans with the affected First Nations.

VGG and Chance submitted their finalized Plan to Minister Ranj Pillai on May 22, 2018. To complete its obligations under MO 2017/37, Chance filed a total of four communications and engagement plans. All four plans were approved by the Minister and Chance received a five-year tenure extension on the six southern permits.

A condition of the five-year tenure extension, issued via MO 2018/42, required that Chance submit annual reports summarizing actions taken to implement each communications and engagement plan.

The Plan incorporates VGG's Oil and Gas Engagement Policy (the Policy). The Policy, developed by VGG and reviewed by Chance, provides a protocol for engaging with VGG on oil and gas matters.

See **Appendix C** for a map of Chance's current permits.

DRAFT

3.0 ENGAGEMENT AND COMMUNICATION PLAN IMPLEMENTATION SUMMARY

3.1 Summary

In the past year, VGG and Chance have continued to build their relationship. Parties have advanced discussions on Chance's proposed projects (see **Table 1**) and the implementation of VGG's Policy (e.g., Chance and VGG develop a Cooperation Agreement).

Table 1 Chance proposed projects

Project Name	Date Draft Project Description was Shared with VGG	YESAB Assessment Process	Anticipated Submission to YESAB
Eagle Plains Exploration Project	June 2019	Executive Committee Screening	Spring 2021
Eagle Plain Well Maintenance Project	May 2020	Designated Office Evaluation	July/August 2020

Between August 1, 2019 and June 30, 2020, a number of engagement activities have occurred, including, in-person meetings, conference calls, formal letters, and informal phone calls and emails.

The main themes of discussion between VGG and Chance have been the following:

- Drafting/negotiating a Cooperation Agreement
- Implementation of the Policy
- Draft Project Description and scope of activities for Chance's proposed Eagle Plains Exploration Project
- Draft Project Description for Chance's proposed Eagle Plain well Maintenance Project
- Proposal submission processes to Yukon Environmental and Socio-economic Assessment Board (YESAB)

The correspondence between Chance and VGG is documented in the Engagement Log (see **Appendix D**).

3.2 August 9, 2019 – Presentation at Vuntut Gwitchin General Assembly (In-Person)

Location: Old Crow Community Centre

Attendees: VGG Chief and Council and Technical Staff, Old Crow Community Members, Chance Management, Hemmera

Chance was invited to present their Eagle Plains Exploration Project (the Project) at the 2019 Vuntut Gwitchin General Assembly. For this presentation, Chance presented a description of their oil and gas exploration project activities, including where they would be located, the equipment that would be required, and potential opportunities for First Nations. Hemmera joined Chance for this presentation and explained the YESAB application process that Chance would be undergoing, and opportunities for community engagement and consultation during the process of completing the project proposal for YESAB as well within the YESAB process. After the presentation, Chance answered questions from community members.

DRAFT

The purpose of this presentation was for Chance to explain their project to a broad audience in Old Crow and to answer questions asked by community members.

3.3 October 31, 2019 – VGG, Natural Resource Committee, and Chance Meeting (Conference Call)

Attendees: VGG Staff and Natural Resources Committee members, Chance Management, Hemmera

The purpose of this conference call was for parties to coordinate their activities moving forward. Chance provided an update on summer 2019 fieldwork and data being gathered. Chance provided a brief description of the proposed Eagle Plains Exploration Project. VGG requested that Chance provide a list of services (e.g., business, equipment) the project would require, over the long term, so the First Nation can strategize employment/training opportunities. VGG stated it could review Chance's 2018 4-page project description and provide feedback, however reviewing the 2019 50-page project description would require considerably more effort. VGG also indicated that advancing work on both the project description review and the cooperation agreement, at the same time, would take a considerable level of effort. VGG would likely need Chance to identify a priority. Parties discussed the evolution of the Cooperation Agreement to date, some of the outstanding issues, and decided to plan an in-person workshop for November 2019 for parties to advance the agreement.

3.4 November XX-XX – Cooperation Agreement Negotiation Workshop (In-Person)

Location: Whitehorse

Attendees: VGG Technical Staff, Chance Management, Third Party Facilitator

Chance and VGG retained a third-party facilitator to mediate negotiation of the Cooperation Agreement required under Stage II of the Policy. Both parties met for two days to discuss objectives and content of the Cooperation Agreement. Meeting details as well as the subsequent draft of the Cooperation Agreement are confidential.

3.5 December 2, 2019 – VGG, Chance and Hemmera Meeting (Conference Call)

Attendees: VGG Technical Staff, Chance Management, Hemmera

VGG, Chance, and Hemmera met to discuss the completion of Chance's YESAB Project Proposal for proposed Eagle Plains Exploration Project. VGG had been provided capacity funding from Chance to engage technical consultants and their review of Chance documents was under way. VGG provided an overview of its preferred approach which included a gap-analysis led by the First Nation, a community workshop, and subsequent state of knowledge workshop. Parties and their consultants would have to work together to harmonize activities and timelines. All parties discussed a timeline for working together and proposed future meetings. Hemmera offered to have a meeting with VGG staff to discuss YESAB processes, requirements under legislation, and Hemmera's past experiences.

3.6 Winter and Spring 2020

Chance and VGG have continued to exchange formal letters as well as informal emails and phone calls since last meeting in December 2019.

DRAFT

Chance is currently developing a YESAB Designated Office submission for its proposed Eagle Plain Well Maintenance Project. Chance sent a letter to VGG May 25th, 2020 with the purpose of introducing the project and initiating engagement.

Covid-19 has had significant effects on VGG and Chance's ability to move forward on items, particularly as it relates to meetings and engagement activities.

4.0 PLANS FOR ONGOING ENGAGEMENT AND NEXT STEPS

VGG and Chance will continue to hold discussions at regular intervals as Chance develops its project proposals for YESAB, and Chance will comply with the stages of the Policy moving forward. Meetings have occurred and are being planned for July 2020, but due to timing constraints this report only summarizes engagement to the end of June 2020.

Upcoming engagement activities are expected to involve the following:

- Share data collected during 2019 Summer/Fall field season
- Correspondence and meeting between VGG and Chance on Chance's proposed Eagle Plain Well Maintenance Project
- Meetings between VGG technical staff and technical consultants preparing the Project Proposal for proposed Eagle Plains Exploration Project
- Completing the Cooperation Agreement under Stage II of the Policy

DRAFT

5.0 APPROVAL OF IMPLEMENTATION SUMMARY

VGG and Chance have reviewed this report and agree to its contents as an accurate summary of the engagement activities carried out between August 1, 2019 and June 30, 2020.

Vuntut Gwitchin Government and Chance Oil and Gas Limited Communication and Engagement Plan

DRAFT

Vuntut Gwitchin Government

Chance OIL AND GAS LIMITED

May 22, 2018

Honourable Ranj Pillai
Minister of Energy, Mines and Resources
Government of Yukon
Box 2703
Whitehorse, Yukon Y1A 2C6

Dear Minister Pillai,

Re: Submission of the Vuntut Gwitchin Government and Chance Oil and Gas Limited Communications and Engagement Plan

Ministerial Order 2017/037 of the Yukon Oil and Gas Act states the following in clause 5:

> *5 It is a condition of this Order that Chance Oil and Gas Limited must, in consultation with each affected First Nation, revise the first nations communications and engagement plan filed under O.I.C. 2016/169 to the satisfaction of the Minister on or before August 1, 2018.*

Vuntut Gwitchin Government (VGG) and Chance Oil and Gas Limited (Chance) are pleased to inform you of our collaborative efforts to develop a mutually agreeable framework to facilitate effective and meaningful communications and engagement between VGG and Chance. The framework captured in the enclosed Communications and Engagement Plan (Plan), and its collaborative development, establishes a solid foundation for a respectful relationship that both parties will implement and enjoy as we continue to work together now and into the future.

Please accept the enclosed Plan for the purposes of Ministerial Order 2017/037. We trust that the Plan will be of satisfaction to the Minister, as it meets the needs of VGG and Chance at this time.

Sincerely,

William Josie
Director of Natural Resources
Vuntut Gwitchin Government

for, Greg Charlie
Vice President of Government and External Relations
Chance Oil and Gas Limited

Enclosed: Communications and Engagement Plan

COMMUNICATION AND ENGAGEMENT PLAN

VUNTUT GWITCHIN GOVERNMENT & CHANCE OIL AND GAS LIMITED

MAY 17, 2018

1. Background

Chance Oil and Gas Limited ("Chance") is an oil and gas exploration company that currently holds valid permits to perform oil and gas activities in the Eagle Plain basin within the Traditional Territory of the Vuntut Gwitchin First Nation ("VGFN").

As a condition of order-in-council 2016/169 dated August 30, 2016 concerning the return of work deposits to Chance in relation to oil and gas permits nos. 0005 to 0011, Chance was required to file a communication and engagement plan (the "Plan"). The Plan, as it was submitted, was not mutually agreed upon between Chance and the Vuntut Gwitchin Government ("VGG").

As a condition of ministerial order 2017/37 dated August 29, 2017 concerning a one-year extension for oil and gas permit nos. 0012 to 0017, Chance is now required to revise the Plan in consultation with VGFN on or before August 1, 2018.

2. Purpose

The purpose of this document is to revise the Plan in a manner that establishes a mutually agreed upon framework between Chance and VGG to guide communication (i.e. the exchange of information) and engagement (i.e. meaningful participation in planning, problem-solving and decision-making) in relation to all aspects of Chance's activities, including but not limited to, community information programs; existing or proposed oil and gas dispositions; and existing or proposed oil and gas activities.

Nothing in this Plan is intended to address or satisfy any duties or responsibilities of the Government of Yukon that exist or may arise in relation to Chance's exploration program.

3. Application of Oil and Gas Engagement Policy

The *Vuntut Gwitchin Government Oil and Gas Engagement Policy* attached to this Plan as Appendix A (the "Policy") will be the overarching framework that guides engagement between VGG and Chance in relation to Chance's activities. Chance will comply with the Policy and any other applicable VGG policies. To the extent that there may be any inconsistency between this Plan and the Policy, the Policy will prevail.

4. Communication and Engagement

The communication and engagement between Chance and VGFN in relation to Chance's exploration program activities is anticipated to encompass communication and engagement between: (a) Chance and VGG; and (b) Chance and VGFN Citizens.

4.1 Communication and Engagement between Chance and VGG

The VGG committee mandated under part two of the Policy will be the VGG body responsible for managing communications and engagement between Chance and VGG, including informing and seeking views of VGFN Citizens, with the exception of any communications related to any

negotiations of towards a Cooperation Agreement or Benefits and Stewardship Agreement which will occur directly between Chance and Council as set out under the Policy.

Table 1.

Subject Matter	VGG Contact(s)	Chance Contact(s)
Communications related to Chance's exploration program activities, other than those communications excepted below.	• Director of Natural Resources • Chair of the Standing Committee on Natural Resources, Heritage, Tourism and Economic Development	• Management Team
Communications related to the negotiation of a Cooperation Agreement or Benefits and Stewardship Agreement.	• Council	• Management Team

4.2 Communication and Engagement between Chance and VGFN Citizens

VGG does not serve a gatekeeping role with respect to any communications and engagement that Chance may wish to undertake with VGFN Citizens in relation to Chance's exploration program activities; however, VGG and Chance will seek to coordinate communication and engagement efforts with VGFN Citizens to the extent such joint communication and engagement is possible or appropriate. As detailed in the Policy, Chance will submit a written notice to the Director of Natural Resources within a reasonable time prior to any proposed public meetings with VGFN Citizens in order to facilitate coordination between Chance and VGG.

Table 2.

Subject Matter	VGG Contact(s)	Chance Contact(s)
Written notice of proposed meetings with VGFN Citizens in relation to Chance's exploration program activities.	• Director of Natural Resources	• Vice President of Government and Community Relations

4.3 Communication and Engagement Methods and Content

Chance and VGG will use the following methods for carrying out communication and engagement in relation to Chance's exploration program activities:

- In-person meetings;
- Public meetings (for communication and engagement with VGFN Citizens in Old Crow and Whitehorse);

- E-mail correspondence;
- Telephone correspondence (teleconferences and less formal phone calls);
- Power Point presentations (to support in-person meetings);
- Reports (as requested and as required);
- Social media;
- Newsletters; and
- Official websites.

The information exchanged in communication and engagement between Chance and VGFN is anticipated to address the following key items:

- Information programs regarding VGFN culture and history;
- Information programs regarding the oil and gas industry, including its history and regulation in Yukon;
- Any existing or proposed Chance oil and gas dispositions;
- Any existing or proposed Chance oil and gas activities;
- Items set out in the Policy that must be addressed in any Cooperation Agreement and Benefits and Stewardship Agreement between VGFN and Chance; and
- Implementation of the Policy.

5. Records Management

Chance and VGG will use the following records management protocols in relation to communications and engagement between Chance and VGG.

5.1 Records Subject to Disclosure to Regulators and Assessors

Subject to the records management protocols in this Plan, Chance may disclose the following types of relevant records to regulators and assessors:

- meeting agendas;
- meeting minutes;
- meeting participant lists;

- records log which includes summaries of the following: in-person meetings; e-mail and telephone correspondence between Chance and VGG, including supporting materials shared or discussed in the correspondence;

- reports provided by either VGG or Chance to one another; and

- Power Point presentations provided by either VGG or Chance to one another.

5.2 Records Management Procedures and Confidentiality Protocols

Records of communications between VGG and Chance will be made, and any support services retained by either Chance or VGG to those records will be conducted in a fair and unbiased manner. Should VGG and Chance choose not to retain records management support services, VGG and Chance will jointly decide on an individual or individuals from either or both parties to be responsible for records keeping and management.

Chance, VGG and any person or party retained to assist in records management will comply with the following procedures for records management:

- Meeting agendas will be developed collaboratively between VGG and Chance and mutually agreed upon prior to the outset of the meeting.

- Meeting minutes will be taken by a designated records management person or party and sent to Chance and VGG within 2 weeks via e-mail. VGG and Chance may review and provide comment to the records management person or party on these meeting minutes within 30 days of both parties receiving the meeting minutes. Should either party require more time to review the meeting minutes, the party will notify the records management person or party by e-mail within 2 weeks of receiving the minutes. No response by VGG or Chance to meeting minutes will be interpreted as general acceptance of the meeting minutes by that party.

- Action items and key outcomes will be logged during meetings and will be reviewed by both parties at the end of the meeting to ensure that there is general agreement on the list of actions and parties responsible for those actions and on the list of key outcomes from the meeting. The list of action items and the list of key outcomes will be recorded within the meeting minutes.

- Any reports or Power Point presentations provided by either VGG or Chance to one another will be considered final upon delivery unless otherwise specified as drafts.

- A record log will be jointly reviewed and approved by Chance and VGG for accuracy, completeness, and compliance with this Plan prior to being disclosed to any regulator and assessor.

Chance and VGG will comply with the following confidentiality protocols for records management and the disclosure of records to regulators and assessors:

Table 3.

Type of Record	Confidentiality Assumption	Process for Establishing Confidentiality
Meeting Agendas	• Not confidential.	• Should confidential matters need to be discussed, a separate agenda will be created for these matters and remain confidential.
Meeting Minutes	• Not confidential.	• Confidential discussions/content will be identified before the meeting begins, during the meeting, or as part of the minutes review process.
Meeting Participant List	• Not confidential.	• Unless otherwise specified during the meeting, these items are not considered confidential.
Records Log	• Not confidential.	• Should correspondence need to be confidential, it is the responsibility of each party to notify the other when a meeting, e-mail, phone call, or attachment is confidential at the time it occurs or immediately thereafter.
Reports provided by either VGG or Chance to one another	• Not confidential. • Note: Any reports containing traditional knowledge or traditional land use will be subject to separate protocols agreed upon by VGG and Chance.	• Should a report shared between parties need to be confidential, it is the responsibility of each party to notify the other of this when the report is shared.
Power Point presentations provided by either VGG or Chance to one another	• Not confidential.	• Unless otherwise specified during the meeting, these items are not considered confidential.

6. Plan Review and Amendment

Chance and VGG will review and assess this Plan and its implementation on a quarterly basis. Following any review and assessment of the Plan, the Plan may be amended upon the mutual agreement of Chance and VGG.

SCHEDULE A
VUNTUT GWITCHIN GOVERNMENT OIL AND GAS ENGAGEMENT POLICY

VUNTUT GWITCHIN GOVERNMENT
OIL AND GAS ENGAGEMENT POLICY

MAY 2018

PART ONE
GENERAL PROVISIONS

Title

1. This policy may be cited as the *Vuntut Gwitchin Government Oil and Gas Engagement Policy*.

Definitions

2. In this policy:

"**Application**" means an application made by a Proponent in relation to an Oil and Gas Disposition pursuant to the *Oil and Gas Act*, R.S.Y. 2012, c. 162;

"**Benefits and Stewardship Agreement**" means the agreement required in relation to any oil and Gas Activity as set out at Stage III of the Engagement Process under part three of this policy.

"**Board**" means a designated office, executive committee or panel of the Yukon Environmental and Socio-Economic Assessment Board.

"**Citizen**" means a citizen of the Vuntut Gwitchin First Nation pursuant to Appendix II of the Constitution (Citizenship Code).

"**Citizen Representative**" means a Citizen appointed to the Committee by the Council.

"**Committee**" means the lands and resources committee of the Vuntut Gwitchin First Nation as mandated under part two of this policy.

"**Constitution**" means the Constitution of the Vuntut Gwitchin First Nation.

"**Cooperation Agreement**" means the agreement required in relation to any Oil and Gas Activity as set out at Stage II of the Engagement Process under part three of this policy.

"**Council**" means the branch of the Vuntut Gwitchin Government established by the Constitution consisting of the Chief, Deputy Chief and all Councillors.

"**Director of Natural Resources**" means the Director of the Vuntut Gwitchin Government's Natural Resources Department.

"**Elders Representative**" means a member of the Vuntut Gwitchin First Nation Elders Council appointed to the Committee by the Elders Council.

"**Engagement Process**" means the process commencing under part three of this policy for engagement between the Vuntut Gwitchin Government and a Proponent in relation to any Application or Oil and Gas Activity and continuing for so long as required.

"**Intergovernmental Process**" means any engagement process between the Vuntut Gwitchin Government and Government of Yukon on matters related to Oil and Gas Activities, Oil and Gas Dispositions and their regulation.

"**Oil and Gas Activity**" or "**Oil and Gas Activities**" means any existing or proposed oil and gas activity or activities as defined by Section 1 of the *Oil and Gas Act*, R.S.Y. 2012, c. 162 that affects, or has the potential to affect, any rights, responsibilities or interests of the Vuntut Gwitchin First Nation whether or not the oil and gas activity or activities are situated within the Vuntut Gwitchin First Nation Traditional Territory.

"**Oil and Gas Disposition**" or "**Oil and Gas Dispositions"** means any existing or proposed oil and gas disposition or dispositions as defined by as defined by Section 1 of the *Oil and Gas Act*, R.S.Y. 2012, c. 162 that affects, or has the potential to affect, any rights, responsibilities or interests of the Vuntut Gwitchin First Nation whether or not the oil and gas disposition or dispositions grants rights to lands situated within the Vuntut Gwitchin First Nation Traditional Territory.

"**Proponent**" means any proponent of an Oil and Gas Activity or holder of an Oil and Gas Disposition.

"**Proposal**" means a proposal required to be submitted by a proponent to the Board pursuant to Section 50(1) of the *Yukon Environmental and Socio-economic Assessment Act*, S.C. 2003, c. 7.

"**Sustainable Development**" means beneficial socio-economic change that does not undermine the ecological and social systems upon which communities and societies are dependent as defined in Chapter 1 of the *Vuntut Gwitchin First Nation Final Agreement*,.

"**Standing Committee Chair**" means the Chair of the Vuntut Gwitchin Government Standing Committee on Natural Resources, Heritage, Tourism and Economic Development.

"**Vuntut Gwitchin First Nation"** means the legal entity established pursuant to Article 9 of the *Vuntut Gwitchin First Nation Self-Government Agreement*.

"**Vuntut Gwitchin First Nation Law**" means any law enacted by the Vuntut Gwitchin First Nation in accordance with its law-making powers under Article 13 of the *Vuntut Gwitchin First Nation Self-Government Agreement*.

"**Vuntut Gwitchin Government**" means the government of the Vuntut Gwitchin First Nation.

"**Youth Representative**" means a Citizen between the ages of 14 and 21 appointed to the Committee by the Council.

Purpose

3. The purpose of this policy is to establish a respectful, transparent and meaningful framework to guide the engagements of the Vuntut Gwitchin Government in relation to Oil

and Gas Activities and Oil and Gas Dispositions in a manner that supports and upholds the objective of Sustainable Development.

Application

4. This policy applies to any engagement between the Vuntut Gwitchin Government and a Proponent in relation to any to Oil and Gas Activities and Oil and Gas Dispositions.

Conflict of Law and Policy

5. In the event of a conflict or inconsistency between this policy and the Constitution, the Constitution shall prevail to the extent of the conflict or inconsistency.

6. In the event of a conflict or inconsistency between this policy and any Vuntut Gwitchin First Nation Law, the Vuntut Gwitchin First Nation Law shall prevail to the extent of the conflict or inconsistency.

General

7. Nothing in this policy is to be construed as abrogating or derogating from the *Vuntut Gwitchin First Nation Final Agreement*.

8. Nothing in this policy is to be construed as providing consent or authorizing any past, existing or proposed Oil and Gas Activity or Oil and Gas Disposition.

9. Nothing in this policy shall be construed as limiting, affecting, fulfilling or discharging the honour of the Crown and the Crown's constitutional duty to consult and accommodate the Vuntut Gwitchin First Nation.

10. This policy may be amended from time to time by the Vuntut Gwitchin Government and will make best efforts to notify any Proponent potentially affected by an amendment.

PART TWO
ADMINISTRATION

Committee

11. The Vuntut Gwitchin Government shall establish the Committee with a mandate to fulfill the following roles and responsibilities in accordance with this policy:

    (a) reviewing information about Oil and Gas Activities, Oil and Gas Dispositions and their regulation;

    (b) informing and seeking views from Citizens on Oil and Gas Activities, Oil and Gas Dispositions, the Engagement Process and/or Intergovernmental Process as necessary;

(c) assisting and providing recommendations to the Council throughout the Engagement Process; and

(d) providing recommendations to the Council throughout the Intergovernmental Process if requested by Council.

12. The Committee shall be made of 5 members consisting of the:

(a) Standing Committee Chair;

(b) Director or Natural Resources;

(c) Elders Representative;

(d) Youth Representative; and

(e) Citizen Representative.

13. The Committee shall meet as regularly as may be necessary to fulfill its roles and responsibilities.

14. The Committee shall have a quorum of 3 members.

15. The Standing Committee Chair and Director of Natural Resources shall serve as co-chairs of the Committee.

16. The Committee shall make best efforts to fulfill its roles and responsibilities by consensus.

17. The Committee may at any time request the support of employees or contractors of the Vuntut Gwitchin Government to assist it in carrying out its roles and responsibilities under this policy.

18. The Committee may invite any persons, including any Proponent, to attend or participate in a meeting of the Committee.

19. The Committee shall not use or disclose to any person confidential information except as may be required to fulfill its roles and responsibilities.

Citizen Consultation

20. The Director of Natural Resources shall be responsible for organizing and carrying out any consultation between the Vuntut Gwitchin Government and Citizens regarding Oil and Gas Activities and Oil and Gas Dispositions with the assistance and participation of the Committee as necessary.

21. In that event that a Proponent wishes to organize and carry out any public consultation with Citizens related to any Oil and Gas Activities or Oil and Gas Dispositions, the Proponent shall submit a notice in writing to the Director of Natural Resources within a reasonable time prior to the proposed meeting date in order to facilitate coordination between the

Proponent and Vuntut Gwitchin Government if appropriate. The written notice shall contain:

(a) proposed dates and location;

(b) proposed agenda;

(c) description of the purpose of the consultation; and

(d) any materials to be relied on by the Proponent during the consultation.

22. Any consultations with Citizens related to any Oil and Gas Activities or Oil and Gas Dispositions that are organized and carried out by the Proponent shall not be construed as consultation with the Vuntut Gwitchin Government.

PART THREE
ENGAGEMENT PROCESS

Stage I – Notice Period

23. Proponents shall provide notice in writing to the Director of Natural Resources of any Application in relation to any Oil and Gas Disposition at the earliest possible opportunity. The written notice of the Application shall contain:

(a) letter of introduction;

(b) company profile including organizational structure, profiles of directors and management team members, financial statements for the previous five fiscal years and compliance record;

(c) detailed description of the Oil and Gas Disposition and Application including any relevant maps, plans or schedules; and

(d) designated Proponent spokesperson.

24. Proponents shall provide notice in writing to the Director of Natural Resources of any Oil and Gas Activity at the earliest possible opportunity in the planning phase and prior to submitting a Proposal to the Board. The written notice shall contain:

(a) letter of introduction;

(b) company profile including organizational structure, profiles of directors and management team members, financial statements for the previous five fiscal years and compliance record;

(c) detailed description of the proposed Oil and Gas Activity, including any relevant maps, plans or schedules;

(d) administration fee in the amount of $1,000.00 made payable to the Vuntut Gwitchin First Nation; and

(e) designated Proponent spokesperson.

25. Upon receipt of any written notice from a Proponent in relation to any Application or Oil and Gas Activity, the Director of Natural Resources shall immediately refer the notice to the Committee. The Committee shall meet to review the notice and:

(a) if the Committee determines the notice is incomplete or insufficient the Committee may request in writing further or better information from the Proponent, and the Proponent shall provide such further or better information upon receipt of the written request; or

(b) if the Committee determines the notice is complete and sufficient then:

(i) in the case of a notice regarding an Application, the Director of Natural Resources may provide written comments to the Proponent or request a meeting with the Proponent to discuss the Application; and

(ii) in the case of a notice regarding an Oil and Gas Activity, the Committee shall notify the Proponent of the determination in writing and the Engagement Process shall proceed to Stage II.

Stage II – Cooperation on any Oil and Gas Activity

26. After completion of Stage I and prior to submitting a Proposal to the Board, a Proponent shall negotiate in good faith and enter into a Cooperation Agreement with the Council for the purpose of establishing a meaningful, respectful and transparent process for engagement.

27. Prior to entering into a Cooperation Agreement, the Council shall refer the agreement to the Committee for review. The Council may enter into a Cooperation Agreement on behalf of the Vuntut Gwitchin First Nation if the Committee determines that the terms and conditions adequately consider and address the following items:

(a) compliance with this policy;

(b) capacity funding for the Engagement Process;

(c) communications and correspondence;

(d) information sharing; and

(e) commitment to negotiate a Benefits and Stewardship Agreement.

Stage III – Benefits and Stewardship on any Oil and Gas Activity

28. After the completion of Stage II and prior to submitting a Proposal to the Board, a proponent shall negotiate in good faith and enter into a Benefits and Stewardship Agreement with the Council for the purpose of establishing appropriate stewardship measures and maximizing any potential benefits for the Vuntut Gwitchin First Nation.

29. Prior to entering into a Benefits and Stewardship Agreement, the Council shall refer the agreement to the Committee for review. The Council may enter into a Benefits and Stewardship Agreement on behalf of the Vuntut Gwitchin First Nation if the Committee determines that the terms and conditions adequately consider and address the following items:

    (a) detailed description of the Oil and Gas Activity;

    (b) capacity funding for participation in the Board's regulatory process;

    (c) compliance with the objective of Sustainable Development;

    (d) compliance with applicable land use plans;

    (e) compliance with Vuntut Gwitchin First Nation General Assembly Resolution No. 2013-01 regarding hydraulic fracturing;

    (f) adequate education and training opportunities;

    (g) adequate employment and procurement opportunities;

    (h) adequate revenue sharing or equity arrangements;

    (i) adequate stewardship measures including but not limited to:

        (i) baseline data collection measures;

        (ii) information sharing measures;

        (iii) joint monitoring of environmental and socio-economic effects, and of the effectiveness of mitigation measures;

        (iv) joint advisory and reporting processes;

        (v) joint fish and wildlife management plan;

        (vi) joint heritage resource protection plan;

        (vii) joint access management plan;

        (viii) joint water quality and quantity management plan;

(ix) joint waste management plan;

(x) joint remediation and reclamation plan;

(xi) adaptive management measures in relation to the foregoing stewardship measures, including adaptability to address any recommendations from the Board;

(j) potential socio-economic effects which includes effects on economies, health, culture, traditions, lifestyles and heritage resources;

(k) potential cumulative effects which includes effects to the environment that are caused by an action in combination with other past, present and future human actions;

(l) potential effects on any Vuntut Gwitchin First Nation rights, responsibilities and interests under the *Vuntut Gwitchin First Nation Final Agreement* and *Vuntut Gwitchin First Nation Self-Government Agreement*;

(m) compliance and enforcement measures;

(n) dispute resolution mechanisms; and

(o) Vuntut Gwitchin First Nation approval and ratification process.

30. In addition to a Benefits and Stewardship Agreement, the Council may enter into a separate agreement with a Proponent and other parties for the purpose of addressing the limited requirements under section 68 of the *Oil and Gas Act*, R.S.Y. 2012, c. 162.

APPENDIX B

Ministerial Order 2018/42

DRAFT

YUKON

CANADA

MINISTERIAL ORDER 2018/ 42

OIL AND GAS ACT

Pursuant to the *Oil and Gas Act*, the Minister of Energy, Mines and Resources orders

1 In this Order

"subject permit" means each of the following oil and gas permits held by Chance Oil and Gas Limited:

(a) oil and gas permit No. 0012,

(b) oil and gas permit No. 0013,

(c) oil and gas permit No. 0014,

(d) oil and gas permit No. 0015,

(e) oil and gas permit No. 0016,

(f) oil and gas permit No. 0017. « *permis visé* »

2 The renewal term of each subject permit is extended by five years (so that it ends on August 30, 2023).

3 The resulting total length of the initial term and the renewal term of a subject permit is 16 years.

YUKON

CANADA

ARRÊTÉ MINISTÉRIEL 2018/42

LOI SUR LE PÉTROLE ET LE GAZ

Le ministre de l'Énergie, des Mines et des Ressources, conformément à la *Loi sur le pétrole et le gaz*, arrête :

1 La définition suivante s'applique au présent arrêté.

« permis visé » Les permis suivants de pétrole et de gaz détenus par Chance Oil and Gas Limited :

a) permis de pétrole et de gaz nº 0012;

b) permis de pétrole et de gaz nº 0013;

c) permis de pétrole et de gaz nº 0014;

d) permis de pétrole et de gaz nº 0015;

e) permis de pétrole et de gaz nº 0016;

f) permis de pétrole et de gaz nº 0017. "*subject permit*"

2 La durée du renouvellement de chaque permis visé est prolongée de cinq ans, de façon à ce qu'elle se termine le 30 août 2023.

3 La durée totale d'un permis visé, y compris la durée initiale et la durée du renouvellement, est de 16 ans.

4(1) In this section

"first nations communications and engagement plan" means the plan filed under O.I.C. 2016/169 and revised in accordance with M.O. 2017/37. *« plan de participation et de communication avec les premières nations »*

(2) It is a condition of this Order that Chance Oil and Gas Limited must file annual reports with the Division Head, in accordance with subsection (3) and to the satisfaction of the Division Head, about the implementation of the first nations communications and engagement plan.

(3) For the purposes of subsection (2), Chance Oil and Gas Limited must file

(a) the first annual report on or before July 31, 2019, in respect of the period beginning on September 1, 2018, and ending on May 31, 2019; and

(b) each subsequent annual report on or before July 31 of each year in respect of the period beginning on June 1 of the preceding year and ending on May 31 of the year in which the report is to be filed.

4(1) La définition suivante s'applique au présent article.

« plan de participation et de communication avec les premières nations » Le plan déposé en vertu du Décret 2016/169 et révisé en conformité avec l'Arrêté 2017/37. *"first nations communications and engagement plan"*

(2) À titre de condition du présent arrêté, Chance Oil and Gas Limited dépose des rapports annuels auprès du chef de division, en conformité avec le paragraphe (3) et à la satisfaction du chef de division, concernant la mise en œuvre du plan de participation et de communication avec les premières nations.

(3) Pour l'application du paragraphe (2), Chance Oil and Gas Limited dépose :

a) le premier rapport annuel au plus tard le 31 juillet 2019, pour la période débutant le 1er septembre 2018 et se terminant le 31 mai 2019;

b) chaque rapport annuel subséquent, au plus tard le 31 juillet de chaque année pour la période débutant le 1er juin de l'année précédente et se terminant le 31 mai de l'année au cours de laquelle le rapport doit être déposé.

Dated at Whitehorse, Yukon,

APPENDIX D
Engagement Log

DRAFT

APPENDIX 2-C-37. *Eagle Plains Well Maintenance and Winter Activities*

Eagle Plains Well Maintenance and Winter Activities

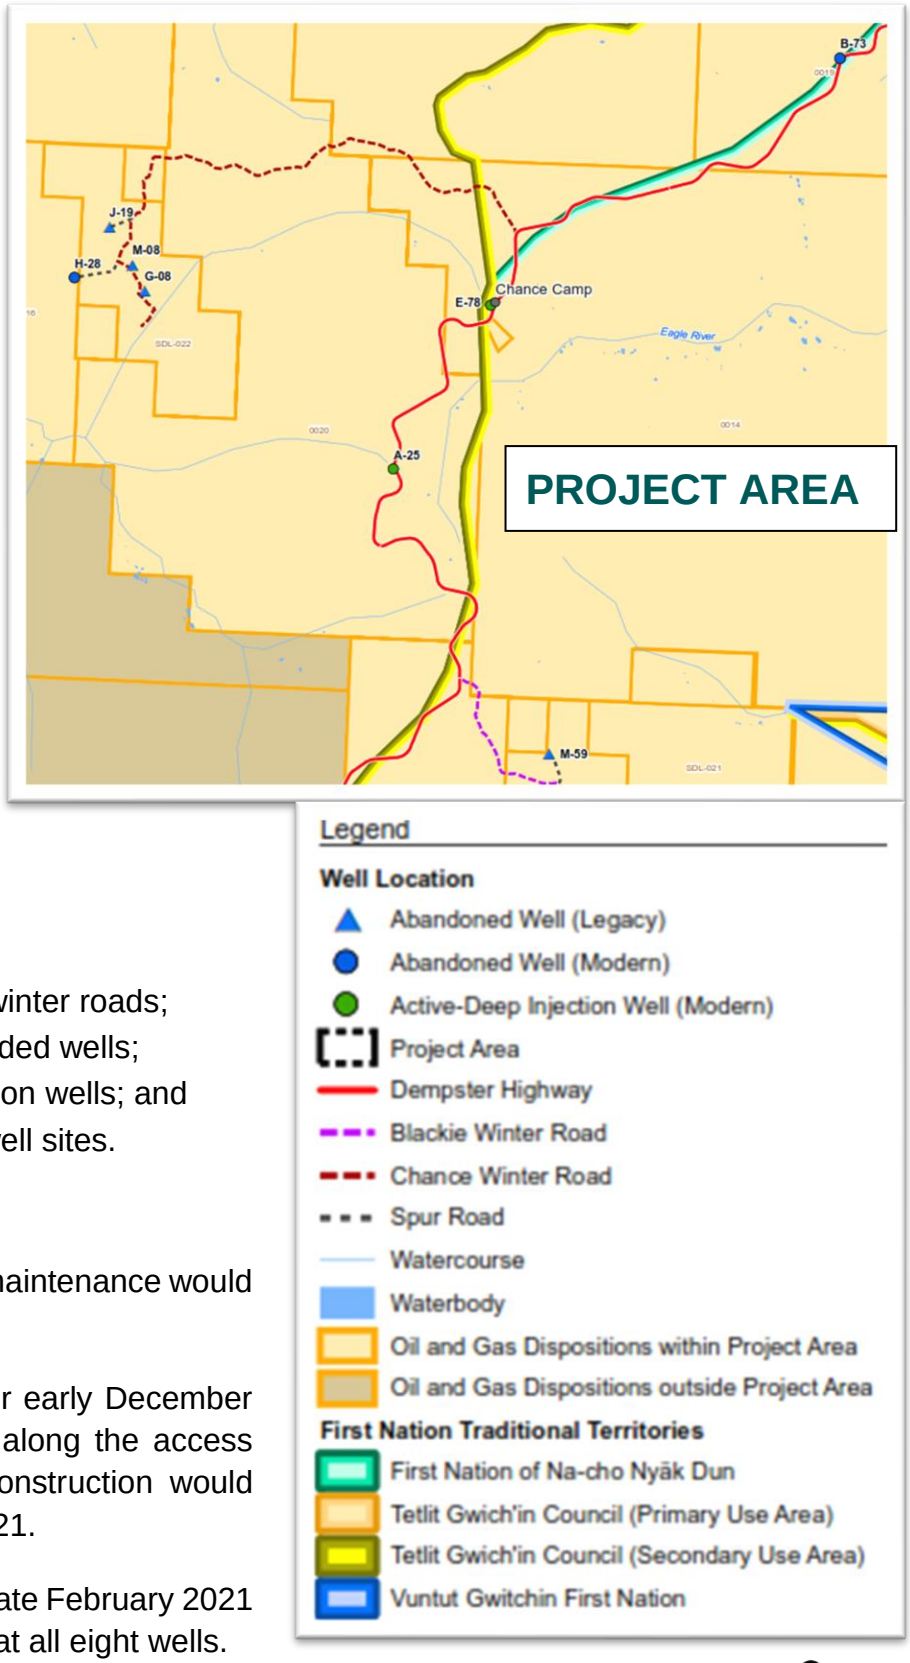
Project Information Handout **September 3, 2020**

PROJECT INFORMATION

Chance is responsible for eight wells, presently in “suspended status”, located on Eagle Plains. Four are legacy wells drilled by other operators between 1959 and 1968, and four are modern wells drilled by Chance in 2012 and 2013.

Government of Yukon, Oil and Gas Branch, has directed Chance to carryout inspection and maintenance activities for all eight suspended wells. Then Chance must either abandon or bring those wells into active status (i.e., end the period of well suspension).

Chance is proposing to abandon six wells and to bring two wells into active status as deep-injection wells.



MAIN PROJECT ACTIVITIES

Chance proposes to:

- Re-establish the Chance and Blackie winter roads;
- Conduct maintenance on eight suspended wells;
- Convert two wells to active deep injection wells; and
- Abandon six wells and reclaim those well sites.

PROJECT TIMELINES

Construction of the winter roads and well maintenance would occur during the winter of 2020/2021.

Site visits would start in late November or early December 2020 in order for Chance to pack snow along the access routes with snowmobiles. Winter road construction would finish in late January or early February 2021.

Well maintenance activities would start in late February 2021 and take about 70 days to finish the work at all eight wells.

Chance
OIL AND GAS LIMITED

Eagle Plains Well Maintenance and Winter Activities

Project Information Handout **September 3, 2020**

WINTER ROADS

The Project is accessed via the Dempster Highway. Wells A-25, E-78, and B-73 are located beside the Dempster Highway.

Well M-59 will be accessed using the Blackie winter road. From the original route, a short spur will be used to access the well site. This route is located slightly east of the original access, but offers a gentler, safer route for vehicles and will require less vegetation clearing.

Wells J-19, M-08, G-08, and H-28 will be accessed using the Chance winter road. Two additional spurs will be used to access well sites J-19 and H-28. These spurs will follow their original routes.

SUMMARY OF WELL MAINTENANCE ACTIVITIES

ACCOMMODATION

Chance anticipates using either the Eagle Plains Hotel or the existing Chance Camp for housing workers. However, the decision to use one or the other will be made by October 2020, at the latest, and will consider:

- The Hotel's ability to accommodate Chance workers
- COVID-19 related self-isolation requirements

STAFF NEEDED

It is anticipated ten people will always be on site, with up to 17 at any one time (including staff on standby) and up to 25 during rig mobilization.

Chance
OIL AND GAS LIMITED

Eagle Plains Well Maintenance and Winter Activities

Project Information Handout **September 3, 2020**

TYPES OF MAINTENANCE ACTIVITIES AND TESTS

Wellhead Inspection: The wellhead is the equipment on the surface used to maintain safe operation and manage the flow of oil and gas. A wellhead inspection is done to make sure all surface equipment is in good condition and operating as it should (e.g., providing a barrier against hydrocarbon leakage, reliable in emergency situations). This inspection follows the standard Yukon Government Oil and Gas Resources Well Inspection Report.

Pressure Test: A test to determine the strength or fracture pressure of the rock around a borehole. During the test, the well is shut in and fluid is pumped into the wellbore to gradually increase the pressure on the rock. At a certain pressure, fluid will enter the rock surrounding the borehole, either moving through small holes in the rock or by creating a space by fracturing the rock. The results of a pressure test show the maximum pressure that may be applied to the well during drilling operations.

Surface Casing Vent Flow (also referred to as a "Bubble Test") and Gas Migration Tests: When a well is drilled, it must be cased with steel pipe to provide stability to the wellbore and to ensure fluids are contained within the well. Multiple casings are used within a well. The shallowest casing is the surface casing. The surface casing isolates usable groundwater from the well and stabilizes the well. After the casing is installed, cement is pumped in the space between the casing and the rock around the wellbore, as well as between casings, to achieve a seal. Surface Casing Vent Flow involves the movement of gas, in rare cases liquid, between the surface casing and the next string of casing upward and out of the surface casings. Gas Migration is the flow of gas outside the surface casing of a well and may be tested by doing a soil vapor survey.

Temperature Log: A detailed record of temperature down the well. The temperature log is interpreted by looking for anomalies from a baseline (i.e., a log recorded before production or recorded with the well shut in). Temperature logs have many applications, mainly to identify areas where the wellbore is taking in fluid, to evaluate a cement or hydraulic fracture treatment, and to locate casing leaks. A temperature log tends to reflect the behavior of a well over a longer time than other measurements.

Cement Log: A log that uses a sound travelling down the casing wall between a transmitter and receiver to determine of the quality of cement bond on the exterior casing wall.

Hydraulically Isolate Formations: An activity where holes are put in the casing at a specific depth. Tubing is then used to inject cement through the holes, allowing cement to flow from the well into the surrounding rocks in sufficient quantity to ensure hydraulic isolation. Then pressure is applied from surface to force the cement into the holes. Once the cement has cured, the cement will be pressure tested as per the *Yukon Oil and Gas and Drilling Production Regulations*. This process is repeated until all formations are hydraulically isolated and pressure tested. These operations begin with the deepest non-isolated formation and progress to the shallowest non-isolated formation. Once all the isolation/testing procedures are complete, the tubing will be pulled from the well, a new well head assembly will be installed, and the well head will be pressure tested once more.

Wellbore fluid test: A test, or series of tests, performed to check that no unwanted reactions occur with a specific fluid. The testing process may include checks for compatibility with other treating fluids, wellbore fluids, reservoir fluids, and the reservoir formation.

1.0 INTRODUCTION

Chance Oil and Gas Limited (Chance or Proponent) is proposing to conduct routine maintenance on 8 of its suspended wells near Eagle Plains, Yukon. The Government of Yukon Oil and Gas Branch has notified Chance that well maintenance is required to maintain the suspended well status on the following 4 wells: NCY McParlon A-25, NCY Ehnjuu Choo B-73, NCY East Chance E-78, and NCY West Chance H-28. In addition, maintenance work will be undertaken on the following wells: Wells Canoe River Chance J-19, Socony Mobil WM Blackie No. 1 M-59, Socony Mobil WM Chance YT No. 1 YT G-08, and Western Minerals Chance YT No. 1 M-08.

There is a distinct difference between a suspended well and an abandoned well. A suspended well is considered a well that is not producing and has been safely secured, and production could be restarted later. An abandoned well has been permanently shut down, plugged, and the well head removed; it is considered safe and secure by regulators (CAPP 2019).

The Proponent will execute well maintenance activities within the confines of the Oil and Gas Drilling and Production Regulations, SOR/2009-315 (OGDPR). Well maintenance activities, also known as workovers, generally include the following activities:

- Pressure testing to confirm integrity of the casing and well head valves
- Removal of equipment in the well bores such as tubing and plugs
- Wireline investigations to measure temperatures and cement integrity and convey any perforating equipment
- Remedial work such as cement squeezes
- Wellbore integrity analysis to determine possible well abandonment.

To enable crews to mobilize to the site with maintenance equipment, the Eagle Plains Well Maintenance Project (Project) will require re-establishment of the Chance and Blackie winter roads.

The proposal is being submitted to the Yukon Environmental and Socio-economic Assessment Board (YESAB) for an assessment under the *Yukon Environmental and Socio-economic Act*, SC 2003, c. 7 (YESAA), which is required to obtain the necessary permits and authorizations to perform the work.

1.1 Proponent Contact Information

The Proponent has retained Hemmera Envirochem Inc. (Hemmera or Agent) to prepare and submit the Project Proposal to the Dawson Designated Office.

The Proponent's contact information is listed as follows:

[redacted], Vice President
Chance Oil and Gas Limited
Suite 202, 208 Main Street
Whitehorse, Yukon, Y1A 2A9
[redacted]
[redacted]

The Agent contact information is listed as follows:

[redacted], Project Manager
Hemmera Envirochem Inc.
230 - 2237 2nd Avenue
Whitehorse, Y1A 0K7 Yukon
Email: [redacted]
Phone: [redacted]

The preferred method of communication for the Proponent and Agent is via email. The Agent authorization form has been submitted to the Dawson Designated Office as part of the Project Proposal documents.

1.2 Location

The Project is located 30 kilometres (km) to 70 km south of Eagle Plains Hotel, in northeast Yukon (**Figure** 1-1). The project area is within the Traditional Territories of the Vuntut Gwitchin (VG) and the First Nation of Na-Cho Nyäk Dun (FNNND), as well as the Tetlit Gwich'in Secondary Use Area of the Gwich'in Settlement Region (**Figure 1-1**). Tr'ondëk Hwëch'in (TH) Traditional Territory and Settlement Land is also located immediately south of the project area.

Seven of the wells are located in the upper reaches of the Porcupine River watershed on the west side of the Dempster Highway, and 1 is located in the upper reaches of the Peel River watershed on the east side of the Dempster Highway. The nearest watercourse to the wells situated in the Porcupine watershed are McParlon Creek, which has 2 tributaries framing the south and western sides of the Chance Significant Discovery Licence and Ehnjuu Choo Creek. The watercourse nearest the Blackie M-59 well is Dalgleish Creek, which flows into the Ogilvie River. There are no waterbodies (i.e., lakes or ponds) in the area of proposed activities.

Details of the exploration wells requiring maintenance are presented in **Table 2-1** and **Figure 2-1**.

The Dempster Highway transects the project area and provides all-season access to the Blackie winter road, the Chance winter road, and the suspended wells at McParlon A-25 and Ehnjuu Choo B-73, which are located immediately adjacent to the Dempster Highway. The nearest outpost is the Eagle Plains Hotel and Highway Maintenance Base, which is located approximately 30 km to 70 km north of the locations where the workovers are planned to occur. (**Figure 2-1**).

The latitude and longitude coordinates for the proposed Project are presented as follows:

NW:	66.20808719	(lat/northing)	−137.6280058	(long/easting)
NE:	66.21832565	(lat/northing)	−136.9320243	(long/easting)
SW:	65.96218433	(lat/northing)	−137.6037058	(long/easting)
SE:	65.97269282	(lat/northing)	−136.9164459	(long/easting)

1.3 Regional Land Use Plans

The Project is located within the boundaries of the North Yukon Planning Region and Peel Watershed Planning Region and is therefore subject to the North Yukon Land Use Plan and (NYLUP) Peel Watershed Land Use Plan (PWLUP). Locations of proposed Project activities are within Land Management Unit (LMU) 9 of the NYLUP and LMU 7 of the PWLUP. (**Table 1-1**). Both are located within the Eagle Plains basin, with the highest potential for oil and gas development. Details regarding how the Project will meet the requirements of the NYLUP and PWLUP are provided in **Section 7.5** and **Table 7-2**.

Table 1-1 Landscape Management Units Overlapping the Project

Landscape Management Unit Number	Landscape Management Unit Name	Integrated Management Area
9 (NYLUP)	Eagle Plains	4
7 (PWLUP)	Dalglish Creek	4

1.4 YESAA Triggers

The Project requires an evaluation by a YESAB Designated Office for the following reasons:

1. The Project location is in the Yukon.
2. The Assessable Activities, Exceptions and Executive Committee Projects Regulations (SOR/2005-379) identifies several triggers for the Project:
   a. Schedule 1, Part 3, Oil and Natural Gas, Item 2:

      On other than an Indian reserve, drilling, operation, modification, decommissioning or abandonment of, or other activity in relation to, an oil or natural gas well or seismic shot hole, but not including a hole drilled to obtain geological information.

   b. Schedule 1, Part 13, Miscellaneous, Item 13:

      On Crown land or settlement land, levelling, grading, clearing, cutting or snow ploughing of a route that provides access to land for the purposes of a geophysical, geological or engineering survey.

3. An authorization by a government agency is required for the activities to be undertaken.

The Dawson Designated Office is expected to carry out the evaluation.

1.5 Regulatory Requirements

Chance currently holds a Type B Water Licence (MN12-061-1) approvals from previous activities at the Project site.

To complete the Project the following approvals are required:

- Air Emission Permit
- Land Use Permits
- Dempster Highway Authorization Permit
- Storage Tank Permit
- Waste Management Permit

- Work within Highway Right-of-Way Permit.

1.6 Alternatives

Currently, no alternatives are being considered. The proposed well maintenance work has been directed by the Government of Yukon and is designed in accordance with Part 7 of the OGDPR. Alternative technologies and methods for accessing the well sites are also not feasible. Winter access and work are proposed to reduce or eliminate potential effects to various valued components (VCs) such as permafrost and vegetation, and Project activities have been designed according to best practices and Government of Yukon standards. Other means of access such as by helicopter are not feasible during winter as low light conditions pose additional personnel health and safety considerations.

2.0 PROJECT DESCRIPTION

Chance is responsible for eight wells, presently in suspended status, located on Eagle Plains. Of these wells, four are legacy wells drilled by other operators between 1959 and 1968, and four are modern wells drilled by Chance (formerly called Northern Cross (Yukon) Limited) in 2012 and 2013. As directed by the Government of Yukon, Oil and Gas Branch, Chance must conduct inspection and maintenance activities for all eight suspended wells, then abandon or bring into active status (i.e. end the period of well suspension). Chance proposes to abandon six wells, and to bring the final two wells into active status as deep-injection wells. Waste fluid produced during the abandonment of the six wells can then be disposed of via injection into the deep-injection wells, enabling Chance to minimize the distance the waste fluid is transported. No oil or gas is expected to be produced from the two active wells; they would specifically be used for disposal of waste fluid. The work is planned for December 2020 to March 2021, although the specific timeframe is weather-dependent (temperatures must be consistently below 0 degrees Celsius (°C) and adequate snowfall is required for access to some of the wells).

This section describes in detail the activities, equipment and schedule making up the Eagle Plains Well Maintenance Program (the Project),

2.1 Project Activities

The main components of the Project are:

- Re-establishment of the Chance and Blackie winter roads (constructed via compaction on a minimum snow base of 10 cm).
- Maintenance activities on the eight suspended wells (well workover).
- Convert two wells to active deep injection wells.
- Abandonment of the remaining six wells, and reclamation of the associated well sites.

The well maintenance activities followed by conversion to deep injection wells or abandonment and reclamation will satisfy a direct order from the Oil and Gas Branch of the Government of Yukon. Construction and re-establishment of the winter roads is required to access five of the well sites while three of the well sites are accessed directly off the Dempster Highway. A letter outlining the order from the Government of Yukon, Oil and Gas Branch is provided in **Appendix A**. Locations for each of the wells is provided in **Table 2-1** and **Figure 2-1**.

Table 2-1 Well Locations and Access

Well Name	Location		Access Route

2.1.1 Site Access and Winter Roads

The Project is accessed via the Dempster Highway. Wells A-25, E-78 and B-73 are located immediately adjacent to the Dempster Highway in cleared areas and are readily accessible in all seasons. Well M-59 will be accessed by re-establishing approximately 5.95 km of the Blackie winter road, which runs east from Km 305 of the Dempster Highway, approximately 20 km south of the Chance Camp. From the original route, a 1.12 km spur north will be used to access the well site (**Figure 2-1**); this route is located slightly east of the original access to the well site, but offers a gentler, safer gradient for vehicles and will require less vegetation clearing.

Wells J-19, M-08, G-08, and H-28 will be accessed by re-establishing approximately 25 km of the Chance winter road, which runs west from the highway, approximately 3 km north of the Chance Camp. Two additional spurs will connect to well sites for J-19 and H-28 from the winter road (**Figure 2-1**); these spurs will follow the original access routes and will be approximately 2.85 km in total.

Both winter roads will be approximately 8 metres (m) to 10 m wide. The total surface area and footprint of both the Chance winter road, Blackie winter road, and spur roads will be approximately 35 hectares (ha). Exact dimensions of the well sites are dependent on topography and may not be exact squares but will cover an area approximately 1 ha per well site, with the wellhead located approximately in the center. As such, the total footprint of the project will be approximately 43 ha.

2.1.1.1 Winter Road Construction Methods

Chance will use similar techniques for winter road construction as described during prior assessments (YESAB # 2006-0237, 2006-0285, 2007-0219, 2008-0047, and 2012-0140). Before any winter road construction, a minimum, verified, snow depth of 10 centimetres (cm) must be present; this depth of snow cover is considered sufficient to protect the ground surface from tires or vehicle tracks. To promote snow compaction and thorough freezing, snowmobiles and snowcats will be used to drive the Chance and Blackie winter roads during late fall/early winter (after the first few snow falls). Re-establishing the Chance winter road will be prioritized due to the larger number of wells accessed by this route and because minimal vegetation clearing is expected (the Chance winter road was last used in April 2014 and substantial regrowth of woody vegetation since is unlikely).The Blackie winter road will provide access to only 1 well; it is also more overgrown.

If the snow depth (minimum of 10 cm) is not sufficient in certain areas during re-establishment of the Blackie winter road, additional snow will only be collected from areas where a surplus of snow is available or from areas where there is no potential for disturbance to the surrounding environment. These areas may include depressions with accumulation of significant amounts of snow. Chance will only remove snow from areas where 10 cm of compacted snow will remain as a base to protect surface vegetation. Alternatively, as the Proponent has done in previous years, crews may remove additional snow from the Chance camp laydown area (approximately 13 ha area). Only clean snow that is free of deleterious substances will be used for re-establishing winter roads.

Once the snow depth is adequate (i.e., 10 cm or greater without compaction), any vegetation along either winter road route will be cleared using a bulldozer and a mulcher. The bulldozer blade will be raised off the ground to avoid cutting the tops of hummocks, tussocks, or high spots. Any trees or large brush encountered will be removed at the ground surface using a mulcher to avoid tearing the surface organic layer, thereby reducing the chance of thawing ice-rich mineral soil beneath. The removed vegetation will then be mulched with a track-mounted mulcher and distributed on the road. The mulch helps keeps the soil in place while protecting the root system of ground cover plants and natural grasses. Where it is safe and practical to do so, crews will save standing live or dead trees along the route that provide wildlife habitat.

If the minimum snow depth base is not present in areas along the Blackie winter road, additional snow may be collected from areas where a surplus is available or from areas with no potential for disturbance to the surrounding environment (such as depressions with significant accumulations of snow). Chance will only remove snow from areas where 10 cm of compacted snow will remain as a base to protect surface vegetation. Alternatively, additional snow from the Chance camp area (approximately 13 ha area) may be used (as Chance has done previously); only clean snow, confirmed free of deleterious substances will be used for re-establishing winter roads. If natural snowfall is below the minimum required depth to construct and maintain the winter roads, snow making equipment could also be used to make up the shortfall, although this would be dependent on the timing of winter road construction and ambient temperatures (requires temperatures below 0°C. Generally, low snowpack is only an issue during the early part of winter, so this provision would only apply on a contingent basis during the months of November, December, and January.

Following vegetation removal, the surface of the road will be constructed using accumulated snow packed into the roadbed and construction of shallow berms on the road margins, into which snow and water trucked from approved sources will be flooded/packed. A combination of snowcats and bulldozers using drags will be used to push and compact the snow along the access routes. To ensure the roads will be stable enough to safely support the service rig and other heavy loads, all construction activities will be supervised by an experienced construction supervisor.

The same construction methods will be utilized to establish access to well sites and clear any vegetation surrounding the well site to accommodate equipment and site infrastructure.

2.1.1.2 Water Withdrawal

Water for the service rig and winter road icing will be primarily sourced from existing withdrawal locations on the Eagle River, with locations on the Ogilvie River as an alternative source. The Eagle River is preferred (closer proximity to the Project), although the Ogilvie River will be more convenient for operations on wells M-59 and A-25. No more than 100 cubic metres (m^3) of water will be withdrawn daily. All water withdrawal will follow the Fisheries and Oceans Canada's Freshwater Intake End-of-Pipe Fish Screen Guidelines (DFO 2020).

If natural snowfall is below the minimum required depth to construct and maintain the winter roads, snow making may be used to make up the shortfall. This is a contingent consideration and could require up to 100 m^3 of water per day for a short period (a few days to a week). The sources of water include the Eagle River and the Ogilvie River. The water to be used to make snow and ice for the winter road(s) will be trucked from the source to the point of use, with each truck expected to complete between 1 and 3 deliveries per day.

2.1.1.3 Winter Road Maintenance

Maintenance of winter access routes may include low ground pressure vehicles (e.g., snow cats), a road grader equipped with a wing snow plow, and some water application. Grading may be required over certain stretches and depressions along the snow-filled roads to smooth the surface.

2.1.1.4 Access Control

Chance understands that increased winter access into the area is of significant concern to First Nations and Indigenous Groups, local residents, trappers, and outfitters. Chance also has safety concerns regarding unauthorized use of Chance and Blackie winter roads due to narrow access routes and the potential presence of sour gas at some wells. In order to ensure crew safety, Chance cannot allow the use of firearms in areas where crews are working. Chance will have radio control of these access routes to ensure authorized personnel gain unobstructed access, but this will not prevent unauthorized use of the roads and area. To address access concerns, gates will be placed at the junction connecting the Blackie and Chance winter roads to the Dempster Highway. The gates will be constructed of heavy materials and positioned with obstacles on either side as much as possible (e.g., heavy forest) to restrict vehicle access.

2.1.1.5 Anticipated Road Use

The majority of anticipated Project traffic on the winter roads will involve mobilizing and setting up the service rig and site infrastructure. At each well site, approximately 11 flatbed truck loads will be required to mobilize equipment, and service rig setup will take approximately 1 day to complete at each well site. Once a site is established and maintenance equipment set up, approximately 1 to 2 pickup trucks will transport supplies and personnel to and from site each day for the duration of work at the site. Additionally, 1 water truck and 1 fuel truck will supply the well site (via the winter roads) every 3 days or as demand dictates.

Public access and use of both the Chance and Blackie winter roads will be restricted. All Project vehicles will be equipped with radio communication and traffic on the roads will be radio monitored and controlled.

2.1.1.6 Road Equipment

Equipment will be required for clearing, grading, and transporting water and materials. Light equipment for transporting personnel, fuel, and other supplies will also be required periodically during construction and well maintenance.

It is anticipated that Challenger cats, D6 cats, snow cats, graders, snow-making equipment, water trucks, and drags will be the primary construction equipment used to re-establish the winter roads. Pickup trucks will be used to transport work crews, fuel, and other supplies, and water trucks will be used to carry water from the Eagle River and Ogilvie River to the Project. Flatbed trailers will be used to transport equipment and larger supplies.

2.1.2 Well Maintenance Activities

Under the Yukon OGDPR, a well is deemed suspended when it is safely secured, but not producing oil or natural gas. The Yukon Oil and Gas Branch has indicated that the wells listed in **Table 2-1** have exceeded the allowable time period for remaining in suspended status and must be either abandoned or brought into active status.

Well maintenance is required on each well prior to abandonment or conversion to active injection wells. Well maintenance equipment may include a service rig, wireline truck, and cementing trucks along with associated support equipment. All equipment will be mobilized to each of the wells on a sequential basis (one at a time) to complete the required maintenance work, which will include downhole suspension of wells to be abandoned, wellbore fluid replacement, and replacement of substandard equipment). The following 8 wells will require maintenance:

- Socony Mobil WM Blackie No 1 M-59 (M-59)
- Western Minerals Chance YT No 1 M-08 (M-08)
- Canoe River Chance YT J-19 (J-19)
- Socony Mobil WM Chance YT No 1 YT G-08 (G-08)
- NCY McParlon A-25 (A-25)
- NCY Ehnjuu Choo B-73 (B-73)
- NCY West Chance H-28 (H-28)
- NCY East Chance E-78 (E-78).

A detailed description of the planned maintenance activities at each well is presented in the following sections. A summary of the activities anticipated to be required at each well is provided in **Table 2-2**.

Table 2-2 Summary of Well Maintenance Activities

2.1.2.1 Legacy Wells

Legacy wells were drilled by other operators from 1959 to 1968 and are located on Significant Discovery Licences Blackie (021) and Chance (022).The following Legacy wells require maintenance:

- Socony Mobil WM Blackie No 1 YT M-59
- Western Minerals Chance YT No 1 M-08
- Canoe River Chance YT J-19
- Socony Mobil WM Chance YT No 1 YT G-08.

Pressure Test and Surface Casing Vent Flow Test and Gas Migration Test

A pressure test will be conducted at each Legacy well to evaluate the integrity of the wellhead and the existing wellbore casing. The well will then be tested for surface casing vent flow (SCVF) and gas migration; SCVF occurs when fluid or gas is flowing from the surface casing vent assembly. Gas migration testing is intended to identify movement of gas from a subsurface zone to the surface through a barrier that should otherwise prevent its movement; barriers can be natural (overburden, shale, permafrost) or artificial (cement sheath, external casing packed, pipe joints, etc.). The Proponent reports that during annual inspections, no SCVF has ever been detected. If SCVF is identified, the well will be inspected and test results logged using a variety of tools (e.g., noise tool, temperature tool, bond log tool) to determine the source of the SCVF and/or gas migration. The logs will be analyzed, and a plan will be formulated to complete a downhole shut off at the source of the SCVF and/or gas migration.

Temperature Log and Cement Bond Log

Once pressure, SCVF, and gas migration testing is complete, the service rig, support equipment, and wireline will be moved to the well site. A blowout preventer, (a specialized pressure control unit to seal, control, and monitor the well and prevent the uncontrolled release of crude oil or natural gas during well operations) will be installed on the wellhead seal. A temperature log will be recorded from the surface to a depth of 300 m below Kelly Bushing (mKB). The data in the temperature log will be analysed for anomalies or departures from the reference gradient; the reference gradient may be the geothermal gradient, a log recorded pre-production, or a log recorded with the well shut in, depending on the well. Most anomalies are related to fluids entering the formation through the borehole or fluid exit.

Following analysis of the temperature log, a cement bond log will be run. The cement log uses the variations in amplitude of an acoustic signal travelling down the casing wall between a transmitter and receiver to determine the quality of a cement bond on the exterior casing wall. The acoustic signal will be more attenuated in the presence of cement than if the casings were uncemented. The cement log is used to identify sections of the well bore that will need interventions to isolate porous formations from adjacent formations.

Isolate Hydraulically Connected Formations

To isolate a formation from an adjacent formation, the casing will be perforated at the appropriate depth using a wireline-conveyed perforating gun. Tubing will then be used to inject cement through the perforations in sufficient quantity to ensure adjacent formations are isolated from each other, at which point pressure will be applied from surface to force the cement into the perforations. Once the cement has cured,

the cement will be pressure tested as per the Yukon OGDPR. The process will then be repeated until all formations are isolated from one another and pressure tested. The isolation operations will begin with the deepest non-isolated formation and progress to the shallowest non-isolated formation.

2.1.2.2 Modern Wells

The modern wells were drilled by Chance and Northern Cross (Yukon) Limited (Northern Cross) in 2012 and 2013. The following modern wells require maintenance:

- NCY McParlon A-25
- NCY Ehnjuu Choo B-73
- NCY West Chance H-28
- NCY East Chance E-78.

Of the modern wells, B-73 and H-28 will then be abandoned and A-25 and E-78 will be converted to active deep-injection wells.

Pressure Test and Surface Casing Vent Flow Test and Gas Migration Test

A pressure test will be conducted at each Modern well to evaluate the integrity of the wellhead and the existing wellbore casing. The well will then be tested for SCVF and gas migration, as for the Legacy wells. The Proponent reports that during annual inspections, no SCVF has ever been detected. If SCVF is identified, the well will be inspected and test results logged using a variety of tools (e.g., noise tool, temperature tool, bond log tool) to determine the source of the SCVF and/or gas migration. The logs will be analyzed, and a plan will be formulated to complete a downhole shut off at the source of the SCVF and/or gas migration

Temperature Log and Cement Bond Log

Once SCVF, and gas migration testing is complete, the service rig, support equipment, and wireline will be moved to the well site. A temperature log will be recorded from the surface to a depth of 300 mKB, and used to identify anomalies or departures from the reference gradient (as for Legacy wells, the reference gradient may be the geothermal gradient, a log recorded pre-production, or a log recorded with the well shut in). Most anomalies are related to fluids entering the formation through the borehole or fluid exit.

Following analysis of the temperature log, a cement bond log will be run. The cement log uses the variations in amplitude of an acoustic signal travelling down the casing wall between a transmitter and receiver to determine the quality of a cement bond on the exterior casing wall. The acoustic signal will be more attenuated in the presence of cement than if the casings were uncemented. The cement log is used to identify sections of the well bore that will need interventions to isolate porous formations from adjacent formations.

Wellbore Fluid

The wellbore fluid in wells B-73 and H-28 will be sampled and tested prior to abandonment to determine if the fluid meets the standards in the OGDPR; wellbore fluid is presently a stabilized dilute potassium chloride (KCl) solution (saline) which is non-corrosive and non-freezing, and is used to preserve casing integrity. A

wellbore fluid test is a test or series of tests to check that no undesirable reactions are occurring with a specific fluid. The testing process may include checks for compatibility with other treating fluids, wellbore fluids, reservoir fluids, and the reservoir formation. If the wellbore fluid does not meet the requirements of the OGDPR, a service rig will be moved in to replace it with fluid conforming to the Yukon OGDPR 99(a) and 99(b). The removed fluid from the wellbore will be recycled if permissible and re-used in the well. If it cannot be recycled the fluid will be disposed of via deep-well injection following conversion to active deep-well injection wells.

2.1.2.3 Wellbore Integrity Analysis

The wellbore integrity analysis incorporates all data collected from the Legacy and Modern wells and identifies whether any actions are required prior to well abandonment or deep-injection conversion. The wellbore integrity analysis comprises the following:

- Pressure testing of the wellhead and casing
- Bit and scraper run on tubing to ensure the wellbore is still full drift
- Analysis of the cement behind the production casing and liner casing with a cement bond log tool to determine the cement quality
- Geological analysis to determine what formations need to be isolated after the cement analysis
- Sampling of wellbore fluid on the wells (if necessary)
- Location of the well with respect to the other remaining wells.

The wellbore integrity analysis is required to formulate the final plan for each of the wellbores. The analysis will determine if any the following are required, prior to surface abandonment or conversion:

- Cement squeezes to isolate formations from other formations in accordance with OGDPR Part 7 Section 95(1)(b)
- Casing patches to repair any casing breaches
- Cement plugs or bridge plugs set to suspend or abandon producing formations in accordance with Section 97 (1) and Section 97 (2) of OGDPR Part 7

If any work is required to isolate a formation to satisfy OGDPR Part 7 Section 95(1)(b), cement squeezes will entail perforating an interval close to the formation top and squeezing Arctic-compatible cement in to the annular space between the production casing and the formation face to create a cement sheath that will isolate the formation from other formations above it in the wellbore. The cement squeeze and remaining plug left in the wellbore will conform to the requirements set out in OGDPR Section 98 (1)(b) and Section 98(2). The location of the remaining cement plug will be located after the cement squeezes using the method of setting down on the cement plug with a minimum 90 kilonewton (kN) force with the cementing string after 12 hours as set out in OGDPR Section 100(1)(b). Fluid in the wellbore may have to be replaced if it does not meet the requirements of OGDPR Part 7, Section 99.

2.1.3 Well Abandonment

Once all testing and isolation procedures are complete on each well intended for abandonment (**Table 2-2**), the following procedures will be completed for abandonment:

- Legacy wells (M-59, M-08, J-19, G-08): the existing wellbore fluid will be removed (existing wellbore fluid consists of diesel or stabilized crude oil) and replaced with stabilized KCl solution (freeze-resistant, anti-corrosive and protective of the well casing). The waste wellbore fluid will be burned by the skid boiler (part of the well maintenance equipment) to minimize distance transported and thus potential for spills. The tubing will be pulled from wells J-19 and G-08 (of the wells planned for abandonment, only these two have tubing present) and a 3-4 m deep bell hole excavated for access to the casing located immediately below the wellhead. The casings (surface casing, intermediate casing, and production casing) will be cut off at 2-3 m below ground level and a steel plate will be welded over each casing string, then covered over with the original excavated material.
- Modern wells (H-28 and B-73): if the existing wellbore fluid (stabilized KCl solution) does not meet the standards of the OGDPR, it will be removed and replaced with new stabilized KCl solution. The waste wellbore fluid will be transferred to insulated 400 bbl tanks located at A-25 and E-78 for storage prior to injection into one of the two wells. The casings (surface casing, intermediate casing, and production casing) will be cut off at 2-3 m below ground level and a steel plate will be welded over each casing string, then covered over with the original excavated material. To complete the abandonment of H-28 and B-73 (modern wells), rig matting at the well sites will be removed, as will the cement barricades and metal fencing that surrounds the well heads. In the case of B-73, aggregate material which was brought in to level the site will be removed and returned to its source of origin, a borrow pit north of B-73 at about Km 342, and the impermeable liner will be cut up and removed to allow natural regeneration of the site.

The service rig, all support equipment and all waste materials produced during the maintenance and abandonment activities will then be removed from the site. If the tubing is salvageable, it will be stored at the Chance Camp for re-use; if not, it will be transported to an appropriately accredited recycling or disposal facility offsite in Yukon on BC (please also see **section 2.5**).

2.1.4 Well Conversion to Deep-Injection Wells

Once well maintenance activities are complete on wells A-25 and E-78, they will be set up as deep-injection wells. Each well will be perforated in the geological zone, with the exact location/depth determined by the analysis of the open hole logs. A concrete packer will be set approximately 5 m above the perforated interval and plastic-coated tubing will be run and attached to the packer. The space between the tubing and casing will be filled with non-corrosive / non-freezing fluid (most likely a potassium-chloride (KCl) saline solution) to preserve casing integrity. The wellhead will be upgraded with plastic coated parts to allow for fluid injection. The packer will be pressure tested annually to conform with the required regulations. Once complete, wells A-25 and E-78 will be classified as active deep-injection wells and will no longer be considered “suspended” under the OGDPR.

At each wellhead, a surface facility consisting of 4-8 insulated 400 bbl (barrel equivalents, or 63,600 liters) tanks, tank containment measures, a triplex pump, 2-3 1000 gallon propane storage tanks and associated piping, will be set up on the lease. Wellbore fluids removed from A-25 and E-78 (and possibly from H-28 and/or B-73 if the existing wellbore fluid is found to not meet the standard of the OGDPR) will be stored in the insulated 400 bbl tanks temporarily, prior to injection into the wellbore of A-25 or E-78 using the pump. Propane will be used to heat the tanks to prevent freezing as needed. A small building will be installed over the pump and piping to keep the facility heated.

2.1.5 Well Equipment

Equipment required for well maintenance, and abandonment or conversion will be stored on site, mainly on trucks and flatbed trailers (**Table 2-3**)

Table 2-3 Equipment and Infrastructure Components

Quantity	Component	Description
Re-establishment of Winter Road		
Multiple as needed	Construction Equipment	Challenger cats, D6 cats, snow cats, graders, snow-making equipment, water trucks, and trucks with drags (small trailers pulled behind trucks) will be utilized during the initial phase of the Project to prepare the roads and well pads for well maintenance activities.
Mobilization and Demobilization for Well Maintenance and Abandonment or Injection Conversion		
6	8 ft. x 40 ft. mats	These mats can be wooden or steel and are placed on the ground in an interlocking manner for positioning the service rig and connected equipment.
1	Skid service rig structure (likely 32 – 40 wheeled loads)	Components required to service the well include: • Sub-structure, or base where the derrick (i.e., framework to support drilling apparatus) is fixed • Derrick that supports the draw works and handling equipment • Draw works that lift and lower the handling equipment in the derrick/mast to run pipe in and out of the hole • Blowout preventers, which are pressure control equipment that can hydraulically shut in a well in the event of unplanned influxes of formation fluids into the wellbore.
1	Skid dog house	Skid-mounted unit that contains a generator for supplying power to the rig, an office and change rooms for the crew, and a hydraulic control system to remotely operate the blowout preventer stack.
1	Skid pump	Skid-mounted unit that contains a pump to provide hydraulic pumping power to pump fluids into the wellbore (same as pumps below).
1	Skid tank	Skid-mounted fluid storage tank for the service rig. The skid tank can store fluid to be pumped into the wellbore or store fluid that is pumped out of the wellbore.
1	Skid boiler	Used extensively in very cold and Arctic climates for preventing equipment and fluids from freezing.
1	Junk skid	Skid-mounted trailer with an inventory of spare parts and equipment used during well maintenance work.
1	Catwalk and pipe racks	Used to store tubing or tools that will be removed from or run into the wellbore and for picking up or laying down tubing or tools.
1	Enclosed trailer (chemicals, tools, etc)	Dry storage trailer to keep tools and chemicals to be used during the maintenance operations.
5	Baskets of tools	Tools used to operate the service rig.
350	Tubing storage: Joints of 73.0 mm, L-80, 9.67 kg/m tubing (9.5 m average length)	Storage for tubing that will be stored on location until required to be run in the hole.
1	Super single shack	Skid-mounted office and accommodation for well site supervisors.
3	20-kilowatt generator / light towers, miscellaneous equipment	Light towers will be required on the well sites as the operations will run 24 hours per day.
10-16	400 bbl tanks	These skid-mounted cylindrical steel tanks are about 10 ft. in diameter and approximately 20 ft. high and are used for fluid storage.

Quantity	Component	Description
1	Miscellaneous equipment	Additional equipment transported to site on a trailer for operation of the service rig (e.g., downhole tools, fan heaters).
1	Skidded office/medic trailer	Essential personnel trailers that serve as offices. All office trailers will have self-contained sewage storage, and sewage will be moved periodically to the sewage lagoon at the Chance camp at km 324.
1	Fuel storage	Fuel storage will be needed for equipment such as the service rig, pumps, generators, etc. Bulk fuel will be staged at the Chance camp at km 324 and will be distributed each day as needed via pickup trucks with slip tanks during crew changes.
1	Tank truck	Vehicle used to transport fluid to the service rig during operations (mainly fresh water).
1	Vacuum truck	Vehicle used for removal and transportation of wastewater and sewage from the medic/first aid trailer for disposal.
1	Cement bulker	Used to store and mix cement for use in wells.
1	Cementing unit	Unit used to pump cement into the wellbore during the required cementing operations.
1	Cement bins	Large tanks, normally upright, fully enclosed, and pressurized, where cement products are stored. Cement is pneumatically pumped from the tank into the cementing unit.
1	Wireline unit	Unit to convey tools into the wellbore on wire rope to enable analysis of the casing integrity, setting of bridge plugs, and casing perforation.
1	Slickline unit	Unit to convey tools into and out of the wellbore on steel wire to enable bridge plugs to be pulled or set in the tubing.
2	Pumps	Used to circulate the fluid down the pipe, then around and up the annular space between the pipe and the casing to surface.
1	Main workover fluid storage	Storage location for all the fluid additive materials. Normally these materials are neatly stacked on pallets and shrink wrapped to protect them during the truck journey north.
1	Flare tank and flare	The flare tank is a reservoir to ensure the flare used to burn combustible gas from the well does not starve of combustible gases. Flaring is only planned in the unlikely event the wells that have perforated intervals require depressurization prior to the planned workover operations. The flaring cannot be scheduled in an operation as it may or may not be required depending on the circumstances encountered. The flare stack will be a minimum of 18 m off the ground.
1	Water storage and treatment	Water storage tank and treatment containers to provide potable water for the rig crew and personnel.
6-10	Half-ton trucks	Pickup trucks will be used to transport work crews, fuel, and other supplies between the camp, Eagle Plains Hotel, and the well sites.
Throughout Project		
1	Cement bulker (2 -3 times throughout Project)	A transport truck to deliver cement to the sites for cementing operations.
1	Fuel tank bulker (7-8 times throughout Project)	A transport truck to deliver fuel (diesel and gasoline) to fueling equipment on the sites.

2.1.6 Well Site and Winter Road Reclamation

The Project proposes to re-establish the Blackie winter road to access 1 existing well site (M-59), and the Chance winter road to access wells J-19, M-08, G-08, and H-28. Wells A-25, E-78, and B-73 are adjacent to the highway, readily accessible, and have either rig matting in place or are in a pre-existing cleared area, such as a borrow pit or Chance's Base Camp.

Reclamation activities will aim to return the site as closely as possible to its pre-Project condition, with the exception of well sites around wells A-25 and E-78, where the insulated fluid tanks and structure enclosing the pumps and piping will remain at the sites.

Well site and winter road reclamation activities will be designed to meet the following objectives:

- Leave the site clean following Project completion.
- Remove all garbage, petroleum products, and equipment.
- Prevent long-term erosion or slumping and promote successful natural revegetation of disturbed areas.

Given the winter road construction methods that will be employed (i.e., allowing for 10 cm of snow cover before building the winter road), no additional reclamation is anticipated to be required for the winter roads. As discussed in **Section 2.2.3**, access to each of the roads will be restricted during operations and following the completion of the proposed activities. Restricting access will ensure that the road can fully melt in spring, thus reducing the potential for additional disturbance from outside users and reducing risk to Chance employees.

2.2 Camp Facilities

Chance anticipates using either the Eagle Plains Hotel or the existing Chance Camp for housing workers over the duration of the Project. The Eagle Plains Hotel, located at km 371 of the Dempster Highway, has been operating since the late 1970s and provides a variety of services including hotel facilities, accommodations (64 people during peak use), a restaurant, lounge, public washroom, laundromat, and service garage. The hotel is a recognized tourist destination and provides support services to the Eagle Plains Maintenance Camp operated by the Yukon Department of Highways and Public Works.

Chance's existing camp, office, and storage yard was established in October 2011 and is located at km 325 of the Dempster Highway. It is accessible year-round unless the highway is closed due to weather or construction. For this Project, Chance plans to utilize the camp for storing and transporting equipment and supplies needed for operations and may also utilize the camp for personnel accommodations. The Camp has accommodations for up to 75 people, in trailers, as well as kitchen, sanitary and potable water facilities. The decision to utilize the Eagle Plains Hotel or the Chance Camp will be made by October 2020 at the latest, and will consider:

- The Hotel's ability to accommodate Chance workers over the full duration of the Project
- COVID-19 related self-isolation requirements (see **Section 2.3** for further details)

Over the course of the entire Project, approximately 7 to 12 fixed wing flights will be required to transport workers during shift changes, with up to 2 flights per week. Flights will be privately chartered from Edmonton to Inuvik and then to the Wiley airstrip located at km 389.5 of the Dempster Highway or the Chance Camp airstrip, located at km 325 of the Dempster Highway.

A small medic/first aid trailer equipped with heat, water, and sewer service may be installed at the well site during workover operations to provide essential first aid supplies and refuge for workers. All wastewater and sewage will be collected in tanks approved by the Canadian Standards Association and transported off site for disposal at an approved facility in Fort McPherson.

2.3 COVID-19 Safety Considerations

Coronaviruses are a large family of viruses found mostly in animals. In humans, they can cause diseases ranging from the common cold to more severe diseases such as Severe Acute Respiratory Syndrome (SARS) and Middle East Respiratory Syndrome (MERS). The disease caused by the new coronavirus has been named COVID-19.

While many of the characteristics of COVID-19 are still unknown, mild to severe illness has been reported for confirmed cases. Common symptoms for COVID-19 are fever, cough, sneezing, sore throat, and difficulty breathing. Coronavirus is transmitted via larger liquid droplets from a person's mouth and nose. The virus can spread through these droplets through the eyes, nose, or throat to anyone in close contact with an infected person. The virus is not known to be airborne (e.g., transmitted through the particles floating in the air) and it does not enter the body through the skin, although it can be spread by touch if people touch their mouth or nose before thoroughly washing their hands .

Droplet Contact: Some diseases can be transferred by large infected droplets contacting surfaces of the eye, nose, or mouth. For example, large droplets that may be visible to the naked eye are generated when a person sneezes, coughs, or even talks. These droplets typically spread only 1 m to 2 m and are too large to become airborne and quickly fall to the ground. Influenza and SARS are 2 examples of diseases capable of being transmitted from droplet contact. Currently, health experts believe that coronavirus can also be transmitted in this way.

Airborne transmission: When much smaller evaporated droplets or dust particles containing certain microorganisms float in the air for long periods of time, they can be transmitted to people. Currently, health experts believe that coronavirus cannot be transmitted through the air.

At present, COVID-19 is a public health emergency in Yukon. Guidelines for ensuring public safety have been established by the Chief Medical Officer of Health for Yukon. These guidelines include physical distancing, enhanced cleaning, infectious disease control strategies, and hand hygiene. The state of the pandemic and the responding guidelines are rapidly evolving, and Chance will continue to monitor and follow all policies and guidelines throughout the duration of the Project.

The camp utilized for Project activities and the Eagle Plains Hotel or the camp accommodations used for crew housing will also adhere to all guidelines including physical distancing and sanitization procedures to ensure a healthy environment for workers. The Eagle Plains Hotel currently abides by all guidelines established by the Chief Medical Officer of Health for Yukon. Crew members will be provided with up-to-date information regarding the current state of the pandemic and the procedures in place to address it while they are at camp. A screening procedure conducted prior to a worker's arrival at the Eagle Plains Hotel or the Chance camp will include questions related to symptoms, travel, and known interaction with an infected person; crew members who fail the pre-screening will not be permitted to travel to site. Face masks will be worn during air travel to the site. As per the Yukon Government guidelines, only staff arriving from outside British Columbia (BC), Yukon, NWT, and Nunavut will be required to self-isolate prior to their travel to site.

Throughout the duration of the Project, daily screening, including temperature checks will occur and workers will be instructed to monitor and report any symptoms they may develop. If a crew member reports a COVID-19 symptom, they will be isolated until a COVID-19 test result can be confirmed. Confidential documentation of Project information including crew member names, arrivals and departure details, and worker origin will be maintained for use in contact tracing as needed.

2.4 Fuel Storage

A draft Spill Response Plan has been developed and is available in **Appendix B**. The plan will outline the procedures to be followed in the event of a petroleum product spill during all phases of the Project. It will also include safety procedures for personnel and proper equipment usage during or after a spill.

Fuel (gas or diesel) will be stored in portable tanks (i.e. slip tanks), and tanker trucks, and small volumes of propane stored in 2 or 3 1000 gallon tanks at each wellhead will be stored at A-25 and E-78 to heat the 400 bbl tanks while waste wellbore liquid is being stored (prior to injection into the wells). Fuel volumes will not exceed 8,000 L in aggregate. Fuel storage will only occur during road construction and well maintenance and will be removed upon completion of these activities. All fuel caches will be located a minimum of 60 m from the high-water mark of any nearby watercourse, and fuel will be transported in tidy tanks or by tanker truck, as required. A fuel spill contingency plan will be posted at all storage areas and fuelling stations.

The fluid additives including potassium chloride, fluid inhibitor, and cement will be stored in the Chance laydown yard located at km 325 of the Dempster Highway. These materials will be stored in a dry trailer in their original packaging. The cement will be transported to site in a bulk trailer and stored in the laydown yard.

2.5 Waste Management

All garbage and recyclable materials will be taken off site and disposed of at a licensed disposal facility.

Once all the well testing and isolation procedures are complete, the tubing will be pulled from wells J-19 and G-08 (only these two wells have tubing present, of the wells planned for abandonment). If the tubing is deemed still usable, it will be stored at Chance's camp; if not, it will be transported to an approved recycling or disposal facility in Yukon, Alberta, or BC. Cement waste and wastewater will also be collected and transported to an approved disposal facility.

Waste wellbore fluid from the modern wells (stabilized KCl solution) will be transported to wellsites A-25 or E-78 and stored in the insulated tanks until injected into one of the active deep-injection wells. Wellbore fluid extracted from the legacy wells (diesel or stabilized crude oil) will be burned in the well maintenance skid boiler, which is used to heat the well maintenance equipment. These disposal methods minimize the distance the waste wellbore fluid must be transported for disposal, in turn minimizing Project-related traffic on public highways and spill potential. Wellbore fluid is a dilute potassium chloride solution (saline).

2.6 Project Schedule and Temporal Scope of Activities

Construction of the winter roads and well maintenance is anticipated to occur during the winter of 2020/2021. Initial site visits are expected to occur in late November or early December of 2020 and will be timed to coincide with occurrence of the minimum snowpack to enable crews to pack the access routes

using snowmobiles. Winter road construction is anticipated to occur in late December to February. Well maintenance activities are expected to commence in February and take up to 70 days to complete work at all 8 wells, with completion slated for mid-April 2021.

3.0 SUMMARY OF CONSULTATION

The Proponent recognizes the importance of consulting affected First Nations governments prior to making decisions about the Project.

3.1 Potentially Affected Parties

The Project and all Project activities are located within the Traditional Territories of VG and FNNND, as well as the Tetlit Gwich'in Secondary Use Area of the Gwich'in Settlement Region. The Project is also located to the north of TH Traditional Territory.

Based on the location of the Project either within a First Nation's Traditional Territory or in proximity to a First Nation's Traditional Territory (with the potential for indirect effects), the Project team identified the following First Nations as potentially affected parties:

- Vuntut Gwitchin
- First Nation of Na-Cho Nyäk Dun
- Gwich'in Tribal Council (GTC)
  - Tetlit Gwich'in Council (TGC)
- Tr'ondëk Hwëch'in

Engagement activities were designed to inform potentially affected parties of the Project and provide those parties with a reasonable opportunity to engage with the Project team, learn more about the Project, and provide input or feedback. Chance's approach to engagement was guided by existing engagement and communications plans that Chance has with each of the potentially affected First Nations identified above.

3.2 Summary of Engagement Activities

The following sub-sections provide brief summaries of engagement activities with each potentially affected First Nation.

3.2.1 Initiation

Written communication was sent via email to FNNND, the GTC (including the TGC), and TH to initiate engagement. Initial communication packages for these First Nations included a high-level overview of the Project (e.g., Project activities, components, goals, outcomes), the regulatory submissions Chance would be making, a brief introduction to Hemmera and its role, as well as a request to discuss any concerns the affected party may have and an offer to arrange a conference call should they so desire. Also included was a 4-page Project summary and map of the Project location.

A distinct communication package was sent via email to initiate engagement activities with VG. This package was structured in accordance with protocols outlined in the *Vuntut Gwitchin Government Oil and Gas Engagement Policy* (VG 2018). As such, this package included an earlier draft of the Project Description dated May 22, 2020.

3.2.1 Vuntut Gwitchin

Initial notification was sent to VG's Director of Natural Resources on May 25, 2020. VG and Chance organized a conference call July 9, 2020 wherein VG requested a high-level overview of the Project. VG asked Chance questions to attain additional information for the First Nation to complete their review of the draft Project Description dated May 22, 2020. To assist Chance in preparing meeting materials for the July 9th meeting, VG provided an agenda and questions ahead of time. On July 10, 2020, VG provided Chance with formal information requirements related to the Project. VG requested the following additional information:

- Mitigation measures to avoid or minimize potential environmental effects (specifically with respect to Porcupine Caribou)
- Regulatory context
- Well tests (e.g., varying tests between the wells, how Chance would address evidence of gas migration, what would be done with removed fluid)
- Project components (e.g., which materials would be stored on site, which materials will be incinerated, vehicles planned to be used)
- Water withdrawal (e.g., sources, volume, schedule).

The additional information requested by VG was gathered, drafted, and refined during the effects assessment and development of the Project Proposal. However, feedback from VG impacted the development of mitigation measures and contributed to identifying additional information that was not provided in the earlier draft of the Project Description and the Project Proposal as a whole (e.g., additional information on the regulatory context and the rationale for maintaining the wells in suspended well status versus abandonment).

Chance responded to VG in the format requested on July 22, 2020. This document can be provided upon request. In addition, Chance shared a draft of the Project Proposal with VG on July 22, 2020. In the coming weeks, Chance will be initiating discussions with VG to meet benefit agreement requirements under section 68 of the *Yukon Oil and Gas Act*, RSY 2002, c.162 (YOGA).

3.2.2 First Nation of Na-cho Nyäk Dun

Initial notification was sent to FNNND on May 25, 2020. Additional communications followed on June 9, June 24, and July 20, 2020. Chance did not receive feedback from FNNND while the Project was being refined or when the Project Proposal was being drafted. A draft of the Project Proposal was shared with FNNND July 24, 2020.

Chance looks forward any feedback FNNND may provide in the future and to initiating discussions with FNNND to meet benefit agreement requirements under section 68 of YOGA.

3.2.3 Gwich'in Tribal Council

Chance initially notified the GTC and TGC on May 25, 2020. On June 12, 2020, the GTC provided input from its departments of Lands and Resources, Cultural Heritage, and Economic Development. The following themes were raised by the GTC:

- High environmental standards in the Peel River watershed and protection of scattered wetlands within the LMU 7
- Protection of wildlife and wildlife habitats
- Protection of the environment, water quality and quantity, and risks related to potential spills
- Protection of cultural heritage resources and values.

The GTC also requested that Chance share the Project Description and any other materials related to the Project that might be available. Chance sent a draft Project Description dated May 22, 2020 to both the GTC and TGC; however no other materials (e.g., effects assessments, summaries of mitigation measures, management plans) were available at that time.

The GTC's original feedback helped Chance select VCs, identify mitigation measures, and identify where additional detail was needed in the Project Description. Chance provided a response to the GTC on July 9, 2020. Chance and the GTC then organized a conference call for July 22, 2020, and parties were able to further discuss the Project. During this call, Chance provided an update to the GTC regarding changes that had been made to the Project design since the draft Project Description dated May 22, 2020 and GTC posed follow-up questions to Chance about potential Project-related impacts. A draft of the Project Proposal was subsequently shared with the GTC and TGC on July 24, 2020. The GTC also flagged potential services that Gwich'in businesses might be able to offer Chance and inquired as to what Project-related employment opportunities would be available. Chance indicated that it welcomes the opportunity for additional discussions with the GTC to identify and facilitate potential economic development and employment opportunities. Chance will balance these interests with requirements to source specific equipment and professions for the maintenance work as well as requirements under section 68 of YOGA (i.e., benefits agreements with Yukon First Nations).

3.2.4 Tr'ondëk Hwëch'in

Initial notification was sent to TH on May 25, 2020. A conference call was organized between Chance and TH for June 17, 2020. The purpose of that meeting was for Chance to provide an overview of the Project and an opportunity for TH to ask questions and provide feedback on the Project. During the conference call, TH requested to be identified as a potentially affected First Nation. While Project activities will not occur in TH Traditional Territory, TH will be indirectly affected by activities (e.g., increased traffic, impacts to wildlife in the region). TH also requested additional information on the following themes:

- Potential risks associated with the Project and identified mitigation measures
- The Project's Wildlife Management Plan and how Project activities would be affected if Porcupine Caribou are in the area (possibly the 40 Mile Caribou Herd and Hart River Caribou Herd).

TH also recommended that Chance research the availability of traffic data in the Project area and surrounding region. Knowledge of the available traffic data in the region would inform Chance on any additional baseline studies Chance may need to conduct for future Project proposals.

At the time of the initial call between Chance and TH, no other materials were available (e.g., effects assessments, summaries of mitigation measures, management plans); however, Chance shared the draft Project Proposal with TH when it was completed on July 24, 2020.

3.3 Ongoing Engagement Activities

Chance remains committed to engaging with potentially affected First Nations, welcomes opportunities to discuss the Project in more detail, and looks forward to their input and involvement throughout the Designated Office evaluation process.

4.0 ENVIRONMENTAL AND SOCIO-ECONOMIC EFFECTS ASSESSMENT METHODOLOGY

The assessment methodology outlined in this section provides a structured framework that is consistently applied to all VCs. Chance considered the Proponent's Guide to Project Proposal Submission to a Designated Office (YESAB 2010) when developing the methodology for the Project's effects assessment. This methodology includes definitions and descriptions of assessment terms such as VCs, which are defined as elements of the environmental and socio-economic systems valued for environmental, scientific, social, aesthetic, or cultural reasons.

The assessment methodology for VCs follows the main steps described below:

- Conduct assessment scoping (i.e., identify VC subcomponents and establish assessment boundaries).
- Establish baseline and existing conditions.
- Identify Project-related interactions and potential effects.
- Apply mitigation measures to address potential effects.
- Conduct effects characterization and significance determination.

4.1 Assessment Scope

The scope of the effects assessment focuses on the Project activities with the greatest potential to cause significant adverse effects on selected VCs. The VCs for this assessment were selected based on Project relevance and importance to First Nations, government agencies, and stakeholders, as well as previous assessment documents for related oil and gas and winter road projects in Yukon. The VCs selected for the Project are discussed further in **Section 5.0**.

4.2 Establishing Assessment Boundaries

Assessment boundaries have been identified to define the spatial and temporal extent of the assessment. The spatial assessment boundaries are based on the spatial characteristics of the Project and the VCs, and the areas where the Project–VC interactions and effects are expected to occur. Temporal boundaries encompass periods when the Project is expected to affect VCs and were determined based on the timing and duration of the Project. The spatial and temporal boundaries for the assessment of the Project are defined in **Table 4-1**.

Table 4-1 Spatial and Temporary Boundary Definition

Boundary	Definition
Spatial Boundaries	The spatial boundaries of the Project area are outlined in **Figure 2-1**.
Temporal Boundaries	The temporal boundaries for the Project's assessment cover the construction, operation, and maintenance of the winter roads and maintenance of the wells. To include permitting and construction timelines with some contingency, the temporal scope of this assessment is 2 years.

4.3 Establishing Baseline Conditions

The first step in performing an environmental and socio-economic effects assessment is to understand the existing environmental and socio-economic conditions present within the assessment area. A number of sources were consulted to help characterize the existing environmental and socio-economic conditions within the Project area including historic literature, recent technical reports, databases, monitoring programs, government information, and first-hand knowledge. A summary of existing conditions is provided as part of each VC assessment to establish the setting for the assessment of Project-related effects on each VC. The level of detail provided for the existing conditions is sufficient to enable potential Project–VC interactions to be identified and understood.

4.4 Identifying Project-Related Interactions and Potential Effects

A key step in performing the environmental and socio-economic effects assessment is to understand the Project-related activities and how they might interact with the selected VCs. The intensity of the interaction will result in the potential effect on the VC and will ultimately dictate the mitigation measures implemented to minimize the effect of that interaction. The intensity of the interaction can be defined as “none,” “negligible,” or “potential.” All Project components and activities that will not interact with a VC and will not result in potential effects are not considered further in the assessment. If a potential interaction is predicted, a potential effect is identified and carried forward in the assessment. Mitigation measures are developed when there is potential for the effect to be significant.

Consistent with direction provided in YESAA, each VC assessment section includes descriptions of mitigation measures relevant to the VC to eliminate, reduce, or control adverse Project-related effects, as well as mitigation measures contained in industry codes and standards. The effectiveness of mitigation measures in reducing the potential effect is considered in the characterization of effects.

4.5 Characterization of Effects and Determination of Significance

Effects are characterized for each VC and the potential Project-specific effects are predicted following the implementation of the mitigation. Effects are characterized based on their direction, magnitude, geographic extent, timing, frequency, duration, reversibility, and probability of occurrence. In addition, each VC assessment section provides a description of the relative context for the assessment in terms of the resiliency and sensitivity of the VC. General definitions for these characteristics are presented in **Table 4-2.**

Table 4-2 Residual Effects Characteristics

Residual Effect Characteristic	General Definition	General Rating
Direction	Identifies whether the residual effect will be adverse or positive	• Adverse • Positive
Magnitude	Size or severity of the residual effect relative to the existing condition of the VC, generally measured in terms of the proportion of the VC affected within the Project area, relative to the range of natural variation (or historic variation in the case of human environment VCs)	• Low • Moderate • High
Geographic Extent	Geographic area where the residual effect is likely to occur	• An area within the Project area
Timing	Occurrence of the residual effect with respect to a temporal attribute important to the VC (e.g., time of day, season, stage in life cycle, etc.)	• VC-specific
Frequency	How often the residual effect is likely to occur considering VC-specific temporal characteristics	• Infrequent • Frequent • Continuous
Duration	Length of time the residual effect to the VC is likely to persist, considering VC-specific temporal characteristics	• Short term • Long term • Permanent
Reversibility	Degree to which the residual effect can be reversed once the causal factors cease; irreversible effects are considered permanent	• Fully reversible • Partially reversible • Irreversible
Context	The extent to which the VC has been affected by past and present environmental and socio-economic processes and conditions, and its potential sensitivity to the Project-related residual effect, and its ability to recover from that effect	• Undisturbed • Disturbed • Resilient • Sensitive
Probability of occurrence	Likelihood that the residual effect will occur, considering the probability of a disturbance to actually be caused by the Project, or the likelihood that a specific mitigation will be successful	• Likely • Unlikely

The significance of effects on the VC will be assessed based on the effects characteristics, and the likelihood of each effect. The likelihood of the effect is in part determined by the scientific certainty relative to the quantification of the effect, the effectiveness of the proposed mitigation, and professional judgement based on prior experience in assessing effects and the known effectiveness of proven mitigation measures. The rationale for the determination of significance is provided for each VC.

5.0 VALUED COMPONENT SCOPING

This section identifies and presents information on the ecological, social, cultural, and economic VCs identified for the Project that form the basis of the assessment (**Section 6.0**). These components were selected based on the results of environmental and archaeological field studies, literature reviews, engagement and consultation with First Nations, and professional expertise. The VCs are described in **Section 5.1**, along with a rationale for their selection. The assessment in **Section 6.0** focuses on these VCs.

Potential VCs and VC subcomponents were selected based on the following criteria:

1. Their value as ecological, social, cultural, or economic factors
2. Spatial, temporal, and mechanistic ability to interact with the Project
3. The technical feasibility of conducting an assessment.

Ecological values included consideration of foundational environmental factors or processes, species of conservation concern (e.g., caribou), and more general information on species or processes that represent biodiversity. Social and cultural values were primarily based on current and historic human use such as hunting, recreation, and heritage values. Economic values relate to existing or future use of resources to derive monetary benefits. Often, potential VC subcomponents can include multiple value types. For example, furbearers have ecological, cultural, and economic values.

VCs and subcomponents were also screened based on their ability to interact with the Project, including the degree of spatial and temporal overlap with the Project and mechanism to be affected by the Project. For example, birds are sometimes included as a VC subcomponent for some project environmental assessments because of the numerous species that contribute to biodiversity and diverse habitat associated with the group. However, for this Project the potential to interact with biophysical VCs is low because most species have migrated south during the winter when the Project will be active and the Project has low potential to affect the few resident birds that are present in the Project area.

Finally, technical feasibility was considered for selection of VC subcomponents. These criteria relate to technical factors that could affect the effects assessment, such as the availability of baseline data or the level of understanding of how the Project could affect a VC subcomponent.

Potential VCs that were considered in the scoping exercise but were not carried through for assessment are described in **Section 5.2**. These issues were investigated for potential interactions with the Project and were determined to not require further assessment. **Section 5.2** provides a description of the issues, and a rationale for not including some candidate VCs as Project VCs. Mitigation measures and best practices are also identified for these issues where applicable.

5.1 Valued Components Selected

The VCs selected for assessment are wildlife and wildlife habitat, vegetation and wetlands, and heritage resources. The rationale for selecting these VCs and specific subcomponents for assessment within each VC are provided below.

5.1.1 Wildlife and Wildlife Habitat

Wildlife and wildlife habitat were selected as a VC because there is a potential for interaction between Project activities and wildlife and wildlife habitat, which are considered important ecological components for aesthetic and cultural reasons and are subsistence food sources. Sensitive species and habitats will be given special consideration within this VC assessment. The indicators used to describe and evaluate potential Project-related effects on wildlife and wildlife habitat include habitat, movement and distribution, and mortality or injury.

As a group, wildlife encompasses numerous taxa with diverse habitat requirements. Effects assessments for most resource development projects include a suite of species or species groups as subcomponents to represent the diversity encompassed within the wildlife VC. The suite of species and species groups that were considered during VC selection are outlined in **Table 5-1**. Based on the selection process, caribou (*Rangifer tarandus*) and moose (*Alces alces*) were selected as VC subcomponents for the Project's effects assessment.

Table 5-1 Summary of Selection Process for Wildlife Valued Components

Potential Subcomponent	Value (Ecological, Social, Economic)	Potential to Interact with Project (Spatial, Temporal, Mechanism)	Evaluation Outcome
Caribou	High. The Porcupine Caribou Herd is highly valued for subsistence hunting and is associated with both cultural and ecological values.	Moderate. The Project occurs within the Porcupine Caribou Herd's winter range, and Project activities will occur when caribou may be present; however, caribou do not use the Project area every year. If caribou do occur, the Project may affect local movements and habitat availability.	Selected as a VC subcomponent
Moose	Moderate. Moose are valued as a secondary species for subsistence hunting, after caribou.	Moderate. The Project occurs within annual moose range and Project activities could have a localized effect on moose distribution and habitat availability.	Selected as a VC subcomponent
Furbearers	Moderate. Marten and lynx have high cultural and moderate economic value for trapping, but the area has not been actively trapped for several years.	Low. The Project occurs within marten and lynx ranges, but these species tend to be tolerant or adaptive to low levels of industrial work, as required for this Project. The Project will not create new snowmobile access.	Not selected as a VC subcomponent, but mitigations are provided
Grizzly Bears	Moderate. Grizzly bears are often a species of conservation concern because they occur at low densities and can be sensitive to human disturbance.	Very Low. Grizzly bears will be denning while the Project is active and the chance of a den occurring near work areas is very low.	Not selected as a VC subcomponent, but mitigations are provided
Wolves	Moderate. Wolves play an important role in large mammal predator-prey relationship in northern ecosystems; however, they generally have low social and economic value.	Low. Wolves occur within the Project area but tend to relatively tolerant or adaptive to low levels of industrial work, such as required for this Project.	Not selected as a VC subcomponent; no specific mitigations
Birds	Moderate. Birds are often included as a VC subcomponent in effects assessments because numerous bird species contribute to biodiversity and have diverse habitat associations.	Very Low. The Project has very low potential because the majority of birds in the area are migratory and will be on their wintering grounds, the timing of work is outside the breeding season when birds may be sensitive to disturbance, and effects to bird habitat will be very limited.	Not selected as a VC subcomponent; no specific mitigations

5.1.2 Vegetation and Wetlands

Vegetation and wetlands were selected as a VC because there is a potential for interactions with Project activities, and because of their role supporting biodiversity and wildlife habitat. Further, vegetation and wetlands are valued by First Nations and local residents who may use certain species as a subsistence and economic resource. Project activities may disturb, change, or remove vegetated areas, habitat containing traditional and medicinal plants, and ecological communities that may host rare plants or wetlands.

5.1.3 Heritage Resources

Heritage resources were selected as a VC since the potential for interactions with Project activities and the value of heritage sites and historic resources rests within their context in the landscape where they are located. Once disturbed or removed, that value cannot be restored. Heritage resources refers to archaeological, historical, and paleontological resources collectively (i.e., all are considered types of heritage resources). In Yukon, the *Historic Resources Act* (RSY 2002, c.109) and Archaeological Sites Regulation contain legislation that mandates the management and protection of Yukon archaeological, historical, and paleontological resources. This legislation applies to heritage resources on both private and public land that are older than 45 years. Archaeological, historical, and paleontological resources are protected from unpermitted surveys, disturbances, alterations, or excavations.

5.2 Other Considerations

Other candidate VCs considered for this Project Proposal but not included in the effects assessment include fish and fish habitat, groundwater and groundwater quality, permafrost, air quality, fish and wildlife harvesting, community safety and well-being of Indigenous peoples; tourism and aesthetics; economic activity; land use and recreation; traditional land use; health and safety; and site access and traffic.

5.2.1 Fish and Fish Habitat

While fish and fish habitat are recognized as important values in the Eagle Plains area, they are not included as VCs for this Project due to the negligible potential for interaction with the Project. No direct effects to fish and fish habitat are expected to occur because access roads do not cross any streams and all well sites and access roads are greater than 200 m from mapped water courses or waterbodies. Indirect effects such as sedimentation or water quality are deemed to be negligible because winter roads have minimal effect on natural drainage patterns and do not expose soil for sediment transfer (i.e., there will be no ditching along the winter roads and the duff layer and ground vegetation will be protected).

5.2.2 Groundwater and Groundwater Quality

Groundwater and groundwater quality was considered as a potential VC for the assessment based on the use of wells NCY McParlon A-25 and East Chance E78 for deep well injection. Given the nature of deep well injection and the maintenance activities, there is no anticipated interaction between proposed activities and groundwater in the Eagle Plains area.

The characteristics of the A-25 and E-78 wells and the nature of deep well injection address potential interactions and effects in relation to deep well injection and groundwater. The geological formations proposed for injection are hundreds of metres below the surface. The depth of the proposed zones for injection at A-25 are either or both of Permian aged Jungle Creek sandstone formation which is situated

between approximately 1,063 and 1,102 metres and the Orange Marker which is situated between approximately 768 and 780 metres subsurface. The depth of the proposed zone for injection at E-78 is the Cretaceous aged Fishing Branch sandstone which is situated between approximately 483 and 510 metres subsurface.

Above each of the zones planned for injection are thick (i.e., hundred of metres) of shales that are exceptionally low permeability rocks which means that they serve as very effective barriers to fluid flow. In addition, permafrost is a barrier preventing vertical migration of fluids and has been measured to a depth of about 220 metres subsurface at the J-19 location.

Finally, the entire casing of both wellbores, meaning the annular space between the outside of the steel pipe (i.e., casing) and the country rock surrounding the well bore, has been cemented to prevent and flow to surface outside the casing. The collective effect of these design criteria of the well bores themselves and the geological setting surrounding the geological formations planned for injection prevents migration of injected fluid outside of the injection interval. As such, it is highly unlikely that injected fluid will migrate and interact with groundwater in the Eagle Plains area.

5.2.3 Permafrost

Permafrost was considered as a potential VC for the assessment; however, the timing of Project activities (in the winter) and the relatively short duration of the Project greatly limit any potential effects on permafrost in the area. Additionally, the methods proposed for winter road construction are designed to reduce ground disturbance by mulching large vegetation (trees) rather than pushing it over with a bulldozer, which could potentially pull up root systems and expose underlying sediments. Winter road construction will leave the surface organic mat (moss and peat) intact and uncompressed, thereby minimizing effects on permafrost.

Winter roads actually promote penetration of wintertime cold into the ground due to higher thermal conductivity of ice than adjacent snow, and this response will help counteract any minor reduction in cold penetration below road-edge berms. Excess accumulation or snow piling will not occur to avoid potential effects on local ground temperatures. In addition, since well maintenance activities are not anticipated to adversely affect permafrost, this candidate VC was not considered further in the Project's effects assessment.

5.2.4 Air Quality

Air quality was considered as a potential VC for the assessment; however, given the remoteness of the Project site and the relatively short duration of the Project, the air quality within the Project area will not deteriorate with the re-establishment of the winter roads or well maintenance activities. The Project will involve burning fossil fuels to operate the equipment used for the winter roads and maintenance activities, although emissions from equipment will be relatively low and localized to the areas of active construction and at each well. Additionally, the construction phase of the Project is only projected to last 1 winter, at which point air quality will return to baseline conditions and will not have a lasting effect on local air quality. For these reasons, air quality was not considered further in this effects assessment.

5.2.5 Fish and Wildlife Harvesting

Fish and wildlife harvesting were considered as a potential VC given the importance of this activity for both traditional and subsistence purposes. In this context, harvesting includes hunting, fishing, and berry picking.

Harvesting is important for First Nations to maintain their connections to their Traditional Territories and helps to preserve and enhance their culture, identity, and values. Since Project activities will be located primarily in previously established well sites and where roads have historically been constructed, effects to opportunities to practice harvesting caused by the Project are anticipated be minimal. If Project activities overlap spatially and temporally with Porcupine Caribou Herd migration, there could be potential interactions between Project activities and caribou hunters, specifically related to human health and safety. Any future adverse effects caused by these interactions will be mitigated by implementation of measures described in **Section 6.1**. Therefore, fish and wildlife harvesting were not considered further as a VC in this assessment.

5.2.6 Community Safety and Well-being of Indigenous People

Community safety and well-being of Indigenous peoples were considered as a potential VC in response to the Calls for Justice for Extractive and Development Industries from the National Inquiry into Missing and Murdered Indigenous Women and Girls (2019b). Resource extraction and development projects can exacerbate issues of violence against Indigenous women and girls (MMIWG 2019a).This potential VC was not carried forward in the assessment due to the Project's approach to staffing the site. Staff will not be spending time in nearby communities or along public roadways during their transit to site and instead will arrive onsite via a fixed wing aircraft directly to either the Chance airstrip or the Wiley airstrip.

5.2.7 Tourism and Aesthetics

Tourism and aesthetics were considered as a potential VC due to the Klondike and Dempster Highway's use as a popular tourism route in the territory. Two of the wells are located immediately adjacent to the highway and already have access routes with rig matting in place. These wells will be visible to the public; however, tourism and aesthetics were not carried forward in the assessment because the Project activities likely to affect tourism and aesthetics will be limited to the construction period during winter of 2020 and 2021, during the tourism off season. Project activities will also be localized to the areas of active construction and will return to baseline conditions following the end of the construction period.

5.2.8 Economic Activity

Economic activity in the area surrounding the Project site was considered as a potential VC because it has been identified as an area of interest for the affected First Nations. The Project will have limited interaction with local businesses aside from necessary stops (i.e., fuel stations) by resource delivery drivers during construction and is therefore not considered further in this assessment.

5.2.9 Land Use and Recreation

Land use and recreation were considered as a potential VC given the high volume of traffic along the Dempster Highway and use of the area for land use activities and recreational purposes. The Project is not likely to overlap with land use and recreation activities potentially occurring in the area, however. Effects will be localized to the areas where roads had previously been built and to previously established well sites and camp facilities. Furthermore, the proposed activities are anticipated to be completed during the course of 1 winter (December 2020 to March 2021). As a result, Project activities are not expected to have lasting interactions with land use and recreation beyond the Project's construction schedule and is therefore not considered further in this assessment.

5.2.10 Traditional Land Use

Traditional land use was considered as a potential VC for the Project. Give the location of the Project, Project activities are not expected to have lasting interaction with traditional land use beyond the Project's construction schedule; therefore, this candidate VC was not considered further in this assessment. In addition, the Project is not likely to overlap with land use and recreation activities potentially occurring in the area. Effects will be localized to the areas where winter roads had previously been built and to previously established well sites and camp facilities, and the proposed activities will be completed during 1 winter (December 2020 to March 2021).

5.2.11 Site Access and Traffic

Site access and traffic were considered a potential VC for the assessment given the high volume of traffic along the Klondike and Dempster Highway and a potential increased level of access among travellers to the surrounding lands and site area via the winter access road that will be constructed for the Project. Due to the implementation of security measures (including a gated entrance) at the commencement of re-establishing the winter access roads, this candidate VC was not considered further in the assessment.

6.0 ENVIRONMENTAL AND SOCIO-ECONOMIC EFFECTS ASSESSMENT

6.1 Wildlife and Wildlife Habitat

This section presents the results of the effects assessment on wildlife and wildlife habitat, specifically, caribou and moose. Existing conditions are provided in the sub-section that follow, along with a discussion of potential Project-wildlife interactions and effects, as well as mitigation measures, effects characterization, and significance determinations for caribou and moose.

6.1.1 Existing Conditions

6.1.1.1 Caribou

The Project occurs exclusively within the range of the Porcupine Caribou Herd. In addition, during transport of equipment to and from the Project, likely from Alberta or northeastern BC, truck drivers will travel through the migration routes of several additional caribou herds, including the Forty Mile Herd and the Hart Herd along the Dempster Highway. However, the incremental amount of additional Project-related traffic will be small compared to regular highway traffic; as such, the effects of travel to and from the Project are not included in this assessment. Project equipment comprises approximately 2 dozen trucks travelling to and from the Project area over a 3 to 5 day period.

The Porcupine Caribou Herd is a subpopulation of barren-ground caribou, which is known for large aggregations of individuals, dramatic population fluctuations, lengthy migrations, and significant cultural and social value to northern Indigenous peoples and other Canadians (COSEWIC 2016). Barren-ground caribou have been assessed as Threatened by the Committee on the Status of Endangered Wildlife in Canada (COSEWIC 2016). Within Yukon barren-ground caribou are considered Vulnerable/Apparently Secure (Yukon Government 2020). Although many barren-ground caribou are declining, the Porcupine Caribou Herd has been increasing at a rate of approximately 4% from 123,000 animals in 2001 to 218,000 in 2017 (Yukon Government 2018).

The Porcupine Caribou Herd's annual range extends approximately 250,000 square kilometres (km^2) from Alaska, through Yukon, and into the western edge of NWT. The herd undertakes long-distance migrations across seasonal ranges necessary for key aspects of their life cycle. Seven primary life cycle periods occur for the Porcupine Caribou Herd, which are summarized in **Table 6-1** (PCTC 1993). The timing of this Project (December to mid-April) coincides with the early, mid, and late winter season and the spring, spring migration, and pre-calving season of the Porcupine Caribou Herd.

Winter is considered the season of lowest importance to the herd (PCTC 1993). The herd is at its most dispersed stage during winter, both in terms of the extent of the range it uses and in terms of group aggregations. Average daily movement distances (2 km per day [km/day] to 5 km/day) (Russell and Gunn 2017) are lower than other seasons, except for cows during calving.

Winter range use varies from year to year depending on snow depth and condition. In Yukon during deep snow years, use is concentrated in the Richardson Mountains and the Ogilvie-Hart basins. In low snow years, the Whitestone River and Eagle Plains areas, which contain abundant lichen resources, are used more. Forage for primarily lichens is generally not limiting during the winter, and in shallow to normal snow years, the caribou appear to maintain neutral to surplus energy balances. The Porcupine Caribou Herd are relatively tolerant to human activity during the winter (PCTC 1993).

During the spring, spring migration, and pre-calving season, caribou begin moving north toward the calving grounds. Average daily movement rates increase from approximately 6 km/day at the start of the season to approximately 24 km/day through May. Caribou, especially pregnant cows, typically enter an energy deficit during spring due to reduced forage availability as they leave the lichen-rich taiga and before forbs have emerged; in addition, higher energy expenditure is associated with migration. Spring is rated as higher in importance than winter, but still relatively low overall, due to lack of association with specific habitats, relatively low threats from predators, and lack of insect harassment (PCTC 1993).

No key wildlife areas occur for caribou within the Project area (Environment Yukon 2016a).

Table 6-1 Key Life Cycle Periods for the Porcupine Caribou Herd

Season	Dates	Characteristics	Importance
Early, mid, and late winter	Dec. 1 – Mar. 31	The herd is at its most dispersed at this time across 2 winter ranges: in Yukon, mostly south of the Porcupine River in boreal taiga and in Alaska, centred in the Chandalar River/Arctic Village area. Winter range use varies from year to year depending on snow depth and condition. Caribou at this time of year are relatively tolerant to human activity. In shallow to normal snow years, animals can gain weight.	4 (Lowest)
Spring, spring migration, and pre-calving	Apr. 1 – May 31	Herd distribution varies depending on snow melt; migration routes vary from year to year. Pregnant females are typically in energy deficit due to reduced forage once they leave the lichen-rich taiga.	3
Calving (cows)	June 1 – 10	Calving occurs on the coastal plain of NE Alaska and, to a lesser degree, NW Yukon. This area offers reduced predators and abundant spring forage; no alternative range is available. Cows are at the lowest point of physical condition and are least tolerant to human disturbance.	1 (Highest)
Post-calving and movement (cows)	June 11 – 30	As calves develop over the first 2 weeks of life, the cows and calves tend to aggregate into larger groups and increase movement rates to track plant green-up. The post-calving period imposes high energetic demands on lactating females, and cow/calf groups are relatively intolerant of disturbance. The post-calving range is primarily in Alaska and cows that calved in Yukon tend to move west along the foothills into Arctic National Wildlife Refuge. Insect avoidance can affect distribution by the end of June.	1 (Highest)
Calving to movement (bulls)	June 1 – 30	Bulls, non-pregnant cows, and subadults tend to concentrate east of the calving grounds in northern Yukon. Animals track the progression of green-up from the coastal plains to the northern foothills and into intermountain regions.	3
Early summer	July 1–15	Cows continue to require high-energy intake for milk production, but insect avoidance also drives distribution. Key areas selected for insect avoidance are the coastal plain adjacent to the Beaufort Sea (mostly cows/calves) and mountains in the Brooks and British Mountains (mostly bulls and cows without calves). Long-distance movements during this period are also an insect avoidance behaviour.	2
Mid-summer	July 16 – Aug. 7	Mid-summer continues to be a period of high insect harassment. Two areas are consistently used – the northern Richardson Mountains in Yukon and the southern portion of the Brooks Range in Alaska. Females with cows may be in energy deficit.	2
Late summer and fall migration	Aug. 8 – Oct. 7	As insect activity declines, the herd disperses widely but mostly stays north of the tree line until the latter part of the period – in Alaska south of the Brooks Range and in Yukon north of the Porcupine River. Animals exhibit high feeding rates and gain fat for the winter.	3
Rut and late fall	Oct 8 – Nov 30	The region where rut occurs has no affinity from year to year; rut occurs wherever the herd happens to be along fall migration. In Yukon distribution can occur from the southern Olgilvie Mountains to the Richardson Mountains.	4 (Lowest)

Source: PCPC 1993

6.1.1.2 Moose

Moose occur throughout the Project area and are present in all seasons; however, population levels are poorly known. The Regional Biologist with Environment Yukon has suggested that the density of moose in Eagle Plains is low compared to populations in central and southern Yukon, but relatively high compared to other areas in northern Yukon, and may be rising (M. Suitor, pers. comm.). Extensive wildfires within the Eagle Plains area over the last 30 years are currently in shrub-dominated successional stages that offer productive summer and winter forage for moose, which are expected to support higher numbers of moose than later successional black spruce forests. In November 2000, an aerial moose survey was conducted for a study area that mostly overlapped with the Project area for this Project (Access and EBA 2001). That survey observed 30 moose and estimated a total population of 60 to 90 based on additional tracks seen and a low sight ability factor.

Winter is normally a limiting season for moose when reduced forage, higher energy expenditures due to snow and cold, and higher vulnerability to predation all contribute to limit moose fitness. During winter, moose are primarily associated with shrub-dominated habitats for forage, which include regenerating burns, riparian areas, shrub-carrs, wetlands, stream valleys, and upland deciduous and mixed forest (Suring and Sterne 1998, Environment Yukon 2016b, McCulley et al. 2017). In other regions in Yukon, moose typically use higher-elevation areas in early winter and move to lower elevations in late winter to avoid deep snow and utilize habitats such as riparian areas with shrubs for forage (Environment Yukon 2016b). It is unverified whether migration this occurs in the Project area, but winter snow depths often exceed 50 cm in the Eagle Plains area (Russell and Gunn 2017), which is the threshold at which moose tend to exhibit winter movements to seek lower snow packs (Poole and Stuart-Smith 2005).

No Wildlife Key Areas for moose occur within the Project area (Environment Yukon 2016a)

6.1.2 Project Interactions and Potential Effects

Potential effects to VC subcomponents were evaluated based on the degree of spatial and temporal overlap between Project activities and the VC subcomponents and the type of interactions the Project could have on the VC subcomponents. Types of interaction include both direct effects, such as displacing animals due to sensory disturbances, and indirect effects, such as increasing mortality risk from hunters or natural predators. Project activities and interactions could result in effects to wildlife and wildlife habitat during 3 primary Project stages (**Table 6-2**).

Table 6-2 Potential Interactions between Project Activities and Wildlife and Wildlife Habitat

Activity	Project Interactions	Potential Effects
Winter road construction	• Vegetation removal • Use of heavy equipment • Human presence	• Sensory disturbance • Localized effects to movement and distribution • Direct and indirect habitat effects
Road travel (along the Dempster Highway and winter roads)	• Vehicle travel	• Sensory disturbance • Localized effects to movement and distribution • Indirect habitat effects • Direct and indirect mortality

Activity	Project Interactions	Potential Effects
Well site maintenance	• Vegetation removal • Use of heavy equipment • Human presence	• Sensory disturbance • Localized effects to movement and distribution • Mortality or injury

6.1.2.1 Project Interactions with Caribou

A detailed assessment of potential effects of oil and gas activities in Eagle Plains on caribou was conducted by Russell and Gunn (2017). This assessment draws from their work and has been adapted to align with the limited scope of this Well Maintenance Program.

There is increasing evidence that ungulates, including caribou, tend to respond to human presence and activities in similar manners to how they respond to predators (Frid and Dill 2002). The most common response of caribou is to avoid human activity areas or exhibit greater vigilance behaviours. Reported response distances of caribou vary widely but are mostly in the magnitude of several hundred metres (e.g., 600 m) (Murphy and Curatolo 1987). Caribou may also change their distribution relative to disturbance. In most studies, avoidance of roads is less than 4 km (Vistnes and Nellemann 2001, Cameron et al. 2005), but avoidance of the Dempster Highway varied from 18 km to 30 km over a 20-year period depending on land use and hunting regulations (Johnson and Russell 2014). Caribou responses to human disturbances vary widely, and causal relationships are often poorly understood.

Caribou patterns of avoidance to human disturbances are often affected by the nature of the human activity, specifically, whether caribou are directly hunted or harassed by humans, and time since disturbance began. Reduced behavioural response and apparent avoidance in distribution patterns (i.e., habituation) appear to be associated with lack of hunting and predation (Lawhead et al. 2006, Haskell and Ballard 2008), which highlights the importance of factoring hunting management into mitigations. However, effects on distribution can occur outside of hunted areas and several years after the disturbance began (Johnson et al. 2019).

Russell and Gunn (2017) frame their assessment in terms of sensitivity of the Porcupine Caribou Herd to potential effects and degree of exposure to effects. Sensitivity relates to factors such as herd size and trends, seasonal body condition, ecological life history activities, and environmental stressors such as insects. Caribou are generally more sensitive to effects when populations are low and declining, when their body condition is low, or when they are exposed to other stresses (e.g., insect harassment), and during critical life history periods, notably calving. In the context of the current condition of herd and the timing when Project interactions could occur, the sensitivity of the herd is considered low for the following reasons:

- The herd is at a historically high population level and showing an increasing trend.
- During winter when the Project would occur, Porcupine Caribou are typically in good body condition and free of stressors such as insects.
- The winter period is not associated with a critical life history stage.

Exposure relates to the degree of spatial and temporal overlap between caribou and potential human effects, as well as the mechanisms of effects (e.g., type, magnitude, and duration of effects). The most likely Project-related effects on caribou distribution will be localized and temporary, resulting in potential indirect habitat effects. The only potential source of direct mortality from the Project would be vehicle

collisions, and those can be effectively mitigated. Linear features can indirectly affect the caribou mortality rate caused by natural predators and hunters due to increasing ease of travel. Chance will minimize creating new linear features by re-establishing existing sections of the Chance and Blackie winter roads with short spur roads to access well sites where needed. In total, Chance will re-establish approximately 25 km of the Chance winter road with 2 new spur roads totaling 2.85 km, and approximately 5.95 km of the Blackie winter road with a 1.12 km spur road. The Project goal is to pose a neutral effect on hunting to help balance mitigating effects to caribou while maintaining Indigenous hunting opportunities. Although hunting will not be available along the Blackie and Chance winter roads, the Project will not inhibit Indigenous hunting opportunities in the broader area, which may be accessed from the Dempster Highway.

Russell and Gunn (2017) assessed the potential spatial and temporal overlap between the Porcupine Caribou Herd and a similar project, but with a slightly larger extent as this Project, using 30 years of telemetry data. Their primary analysis area was a 30 km buffer around the Project, based on the maximum distance that caribou avoided the Dempster Highway in another study (Johnson and Russell 2014). Russell and Gunn (2017) found that a collared caribou occurred in the 30 km buffer area during the months of January to April in 15% to 22% of the years. The average percentage of the herd using the 30 km buffer area ranged from 3% in January to approximately 1% in the period from February to April. Average residency times varied from 9 to 17 days per month during the January to April period. In other words, on average, 98% of the herd's movements during the winter occur outside the 30 km buffer surrounding the Project and, for any animal that does occur in the area, they typically spend a third to half of a month there before moving out of the area.

6.1.2.2 Project Interactions with Moose

Moose can be affected by human land use activities, although moose are generally less sensitive than caribou. As outlined below, Project activities could result in 4 types of effects to moose.

1. **Sensory disturbance:** Human presence, work activities, vehicle travel, and equipment operation will generate noise and other sensory effects that may elicit a response in moose. The most likely response to sensory disturbance is to avoid areas where disturbances are occurring, which could result in localized effects to moose movement and distribution as well as indirect habitat effects (Lykkja et al. 2009) (see 2 and 3, below, respectively). When moose are unable to move away from sensory disturbances, they may exhibit physiological stress responses and behavioural modifications (e.g., increased vigilance). However, these responses are not anticipated to occur for this Project because moose can move away from the work areas to avoid them.
2. **Localized effects to movement and distribution:** Numerous studies have examined responses of moose to human activities, including industrial activity, use of roads, and activities associated with rural residences (Andersen et al. 1996, Burson et al. 2000, Yost and Wright 2001, Lykkja et al. 2009). Most studies found avoidance of human activity areas out to approximately 300 m (EDI 2017). However, also in other cases moose appear to choose to be nearer to human activity to avoid natural predators (Muhly et al. 2011). Similar to caribou, responses are greatest when moose are directly harassed or hunted.
3. **Indirect habitat effects:** A consequence of localized avoidance of human activity areas is that habitat within the zone of influence is temporarily not used by animals. As per the effects on movement and distribution, the zone of influence for indirect habitat effects is approximately 300 m.
4. **Direct and indirect mortality:** The Project has the potential to directly affect moose mortality via vehicle collisions (EDI 2015). In addition, the Project could have an indirect effect on mortality by

improving access along the winter roads for human hunters and natural predators; however the mitigation measures presented in the sub-sections below are expected to effectively eliminate the risk of vehicle collisions.

6.1.3 Mitigation Measures

This section presents the mitigation measures developed to reduce and minimize Project-related adverse effects on wildlife and wildlife habitat.

6.1.3.1 General Mitigation Measures for Wildlife and Wildlife Habitat

The following general mitigation measures are proposed for wildlife and wildlife habitat:

- All Project personnel will be required to complete formal orientation and training related to wildlife mitigation measures.
- Work will be scheduled to minimize the spatial extent of concurrent Project activities.
- Access to the well sites will be provided by utilizing existing and historic winter roads, with short spur roads to access well sites in order to minimize the creation of new linear features.
- Project footprints, notably the widths of winter roads, will be minimized as much as possible. On the Chance Road, the width will not exceed the extent of the existing right-of way.
- Project personnel will be prohibited from carrying or using firearms on site. No hunting or shooting rules will be in effect.
- A policy of no harassment of wildlife will apply to all personnel including attempts to chase, catch, divert, follow, photograph, feed, or otherwise harass wildlife, whether on foot or from on-road or off-road vehicles, heavy equipment, or aircraft.
- The use of on-road and off-road vehicles, including snowmobiles, will be restricted to essential Project access routes.
- Personal use of unmanned aerial vehicles (UAVs) will be prohibited.

6.1.3.2 Road Operations

The following measures are designed to mitigate the risk of vehicle collisions and effects of road use on wildlife movements:

- Do not exceed the maximum speed limit along the Dempster Highway of 90 kilometres per hour (km/h).
- Do not exceed the maximum speed along winter roads of 30 km/h.
- Wildlife will always have the right-of-way. Stop when wildlife are observed on or beside the road and allow the wildlife to cross safely. If wildlife stays on the road or right-of-way for more than 5 minutes, resume travel and pass the animals at 10 km/h or less.
- When moose and caribou are on a road, they will sometimes run down the road away from a vehicle. If this happens, stop and wait at least 5 minutes to allow the animal to move off the road. If the animal remains on the road, drive forward at 10 km/h, then stop again when the animal begins to run away. Wait 2 minutes and repeat this procedure. If the animal still does not leave the road, wait 10 minutes and repeat the procedure, alternating with a 2- and 10-minute stop between driving attempts.

- Use two-way radio communication and communicate the location of any wildlife observed along Project roads to other road users on the radio.
- Do not exit the vehicle to chase, catch, divert, follow, photograph, or otherwise harass wildlife.
- Along winter roads, maintain snowbanks at heights of less than 1 m to reduce the hinderance to wildlife crossing them.
- Where snowbanks exceed 60 cm in height, create regular breaks (at least every 500 m) to facilitate easier animal crossing and create escape routes off the road.
- Create matched breaks on either side of the road that animals can use to cross.
- On corners, create run-outs in each direction that are obvious alternative routes for animals to use, instead of following the road.
- Avoid breaks at seismic lines, which could provide human access.

Special rules will apply to caribou within 100 m from the road:

- Stop as far back as possible.
- Alert other drivers.
- Wait until caribou have crossed and moved beyond 500 m from the road or are lost from sight before proceeding.
- Proceed with caution.

For caribou beyond 100 m from the road the following rules will apply:

- Proceed with caution.
- Alert other drivers.
- Watch for direction of movement and change in behaviour.

6.1.3.3 Aircraft Operations

The following measures are designed to mitigate the effects of aircraft use on wildlife:

- Maintain altitudes of greater than 300 m above ground level at all times of the year.
- Maintain altitudes of greater than 600 m above ground level during sensitive times of the year.
- Avoid areas where caribou have been observed in the past.
- Design flight paths to avoid important areas during sensitive times of the year.
- Do not fly toward, circle, or otherwise harass observed caribou.
- If caribou be in a panic or startled the plane will ascend to a higher elevation.

6.1.3.4 Caribou

The majority of potential effects to caribou will be mitigated via measure for general wildlife, road operations and aircraft operations. Additional measures specific to caribou:

- Do not pack snow on any linear features that are not essential to Project work.
- Minimize access to linear features off the winter roads by avoiding creation of breaks in snow berms at junctions with linear features.

- Report all sightings of caribou to the Environmental Monitor.
- If more than a dozen caribou are observed, or if any number of caribou are observed in the same location for longer than a 3-day period, consult a Qualified Environmental Professional (QEP) to determine if site-specific mitigations may be warranted.

Due to the variable nature of caribou occurrence and snow conditions from year to year, Chance will conduct a pre-operations assessment in December, prior to Project initiation, to assess local conditions and gain information about caribou occurrence and snow conditions, which could warrant tailored management measures. For example, if telemetry data indicate that several collared caribou have used in the Project area or are situated near work areas, additional measures may be implemented to mitigate potential effects.

6.1.4 Effects Characterization and Significance

6.1.4.1 Caribou

After application of mitigation measures listed in **Section 6.1.3**, Project activities are not predicted to result in significant effects to habitat, movement and distribution, and mortality or injury to caribou. Detailed effects assessments are provided for each indicator in **Table 6-3**, **Table 6-4**, and **Table 6-5**, respectively. The following key factors have been used to produce this significance determination:

- Although the timing of the Project does overlap with the potential occurrence of the Porcupine Caribou Herd in the area, the extent of the Project area, including a zone of influence, comprises a small proportion of the herd's total winter range. If caribou choose to avoid the work areas (i.e., due to sensory disturbance), alternative habitat will be readily available.
- The timing of the Project, during winter, is a season of lowest importance for the ecology of the Porcupine Caribou Herd and represents a period when the caribou are relatively tolerant of human disturbance (PCTC 1993).
- The most likely potential effect to caribou is temporary, localized avoidance of work areas due to sensory disturbance.
- Chance will minimize creating new linear features by re-establishing existing sections of the Chance and Blackie winter roads with short spur roads to access well sites where needed; thus, a change in access is not anticipated for human hunters and natural predators.

Table 6-3 Characterization of Potential Effects to Caribou Habitat

Potential Project Interaction with Caribou Habitat The Project will consist of work at 8 well sites plus access via approximately 34.92 km of winter roads. Project activities will result in direct habitat effects due to vegetation clearing along the access routes and well sites. The Project may also result in indirect habitat effects if caribou choose to avoid areas near the roads and well sites due to sensory disturbance or perceived predation risk.		
Residual Effect Characteristic	General Definition of Residual Effect Characteristic	Project Effect Characteristic Rating
Direction	Effects to habitat will be adverse.	Adverse
Magnitude	The magnitude of effects is low due to the small extent and narrow width of affected areas.	Low
Geographic Extent	Direct habitat will be limited to the footprint of the winter roads and well sites (approximately 60 ha). Indirect effects can extend out to 4,000 m, depending on site conditions and variation in caribou behaviour. These extents are considered small relative to the herd's total winter range.	Low
Timing	The timing of the Project, during winter, is a season of lowest importance for the ecology of the Porcupine Caribou Herd and a period when the caribou are relatively tolerant of human disturbance.	Low
Frequency	Direct effects will be continuous, though diminishing, in magnitude as vegetation regenerates. Indirect effects will be continuous during active Project work.	Continuous
Duration	Road and well site footprints will take years to regenerate, resulting in long-term direct effects. Indirect effects will be short term and will cease once work activities are completed.	Short term Long term
Reversibility	The effects to habitat are fully reversible. Indirect effects will cease immediately after work activities cease. Direct effects along the winter roads will take several years for vegetation to regrow.	Fully reversible
Context	Work for this Project will occur on previously disturbed sites. Measures to protect the duff layer and ground vegetation will maximize the resiliency of the site to regenerate to similar habitat.	Existing Disturbed/ Resilient
Probability of occurrence	Based on historic telemetry data caribou will likely encounter areas affected by this Project at some point in the future. The likelihood that caribou will be present during the year the Project is active is moderate (over 24, years collared caribou occurred within 4 km of the Project area in 17% of the years).	Likely

Table 6-4 Characterization of Potential Effects to Caribou Movement and Distribution

Potential Project Interaction with Caribou Movement and Distribution The Project will consist of work at 8 well sites and provide access via approximately 34.92 km of winter roads. This work will result in sensory disturbance that could cause caribou to avoid the areas. Responses to sensory disturbance will be mostly less than or equal to (≤) 4 km but will vary in relation to site conditions and caribou behaviour. Effects are most likely to be expressed as temporary, localized avoidance of work areas. No effects to migration are expected because the extent of the Project area is small relative to the extent of winter range available for caribou to travel through.		
Residual Effect Characteristic	**General Definition**	**Rating**
Direction	Effects to movement and distribution could be adverse.	Adverse
Magnitude	The magnitude of effects is predicted to be low due to the limited consequence if caribou choose to avoid work areas. Alternative habitat is available, and avoidance of the area would not hinder migration or sub-regional movements within the winter range.	Low
Geographic Extent	Responses to sensory disturbance are mostly ≤4 km but vary in relation to site conditions and caribou behaviour. These extents are small relative to the herd's total winter range.	Low
Timing	The timing of the Project during winter is a season of lowest importance for the ecology of the Porcupine Caribou Herd and a period when the caribou are relatively tolerant of human disturbance.	Low
Frequency	Potential effects to movement will occur daily and will correspond to periods when Project activities are active.	Frequent
Duration	Project work will occur daily for approximately 12 hours over an 8- to 12-week work period from mid-January to mid-April.	Short term
Reversibility	The potential effects to movement are fully reversible and will cease immediately upon cessation of work activities.	Fully reversible
Context	Oil and gas exploration activities have occurred intermittently in the Eagle Plains area over the last 50 years. Responses of caribou have not been studied in detail, but use of the area by caribou has continued, demonstrating general resiliency to exploration activities.	Existing Disturbed/ Resilient
Probability of occurrence	Based on historic telemetry data it is possible, but uncertain, that caribou will occur in the Project area when Project work is actively underway. Over 25 years, collared caribou occurred within 4 km of the Project area in 17% of the years.	Possible

Table 6-5 Characterization of Potential Effects to Caribou Mortality and Injury

Potential Project Interaction with Caribou Mortality and Injury The Project will consist of work at 8 well sites and provide access over approximately 34.92 km of winter roads. Road use has the potential to cause direct mortality to caribou via vehicle collisions; however, that risk has been reduced to negligible after implementation of mitigation. The Project may also have an indirect effect on mortality through packing of winter roads, which could enhance travel rates by wolves or improve access for hunters. This effect can be reduced if both caribou and wolves avoid work areas in response to human activity/sensory disturbance and if hunter access is restricted.		
Residual Effect Characteristic	**General Definition**	**Rating**
Direction	Effects to mortality or injury could be adverse.	Adverse
Magnitude	The magnitude of potential effects of direct mortality is negligible after mitigations are applied. The effects of indirect mortality are estimated to be low due to caribou and wolves potentially avoiding work areas and restricting hunter access.	Low
Geographic Extent	The winter roads total approximately 34.92 km; this extent is small relative to the herd's total winter range, and the number of caribou that are likely to encounter the road is small.	Low
Timing	The timing of the Project during winter coincides with the potential occurrence of the Porcupine Caribou Herd in the area.	Moderate
Frequency	The potential encounter rate between caribou and wolves or hunters along or adjacent to winter roads is unknown but will likely be infrequent due to factors listed above. Caribou would have the potential to encounter Project traffic daily (i.e., frequently), but the risk of mortality is negligible following mitigation.	Infrequent
Duration	Project work will occur approximately 12 hours per day over an 8- to 12-week work period from mid-January to mid-April.	Short term
Reversibility	The potential effects to mortality are fully reversible. Potential direct effects will cease immediately upon completion of work activities. Vegetation regeneration will take several years to reach a stage that will hinder travel by hunters and natural predators.	Fully reversible
Context	A network of winter roads and seismic lines exists in the area from past exploration. This work will not add significant new features, but it will clear some regenerating vegetation and temporarily pack snow, which could temporarily enhance access by hunters and natural predators.	Existing Disturbed/ Resilient
Probability of occurrence	Based on historic telemetry data it is possible, but uncertain, that caribou will occur in the Project area when work is active. Over 24 years, collared caribou occurred within 4 km of the Project area approximately 17% of the time. If caribou do occur in the area during the year that work occurs, there is a low probability that the Project will contribute to indirect mortality.	Unlikely

6.1.4.2 Moose

Following application of mitigation measures listed in **Section 6.1.3**, Project activities are not predicted to result in significant effects to moose habitat, movement and distribution, or mortality or injury. Detailed effects assessments are provided for each indicator in **Table 6-6**, **Table 6-7**, and **Table 6-8** for each indicator, respectively. The following key factors have been used to produce this significance determination:

- Although the timing of the Project does occur during winter, which is a sensitive season for moose, the extent of the Project area, including a zone of influence, comprises a small proportion of the winter range available to the species. If moose choose to avoid the work areas (i.e., due to sensory disturbance) alternative habitat is available.
- The most likely potential effect to moose is temporary, localized avoidance of work areas due to sensory disturbance.
- Chance will minimize creating new linear features by re-establishing existing sections of the Chance and Blackie winter roads, and new access will be limited to short spur roads to access well sites where needed, and will not result in a significant change in access for human hunters and natural predators.

Table 6-6 Characterization of Potential Effects to Moose Habitat

Potential Project Interaction with Moose Habitat The Project will consist of work at 8 well sites plus access via approximately 34.92 km of winter roads, which will result in direct habitat effects due to vegetation clearing along the access routes and well sites. Indirect habitat effects may also result if moose choose to avoid areas near roads and well sites due to sensory disturbance or perceived predation risk.		
Residual Effect Characteristic	**General Definition**	**Rating**
Direction	Effects to habitat will initially be adverse but may switch to positive for several years if shrubs regenerate on the winter roads.	Adverse/Positive
Magnitude	The magnitude of effects to habitat is low due to the small extent and narrow width of affected areas.	Low
Geographic Extent	Direct habitat will be limited to the footprint of the winter roads and well sites (approximately 60 ha). Indirect effects to habitat are mostly within 300 m, depending on site conditions and variation in moose behaviour. These extents are small relative to the total winter range available to moose.	Low
Timing	The timing of the Project, during winter, is a sensitive season for moose due to limited forage and higher energetic outputs due to snow and cold temperatures.	Moderate
Frequency	Direct effects will be continuous, though diminishing in magnitude, as vegetation regenerates. Indirect effects will be continuous when work activities are active.	Continuous
Duration	Direct effects to the road and well site footprints will take years to regenerate (long term). Indirect effects will cease once work activities are completed (short term).	Short term Long term
Reversibility	The effects to habitat are fully reversible. Indirect effects will cease immediately upon stoppage of work activities. Direct effects along the winter roads will extend several years as vegetation regrows.	Fully reversible
Context	Work for this Project will occur on previously disturbed sites. Measures to protect the duff layer and ground vegetation will maximize the resiliency of the site to regenerate to similar habitat. The extent of this Project, like other historic oil and gas disturbances, are small relative to that natural disturbances (i.e., fire) that affect moose habitat. Approximately two-thirds of the area along the Chance Road has burned in the last 30 years.	Existing Disturbed/ Resilient
Probability of occurrence	Moose are known to use the Project area in winter, and some moose in the area will encounter the Project-related effects on habitat.	Likely

Table 6-7 Characterization of Potential Effects to Moose Movement and Distribution

Potential Project Interaction with Moose Movement and Distribution The Project will consist of work at 8 well sites and provide access via approximately 34.92 km of winter roads. This work will result in sensory disturbance that could cause moose to avoid the areas. Responses to sensory disturbance are mostly less than or equal to (≤1) km but vary in relation to site conditions and moose behaviour. Effects are most likely to be expressed as temporary, localized avoidance of work areas. Moose do not normally make seasonal movements in the Eagle Plains area.		
Residual Effect Characteristic	**General Definition**	**Rating**
Direction	Effects to movement and distribution could be adverse.	Adverse
Magnitude	The magnitude of effects is low due to the limited consequence if moose chose to avoid work areas. Alternative habitat is available, and avoidance of work areas is unlikely to impair within-range movements.	Low
Geographic Extent	Responses to sensory disturbance are mostly ≤300 m but vary in relation to site conditions and moose behaviour. These extents are small relative to the total winter range available in the area.	Low
Timing	The timing of the Project, during winter, is a sensitive season for moose due to limited forage and higher energetic outputs due to snow and cold temperatures.	Moderate
Frequency	Potential effects to movement will occur daily and correspond to periods when Project activities are active.	Frequent
Duration	Project work will occur approximately 12 hours per day over an 8- to 12-week period from mid-January to mid-April.	Short term
Reversibility	The potential effects to movement are fully reversible. Effects will cease immediately upon cessation of work activities.	Fully reversible
Context	Oil and gas exploration activities have occurred intermittently in the Eagle Plains area over the last 50 years. Responses of moose have not been studied in detail, but use of the area by caribou has continued, demonstrating general resiliency to exploration activities. The extent of this Project, and historic oil and gas disturbances, are small relative to natural disturbances (i.e., fire that affect moose habitat and distribution).	Existing Disturbed/ Resilient
Probability of occurrence	Moose are known to use the Project area in winter and some of the moose in the area will likely encounter the work areas and experience sensory disturbance associated with Project activities in those areas.	Likely

Table 6-8 Characterization of Potential Effects to Moose Mortality or Injury

Potential Project Interaction with Moose Mortality or Injury The Project will consist of work at 8 well sites plus access via approximately 34.92 km of winter roads. Road use has the potential to cause direct mortality to moose via vehicle collisions; however, that risk is negligible after mitigations. The Project may also have indirect mortality effects via packing of winter roads, which could enhance travel rates by wolves or access by hunters. However, the potential for this effect will be reduced with both moose and wolves potentially avoiding work areas due to human activity/sensory disturbance and the decision to restrict hunter access for crew safety.		
Residual Effect Characteristic	**General Definition**	**Rating**
Direction	Effects to mortality or injury could be adverse.	Adverse
Magnitude	The magnitude of potential effects of direct mortality is negligible after mitigations. Effects of indirect mortality are estimated to be low due to potential avoidance of the work areas by both moose and wolves and hunter access management.	Low
Geographic Extent	The winter roads total approximately 34.92 km. This extent is small relative to the herd's total winter range, and the number of moose that are likely to encounter winter roads and well sites is small.	Low
Timing	The timing of the Project, during winter, is a sensitive season for moose due to limited forage and higher energetic outputs due to snow and cold temperatures.	Moderate
Frequency	The potential encounter rate between moose and wolves or hunters along or adjacent to winter roads is unknown, but is expected to be infrequent, due to factors listed above. Moose would have the potential to encounter Project traffic daily (i.e., frequent), but the risk of mortality is negligible after mitigation.	Infrequent
Duration	Project work will occur approximately 12 hours per day over an 8- to 12-week period from mid-January to mid-April.	Short term
Reversibility	The potential effects to moose mortality are fully reversible. Potential direct effects will cease immediately upon completion of work activities. Vegetation regeneration will take several years to reach a stage that will hinder travel by hunters and natural predators.	Fully reversible
Context	A network of winter roads and seismic lines exists in the area from past exploration. This Project will not add significant new features, but it will clear some regenerating vegetation and temporarily pack snow, which could temporarily enhance access by hunters and natural predators.	Existing Disturbed/ Resilient
Probability of occurrence	Moose are known to use the Project area in winter, and some of the moose in the area will likely encounter the work areas. However, following implementation of mitigation measures, the probability of direct and indirect mortality associated with Project activities is low.	Unlikely

6.2 Vegetation

The Project falls within the Taiga Cordillera Ecozone and Eagle Plains Ecoregion. Descriptions of the Ecoregion are drawn from the Yukon Ecoregions Working Group (2004). The following sections describe the known baseline information for vegetation and wetlands in these regions, the likely Project interactions and potential effects resulting from Project activities, mitigation measures to reduce or eliminate those effects, and a summary statement concluding the overall significance of the Project on vegetation and wetlands.

6.2.1 Existing Conditions

The Project falls within the Eagle Plains Ecoregion, a 20,400 km^2 region in north Yukon between the Richardson and Ogilvie Mountains. Most of the region is low-altitude rolling topography, between 300 m and 600 m above sea level, with few scattered peaks to approximately 1,000 m above sea level outside the Project area. Most of the watercourses in the Ecoregion drain north into the Yukon River via the Whitestone, Porcupine, and Eagle rivers. The southeastern corner of the region drains east to the Mackenzie River via the Peel, Wind, and Ogilvie rivers. The few lakes that exist in the region are generally oxbow or thermokarst lakes (Yukon Ecoregions Working Group 2004). The Eagle Plains Ecoregion is within the continuous permafrost zone where permafrost can be found up to 200 m thick. Several permafrost-produced landforms and processes can be found across the region, including ice-wedge polygons, cryoturbation, solifluction, soil creep, and active layer detachment slides on shale (Yukon Ecoregions Working Group 2004).

The Eagle Plains Ecoregion experiences a moderate amount of precipitation, with annual amounts around 400 millimetres (mm). Most of the precipitation falls as rain throughout the summer months, averaging 50 mm to 80 mm per month from June through August. Precipitation is lighter from September to April and typically falls as snow. Average winter temperatures on the Eagle Plains Plateau are around −30°C and −5°C, with extremes as low as −60°C. Winter conditions usually last from October to May. Average summer temperatures are around 13°C, with extremes as high as 30°C. Due to its proximity to the Arctic Circle, this region experiences brief periods of continuous sun above and below the horizon (Yukon Ecoregions Working Group 2004).

The vegetation of the Eagle Plains Ecoregion is primarily boreal forest. The most common climax forest community is black spruce woodland associated with hummocks. Tree growth is often limited by the presence of permafrost in many areas of the Ecoregion, causing open, stunted forests and shrub-dominated communities at tall and low shrub structural stages. Upland black and white spruce forests typically have well-developed shrub communities, including Labrador tea, shrub birch, willow, alder, rose, spiraea, and blueberry, with a ground cover of lichen and moss. Moderately well to well-drained sites commonly have white spruce or deciduous stands with lichen ground cover. More poorly drained areas with low slope gradients and fine-textured soils are associated with overstorey species such as black spruce, shrub birch, Labrador tea, and occasionally tamarack, and often have ground cover dominated by cottongrass tussocks. Deciduous or mixed stands are also often found in areas of recent anthropogenic disturbance, such as old roads, drill sites, and gravel pits. Deciduous trees in the Eagle Plains Ecoregion include Alaskan paper birch, balsam poplar, trembling aspen, and willow (Yukon Ecoregions Working Group 2004).

Graminoid and shrubby fens, shrubby bogs and graminoid marshes are scattered throughout the Ecoregion. Several sedge species are dominant in both the graminoid fens and marshes, including narrow-leaf cottongrass, aquatic sedge, northern beaked sedge, and mud sedge. Shrub species in fens include

leatherleaf and bog rosemary. The ground cover of the shrubby bogs is dominated by sphagnum, sometimes with extensive lichen cover. Shrub species typically include low bush cranberry, bog cranberry, bog rosemary, cloudberry, Labrador tea, shrub birch, willow, black spruce and occasionally tamarack. Riparian forests of white and black spruce are found as narrow strips along most major watercourses in the Ecoregion (Yukon Ecoregions Working Group 2004).

Evidence of forest fires can be observed throughout the Project area, as fires are relatively common. Regenerating burns are dominated by shrubby vegetation, including willow, shrub birch, and alder. Alaskan paper birch is commonly the first tree species to colonize burn areas. Occasionally, on well-drained sites trembling aspen and balsam poplar may be the first tree species to re-colonize. The extent of old burns can be recognized by the presence of the current black spruce – Alaskan paper birch woodlands (Yukon Ecoregions Working Group 2004).

Ecological and Landscape Classification (ELC) mapping was completed for the Eagle Plains Exploration Project in 2019 and 2020, which encompassed the Project area. The ELC mapping was based on manual delineation and attribution of digital ortho-imagery following the Yukon Ecological and Landscape Classification and Mapping Guidelines, Version 1.0. (Environment Yukon 2016c) and the Standard for Terrestrial Ecosystem Mapping in British Columbia (RIC 1998). ELC mapping was further informed by extensive field sampling of vegetation communities across a diversity of ecosystems, slope positions, and moisture and nutrient regimes throughout the Eagle Plains Exploration Project.

Vegetation was examined at 3 scales to assess potential effects of the Project: Vegetation Regional Assessment Area (VRAA), Vegetation Local Assessment Area (VLAA), and the road footprint itself. The VRAA includes vegetation within a 2 km buffer on either side of the Chance and Blackie winter roads and represents the vegetation communities surrounding the roads to provide context for more localized potential effects. The VLAA includes vegetation within a 100 m buffer on either side of the Chance and Blackie winter roads and represents the extent where potential direct and indirect Project-related effects may occur. The area encompasses the 20-m-wide path of the access roads (10 m buffer on the centreline) and the well sites where tree and shrub clearing will occur.

The ELC units (ecosites) comprising the VRAA and VLAA are summarized in **Table 6-9** (the footprint is not included because it is such a narrow strip that ELC mapping does not accurately reflect the previous disturbance along it at that fine a scale). Comparison of the VRAA and the VLAA indicates that the relative proportions of ecosites are similar across both study areas. Both areas are dominated by the following species:

- Moist Spruce – Labrador Tea forest (shrub structural stage)
- Moist Spruce – Labrador Tea forest (mature forest structural stage)
- Moist Spruce – Alder – Labrador Tea forest
- Mesic White Spruce – Alaska Paper Birch – Alder.

A small number of ecosites occur more frequently in the VLAA than the VRAA in 2 circumstances. The first are ecosites associated with prior anthropogenic disturbance along the roads and well sites: Mesic birch-willow, Anthropogenic, and Road. The second group includes sites associated with upper and crest topographic positions, where the existing winter roads were previously situated, and will be situated for the Project: Mesic black spruce – Labrador tea (conifer), Dry spruce – lichen (conifer).

One ecosite that occurs less frequently in the VLAA than in the VRAA is Moist Shrub \ Scrub Birch – Labrador Tea – Willow, which is associated with lower slope and valley bottom positions and which the Project access routes avoid.

Both the Chance and Blackie winter roads have been cleared and used for access in previous years. Their footprints are in early- to mid-seral stages and differ from the surrounding vegetation. Chance Road was last used in 2014 and is currently regenerating to low and tall shrub communities undergoing either normal or stagnated succession. Chance Road is dominated by dense shrub birch, willow, alder, and paper birch, ranging from 25% to 60% cover, and with thick herbaceous vegetation (i.e., graminoids and forbs), ranging from 40% to 75% cover (**Photo 1**). In burned areas, Chance Road is similar to the surrounding vegetation, while in unburned areas, the surrounding vegetation consists of taller, more mature black spruce forest. Blackie Road has not been used in several decades and is more successionally advanced – dominated by fairly open (25% cover) black spruce and shrub birch at a tall shrub structural stage (**Photo 2**).This represents a similar vegetation community but in a different structural stage than the surrounding vegetation, which is characterized by taller, mature black spruce forest with willow and paper birch shrub layers. No rare nor invasive plants have been documented in the VRAA, VLAA, or footprint, although targeted rare and invasive plant surveys have not been conducted in the Project area.

As documented in the ELC mapping, wetlands and watercourses cover 49.9 ha in the VRAA and include rivers and black spruce bogs. There are no wetlands nor mapped watercourses within 200 m of the road and well site footprints.

Photo 1. View of a typical section of Chance Road, regenerating to a low shrub vegetation community dominated by deciduous shrubs.

Photo 2. View of a section of Blackie Road, regenerating to a tall shrub vegetation community dominated by black spruce.

Table 6-9 Vegetation Communities Occurring within the Vegetation Regional Assessment Area and Local Assessment Area

Ecosite Code	Ecosite Name	VRAA		VLAA	
		Area (ha)	Area (%)	Area (ha)	Area (%)
02	Mesic birch-willow	66.6	0%	31.8	5%
04	Mesic white spruce – Alaska paper birch - alder	1111.0	8%	39.6	7%
05	Mesic Alaska paper birch (deciduous)	654.6	5%	24.7	4%
06	Mesic black spruce – Labrador tea (conifer)	685.9	5%	40.8	7%
14	Dry spruce-lichen (conifer)	138.9	1%	15.7	3%
15	Dry aspen-lichen (deciduous)	2.3	0%	0.0	0%
16	Dry spruce-birch-lichen (mixed wood)	173.0	1%	1.6	0%

6.2.2 Project Interactions and Potential Effects

Re-establishment and construction of the winter roads and spur roads will result in alteration of up to 60.4 ha of vegetation within the road footprint. The footprint will be cleared of vegetation through mulching and manual felling. The cutters of the mulcher will be raised off the ground to minimize disturbance to hummocks, tussocks, and high spots, but will remove taller shrubs and trees to allow safe vehicle and equipment travel. Mulching will remove shrubs and trees while protecting the moss layer, soil, and root systems of low-growing plants.

In addition to the direct loss of vegetation within the road footprint due to clearing, winter road re-establishment, spur road construction, and travel within the road footprint may cause potential effects to vegetation by altering underlying soils. These potential effects include soil disturbance, soil compaction, root damage, altered soil moisture regime, and permafrost thaw. Soil disturbance and root damage would most likely be caused by physical interactions from machinery during clearing, while soil compaction, altered soil moisture, and permafrost thaw would most likely be caused by repeated travel of heavy equipment compressing underlying soils, which can lead to altered thermal and hydrological characteristics.

Vegetation clearing within the road footprint may result both direct and indirect effects. Potential direct effects include change to earlier successional stage, change of wildlife habitat and forage, loss of primary productivity and carbon sequestration, reduction of biodiversity, and aesthetic impacts. Potential indirect effects may extend into the VLAA and are generally attributable to edge effects, including altered light availability, altered temperature regimes, altered wind patterns, increased nutrient availability from cleared

and mulched vegetation, altered seed dispersal, changes to vegetation composition and growth such as infiltration of early seral plants, and altered herbivory patterns.

Potential effects to rare plants include disturbance or destruction during construction if rare plants occur within the footprint of project activities and changes to habitat characteristics caused by vegetation removal and edge effects in the VLAA. There are no tracked shrub or tree species occurring within the Eagle Plains Ecoregion, so only rare ground cover plants (e.g., forbs, graminoids, mosses, lichens) would be at risk of physical disturbance (Yukon Conservation Data Centre 2019). Ensuring a minimum 10 cm snowpack on all areas to be cleared will greatly reduce the potential for physical disturbance or destruction of any rare plants occurring in the footprint.

Potential effects to invasive plants include introduction and spread of invasive plants via equipment or personnel brought in from infested areas.

All of the aforementioned effects have the potential to affect wetlands within the footprint or VLAA, often with increased significance due to the sensitivity of wetlands (e.g., more sensitive soils, hydrological regimes, higher biodiversity and wildlife value, wetland-obligate species). No wetlands are documented within the footprint or VLAA in the ELC mapping, so these effects are unlikely.

The construction phase of the Project could also result in degradation of vegetation due to spills (e.g., hydraulic fluid, fuel etc.) along the access roads.

6.2.3 Mitigation Measures

The following mitigation measures have been developed to minimize potential effects to vegetation and wetlands:

- Existing and historic winter roads, with short spur roads to access well sites, will be used as the primary access routes to minimize the amount of vegetation that is cleared.
- Winter roads will consist of packed and frozen snow and ice to maintain ground vegetation and to avoid site disturbance to the underlying duff layer, soil, and permafrost. A minimum 10 cm snowpack will be required over all road surfaces.
- The extent of vegetation clearing, notably the widths of winter roads and areas at well sites, will be minimized. On the Chance Road, the width will not exceed the existing right-of-way extent, which will minimize the direct loss of vegetation and reduce potential edge effects from Project activities.
- Shrubby vegetation will be cut as high as possible, normally at least 30 cm above the ground. Where possible, shrubs will be pushed over instead of cut.
- The winter roads are located primarily on crest and upper slope positions, which minimizes potential overlap with wetlands and riparian areas. If small wetlands or riparian areas along non-classified drainages are encountered, special efforts will be made to minimize effects by enhancing the thickness of the packed snow/ice base and minimizing the right-of-way width.
- To avoid the spread of invasive plants, equipment will be washed and inspected prior to transport to site.

6.2.4 Effects Characterization and Significance Determination

With the mitigation measures listed in **Section 6.2.3** applied, Project activities are not predicted to result in significant effects to vegetation and wetlands. Most of the effects will be low to moderate in magnitude and considered unlikely to occur and/or reversible over the long term.

Loss and Alteration of Vegetation

The loss and alteration of vegetation will be mitigated primarily by using existing and historic access roads to minimize the area to be disturbed and by limiting use to winter. A maximum of 60.4 ha of vegetation will be cleared within the footprint of Project activities, which represents only 0.44% of the VRAA. Existing and historic winter roads in the area typically support early to mid-seral vegetation at a lower structural stage than the surrounding vegetation. By re-activating previously used roads and construction of short spur roads to access well sites, Chance will minimize disturbance to mature forests and surrounding vegetation and minimizes the overall change in seral stage. By limiting activities to winter and maintaining a 10 cm snowpack overlying frozen ground, the ground vegetation in the surrounding area, along with its root structure and litter layer, will be protected from physical disturbance. Cutting vegetation as high as possible will similarly reduce the total amount of vegetation loss, reduce disturbance to root structure, and increase the potential for regrowth from the root mass, which will in turn accelerate regeneration after the winter roads have been decommissioned.

Overall, the potential effects of loss and alteration of vegetation are low in magnitude and reversible with regeneration. In addition, the loss and alteration of vegetation will be limited to a small area that has been previously disturbed, will only involve removal of trees and shrubs greater than 30 cm tall while leaving ground vegetation intact, and will facilitate regeneration. Potential effects are limited in geographic and temporal extent will primarily occur in the footprint of existing roads during a single winter and will start to regenerate the following spring. With mitigations applied, the potential effects of loss and alteration of vegetation are not considered significant.

Creation of Edge Effects

Creation of edge effects (e.g., light availability, temperature regime, wind patterns, vegetation composition and growth, seed dispersal) will be mitigated by using existing and historic access roads, minimizing length of spur roads, and by limiting use to winter. Primarily using previously disturbed access roads that already experience some edge effects will minimize the creation of new edges and thus reduce overall edge effects. Some additional edge effect will be created by establishment of approximately 3.97 km of spur roads to well sites. Limiting use to winter and minimizing disturbance to ground vegetation will preserve ground vegetation integrity, which will further reduce the potential effects of forest edges. Potential edge effects will decrease as vegetation in the footprint regenerates following completion of well maintenance activities.

Overall potential effects of edge creation are low in magnitude and reversible with regeneration. The majority of the footprint and VLAA already experience some edge effects from past disturbance along the proposed routes. The Project may reinforce pre-existing edge effects but will minimize new edge creation. Potential effects are limited in geographic and temporal extent; they will only occur in the footprint and VLAA and will diminish as regeneration progresses. With mitigations applied, the potential effects of edge creation are not considered significant.

Disturbance to Soils

The disturbance to soils will be mitigated by creating a frozen snow and ice surface on primarily existing and historic winter roads, which will minimize effects to soils and permafrost. In addition, using previously disturbed access roads will avoid potential effects to undisturbed sites. Re-activating and using access roads during winter while the soil is frozen and maintaining a 10 cm snowpack will also protect the duff layer, soil surface, and soil structure from disturbance while minimizing potential permafrost thaw.

Overall, potential effects of soil disturbance are low in magnitude and unlikely to occur, as well as being limited in geographic and temporal extent, will only occur in the footprint. In addition, work will only occur over a single winter. With mitigations applied, the potential effects of soil disturbance are not considered significant.

Disturbance to Rare Plants

Disturbance to rare plants will be mitigated by limiting road re-establishment, spur road construction, and use to winter, and by minimizing ground disturbance. There are no rare shrub or tree species documented within the Eagle Plains Ecoregion; only rare ground vegetation species have the potential to be affected by the Project. Ground vegetation will be dormant in winter and protected by a minimum 10 cm snowpack, thus protecting any rare plants occurring within the footprint. Potential changes to habitat characteristics affecting rare plants will be mitigated by minimizing the creation of edge effects and overall vegetation loss and alteration.

Overall, potential effects to rare plants are low in magnitude, unlikely to occur, and limited in geographic and temporal extent; they would only occur in the footprint and VLAA, and physical disturbance would only occur during road re-establishment and use during a single winter. With mitigations applied, potential effects to rare plants are not considered significant.

Spread of invasive species

Spread of invasive species will be mitigated by limiting road re-establishment, spur road construction, and use to winter and inspecting equipment for cleanliness. Vegetation will be dormant in winter, so the potential for seed dispersal from plants within the footprint will be low. In addition, potential introduction of invasive species from off-site sources will be minimized by inspecting equipment brought on site for cleanliness, including any dirt wads or old vegetation that may be harbouring seeds.

Overall, potential effects of invasive species are moderate in magnitude but unlikely to occur. Potential effects are limited in geographic and temporal extent and they may only occur in the footprint and VLAA, and the risk of introduction of invasive plants would only occur during road re-establishment and use in a single winter. With mitigations applied, the potential effects of invasive species are not considered significant.

Alteration of Wetlands

Alteration of wetlands will be mitigated by using existing and historic access roads, and construction of spur roads, that follow upland topography such as ridges to avoid wetland areas. Although there are no wetlands

or named watercourses documented within the footprint or VLAA, snowpack depth will be increased if small wetlands or riparian areas are encountered along non-classified drainages.

Overall potential effects to wetlands are low in magnitude, unlikely to occur, limited in geographic and temporal extent, and would only occur in the footprint and VLAA during road re-establishment and use over a single winter. With mitigations applied, the potential effects to wetlands are not considered significant.

Degradation of Vegetation or Wetlands Due to Spills

Spills will be mitigated by implementing the Spill Contingency Plan, which is currently in development.

Overall potential effects of spills are moderate in magnitude but unlikely to occur. Potential effects are limited in geographic and temporal extent; they can occur only in the footprint, and potential occurrence is limited to a single winter. Potential effects would be short term and would be at least partially reversible. With mitigations applied, the potential effects of spills are not considered significant.

6.3 Heritage Resources

The human history of Yukon, from the earliest Indigenous groups to the arrival of fur traders and prospectors in the 19th century and beyond, is preserved in the Yukon's heritage and historic resources.

According to the *Historic Resources Act*, RSY 2002, c 109, historic resources include historic sites, historic objects, and any work or assembly of works of nature or human endeavour that is valued for its archaeological, palaeontological, pre-historic, historic, scientific, or aesthetic features. Historic sites generally date to a time of written history (i.e., the past 100 to 150 years in Yukon) and typically contain examples of built heritage or structures (e.g., cabins, caches, graves, brush camps) (Gotthardt and Thomas 2007). Archaeological sites are typically older than 150 years and can be found on the surface (i.e., artifacts that have been exposed or were never buried) or buried in the ground (e.g., stone tools and chips, animal bone fragments, remains of ancient hearths and campfires) (Gotthardt and Thomas 2007).

Archaeological sites and resources are culturally meaningful, connecting community members to the past and representing a collective identity. These resources offer ways of knowing and generational knowledge that are passed on through the generations. Every Indigenous group manages cultural heritage in a unique way, but always with respect for the past and future generations.

6.3.1 Existing Conditions

In 2013, a Heritage Resources Overview Assessment (HROA) was conducted by Matrix Research Ltd. in support of the 2013 Seismic Program at Eagle Plains on behalf of Northern Cross. The intent of this assessment was to determine the heritage potential within the proposed development area and provide recommendations for managing heritage resources.

The HROA determined that a "significant portion" of the study area is considered to have low pre-contact heritage resources potential (Matrix Research 2013). However, the HROA also identified several areas considered to have high heritage resources potential associated with locations along streams and the upland areas overlooking these tributaries. The HROA recommended that further heritage resources investigations, specifically a Heritage Resource Impact Assessment (HRIA), be conducted within the zones

of high heritage resource potential prior to any potentially land-altering development activities (Matrix Research 2013).

An HRIA was then conducted later in 2013 by Matrix Research, further assessing the identified zones of high potential (**Appendix C**). As indicated in a letter report dated May 15, 2014 to Northern Cross, Matrix Research concluded that the proposed well sites and access roads do not conflict with any of the areas containing heritage values (**Appendix D**). Matrix Research did, however, identify areas within the study area containing heritage values, identified as high potential areas to avoid and labelled as 'avoidance areas'. Matrix Research recommended that these areas, "be avoided by any potential land-altering activities and that if avoidance was not possible further heritage assessment should be conducted prior to any development (Matrix Research 2014)."

6.3.2 Project Interactions and Potential Effects

Results of the 2013 HROA and HRIA conducted by Matrix Research indicate that no Project interactions or potential effects are anticipated for heritage resources. Should the Project development areas or locations be altered and fall outside of the currently assessed area, additional assessment of heritage resources will be undertaken.

6.3.3 Mitigation Measures

The following list describes the mitigation measures to eliminate, reduce, or control potential effects to heritage resources caused from Project activities:

- Develop and implement a Project-specific Heritage Resources Chance Find Procedure to manage the discovery process for encounters with any unanticipated heritage resources. If a heritage resource is encountered, all development activities in the vicinity of the heritage resources will be suspended immediately. In such cases, the Cultural Services Branch, Department of Tourism and Culture, Government of Yukon, VGFN, and FNNND will be contacted immediately with information on the heritage remains and nature of the disturbance.
- Chance will avoid any land-altering activities in the avoidance areas identified in the Matrix Research 2014 letter report (**Appendix D**) to further protect heritage resources.

6.3.4 Effects Characterization and Significance Determination

Following the application of mitigation measures, Project activities are not expected to result in significant effects to heritage resources. Should the Project development areas/locations be altered and fall outside of the currently assessed area or within avoidance areas or areas identified as high potential, additional heritage resource assessment will be undertaken to determine the extent of potential effects to heritage resources.

7.0 SUMMARY OF MITIGATION MEASURES

The following sections describe the Proponent's proposed mitigation measures to eliminate, reduce, or control potential effects of the Project to the selected VCs.

7.1 Wildlife and Wildlife Habitat

7.1.1 General Mitigation Measures for Wildlife and Wildlife Habitat

- All Project personnel will be required to complete formal orientation and training related to wildlife mitigation measures.
- Work will be scheduled to minimize the spatial extent of concurrently occurring work.
- Access to the well sites will utilize existing and historic winter roads, with short spur roads to access well sites in order to minimize the creation of new linear features.
- Project footprints, notably the widths of winter roads, will be minimized as much as possible. On the Chance Road, the width will not exceed the existing right-or way extent.
- Project personnel will be prohibited from having firearms on site.
- A no harassment of wildlife policy will apply to all personnel, including attempts to chase, catch, divert, follow, photograph, feed, or otherwise harass wildlife whether on foot, in on-road or off-road vehicles, heavy equipment, or aircraft.
- The use of on-road and off-road vehicles, including snowmobiles, will be restricted to essential Project access routes.
- Personal use of UAVs) will be prohibited.

7.1.2 Road Operations

The following measures are designed to mitigate the risk of vehicle collisions and effects of road use on wildlife movements:

- The maximum speed limit along the Dempster Highway is 90 km/h.
- The maximum speed along winter roads will be 30 km/h.
- Wildlife will always have the right-of-way. This requires vehicle operators to stop when wildlife species are observed on or beside the road, allowing them to cross safely. If wildlife stays on the road or right-of-way for more than 5 minutes, drivers may resume travel and pass the animals at less than 10 km/h. Special rules apply to caribou within 100 m from the road:
  - Stop as far back as possible.
  - Alert other drivers.
  - Wait until caribou have crossed and moved beyond 500 m from the road or are lost from sight before proceeding.
  - Proceed with caution.
- The following rules will guide encounters with caribou beyond 100 m from the road:
  - Proceed with caution.
  - Alert other drivers.
  - Watch for direction of movement and change in behaviour.

- When moose and caribou are on a road, they will sometimes run down the road away from a vehicle. If this happens, stop and wait at least 5 minutes to allow the animal to move off the road. If the animal remains on the road, drive forward at 10 km/h, then stop again when the animal begins to run away. Wait 2 minutes and repeat this procedure. If the animal still does not leave the road, wait 10 minutes and repeat the procedure, alternating with a 2- and 10-minute stop between driving attempts.
- Drivers will be required to use two-way radio communication and communicate the location of any wildlife observed along Project roads to other road users on the radio.
- Drivers will be prohibited from exiting the vehicle to chase, catch, divert, follow, photograph, or otherwise harass wildlife.
- Along winter roads, the Proponent will:
  - maintain snowbanks at heights greater than 1 m to reduce the hinderance to crossing wildlife
  - create regular breaks (at least every 500 m) where snowbanks exceed 60 cm in height to facilitate animal crossing and provide off-road escape routes
  - create matched breaks that animals can use to cross on either side of the road
  - on corners, create run-outs in each direction that are obvious alternative routes for animals to use, instead of following the road
  - avoid breaks at seismic lines that could provide human access.

7.1.3 Aircraft Operations

The following measures are designed to mitigate the effects of aircraft use on wildlife:

- Maintain altitudes of more than 300 m above ground level at all times of the year.
- Maintain altitudes of more than 600 m above ground level during sensitive times of the year.
- Avoid areas where caribou have been observed in the past.
- Design flights paths to avoid important areas during sensitive times of the year.
- Do not fly toward, circle, or harass any observed caribou.
- If caribou appear to be in a panic or startled, ascend to a higher elevation.

7.1.4 Caribou

The majority of potential effects to caribou will be mitigated via measure for general wildlife, road operations and aircraft operations. Additional measure specific to caribou include the following:

- Do not pack snow on any linear features that are not essential to Project work.
- Minimize access to linear features off the winter roads; avoid creating breaks in snow berms at junctions with linear features.
- Report all sightings of caribou to the Environmental Monitor.
- If more than a dozen caribou are observed, or if any number of caribou are observed in the same location for longer than a 3-day period, consult a QEP to determine if site-specific mitigations may be warranted.

Due to the variable nature of caribou occurrence and snow conditions from year to year, Chance will conduct a pre-operations assessment in December, prior to initiating the Project to assess local conditions (specifically including information about caribou occurrence and snow conditions) that could warrant tailored management measures. For example, if telemetry data indicate that several collared caribou are in the Project area near work areas, additional measures may be implemented to mitigate potential effects.

7.2 Vegetation and Wetlands

Mitigation measures related to vegetation and wetlands include the following:

- Existing and historic winter roads, with short spur roads to access well sites, will be used as the primary access routes to minimize the amount of vegetation that is cleared.
- Winter roads will consist of packed and frozen snow and ice to maintain ground vegetation and avoid site disturbance to the underlying duff layer, soil, and permafrost. A minimum 10 cm snowpack will be required over all road surfaces.
- Minimize the extent of vegetation clearing, notably the widths of winter roads and areas at well sites. On the Chance Road, the width will not exceed the existing right-or way extent, which will minimize the direct loss of vegetation and reduce potential edge effects.
- Cut shrubby vegetation as high as possible, normally at least 30 cm above the ground. Where possible, push shrubs over instead of cutting them.
- The winter roads are located primarily on crest and upper slope positions, which minimizes potential overlap with wetlands and riparian areas. If small wetlands or riparian areas along non-classified drainages are encountered, special efforts will be required to minimize effects by enhancing the thickness of the packed snow and ice base and minimizing the right-of-way width.
- To avoid the spread of invasive plants, wash and inspect equipment prior to transporting it to site.

7.3 Heritage Resources

The following mitigation measures are proposed to eliminate, reduce, or control potential effects to heritage resources from Project activities:

- Develop and implement a Project-specific Heritage Resources Chance Find Procedure to address the discovery of any unanticipated heritage resources. If heritage resources are encountered, immediately suspend all development activities in the vicinity of the heritage resources. In such cases, contact the Cultural Services Branch, Department of Tourism and Culture, Government of Yukon, VGFN, and FNNND immediately and provide information on the heritage remains and nature of the disturbance.
- Avoid any land-altering activities in the avoidance areas identified in the Matrix Research 2014 Letter Report to protect heritage resources.

7.4 Fish and Fish Habitat

The Project has no direct interaction with fish and fish habitat. Potential indirect effects are also limited due to the location of winter roads and well sites at least 200 m from streams and waterbodies. The following measures are designed to further mitigate indirect effects relating to water quality:

- If non-classified drainages are encountered, minimize effects to downstream water quality and sedimentation risk. These special efforts include:
  - enhancing the thickness of the packed snow/ice base over and adjacent to the drainage area
  - minimizing the width of the right-of-way through the area
  - removing slash from vegetation clearing away from the area so it will not be transported downstream during spring run-off.
- If any site disturbance occurs during winter road construction or operation (i.e., exposure of organic or mineral soil), document the location and extent of the site during operations and treat the area to control sediment control and regenerate vegetation the following summer.
- In the event of a hydrocarbon spill, follow measures described in the Spill Contingency Plan to contain the spill and prevent the spill from affect adjacent water courses.

7.5 Regional Land Use Plans

The Project is located within the boundaries of the North Yukon Planning Region and Peel Watershed Planning Region and is therefore subject to the NYLUP and PWLUP. Locations of proposed Project activities are also within LMU 9 of the NYLUP and LMU 7 of the PWLUP. (**Table 7-1**). Both are located within the Eagle Plains basin, which has the highest potential for oil and gas development. Details regarding how the Project will meet the requirements of the NYLUP and PWLUP are provided in **Table 7-2.**

Table 7-1 Landscape Management Units Overlapping the Project

Landscape Management Unit Number	Landscape Management Unit Name	Integrated Management Area
9 (NYLUP)	Eagle Plains	4
7 (PWLUP)	Dalglish Creek	4

Table 7-2 Commitments and Mitigations to Meet the Requirements of the North Yukon Land Use Plan and Peel Watershed Land Use Plan

Topic	Recommendation		Best Management Practices		Commitment/Mitigation
	NYLUP	PWLUP	NYLUP	PWLUP	
Surface Disturbances	• Develop and monitor site closure/remediation plans that will result in significant disturbance. • To provide a benchmark for the monitoring cumulative effect indicator levels, document the status of existing surface disturbances.	• In the Integrated Management Area (IMA), maintain the amount of surface disturbance below the cumulative effects indicator levels recommended in the plan.	• Reduce the size, intensity, and duration of all surface disturbances. • Use native endemic plants for active reclamation of disturbed sites.	• Reduce size, intensity, and duration of human-caused physical surface disturbances (e.g. utilize low impact seismic, winter roads and follow the principle of full reclamation).	• Mitigate the size, intensity, and duration of human-caused physical disturbances primarily by using existing and historic access roads to minimize the disturbance area and limiting use to winter.
Wildlife Habitat	• Reduce size, intensity, and duration of human-caused physical surface disturbances (e.g., utilize low impact seismic, winter roads and enhanced reclamation). • Reduce other human land use impacts such as noise, smell, and light. • Avoid or reduce activities in significant wildlife habitats during important biological periods (e.g., utilize timing windows). • Coordinate, manage, and minimize new road and trail access.	• In the IMA, give special consideration to the protection of Boreal caribou habitat when assessing the potential development. • Collect adequate wildlife and habitat baseline data prior to commencing any development activities.	• Avoid or minimize the creation of new access roads and trails; utilize existing routes unless their use will cause additional long-term environmental impacts. • Avoid or minimize the size, extent, duration, and level of activities in concentrated seasonal use areas. • Use appropriate operational timing windows in significant wildlife habitats to minimize activities wherever possible, during periods of wildlife use. • When new access creation is necessary: ▫ Develop and use non-permanent winter access routes should instead of all-season access routes. ▫ Gate or otherwise restrict hunting along new access routes. ▫ Where possible, direct new access routes through less significant wildlife habitats.	• Coordinate and manage new road and trail access. ▫ To the extent possible, avoid routing new roads and trails through concentrated seasonal use areas and significant habitats. ▫ Avoid using or crossing seasonal migration corridors. • Avoid or reduce activities in significant wildlife habitats during important biological periods (e.g. utilize timing windows). ▫ Porcupine Caribou are typically in the region during winter period (December to March). ▫ Avoid concentrated woodland caribou use areas. • Reduce other human land use-related disturbances such as noise, odours, light.	• Mitigate the size, intensity, and duration of human-caused physical disturbances primarily by using existing and historic access roads to minimize the area to be disturbed and limiting use to winter. • The timing of the Project, during winter, is a season of lowest importance for the ecology of the Porcupine Caribou Herd and a period when the caribou are relatively tolerant of human disturbance (PCTC 1993). • Schedule work to minimize the spatial extent across Concurrently occurring work. • Minimize access to linear features off the winter roads by avoiding the creation of breaks in snow berms at junctions with linear features. • Do not pack snow on any linear features that are not essential to Project work. • Report all sightings of caribou to the Environmental Monitor. • If more than a dozen caribou are observed, or if any number of caribou are observed in the same location for longer than a 3-day period, consult a QEP to determine if site-specific mitigations may be warranted. • Restrict the use of on-road and off-road vehicles, including snowmobiles, to essential Project access routes. • Prohibit personal use of UAVs.
Focal Species Management – Porcupine Caribou Herd (NYLUP)	See recommendations for wildlife habitat.		• Avoid or minimize the size, extent, duration, and level of activities in concentrated seasonal use areas. • Avoid using or crossing seasonal migration corridors with new access routes. • Define and implement safe operation distances from the herd. • Consider the following seasons when determining appropriate operational timing windows (seasons when Porcupine caribou occupy the region): ▫ Spring migration – April 1 to May 31 ▫ Early summer – July 1 to July 15 ▫ Mid to late summer – July 16 to August 7 ▫ Fall migration – August 8 to October 7 ▫ Rut – October 8 to ▫ Winter – December 1 to March 31.	Not applicable	

Topic	Recommendation		Best Management Practices		Commitment/Mitigation
	NYLUP	PWLUP	NYLUP	PWLUP	
Fish Habitat	• Prohibit water withdrawals in over-wintering areas with sensitive fish.	• Complete adequate fish, waterbird, aquatic habitat, and water quality baseline data collection prior to commencing any development activities .	• Do not us ice roads or winter roads as river/creek crossings as they inadequately mitigate potential impacts to fish and fish stocks.	• Minimize surface and vegetation disturbance in riparian areas. • Avoid or minimize industrial land use activities in wetlands and riparian areas. • Prohibit significant levels of in-stream water withdrawals in sensitive over-wintering fishing habitat during winter. • Avoid large scale-industrial and/or infrastructure projects within major river corridors. • Minimize stream crossings; if stream crossings are required design and use proper bridge and crossing structures for ease of removal (i.e., temporary structure).	The Project has no direct interaction with fish and fish habitat. Potential indirect effects are also limited due to the location of winter roads and well sites at least 200 m from streams and waterbodies. The following measures are designed to further mitigate indirect effects relating to water quality and fish habitat. • If non-classified drainages are encountered, make special efforts to minimize effects to downstream water quality and sedimentation risk by: ▫ enhancing the thickness of the packed snow/ice base over and adjacent to the drainage area ▫ minimizing the width of the right-of-way through the area ▫ removing vegetation clearing slash from the area so it will not be transported downstream during spring run-off.

8.0 CONCLUSION

The Project requires an evaluation by a YESAB Designated Office because the Assessable Activities, Exceptions and Executive Committee Projects Regulations of YESAA identified 3 assessable activities:

1. The Project location is in the Yukon.
2. The Assessable Activities, Exceptions and Executive Committee Projects Regulations identifies several triggers for the Project including:
    a. Schedule 1, Part 3, Oil and Natural Gas, Item 2:

    On other than an Indian reserve, drilling, operation, modification, decommissioning or abandonment of, or other activity in relation to, an oil or natural gas well or seismic shot hole, but not including a hole drilled to obtain geological information.

    b. Schedule 1, Part 13, Miscellaneous, Item 13:

    On Crown land or settlement land, levelling, grading, clearing cutting or snow ploughing of a route that provides access to land for the purposes of a geophysical, geological or engineering survey.

3. A government agency authorization is required to undertake the activities.

The Proponent understands that the purpose of the YESAB Designated Office evaluation process in Yukon is to inform planning and decision-making by governments to avoid or minimize significant environmental and socio-economic effects while realizing development objectives. The Proponent also recognizes that the YESAB Designated Office evaluation process provides an integrated means of identifying, evaluating, and mitigating a proposed project's potential adverse environmental and socio-economic effects. VCs for the assessment were selected based on the potential for Project activities for this proposal to interact with the identified VC and result in adverse effects. Where effects assessments indicated that adverse effects could occur to a VC, the assessment proposes technically feasible and appropriate mitigation measures to avoid or minimize those effects. Following the implementation of the proposed mitigation measures, Project-related residual adverse effects to the selected VCs will likely be not significant.

Board of Directors
Chance Oil and Gas Limited
Suite 1000, 340 – 12 Ave SW
Calgary, AB T2R 1L5

Attention: [redacted]

Dear [redacted]

RE: Communication and Engagement with the Vuntut Gwitchin Government ("VGG") in relation to Chance Oil and Gas Limited's ("COGL") notice of Proposed Oil and Gas Activity dated June 5, 2019 ("Proposed Exploration Program") under VGG's Oil and Gas Engagement Policy ("Policy")

I am writing to you as Chief of the Vuntut Gwitchin First Nation ("VGFN") and Chief Executive Officer of VGG to bring directly to your attention our serious concerns with COGL's consistent failure to adhere to our Policy and the joint VGG-COGL Communication and Engagement Plan dated May 17, 2018 ("Plan") in communication and engagement with us about the Proposed Exploration Program. VGG has raised our concerns with COGL about this pattern of communication and engagement on several occasions in the past, including bringing concerns directly to the attention of COGL directors, to no avail. This has significantly frustrated VGG's good faith efforts to establish and maintain a respectful, transparent and meaningful process for communication and engagement with COGL as required under our Policy and the Plan we agreed upon together.

As VGG has communicated throughout our engagement with COGL, we are committed as a government to upholding the objective of sustainable development enshrined in our Land Claim Agreement and the human rights of VGFN citizens to free, prior and informed consent in relation to the Proposed Exploration Program through the implementation of the Policy. As clearly described by the UN Expert Mechanism on the Rights of Indigenous Peoples[1], this means, among other things, that:

- "The context or climate of the process should be free from intimidation, coercion, manipulation and harassment."
- "Features of the relationship between the parties should include trust and good faith, and not suspicion, accusations, threats."

[1] Free, Prior and Informed Consent: A Human Rights-based Approach: Study of the Expert Mechanism on the Rights of Indigenous Peoples, UNHRC, 39th Sess, UN Doc A/HRC/39/62 (2018) available online at https://undocs.org/en/A/HRC/39/62. See also International Finance Corporation, Performance Standard 7: Indigenous Peoples (January 1, 2012) available online at: https://www.ifc.org/ps7.

- “Indigenous peoples should have the freedom to be represented as traditionally required under their own laws, customs and protocols.”
- “Indigenous peoples should have the freedom to guide and direct the process of consultation… They should exert sufficient control over the process and should not feel compelled to get involved or continue.”
- “Indigenous peoples should have the freedom to set their expectations and to contribute to defining methods, timelines, locations and evaluations.”
- “Providing the time necessary for Indigenous peoples to absorb, understand and analyse information and to undertake their own decision-making processes.”
- “Indigenous peoples may withhold consent temporarily because of deficiencies in the process. Such deficiencies often consist of non-compliance with the required standards for the consent to be free, prior and informed.”
- “If Indigenous peoples choose to give their consent to a project, consent should be consistent with Indigenous peoples’ own laws, customs, protocols and best practices, including representation by legal counsel whenever possible and as required by law.”

Please therefore take notice that following recent events at a special meeting of the VGFN General Assembly, and consultation between the Council and the Natural Resources Committee, VGG is implementing the following measures effective immediately which will remain in effect until further notice to COGL:

- All communication and engagement between VGG and COGL about the Proposed Exploration Program will be ceased including all negotiations under the Policy towards a Cooperation Agreement and Benefits and Stewardship Agreement. This includes COGL directors, officers, employees, consultants, professional advisors and representatives ceasing all public and private communications with VGFN Council, VGG employees and contractors, and members of the VGG Natural Resources Committee regarding the Proposed Exploration Program.
- VGG will be conducting an internal review of the Plan for its consistency with the Policy and the adequacy of measures for maintaining a respectful, transparent and meaningful process for communication and engagement as provided for under s. 6 of the Plan. The Policy continues to be the paramount and overarching framework applicable to COGL until our internal review of the Plan is complete.
- COGL directors, officers, employees, consultants, professional advisors and representatives, while acting in such a capacity, may only participate by invitation in our internal governance processes and mechanisms regarding the Proposed Exploration Program, such as VGG planned consultation meetings with VGFN citizens and meetings of the VGFN General Assembly.
- COGL will submit advance written notice of any COGL planned consultation activities with VGFN citizens to the VGG Director of Natural Resources pursuant to s. 21 of the Policy. Any COGL planned consultation activities with VGFN citizens, including any activities of COGL’s “Community Engagement Committee” do not constitute consultation with VGG and is not representative of our internal governance processes and mechanisms.
- Future communication and engagement between VGG and COGL about the Proposed Exploration Program will be initiated upon invitation directly from me as the Chief to you as Chairman of the

Board. Any future meetings will be held in Old Crow in an open forum where VGFN citizens may attend, observe and participate in discussions.

- Future negotiations of a Cooperation Agreement or Benefits and Stewardship Agreement in relation to the Proposed Exploration Program will also be held in Old Crow in an open forum where VGFN citizens may attend and observe.

These measures are being implemented by VGG to prioritize the completion of deep consultation by VGG with VGFN citizens through our own internal governance processes and mechanisms before VGG decides to continue any further in communication and engagement with COGL under stage 2 of the Policy regarding the Proposed Exploration Program. Your direct involvement and participation in the conduct of future meetings between VGG and COGL will be respectfully and strongly encouraged.

Yours truly,

[redacted]

Attention: [redacted] **Councillor and Co-Chair of the Natural Resources Committee**

Dear [redacted]:

I am writing in response to your letter of July 10, 2019. We would be pleased to meet with the Natural Resources Committee ("NRC") in August to discuss both the matter you have raised in your letter regarding the financial circumstances of Chance Oil and Gas Limited ("Chance", the "Company") and other matters related to ongoing engagement. [redacted]nd I will be in Old Crow during the General Assembly ("GA") where we have been invited to make a presentation to the community on August 9. The three of us will be in Old Crow from late morning on August 8 until the morning of August 10 although both [redacted] and [redacted] will arrive before August 8. In addition to Chance representatives, [redacted] [redacted]and [redacted]f Hemmera will also be in Old Crow for the entire week of August 5-9 doing some engagement work with the community as part of the process of pre-submission consultation required by the Yukon Environmental and

Socio-Economic Assessment Board ("YESAB"). Hopefully there is a time while the three of us from Chance are in Old Crow to meet with the NRC, perhaps during an evening depending on the GA agenda. Please let us know what you are able to arrange.

In anticipation of the discussion surrounding the financial situation of Chance, I would like to highlight a few points for you and the NRC to consider:

1. Chance is an exploration company with a 25-year corporate history in Yukon;
2. Chance has a very supportive shareholder base to help finance the Company's business plan;
3. To demonstrate this fact, Chance has successfully raised almost $150 million to undertake a variety of exploration projects during the past 25 years;
4. An important aspect of financial management is to fund the Company on a "needs only basis" given the unknown time frame to complete impact assessments, obtain licenses to undertake activity, and manage the uncertainties inherent with oil and gas exploration;
5. The Eagle Plain area is under explored and the understanding of the oil and natural gas resource potential is still relatively immature, but through our efforts, it is improving all the time;
6. Notwithstanding the knowledge gains that Chance has made in the past 25 years, there is still considerable uncertainty in terms of outcomes from exploration activities so there is not yet a basis for any sustainable development in the area;
7. Successful exploration work will attract further investment, but the timeframe needed to graduate from exploration to resource development is unpredictable;
8. Yukon Government policies and YESAB processes have shown themselves to be unpredictable and variable both of which harm investment prospects in Yukon.

Although the foregoing comments have been presented in the context of Chance's situation, they equally apply to any oil and gas company, big and small, wishing to get involved in exploration activities at Eagle Plain.

Because of previously made commitments to continue engagement with the other affected First Nations who have interests in and around Eagle Plain and scheduled annual leave during the next two months, it is most convenient for Chance to meet with the NRC while we are in Old Crow to participate at the annual GA. Also, to the extent that this proposed meeting with the NRC relates to Chance's outstanding application to the Yukon Government seeking extension in tenure to exploration permits 0006-0011 and 0019, having our meeting while we are in Old Crow is worthwhile to accommodate the Yukon Government processes outlined in the Yukon Oil and Gas Act prior to the August 30, 2019 deadline for the permits to be either continued or expire.

Thank you for the invitation to meet and hopefully you are able to accommodate the suggested timing during the GA. We look forward to continuing working with you preparing the YESAB submission and other engagement activities.

Yours truly,
Chance Oil and Gas Limited

APPENDIX 2-C-43. *Vuntut Gwitchin Heritage Act*

VUNTUT GWITCHIN HERITAGE ACT

An Act to provide direction for the management of Yukon First Nations heritage and culture, in order to:

i. recognize and affirm the inherent right of the Vuntut Gwitchin over its heritage and culture;
ii. recognize and affirm the Vuntut Gwitchin Self-government Agreement Section 13 powers over Vuntut Gwitchin heritage and culture;
iii. recognize the uniqueness of Yukon First Nations concepts of heritage; and
iv. fulfil the Vuntut Gwitchin Final Agreement Chapter 13 provisions to respect and foster the culture, history and values of Yukon First Nations People.

Yukon First Nations Culture and Heritage

Each Yukon First Nation has its own unique cultural practices and languages. Yukon First Nations also share a common heritage with many common laws, principles and values. This document articulates our shared understandings and core heritage values — in order to distinguish what our Elders call "our way" from the "western" or "English way."

What Our Elders Say About Our Heritage

Living heritage – the Vuntut Gwitchin way

"Our culture is our inheritance. When we live our culture we are keeping it alive, we are sustaining it. You don't know traditional knowledge, you have to live it – the way we grow up, the way we hunt, the way we live on the land. The land is our university and our church. We went to school out on the land. That's our university."

Storytelling

"In our way, we tell stories to get something out. The story comes from a true incident or experience and it tells us how someone had learned from that event. Because it is based on a true incident it is a valid lesson. Rather than trying to teach someone something, you tell a story about something you experienced. This shows the listener that they are not the only one who has experienced that kind of situation. It is a way of teaching so that the listener doesn't become offended or defensive. We live our culture, that's how we were taught."

Living "in a good way"

"Heritage is our way of life. The stories about creation and how we learn from the animals and the land teach us about how to take care of ourselves and to survive on the land and to do it "in a good way." And I guess that "in a good way" means respect. That is our biggest law. Respect is the one that encompasses everything. When you go against doing things "in a good way," that is with respect, that's when traditional law comes in. When we do things in a bad way, it is disrespect – meaning that you have gone against all the natural laws. You bring all the negative to yourself. It is the same concept as – the idea that what you put out there comes back to you."

"We are part of the land, part of the water"

"Heritage is our knowledge of and connection to the land. We are part of the land. When we are out there on that land, we are part of it, but we are not the be-all and end-all. Every rock, plant, tree and animal are part of the land and the water is part of it. Everything has a spirit. Our connection to the land is a spiritual connection."

Place and identity

"The land is part of our culture. People connect themselves to place. Place is very critical for us. In the past, we had no maps but there were lots of sacred areas – and landmarks that always provided for us. The land is who we are."

Responsibility and survival

"The land ensures our survival. You have to look after the land, you have to look after the animals. The land is our heritage: because we use it, because it is everything, everything comes from the land. Keep your land clean, keep your animals, they are your friends. You look after them, they look after you. You look after your water, land, trees, you look after the land, you respect it. That's our spirituality."

Relatedness and "what is called 'ownership' in the English way"

"My grandma always said when we were out on the land 'you remember, this is the animals' home, and the home of every living thing.' In our way, they are all an integral part of the land. Everything is an integral piece, we humans are just one part. The land is our lifeblood. The land is not our land. We belong to this land: we are born on it, we are raised up on it and we are going to die on it. This land owns us, we don't own the land."

Yukon First Nations Way of Life, Traditional Laws and Core Values Pertaining to Heritage

Way of Life Summary

Our heritage is a way of life in which knowledge and understanding of history, culture, and survival is passed on from generation to generation by parents and Elders.

The oral, cultural, experience-on-the-land basis of our heritage makes it flexible, adaptive and evolving. It is a dynamic, living heritage and culture based on traditions which are shaped by our history in a harsh environment. Balancing tradition and adaptability has ensured our survival. In our way, change and adaptation are aspects of our laws, practices and values, that have guided and protected us for millennia.

Our sense of relationship and relatedness is distinct from the Western concept of autonomous individuality. Our way of life includes relationships with people, other animals, plants, the spirit world, and the land – rivers, lakes, mountains, wetlands, etc. All parts of the land are interdependent.

The land is central to our identity; it is the source of life, we understand ourselves as part of the land, related to the entire natural environment and to everything in it. In our way, we see the interconnectedness of all aspects of life. Everything is imbued with spirit.

Our kinship ties are based on people who honour the same relationships, and are not dependent on blood relations, language, or geography. Our concept of relatedness underlies our stewardship responsibilities to one another, to our heritage, and to the land.

Our law requires us to respect and honour our heritage, practices and protocols, including respect for the land and acceptance of our stewardship responsibilities towards it.

Our heritage is our way of life as part of the land. In our way we do not divide heritage into separate categories. What we consider directly related to our history and culture is not affected by western classification.

Principles and Values Pertaining to our Heritage

Our holistic perspective produces concepts of reciprocity, moderation, balance, harmony that beget a code of conduct based on the principle of reciprocity (a concept of moderation and self-control, of taking and giving back) and the supreme value of respect (an attitude of humility and gratitude). These principles guide the interplay of values like humility, adaptability, openness, responsibility, honour, truthfulness, and self-reliance that are reflected in expected behaviors that people demonstrate between each other and the land.

Historically, land was to be shared by everyone regardless of family, language, or nation. When conflict arose it was resolved in accordance with traditional practices. Resolution of conflict was based on reciprocity and balance between people. Members of the group with knowledge and experience would discuss the issue and come to an agreement that would resolve the situation. The goal was to maintain balance between the individuals, families, or groups. It was imperative that solutions did not create undue hardship for either group nor create excessive benefit for the other. In this way moderation, humility, balance, and respect were reinforced.

Moderation and balance govern paradoxical values like interdependence and self-reliance. In our way “tradition” includes “openness to new things.”

Harmony and balance pertain to maintaining the greater good, in our holistic perspective. In our code of conduct, collaboration, working together collectively in the interest of the greater community are essential; consensus decision-making is expected; resources and work are shared. All things are cared for.

Adaptability and openness to new things, resourcefulness, ingenuity and self-reliance are essential characteristics and values for survival in our harsh environment.

Accountability, taking responsibility for actions and stewardship obligations, honouring relationships, being truthful and doing what we say we are going to do are valued behaviours and habits that guarantee the sustainability of the land and our peoples.

The supreme value of respect pervades our traditional laws, customs and practices. Treating every person and every living thing respectfully is deeply ingrained in our way of life and traditional practices. Respect is core in all aspects of life and should be reflected in thoughts, words and actions. Respect for Elders is particularly important.

Citation

1. This Act may be cited as the Vuntut Gwitchin Heritage Act.

Purpose

2. This Act:

   (a) affirms the Yukon First Nations inherent right to define our heritage, culture, history and values;
   (b) ensures the preservation and promotion of the Vuntut Gwitchin's heritage in and on the Traditional Territory of the Vuntut Gwitchin, in a manner that is consistent with Chapter 13 (and the inherent right);
   (c) ensures that Heritage Resources in Vuntut Gwitchin Traditional Territory are managed in a manner that is consistent with Yukon First Nations values and the Vuntut Gwitchin Final Agreement;
   (d) articulates Yukon First Nations values and principles related to heritage and provides definitions required for the implementation of this Act;
   (e) provides a mechanism for resolving conflicts between the Vuntut Gwitchin and other Yukon First Nations, and between the Vuntut Gwitchin and other governments, regarding the stewardship and management of Heritage Resources; and
   (f) such other matters ancillary to the foregoing.

Interpretation

3. In this Act the following definitions apply,

   (a) **Act** means the Vuntut Gwitchin Heritage Act approved by the Vuntut Gwitchin General Assembly, as amended from time to time;

   (b) **Archaeological** means relating to the field of archaeology, the scientific study of cultures through the examination of their material remains such as buildings, graves, tools, and other artefacts.

(c) **Council** means the Chief and Council identified in the *Vuntut Gwitchin Constitution*.

(d) **Cultural Landscape** refers to the unity of culture, history, the spirit world, the land and its inhabitants.

(e) **Ethnographic**

i. means relating to the branch of anthropology called ethnography, concerned with ethnicity or ethnic groups, used to describe an object or other tangible or intangible aspects of a particular ethnic/cultural group; and

ii. can include archaeological and paleontological objects.

(f) **Heritage Resources** has the same meaning as in the Final Agreement which includes, Moveable Heritage Resources, **Heritage Sites** and Documentary Heritage Resources.

(g) **Heritage Site** has the same meaning as in the Final Agreement, and includes intangibles associated with the Yukon First Nations concept of "cultural landscape."

(h) **Historic Resources** means relating to the field of history. Yukon First Nations history is a dimension of a dynamic living heritage that is transmitted through stories, place names, families and a way of life. In the holistic Yukon First Nations worldview the term "Historic" is included within the term "heritage." This act therefore does not distinguish between Historic Resources and Heritage Resources. Historic Resources include tangible and intangible evidence of Yukon First Nations heritage.

(i) **Paleontological** means relating to the field of palaeontology, the scientific study of past life using fossil and paleontological evidence.

(j) **Yukon First Nations**

i. has the same meaning as in the Vuntut Gwitchin Final Agreement and includes "Yukon Indian People."

ii. refers to the collective and shared ethnicity of "Yukon Indian People," and may also refer collectively to the group of First Nations located in Yukon.

(k) **Yukon First Nations Heritage** refers to

i. the way of life and worldview inherited from previous generations, and

ii. both tangible and intangible elements of Yukon First Nations heritage.

Application

4. Vuntut Gwitchin heritage shall be managed in accordance with this Act and in accordance with the Vuntut Gwitchin Final Agreement and the inherent right of the Vuntut Gwitchin respecting heritage and culture.

5. Vuntut Gwitchin Heritage Resources shall be managed in a manner that is consistent with Yukon First Nations values and the Vuntut Gwitchin Final Agreement.

6. "What our Elders Say" and "Yukon First Nations Worldview, Traditional Laws and Core Values Pertaining to heritage" sections shall guide the interpretation and understanding of Yukon First Nations heritage, and this Act.

7. This Act applies to the Traditional Territories of the Vuntut Gwitchin.

Authority

8. **Definition:**

   (a) **Yukon Heritage Resources Board** means the board referred to in the Vuntut Gwitchin Final Agreement;

   (b) **Authorized Body** means the body authorized by the Vuntut Gwitchin to determine direct relatedness and to settle disputes.

9. Defining the culture and values of Vuntut Gwitchin is within the exclusive jurisdiction and authority of the Vuntut Gwitchin.

10. The determination of whether or not a Heritage Resource discovered or found within the Traditional Territory of the Vuntut Gwitchin can be readily identified as directly related to Yukon First Nations history and culture is the exclusive jurisdiction of the Vuntut Gwitchin, and shall be made in accordance with this Act.

11. The Authorized Body shall be established by the Vuntut Gwitchin Council for the purposes of:

   (a) determining direct relatedness and providing recommendations to the Yukon Heritage Resources Board and

   (b) addressing and resolving any conflicts or disputes over stewardship responsibilities towards heritage interests between different Yukon First Nations, and advising the Yukon Heritage Resources Board.

12. The Authorized Body shall attempt to make decisions by consensus, and may consult with any individuals, members of the community or bodies (including other Authorized Bodies) in making their decision.

13. Any dispute with respect to the stewardship and custody of Heritage Resources between different First Nations shall be resolved by one or more designated representatives of each First Nation Authorized Body, or by representative(s) appointed by the respective Council of each First Nation.

   (a) Any resolution of a dispute shall be documented and forwarded to the Yukon Heritage Resources Board.

   (b) Any dispute resolution failure shall be documented and forwarded to the Yukon Heritage Resources Board.

Determining Relatedness

14. **Definition:**

    (a) **Determining Direct Relatedness** means determining whether or not a Yukon Heritage Resource, Site or other intangible heritage interest is "directly related to" the culture and history of Yukon First Nations.

15. Any determination of relatedness (that is, whether or not a Heritage Resource is directly related to the culture and history of Yukon First Nations, as required for the implementation of the Vuntut Gwitchin Final Agreement) shall be made by the Authorized Body.

16. In rendering its decision on the relatedness of a Heritage Resource to a Yukon First Nation, the Authorized Body shall provide written reasons why the Heritage Resource is connected to the Yukon First Nation.

17. If the Authorized Body is not able to readily identify whether a Heritage Resources found on non-settlement land is directly related to the culture and history of Yukon First Nations, the Authorized Body shall refer the matter to the Heritage Resources Board, with recommendations regarding the manner in which the relatedness to Yukon First Nations should be determined.

Ownership

18. This Act recognizes the custody and stewardship responsibilities for heritage and the land that Yukon First Nations customary laws require.

19. For the purposes of determining the ownership of Heritage Resources under the Vuntut Gwitchin Final Agreement 13.3.2, **ethnographic** Heritage Resources can include everything of heritage value – whether found in or on the land or water, whether animal or human or any other product of the land, that at any time was or is related to the culture and history of Yukon First Nations Peoples – regardless of whether it might also be described in the "western way" as *archaeological* or *paleontological* resources.

General Provisions

Regulations

20. The Council may make regulations it considers advisable for the purposes of this Act, including, but not limited to, the following matters:

    (a) stewardship standards in the management and care of Vuntut Gwitchin Heritage Resources, including Heritage Sites;

    (b) stewardship standards with respect to developments taking place in the Vuntut Gwitchin Traditional Territory;

    (c) research being conducted with Vuntut Gwitchin people or on the Traditional Territory of the Vuntut Gwitchin;

    (d) place names in the Traditional Territory of the Vuntut Gwitchin;

(e) communication protocols between

i. researchers and the Vuntut Gwitchin,

ii. a person (including an official of another government) or a company conducting business who discovers anything of Yukon First Nations heritage value,

iii. different governments regarding anything of Yukon First Nations heritage value and including information being provided about the Vuntut Gwitchin; and

(f) any other matter the Council considers advisable for the operation of this Act.

Discovery of Heritage Resources

21. **Definitions:**

(a) **Person** means any person including officials of other governments or a company conducting business.

22. Any person who finds a Heritage Resource as defined in this Act in the Traditional Territory of the Vuntut Gwitchin that is or may be related to the history or culture of Yukon First Nations on or in the Traditional Territory of the Vuntut Gwitchin must report the finding to the Vuntut Gwitchin within 5 days or as soon as is practicable.

23. A person who finds a Heritage Resource under Section 22 shall not damage or remove it from the place it was found without the written consent of the Vuntut Gwitchin, unless the discovery is accidental and the object may be difficult to re-locate if it is left where it was found.

(a) If a Heritage Resource is discovered accidentally and may be difficult to relocate then the finder shall report the finding and deliver the object to the Vuntut Gwitchin, immediately or as soon as is practicable.

24. If there is any inconsistency or conflict between the provisions of this Act and the provisions of the Final Agreement, the Final Agreement shall prevail to the extent of the inconsistency or conflict.

Penalties

25. A person who contravenes this Act commits an offence is liable to:

(a) a fine up to $5,000, or 6 months imprisonment or both; or

(b) any other culturally prescribed remedy that is not in conflict with Canadian or Yukon Law.

Commencement

26. This Act comes into force on the date proclaimed by the Vuntut Gwitchin Council.

1.0 INTRODUCTION

This report demonstrates implementation of the *Vuntut Gwitchin Government and Chance Oil and Gas Limited Communications and Engagement Plan* (Plan) (see **Appendix A**) finalized on May 22, 2018. It summarizes discussions held between Vuntut Gwitchin Government (VGG) and Chance Oil and Gas Limited (Chance) between June 1, 2020 and May 31, 2021. The purpose, objectives, and outcomes of each discussion are explained below to fulfill the requirements of Ministerial Order (MO) 2018/ 42 (See **Appendix B**) issued to Chance on August 30, 2018.

2.0 BACKGROUND

The development of communications and engagement plans began with Order in Council (OIC) 2016/169. OIC 2016/169 required Chance to file a First Nations communication and engagement plan with the Minister of Energy, Mines and Resources in order to extend tenure on their northern permits: 0005, 0006, 0007, 0008, 0009, 0010, and 0011 (see **Appendix C**). Chance complied with OIC 2016/169 and received their tenure extension.

Chance subsequently received MO 2017/37 when applying for tenure extension on six of eight southern permits: 0012, 0013, 0014, 0015, 0016, and 0017. MO 2017/37 required Chance to revise, in consultation with affected First Nations, the consultation and engagement plan filed under OIC 2016/169. The affected First Nations listed in MO 2017/37 were Vuntut Gwitchin First Nation (VGFN), Tr'ondëk Hwëch'in, First Nation of Na-Cho Nyäk Dun, Gwich'in Tribal Council, and Tetlit Gwich'in Council.

VGG and Chance collaboratively developed their Plan through a series of in-person meetings and conference calls. Hemmera was retained by Chance in November 2017 to facilitate the development and completion of the communications and engagement plans with the affected First Nations.

VGG and Chance submitted their finalized Plan to Minister Ranj Pillai on May 22, 2018. To complete its obligations under MO 2017/37, Chance filed a total of four communications and engagement plans. All four plans were approved by the Minister and Chance received a five-year tenure extension on the six southern permits.

A condition of the five-year tenure extension, issued via MO 2018/42, required that Chance submit annual reports summarizing actions taken to implement each communications and engagement plan.

The Plan incorporates VGG's Oil and Gas Engagement Policy (the Policy). The Policy, developed by VGG and reviewed by Chance, provides a protocol for engaging with VGG on oil and gas matters.

See **Appendix C** for a map of Chance's current permits.

3.0 ENGAGEMENT AND COMMUNICATION PLAN IMPLEMENTATION SUMMARY

3.1 Overview

Parties have advanced discussion on Chance's proposed Eagle Plains Exploration Project and Chance's proposed project for Well Maintenance and Extended Flow Testing. The following sections provide separate

DRAFT

summaries of engagement activities that occurred for each of Chance's projects between June 1, 2020 and May 31, 2021. Engagement activities pertaining to the Well Maintenance and Extended Flow Testing Project are summarized first followed by engagement activities/events in relation to the Eagle Plains Exploration Project.

3.2 Summary of Engagement – Well Maintenance and Extended Flow Testing Project

Initial notification was sent to VGG's Director of Natural Resources on May 25, 2020. A distinct communication package was sent via email to initiate engagement activities with VGG. This package was structured in accordance with protocols outlined in the *Vuntut Gwitchin Government Oil and Gas Engagement Policy*. This package included a draft of the project description dated May 22, 2020.

VGG and Chance organized a conference call July 9, 2020 wherein VGG requested a high-level overview of the project. To assist Chance in preparing meeting materials for the July 9th meeting, VGG provided an agenda and questions ahead of time. VGG informed Chance that its questions were meant to gather additional information necessary for the First Nation to complete their detailed review of the draft project description (dated May 22, 2020). On July 10, 2020, VGG provided Chance with formal information requirements related to the project. VGG requested the following additional information:

- Mitigation measures to avoid or minimize potential environmental effects (specifically with respect to Porcupine Caribou)
- Regulatory context
- Well tests (e.g., varying tests between the wells, how Chance would address evidence of gas migration, what would be done with removed fluid)
- Project components (e.g., which materials would be stored on site, which materials will be incinerated, vehicles planned to be used)
- Water withdrawal (e.g., sources, volume, schedule).

The additional information requested by VGG was gathered, drafted, and refined during the effects assessment and development of the project proposal. Feedback from VGG impacted the development of mitigation measures and contributed to identifying additional information that was previously missing from the earlier draft of the project description and the project proposal (e.g., additional information on the regulatory context and the rationale for maintaining the wells in suspended well status versus abandonment) as it was being developed.

On July 22, 2020, Chance responded to VGG's July 10, 2020 information request in the format requested by VGG. This document can be provided upon request. In addition, Chance shared a draft of the project proposal with VGG on July 22, 2020.

Following additional conversations with the regulator (Government of Yukon), Chance was required to make changes to its project design. On August 7, 2020, VGG was provided notice that revisions were being made to the project and that additional information would be forthcoming. A revised project proposal was provided, via email, to VGG on August 28, 2020, along with a cover letter summarizing the revisions and providing a rationale for each.

Chance held a community open house in Old Crow on September 3, 2020 and was able to have an in-person meeting with the members of the VGG Natural Resource Committee that same day. Members of

DRAFT

the committee and VGG Government took the opportunity to question Chance on the revised project and, while high level feedback was provided, VGG informed Chance that they would be providing detailed comments the following week. Chance representatives also met with the Old Crow Development Corporation (September 2, 2020), and the North Yukon Renewable Resources Council (September 3, 2020) during that week. For both of those meetings Chance provided an overview of the proposed project and answered questions related to the Project design and effects assessment.

Chance submitted an initial project proposal to YESAB on September 11, 2020. On October 9, 2020, VGG informed Chance that their questions, alluded to following the VGG Natural Resource Committee meeting (September 3, 2020), were finalized and would be incorporated into VGG's submission into YESAB. At that time, Chance was not provided a copy.

After additional consideration, Chance determined that changes were required for its project proposal. On November 2, 2020, via email, Chance notified VGG that it had decided to withdraw its project proposal from YESAB and submit a revised version. In that email Chance stated that once a revised proposal had been drafted, Chance would notify VGG by sharing a draft and requesting a meeting to discuss the changes further, and Chance stated at that time that after it had the opportunity to discuss those changes with VGG, the project proposal would be finalized and resubmitted to the Dawson Designated Office (DO).

On November 3, 2020, Chance and the VGG Natural Resource Committee had a meeting wherein Chance was able to provide additional information pertaining to reasons for the withdrawal of the original application from the DO. At that time, VGG representatives expressed concern regarding the significance of the changes from the previous iterations (i.e., inclusion of extended flow testing (EFT)). VGG indicated that, after receiving the new version in writing, it would require time to review and formulate a response. VGG suggested that an additional meeting between Chance and VGG would be needed. Chance agreed to schedule a meeting with VGG and that the meeting would occur after the First Nation had received the revised project proposal.

The revised draft project proposal was provided, via email, to VGG on November 19, 2020. However, in that email, Hemmera indicated that Chance would be submitting the proposal to YESAB the following day. VGG responded that same day and expressed concern about Chance not meeting with VGG prior to submission to YESAB and the short timeframe for VGG to be able to provide comments prior to submission. VGG indicated that it would likely not be able to provide comments in that timeframe, especially given the significant shift in Chance's proposed activities. On November 20, 2020, Hemmera informed VGG that Chance would delay submission to YESAB until the following week.

On November 25, 2020, VGG informed Chance, via email, that it was not able to provide detailed comments within the short timeline provided by Chance. From their initial and limited review of the revised proposal, VGG identified several questions that required clarification from Chance. VGG also stated that they reserved the ability to provide further and more detailed comments and views in the future once they had an opportunity to understand the revised proposal more fully. VGG advised Chance that the questions included in their email were in addition to any outstanding questions and information requests previously sought by VGG pertaining to Chance's original proposal (i.e., to the extent that they remained relevant). To facilitate an accurate and comprehensive response, Chance requested VGG provide an updated document containing their comprehensive feedback and questions.

DRAFT

On December 14, 2020, Chance shared an updated project proposal in response to VGG's November 15th questions. Chance and VGG subsequently held a meeting on December 17, 2020 where parties discussed Chance's responses and additional questions VGG had at that time. The discussion centered around Chance's consideration of potential interactions between EFT activities and birds, air quality, caribou, and permafrost. Additional detail is provided below:

- Chance clarified a flare stack height of 30.5 m is planned in order to minimize possible interactions with permafrost, vegetation and/or trees.
- Text was added to demonstrate consideration of Air Quality as a potential valued component and rationale as to why it was not carried forward for assessment.
- Text was added clarifying that while flaring, and other activities related to EFT, could cause additional potential disturbance and effects on wildlife, the assessment of potential project effects on caribou assumed 24h noise and light disturbances, so that including EFT activities was not considered a material change.

Additionally, in correspondence leading up to the December 17th meeting and during the meeting itself, VGG expressed the importance of addressing concerns of Yukon First Nation partners prior to the Proposal's submission to YESAB. The project proposal was submitted to YESAB on December 24, 2020.

3.3 Summary of Engagement – Eagle Plains Exploration Project

Between June 1, 2020 and May 31, 2021, Chance and VGG exchanged emails/letters and met in relation to their ongoing negotiations of a Cooperation Agreement. Meeting details as well as subsequent drafts of the Cooperation Agreement are confidential and not addressed in this report.

While Chance and VGG did not meet to discuss the Eagles Plains Exploration Project between June 1, 2020 and May 31, 2021, in the Spring of 2021 two key letters were exchanged between VGG and Chance. They are summarized in the following section.

3.3.1 Correspondence Summaries

Date: March 31, 2021
Location: Letter via email
Addressed: [redacted]

Chief [redacted] and the VGG Chief Executive Officer of VGG addressed a letter to [redacted], Chairman and CEO of Chance. The topic of the letter was on communication and engagement with the VGG. Chief [redacted] stated that Chance had, in relation to the Eagle Plains Exploration Project, consistently failed to adhere to the Policy and the joint Plan. Chief [redacted] explained that VGG has effectively communicated that they are committed to sustainable development, and the rights of VGFN Citizens to free, prior, and informed consent. Additionally, Chief [redacted] referenced constituent elements of free, prior, and informed consent from the UN Expert Mechanism on the Rights of Indigenous Peoples.

The letter gave notice that, following events at a special meeting of the VGFN General Assembly and consultation between VG Council and the Natural Resources Committee, VGG was immediately implementing the following measures:

DRAFT

1. Ceasing all communication and engagement between VGG and Chance, including negotiations under the Policy.
2. VGG would be conducting an internal review of the Plan for consistency with the Policy.
3. Requiring that all Chance staff, directors, consultant, and advisors, while acting in such a capacity, may only participate by invitation in VGG internal governance processes and mechanisms regarding the Eagle Plains Exploration Project (e.g., VGG planned consultation meetings with VGFN Citizens and meetings of the VGFN General Assembly).
4. Instructing Chance to submit advance written notice of any planned consultation with VGFN Citizens, which would not be considered consultation with VGG, accordance with section 21 of the Policy.
5. Stating future communication and engagement between Chance and VGG would be initiated from Chief [redacted] to [redacted] and any future meetings would be held in Old Crow in an open forum where VGFN Citizens could attend and participate.
6. Stating future negations of the Cooperation Agreement or Benefits and Stewardship Agreements would be held in Old Crow for VGFN Citizens to attend and observe.

VGG informed Chance that these measures would remain in effect until further notice.

Date: April 12, 2021
Location: Letter via email
Addressed: To [redacted]*. From* [redacted]

Before addressing the VGG's letter (dated March 31, 2021), [redacted] provided a background description of his personal interests and commitments for oil and gas exploration in the Eagle Plains Basin. Chernoff stated that despite hydraulic fracking being banned in 2015, he is still committed to exploration in the Eagle Plains Basin. Chernoff referenced the letter from VGG and disagreed with Chief [redacted], stating that Chance has followed both the Policy and the Plan. [redacted] described that Chance believes it has been cooperative, respectful, transparent in its dealings with VGG.

[redacted] described some of Chance's efforts at collaboration, stating that they have shared significant information with the Natural Resources Committee and that Chance would be arranging meetings so its consultants could share information with VGG and VGFN Citizens. [redacted] shared concerns that he believed VGG had not reciprocated Chance's good faith efforts. Chernoff described how Chance has complied with various regulatory requirements: Yukon *Oil and Gas Act*, *Yukon Environmental and Socio-Economic Assessment Act*, and the North Yukon Regional Land Use Plan. [redacted] invited suggestions from VGG on how the disconnect between Chance and VGG could be resolved in a timely manner while equitably addressing the interests of the parties.

[redacted] shared his disappointment with VGG was taking steps to terminate further engagement. He declared Chance's ongoing respect for the VGFN Land Claim Agreement and the economic, environmental, cultural and heritage interests of the VGFN. As a result of time restraints pertaining to Chance's tenures, [redacted] stated that Chance would move ahead with steps needed to preserve its tenure interests and that Chance intended to submit the Eagle Plains Exploration Project to YESAB fall 2021. [redacted] closed with a suggestion that that [redacted] and himself should meet with VG Chief and Council at their earliest convenience.

3.4 Communication Log

The correspondence between Chance and VGG is documented in the Engagement Log (see **Appendix D**).

4.0 PLANS FOR ONGOING ENGAGEMENT AND NEXT STEPS

No additional engagement activities are expected for the Well Maintenance and Extended Flow Testing Project while it is undergoing YESAB's review.

For the Eagle Plains Exploration Project, upcoming engagement activities may include open houses in Old Crow, subject to COVID restrictions, as well as meetings with the North Yukon Renewable Resource Council.

Consultation and engagement activities between the VGG will continue to be guided by the March 31 letter from Chief [redacted] to [redacted], as well as the Plan and the Policy therein.

DRAFT

5.0 APPROVAL OF IMPLEMENTATION SUMMARY

VGG and Chance have reviewed this report and agree to its contents as an accurate summary of the engagement activities carried out between June 1, 2020 and May 31, 2021.

DRAFT

APPENDIX A

Vuntut Gwitchin Government and Chance Oil and Gas Limited Communication and Engagement Plan

DRAFT

Vuntut Gwitchin Government

Chance OIL AND GAS LIMITED

May 22, 2018

Honourable [redacted]
Minister of Energy, Mines and Resources
Government of Yukon
Box 2703
Whitehorse, Yukon Y1A 2C6

Dear Minister [redacted]

Re: Submission of the Vuntut Gwitchin Government and Chance Oil and Gas Limited Communications and Engagement Plan

Ministerial Order 2017/037 of the Yukon Oil and Gas Act states the following in clause 5:

> *5 It is a condition of this Order that Chance Oil and Gas Limited must, in consultation with each affected First Nation, revise the first nations communications and engagement plan filed under O.I.C. 2016/169 to the satisfaction of the Minister on or before August 1, 2018.*

Vuntut Gwitchin Government (VGG) and Chance Oil and Gas Limited (Chance) are pleased to inform you of our collaborative efforts to develop a mutually agreeable framework to facilitate effective and meaningful communications and engagement between VGG and Chance. The framework captured in the enclosed Communications and Engagement Plan (Plan), and its collaborative development, establishes a solid foundation for a respectful relationship that both parties will implement and enjoy as we continue to work together now and into the future.

Please accept the enclosed Plan for the purposes of Ministerial Order 2017/037. We trust that the Plan will be of satisfaction to the Minister, as it meets the needs of VGG and Chance at this time.

[redacted]

Director of Natural Resources
Vuntut Gwitchin Government

Vice President of Government and External Relations
Chance Oil and Gas Limited

Enclosed: Communications and Engagement Plan

COMMUNICATION AND ENGAGEMENT PLAN

VUNTUT GWITCHIN GOVERNMENT & CHANCE OIL AND GAS LIMITED

MAY 17, 2018

1. Background

Chance Oil and Gas Limited ("Chance") is an oil and gas exploration company that currently holds valid permits to perform oil and gas activities in the Eagle Plain basin within the Traditional Territory of the Vuntut Gwitchin First Nation ("VGFN").

As a condition of order-in-council 2016/169 dated August 30, 2016 concerning the return of work deposits to Chance in relation to oil and gas permits nos. 0005 to 0011, Chance was required to file a communication and engagement plan (the "Plan"). The Plan, as it was submitted, was not mutually agreed upon between Chance and the Vuntut Gwitchin Government ("VGG").

As a condition of ministerial order 2017/37 dated August 29, 2017 concerning a one-year extension for oil and gas permit nos. 0012 to 0017, Chance is now required to revise the Plan in consultation with VGFN on or before August 1, 2018.

2. Purpose

The purpose of this document is to revise the Plan in a manner that establishes a mutually agreed upon framework between Chance and VGG to guide communication (i.e. the exchange of information) and engagement (i.e. meaningful participation in planning, problem-solving and decision-making) in relation to all aspects of Chance's activities, including but not limited to, community information programs; existing or proposed oil and gas dispositions; and existing or proposed oil and gas activities.

Nothing in this Plan is intended to address or satisfy any duties or responsibilities of the Government of Yukon that exist or may arise in relation to Chance's exploration program.

3. Application of Oil and Gas Engagement Policy

The *Vuntut Gwitchin Government Oil and Gas Engagement Policy* attached to this Plan as Appendix A (the "Policy") will be the overarching framework that guides engagement between VGG and Chance in relation to Chance's activities. Chance will comply with the Policy and any other applicable VGG policies. To the extent that there may be any inconsistency between this Plan and the Policy, the Policy will prevail.

4. Communication and Engagement

The communication and engagement between Chance and VGFN in relation to Chance's exploration program activities is anticipated to encompass communication and engagement between: (a) Chance and VGG; and (b) Chance and VGFN Citizens.

4.1 Communication and Engagement between Chance and VGG

The VGG committee mandated under part two of the Policy will be the VGG body responsible for managing communications and engagement between Chance and VGG, including informing and seeking views of VGFN Citizens, with the exception of any communications related to any

negotiations of towards a Cooperation Agreement or Benefits and Stewardship Agreement which will occur directly between Chance and Council as set out under the Policy.

Table 1.

Subject Matter	VGG Contact(s)	Chance Contact(s)
Communications related to Chance's exploration program activities, other than those communications excepted below.	• Director of Natural Resources • Chair of the Standing Committee on Natural Resources, Heritage, Tourism and Economic Development	• Management Team
Communications related to the negotiation of a Cooperation Agreement or Benefits and Stewardship Agreement.	• Council	• Management Team

4.2 Communication and Engagement between Chance and VGFN Citizens

VGG does not serve a gatekeeping role with respect to any communications and engagement that Chance may wish to undertake with VGFN Citizens in relation to Chance's exploration program activities; however, VGG and Chance will seek to coordinate communication and engagement efforts with VGFN Citizens to the extent such joint communication and engagement is possible or appropriate. As detailed in the Policy, Chance will submit a written notice to the Director of Natural Resources within a reasonable time prior to any proposed public meetings with VGFN Citizens in order to facilitate coordination between Chance and VGG.

Table 2.

Subject Matter	VGG Contact(s)	Chance Contact(s)
Written notice of proposed meetings with VGFN Citizens in relation to Chance's exploration program activities.	• Director of Natural Resources	• Vice President of Government and Community Relations

4.3 Communication and Engagement Methods and Content

Chance and VGG will use the following methods for carrying out communication and engagement in relation to Chance's exploration program activities:

- In-person meetings;
- Public meetings (for communication and engagement with VGFN Citizens in Old Crow and Whitehorse);

- E-mail correspondence;
- Telephone correspondence (teleconferences and less formal phone calls);
- Power Point presentations (to support in-person meetings);
- Reports (as requested and as required);
- Social media;
- Newsletters; and
- Official websites.

The information exchanged in communication and engagement between Chance and VGFN is anticipated to address the following key items:

- Information programs regarding VGFN culture and history;
- Information programs regarding the oil and gas industry, including its history and regulation in Yukon;
- Any existing or proposed Chance oil and gas dispositions;
- Any existing or proposed Chance oil and gas activities;
- Items set out in the Policy that must be addressed in any Cooperation Agreement and Benefits and Stewardship Agreement between VGFN and Chance; and
- Implementation of the Policy.

5. Records Management

Chance and VGG will use the following records management protocols in relation to communications and engagement between Chance and VGG.

5.1 Records Subject to Disclosure to Regulators and Assessors

Subject to the records management protocols in this Plan, Chance may disclose the following types of relevant records to regulators and assessors:

- meeting agendas;
- meeting minutes;
- meeting participant lists;

- records log which includes summaries of the following: in-person meetings; e-mail and telephone correspondence between Chance and VGG, including supporting materials shared or discussed in the correspondence;

- reports provided by either VGG or Chance to one another; and

- Power Point presentations provided by either VGG or Chance to one another.

5.2 Records Management Procedures and Confidentiality Protocols

Records of communications between VGG and Chance will be made, and any support services retained by either Chance or VGG to those records will be conducted in a fair and unbiased manner. Should VGG and Chance choose not to retain records management support services, VGG and Chance will jointly decide on an individual or individuals from either or both parties to be responsible for records keeping and management.

Chance, VGG and any person or party retained to assist in records management will comply with the following procedures for records management:

- Meeting agendas will be developed collaboratively between VGG and Chance and mutually agreed upon prior to the outset of the meeting.

- Meeting minutes will be taken by a designated records management person or party and sent to Chance and VGG within 2 weeks via e-mail. VGG and Chance may review and provide comment to the records management person or party on these meeting minutes within 30 days of both parties receiving the meeting minutes. Should either party require more time to review the meeting minutes, the party will notify the records management person or party by e-mail within 2 weeks of receiving the minutes. No response by VGG or Chance to meeting minutes will be interpreted as general acceptance of the meeting minutes by that party.

- Action items and key outcomes will be logged during meetings and will be reviewed by both parties at the end of the meeting to ensure that there is general agreement on the list of actions and parties responsible for those actions and on the list of key outcomes from the meeting. The list of action items and the list of key outcomes will be recorded within the meeting minutes.

- Any reports or Power Point presentations provided by either VGG or Chance to one another will be considered final upon delivery unless otherwise specified as drafts.

- A record log will be jointly reviewed and approved by Chance and VGG for accuracy, completeness, and compliance with this Plan prior to being disclosed to any regulator and assessor.

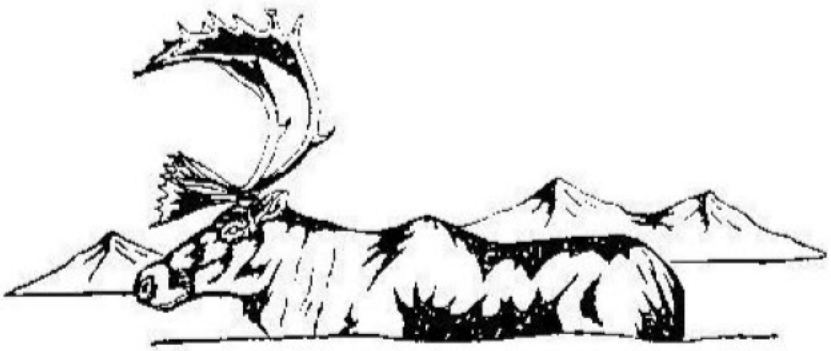
Chance and VGG will comply with the following confidentiality protocols for records management and the disclosure of records to regulators and assessors:

Table 3.

Type of Record	Confidentiality Assumption	Process for Establishing Confidentiality
Meeting Agendas	• Not confidential.	• Should confidential matters need to be discussed, a separate agenda will be created for these matters and remain confidential.
Meeting Minutes	• Not confidential.	• Confidential discussions/content will be identified before the meeting begins, during the meeting, or as part of the minutes review process.
Meeting Participant List	• Not confidential.	• Unless otherwise specified during the meeting, these items are not considered confidential.
Records Log	• Not confidential.	• Should correspondence need to be confidential, it is the responsibility of each party to notify the other when a meeting, e-mail, phone call, or attachment is confidential at the time it occurs or immediately thereafter.
Reports provided by either VGG or Chance to one another	• Not confidential. • Note: Any reports containing traditional knowledge or traditional land use will be subject to separate protocols agreed upon by VGG and Chance.	• Should a report shared between parties need to be confidential, it is the responsibility of each party to notify the other of this when the report is shared.
Power Point presentations provided by either VGG or Chance to one another	• Not confidential.	• Unless otherwise specified during the meeting, these items are not considered confidential.

6. Plan Review and Amendment

Chance and VGG will review and assess this Plan and its implementation on a quarterly basis. Following any review and assessment of the Plan, the Plan may be amended upon the mutual agreement of Chance and VGG.



VUNTUT GWITCHIN GOVERNMENT
OIL AND GAS ENGAGEMENT POLICY

MAY 2018

PART ONE
GENERAL PROVISIONS

Title

1. This policy may be cited as the *Vuntut Gwitchin Government Oil and Gas Engagement Policy*.

Definitions

2. In this policy:

"**Application**" means an application made by a Proponent in relation to an Oil and Gas Disposition pursuant to the *Oil and Gas Act*, R.S.Y. 2012, c. 162;

"**Benefits and Stewardship Agreement**" means the agreement required in relation to any oil and Gas Activity as set out at Stage III of the Engagement Process under part three of this policy.

"**Board**" means a designated office, executive committee or panel of the Yukon Environmental and Socio-Economic Assessment Board.

"**Citizen**" means a citizen of the Vuntut Gwitchin First Nation pursuant to Appendix II of the Constitution (Citizenship Code).

"**Citizen Representative**" means a Citizen appointed to the Committee by the Council.

"**Committee**" means the lands and resources committee of the Vuntut Gwitchin First Nation as mandated under part two of this policy.

"**Constitution**" means the Constitution of the Vuntut Gwitchin First Nation.

"**Cooperation Agreement**" means the agreement required in relation to any Oil and Gas Activity as set out at Stage II of the Engagement Process under part three of this policy.

"**Council**" means the branch of the Vuntut Gwitchin Government established by the Constitution consisting of the Chief, Deputy Chief and all Councillors.

"**Director of Natural Resources**" means the Director of the Vuntut Gwitchin Government's Natural Resources Department.

"**Elders Representative**" means a member of the Vuntut Gwitchin First Nation Elders Council appointed to the Committee by the Elders Council.

"**Engagement Process**" means the process commencing under part three of this policy for engagement between the Vuntut Gwitchin Government and a Proponent in relation to any Application or Oil and Gas Activity and continuing for so long as required.

"**Intergovernmental Process**" means any engagement process between the Vuntut Gwitchin Government and Government of Yukon on matters related to Oil and Gas Activities, Oil and Gas Dispositions and their regulation.

"**Oil and Gas Activity**" or "**Oil and Gas Activities**" means any existing or proposed oil and gas activity or activities as defined by Section 1 of the *Oil and Gas Act*, R.S.Y. 2012, c. 162 that affects, or has the potential to affect, any rights, responsibilities or interests of the Vuntut Gwitchin First Nation whether or not the oil and gas activity or activities are situated within the Vuntut Gwitchin First Nation Traditional Territory.

"**Oil and Gas Disposition**" or "**Oil and Gas Dispositions"** means any existing or proposed oil and gas disposition or dispositions as defined by as defined by Section 1 of the *Oil and Gas Act*, R.S.Y. 2012, c. 162 that affects, or has the potential to affect, any rights, responsibilities or interests of the Vuntut Gwitchin First Nation whether or not the oil and gas disposition or dispositions grants rights to lands situated within the Vuntut Gwitchin First Nation Traditional Territory.

"**Proponent**" means any proponent of an Oil and Gas Activity or holder of an Oil and Gas Disposition.

"**Proposal**" means a proposal required to be submitted by a proponent to the Board pursuant to Section 50(1) of the *Yukon Environmental and Socio-economic Assessment Act*, S.C. 2003, c. 7.

"**Sustainable Development**" means beneficial socio-economic change that does not undermine the ecological and social systems upon which communities and societies are dependent as defined in Chapter 1 of the *Vuntut Gwitchin First Nation Final Agreement*,.

"**Standing Committee Chair**" means the Chair of the Vuntut Gwitchin Government Standing Committee on Natural Resources, Heritage, Tourism and Economic Development.

"**Vuntut Gwitchin First Nation"** means the legal entity established pursuant to Article 9 of the *Vuntut Gwitchin First Nation Self-Government Agreement*.

"**Vuntut Gwitchin First Nation Law**" means any law enacted by the Vuntut Gwitchin First Nation in accordance with its law-making powers under Article 13 of the *Vuntut Gwitchin First Nation Self-Government Agreement*.

"**Vuntut Gwitchin Government**" means the government of the Vuntut Gwitchin First Nation.

"**Youth Representative**" means a Citizen between the ages of 14 and 21 appointed to the Committee by the Council.

Purpose

3. The purpose of this policy is to establish a respectful, transparent and meaningful framework to guide the engagements of the Vuntut Gwitchin Government in relation to Oil

and Gas Activities and Oil and Gas Dispositions in a manner that supports and upholds the objective of Sustainable Development.

Application

4. This policy applies to any engagement between the Vuntut Gwitchin Government and a Proponent in relation to any to Oil and Gas Activities and Oil and Gas Dispositions.

Conflict of Law and Policy

5. In the event of a conflict or inconsistency between this policy and the Constitution, the Constitution shall prevail to the extent of the conflict or inconsistency.

6. In the event of a conflict or inconsistency between this policy and any Vuntut Gwitchin First Nation Law, the Vuntut Gwitchin First Nation Law shall prevail to the extent of the conflict or inconsistency.

General

7. Nothing in this policy is to be construed as abrogating or derogating from the *Vuntut Gwitchin First Nation Final Agreement*.

8. Nothing in this policy is to be construed as providing consent or authorizing any past, existing or proposed Oil and Gas Activity or Oil and Gas Disposition.

9. Nothing in this policy shall be construed as limiting, affecting, fulfilling or discharging the honour of the Crown and the Crown's constitutional duty to consult and accommodate the Vuntut Gwitchin First Nation.

10. This policy may be amended from time to time by the Vuntut Gwitchin Government and will make best efforts to notify any Proponent potentially affected by an amendment.

PART TWO
ADMINISTRATION

Committee

11. The Vuntut Gwitchin Government shall establish the Committee with a mandate to fulfill the following roles and responsibilities in accordance with this policy:

    (a) reviewing information about Oil and Gas Activities, Oil and Gas Dispositions and their regulation;

    (b) informing and seeking views from Citizens on Oil and Gas Activities, Oil and Gas Dispositions, the Engagement Process and/or Intergovernmental Process as necessary;

(c) assisting and providing recommendations to the Council throughout the Engagement Process; and

(d) providing recommendations to the Council throughout the Intergovernmental Process if requested by Council.

12. The Committee shall be made of 5 members consisting of the:

(a) Standing Committee Chair;

(b) Director or Natural Resources;

(c) Elders Representative;

(d) Youth Representative; and

(e) Citizen Representative.

13. The Committee shall meet as regularly as may be necessary to fulfill its roles and responsibilities.

14. The Committee shall have a quorum of 3 members.

15. The Standing Committee Chair and Director of Natural Resources shall serve as co-chairs of the Committee.

16. The Committee shall make best efforts to fulfill its roles and responsibilities by consensus.

17. The Committee may at any time request the support of employees or contractors of the Vuntut Gwitchin Government to assist it in carrying out its roles and responsibilities under this policy.

18. The Committee may invite any persons, including any Proponent, to attend or participate in a meeting of the Committee.

19. The Committee shall not use or disclose to any person confidential information except as may be required to fulfill its roles and responsibilities.

Citizen Consultation

20. The Director of Natural Resources shall be responsible for organizing and carrying out any consultation between the Vuntut Gwitchin Government and Citizens regarding Oil and Gas Activities and Oil and Gas Dispositions with the assistance and participation of the Committee as necessary.

21. In that event that a Proponent wishes to organize and carry out any public consultation with Citizens related to any Oil and Gas Activities or Oil and Gas Dispositions, the Proponent shall submit a notice in writing to the Director of Natural Resources within a reasonable time prior to the proposed meeting date in order to facilitate coordination between the

Proponent and Vuntut Gwitchin Government if appropriate. The written notice shall contain:

(a) proposed dates and location;

(b) proposed agenda;

(c) description of the purpose of the consultation; and

(d) any materials to be relied on by the Proponent during the consultation.

22. Any consultations with Citizens related to any Oil and Gas Activities or Oil and Gas Dispositions that are organized and carried out by the Proponent shall not be construed as consultation with the Vuntut Gwitchin Government.

PART THREE
ENGAGEMENT PROCESS

Stage I – Notice Period

23. Proponents shall provide notice in writing to the Director of Natural Resources of any Application in relation to any Oil and Gas Disposition at the earliest possible opportunity. The written notice of the Application shall contain:

(a) letter of introduction;

(b) company profile including organizational structure, profiles of directors and management team members, financial statements for the previous five fiscal years and compliance record;

(c) detailed description of the Oil and Gas Disposition and Application including any relevant maps, plans or schedules; and

(d) designated Proponent spokesperson.

24. Proponents shall provide notice in writing to the Director of Natural Resources of any Oil and Gas Activity at the earliest possible opportunity in the planning phase and prior to submitting a Proposal to the Board. The written notice shall contain:

(a) letter of introduction;

(b) company profile including organizational structure, profiles of directors and management team members, financial statements for the previous five fiscal years and compliance record;

(c) detailed description of the proposed Oil and Gas Activity, including any relevant maps, plans or schedules;

(d) administration fee in the amount of $1,000.00 made payable to the Vuntut Gwitchin First Nation; and

(e) designated Proponent spokesperson.

25. Upon receipt of any written notice from a Proponent in relation to any Application or Oil and Gas Activity, the Director of Natural Resources shall immediately refer the notice to the Committee. The Committee shall meet to review the notice and:

(a) if the Committee determines the notice is incomplete or insufficient the Committee may request in writing further or better information from the Proponent, and the Proponent shall provide such further or better information upon receipt of the written request; or

(b) if the Committee determines the notice is complete and sufficient then:

(i) in the case of a notice regarding an Application, the Director of Natural Resources may provide written comments to the Proponent or request a meeting with the Proponent to discuss the Application; and

(ii) in the case of a notice regarding an Oil and Gas Activity, the Committee shall notify the Proponent of the determination in writing and the Engagement Process shall proceed to Stage II.

Stage II – Cooperation on any Oil and Gas Activity

26. After completion of Stage I and prior to submitting a Proposal to the Board, a Proponent shall negotiate in good faith and enter into a Cooperation Agreement with the Council for the purpose of establishing a meaningful, respectful and transparent process for engagement.

27. Prior to entering into a Cooperation Agreement, the Council shall refer the agreement to the Committee for review. The Council may enter into a Cooperation Agreement on behalf of the Vuntut Gwitchin First Nation if the Committee determines that the terms and conditions adequately consider and address the following items:

(a) compliance with this policy;

(b) capacity funding for the Engagement Process;

(c) communications and correspondence;

(d) information sharing; and

(e) commitment to negotiate a Benefits and Stewardship Agreement.

Stage III – Benefits and Stewardship on any Oil and Gas Activity

28. After the completion of Stage II and prior to submitting a Proposal to the Board, a proponent shall negotiate in good faith and enter into a Benefits and Stewardship Agreement with the Council for the purpose of establishing appropriate stewardship measures and maximizing any potential benefits for the Vuntut Gwitchin First Nation.

29. Prior to entering into a Benefits and Stewardship Agreement, the Council shall refer the agreement to the Committee for review. The Council may enter into a Benefits and Stewardship Agreement on behalf of the Vuntut Gwitchin First Nation if the Committee determines that the terms and conditions adequately consider and address the following items:

(a) detailed description of the Oil and Gas Activity;

(b) capacity funding for participation in the Board's regulatory process;

(c) compliance with the objective of Sustainable Development;

(d) compliance with applicable land use plans;

(e) compliance with Vuntut Gwitchin First Nation General Assembly Resolution No. 2013-01 regarding hydraulic fracturing;

(f) adequate education and training opportunities;

(g) adequate employment and procurement opportunities;

(h) adequate revenue sharing or equity arrangements;

(i) adequate stewardship measures including but not limited to:

(i) baseline data collection measures;

(ii) information sharing measures;

(iii) joint monitoring of environmental and socio-economic effects, and of the effectiveness of mitigation measures;

(iv) joint advisory and reporting processes;

(v) joint fish and wildlife management plan;

(vi) joint heritage resource protection plan;

(vii) joint access management plan;

(viii) joint water quality and quantity management plan;

(ix) joint waste management plan;

(x) joint remediation and reclamation plan;

(xi) adaptive management measures in relation to the foregoing stewardship measures, including adaptability to address any recommendations from the Board;

(j) potential socio-economic effects which includes effects on economies, health, culture, traditions, lifestyles and heritage resources;

(k) potential cumulative effects which includes effects to the environment that are caused by an action in combination with other past, present and future human actions;

(l) potential effects on any Vuntut Gwitchin First Nation rights, responsibilities and interests under the *Vuntut Gwitchin First Nation Final Agreement* and *Vuntut Gwitchin First Nation Self-Government Agreement*;

(m) compliance and enforcement measures;

(n) dispute resolution mechanisms; and

(o) Vuntut Gwitchin First Nation approval and ratification process.

30. In addition to a Benefits and Stewardship Agreement, the Council may enter into a separate agreement with a Proponent and other parties for the purpose of addressing the limited requirements under section 68 of the *Oil and Gas Act*, R.S.Y. 2012, c. 162.

APPENDIX B
Ministerial Order 2018/42

DRAFT

YUKON

CANADA

MINISTERIAL ORDER 2018/ 42

OIL AND GAS ACT

Pursuant to the *Oil and Gas Act*, the Minister of Energy, Mines and Resources orders

1 In this Order

"subject permit" means each of the following oil and gas permits held by Chance Oil and Gas Limited:

(a) oil and gas permit No. 0012,

(b) oil and gas permit No. 0013,

(c) oil and gas permit No. 0014,

(d) oil and gas permit No. 0015,

(e) oil and gas permit No. 0016,

(f) oil and gas permit No. 0017. « *permis visé* »

2 The renewal term of each subject permit is extended by five years (so that it ends on August 30, 2023).

3 The resulting total length of the initial term and the renewal term of a subject permit is 16 years.

ARRÊTÉ MINISTÉRIEL 2018/42

LOI SUR LE PÉTROLE ET LE GAZ

Le ministre de l'Énergie, des Mines et des Ressources, conformément à la *Loi sur le pétrole et le gaz*, arrête :

1 La définition suivante s'applique au présent arrêté.

« permis visé » Les permis suivants de pétrole et de gaz détenus par Chance Oil and Gas Limited :

a) permis de pétrole et de gaz nº 0012;

b) permis de pétrole et de gaz nº 0013;

c) permis de pétrole et de gaz nº 0014;

d) permis de pétrole et de gaz nº 0015;

e) permis de pétrole et de gaz nº 0016;

f) permis de pétrole et de gaz nº 0017. "*subject permit*"

2 La durée du renouvellement de chaque permis visé est prolongée de cinq ans, de façon à ce qu'elle se termine le 30 août 2023.

3 La durée totale d'un permis visé, y compris la durée initiale et la durée du renouvellement, est de 16 ans.

4(1) In this section

"first nations communications and engagement plan" means the plan filed under O.I.C. 2016/169 and revised in accordance with M.O. 2017/37. *« plan de participation et de communication avec les premières nations »*

(2) It is a condition of this Order that Chance Oil and Gas Limited must file annual reports with the Division Head, in accordance with subsection (3) and to the satisfaction of the Division Head, about the implementation of the first nations communications and engagement plan.

(3) For the purposes of subsection (2), Chance Oil and Gas Limited must file

(a) the first annual report on or before July 31, 2019, in respect of the period beginning on September 1, 2018, and ending on May 31, 2019; and

(b) each subsequent annual report on or before July 31 of each year in respect of the period beginning on June 1 of the preceding year and ending on May 31 of the year in which the report is to be filed.

4(1) La définition suivante s'applique au présent article.

« plan de participation et de communication avec les premières nations » Le plan déposé en vertu du Décret 2016/169 et révisé en conformité avec l'Arrêté 2017/37. *"first nations communications and engagement plan"*

(2) À titre de condition du présent arrêté, Chance Oil and Gas Limited dépose des rapports annuels auprès du chef de division, en conformité avec le paragraphe (3) et à la satisfaction du chef de division, concernant la mise en œuvre du plan de participation et de communication avec les premières nations.

(3) Pour l'application du paragraphe (2), Chance Oil and Gas Limited dépose :

a) le premier rapport annuel au plus tard le 31 juillet 2019, pour la période débutant le 1er septembre 2018 et se terminant le 31 mai 2019;

b) chaque rapport annuel subséquent, au plus tard le 31 juillet de chaque année pour la période débutant le 1er juin de l'année précédente et se terminant le 31 mai de l'année au cours de laquelle le rapport doit être déposé.

Dated at Whitehorse, Yukon,

Government and Community Relations
Chance Oil and Gas Limited
Suite 200, 208 Main Street
Whitehorse, YT Y1A 2A9

Dear Greg:

RE: Chance Oil and Gas Limited's ("Chance") Notices

This letter is responding to the following notices submitted by Chance to the Vuntut Gwitchin Government's ("VGG") Natural Resources Committee ("Committee"):

- The notice submitted March 15, 2019 pursuant to section 23 of the VGG Oil and Gas Engagement Policy ("Policy") of Chance's intention to apply to extend the tenure of oil and gas permits 0006, 0007, 0008, 0009, 0010, 011, and 0019 ("Section 23 Notice").
- The notice submitted June 6, 2019 pursuant to section 24 of the Policy of Chance's proposed oil and gas activities in the Eagle Plains basin ("Section 24 Notice").

The Committee has reviewed both the Section 23 Notice and Section 24 Notice, along with Chance's financial statements and information shared during the August 8th, 2019 meeting in Old Crow, and has determined that both notices are complete and sufficient in accordance with Section 25 of the Policy.

Section 23 Notice

The Committee has determined that the Section 23 Notice is complete and sufficient pursuant to subparagraph 25(b)(i) of the Policy.

The Committee has no written comments to provide in relation to the Section 23 Notice and therefore our consideration of this matter under the Policy is concluded.

Section 24 Notice

The Committee has determined that the Section 24 Notice is complete and sufficient pursuant to subparagraph 25(b)(ii) of the Policy. Accordingly, the engagement between VGG and Chance in

relation to the proposed oil and gas activities that are the subject of the Section 24 Notice has advanced to Stage II of the Engagement Process under the Policy.

The Committee wishes to make clear that its determination that the Section 24 Notice is complete and sufficient is a determination only in relation to the satisfaction of the criteria set out in section 24 of the Policy. This determination should not be construed or understood as acceptance or agreement on behalf of VGG with respect to Chance's proposed oil and gas activities and related plans. VGG's consideration of the substantive contents of the proposed oil and gas activities, including the detailed description of proposed plans, will occur if engagement advances to Stage III of the Engagement Process under the Policy in which Committee would be seeking to ensure a number of considerations are adequately addressed as set out in section 29 of the Policy.

Next Steps

The Policy now requires the negotiation of a Cooperation Agreement between the Council and Chance in relation to the proposed oil and gas activities that are the subject of the Section 24 Notice. If these negotiations result in proposed terms and conditions that the Committee determines adequately addresses the considerations under section 27 of the Policy then Council may enter into that Cooperation Agreement. Practically speaking the negotiation of a Cooperation Agreement will be primarily carried out on behalf of VGG through the direction of the members of the Committee with the support and advice of VGG staff and advisors.

VGG and Chance engaged in preliminary discussions towards a Cooperation Agreement in 2018. Following further review the most recent version of the Cooperation Agreement dated October 20, 2018 has been updated to reflect the evolution of engagement. The Committee encloses to this letter a draft Cooperation Agreement dated August 26, 2019 as a preferred form of agreement for discussions with Chance under Stage II.

VGG proposes that the Committee and Chance seek to schedule a meeting to discuss the draft Cooperation Agreement together in September 2019. In the meantime, the Committee welcomes any written comments and feedback on the draft Cooperation Agreement in order to allow the Committee to review and consider prior to the next meeting.

Sincerely,

[redacted]

Chair, Natural Resources Committee

Chance Oil and Gas Limited
Suite 200, 208 Main Street
Whitehorse, YT Y1A 2A9

Dear Greg:

RE: Chance Oil and Gas Limited's ("Chance") Notices

On behalf of the Vuntut Gwitchin Government's ("VGG") Natural Resources Committee ("Committee") this letter is responding to the following notices submitted by Chance in accordance with the VGG Oil and Gas Engagement Policy ("Policy"):

- The notice of Chance's application to extend the term of oil and gas permits 0006, 0007, 0008, 0009, 0010, 011, and 0019 submitted on March 15, 2019 pursuant to section 23 of the Policy.
- The notice of Chance's proposed oil and gas activities in the Eagle Plains basin submitted on June 6, 2019 pursuant to section 24 of the Policy.

The Committee has reviewed both notices [redacted]
Following this review the Committee has questions regarding the financial circumstances of the company and potential risks this may pose to ensuring the fundamental objective of sustainable development is adhered to within our Traditional Territory. The Committee has determined by consensus that we are not in a position to recommend VGG proceed to any further stage of engagement with Chance unless the potential risks we are concerned about could be addressed. The Committee requests a meeting with Chance to discuss these matters further. The Committee proposes that we schedule a meeting in Old Crow in August 2019 for this purpose.

Sincerely,

APPENDIX 2-C-47. Land Tenure Extension Request for Exploration Permits 0008-0017, 0019 and 0020 Letter

Chance
OIL AND GAS LIMITED

December 15, 2021

Government of Yukon
Department of Energy, Mines and Resources
P.O. Box 2703
Whitehorse, YT
Y1A 1B2

sent via email: [redacted]

Attention: Hon. [redacted], Minister of Energy, Mines and Resources
Dear Sir:

Re: Land Tenure Extension Request for Exploration Permits 0008-0017, 0019 and 0020 ("Permits")

Chance Oil and Gas Limited ("Chance", the "Company") hereby requests that the referenced Permits be extended for an additional five years pursuant to Sections 27(b), 28(1)(c) and (d) and 31.01 of the Yukon *Oil and Gas Act* (the "Act"). The basis for this extension request is described in the following paragraphs and has not materially changed since the last request for tenure extension was made on March 11, 2020 for one of the Exploration Permits. Timelines to be able to exercise exploration rights in Yukon are long and growing.

The actions of Chance and its predecessor, Northern Cross (Yukon) Limited, in respect of the rights under the Permits have been consistent with the Act by diligently trying to conduct an exploration program at Eagle Plains to evaluate the crude oil and natural gas resource potential. These efforts are substantially documented in the records of a variety of government departments, including Energy Mines and Resources. The Company has only been partially successful accomplishing its exploration objectives.

Unfortunately, Chance has been subjected to external influences beyond the control of the Company. These include the indefinite, perhaps permanent, moratorium on hydraulic fracture

stimulation ("Moratorium") in the Eagle Plain Sedimentary Basin, the impact of the Peel Watershed Land Use Planning exercise which challenged access, and the inconsistent, unpredictable and expanded time and information requirements of environmental impact assessment processes with the Yukon Environmental and Socio-economic Assessment Board ("YESAB"). Timelines and conditions related to the conduct of exploration activities are further increased by the requirement under Ministerial Orders whereby Chance has established Engagement and Communication Plans ("Plans") with four First Nations, including designated organizations. The Company is using its best efforts to actively implement these Plans in respect of a significant exploration project, but the pace of this implementation is slow and uneven and has been dramatically affected by Covid 19. The collective impact of these influences was not reasonably foreseen at the time Chance was awarded the Permits nor after exploration activities commenced, but they have adversely affected the ability of the Company to exercise its exploration rights either in a timely way or at all.

Since the Permits were originally awarded during the period between 2007 and 2010, Chance has demonstrated its commitment to oil and gas exploration in Yukon by diligently undergoing several YESAB assessments, obtaining regulatory approvals, and executing drilling and seismic data acquisition programs within the area of the Permits. This work was conducted in an environmentally and corporately responsible manner and in full compliance with various permits and licenses issued to undertake this exploration work. The efforts of the Company have advanced the geological understanding of the Eagle Plain Sedimentary Basin while providing very significant benefits to Yukon in the form of employment, training, and business opportunities. Well over $100 million has been spent, which is about five times the amount that was committed at the time these Permits were originally awarded. Most of this investment is now stranded in view of the Moratorium.

Chance has undertaken or consultants acting on behalf of Chance have undertaken the following activities related to the proposed multi-well exploration and seismic data acquisition program:

1. Geological field program to sample rocks at various outcrops at Eagle Plain to help mature new prospects,
2. Purchased under license vintage 2D seismic data in the Eagle Plain area,
3. Bird survey,
4. Fish and other aquatic surveys,
5. Site investigations of vintage and modern seismic lines to understand use by wildlife and humans and regeneration patterns,
6. Field studies covering a range of permafrost processes;
7. Water sampling at various locations in the proposed area of exploration interest;
8. Porcupine Caribou studies in collaboration with the Porcupine Caribou Management Board,
9. LiDAR and aerial photography surveys; and

10. Meetings with affected First Nations in Old Crow, Inuvik, Tsiigehtchic, Ft. McPherson, Aklavik, Dawson City, Mayo and Whitehorse in respect of a proposed multi-well exploration and seismic data acquisition plan.

More field work is planned for the winter of 2022-2023 to evaluate the condition of 8 suspended wells operated by Chance with the objective of remediating any problems so the wells can remain suspended until used in future operations, converting two wells to become deep zone injectors or disposal wells, extended flow testing of three natural gas formations in three vintage wells and abandoning at least 3 of the suspended wells. Where possible, Chance hires First Nation citizens to participate in these field programs. In the past three years, the approximate expenses incurred to undertake these activities was $6.7 million. Spending at this level or higher is anticipated to continue for additional exploration work and related activities as described above for well maintenance and continuance. Preserving suspended status of wells that are sound and secure supports the request for tenure extension as well.

Chance is hopeful that it will be in a position to submit to the Executive Committee of YESAB under new processes expected to commence in the first quarter of 2022 to begin the assessment of the multi-well exploration drilling and seismic data acquisition project, but First Nation engagement under the Plans may be a rate determining step.

The maintenance program planned for the winter of 2022-2023 offers a great opportunity to measure the depth of permafrost and Chance plans to run a temperature survey in a number of the suspended wells to determine the geographic extent of permafrost and any variability of its depth.

Notwithstanding very limited oil field service and supply capacity resident in Yukon, the historical exploration drilling and seismic data gathering programs operated by the Company were organized and executed in a way that responded to concerns expressed by many Yukon stakeholders to maximize Yukon participation and mitigate the historical experience of intensive, short term projects punctuated by lengthy periods of inactivity that collectively had the effect of restricting local participation in employment, training and business opportunities. For almost two years, Chance's drilling and seismic programs provided reasonably steady employment for many Yukon citizens working directly or indirectly on the projects. Going forward, to overcome the frustration of starting and stopping, future activities are expected to be small scale and be undertaken over longer time periods. This style of operation has the objective of providing opportunities for Yukon citizens and businesses to invest in training and equipment to be able to assume growing roles in any activities that Chance might propose while benefitting from learning curve efficiency and economy of scale arising from steady, predictable operations. Environmental impacts are expected to be significantly reduced by operating on a small scale over longer periods of time, too.

Future exploration activities will require maximum allowable tenure extensions in order to satisfy commitments anticipated to be made under the Plans as they are implemented, undergo higher level YESAB impact assessments, obtain required regulatory approvals and ultimately undertake any planned activities. For example, in several meetings with your officials, Chance has outlined an exploration plan to drill up to thirty (30) exploration and appraisal wells, acquire up to fifteen hundred (1,500) square kilometres of new 3-D seismic data and acquire up to two thousand (2,000) kilometres of new 2-D seismic data. This plan will take years to complete especially if the scale of operations is small in order to minimize environmental impacts and maximize participation of Yukon citizens and businesses. Prior to undertaking this program, environmental impact assessments are required which are expected to take at least a couple of years to complete with more time needed to execute on approved activities.

Developing Yukon energy resources will also have a beneficial impact on greenhouse gas emissions by displacing imported fuels extracted and processed thousands of kilometres away from Yukon. In addition, as the energy market transitions to a lower or no carbon condition, the hydrocarbons in Yukon offer a great source of hydrogen and the geological formations at Eagle Plains provide opportunities to sequester CO2.

This letter has been prepared on a "Without Prejudice" basis given the unresolved legal claim that the Company has made against Yukon in respect of the damages caused by the Moratorium. Tenure extension is needed to continue implementing the Plans and advance the proposed exploration project through the YESAB process to execution.

In conclusion, Chance believes that it has diligently acted and continues to act in a manner that is consistent with the Act, that the exercise of its exploration rights has been significantly impaired by circumstances that were neither foreseen nor within the Company's control. Throughout the evolving landscape of procedural changes, political sensitivity and growing obligations to engage with aboriginal communities, Chance has taken numerous and costly measures to mitigate the impediments where it can.

Chance trusts that you will consider this tenure request in the face of expanding timelines and complexities associated with the undertaking of exploration projects.

Yours truly,
Chance Oil and Gas Limited

SENT VIA E-MAIL

August 5th, 2022

Michael N. Chernoff
Chairman and Chief Executive Officer
Chance Oil and Gas Limited
Suite 1000, 340 – 12 Ave SW

Calgary, AB T2R 1L5

Dear Mr. Chernoff:

RE: Communication and engagement on Chance Oil and Gas Limited's (COGL) proposed multi-year, multi-well oil and gas exploration program (Proposal)

I am writing to you as Chief of the Vuntut Gwitchin First Nation (VGFN) and Chief Executive Officer of the Vuntut Gwitchin Government (VGG) in follow-up to my previous correspondence to you by letter dated March 31, 2021, and your correspondence by letters dated April 12, 2021, and October 27, 2021, respectively. VGG has now completed an internal review and consideration of the circumstances that resulted in VGG ceasing communication and engagement with COGL under the VGG Oil and Gas Engagement Policy (Policy) with respect to the Proposal last year.

I appreciate you sharing with me your perspective from your 60+ years of personal history and experience pursuing oil and gas within the Eagle Plain basin. However, it is not merely in the "minds of men" where the oil you seek may be found but also the VGFN Traditional Territory which past and present generations of Vuntut Gwitchin have collectively governed and managed for millennia to ensure our continued survival, dignity and well-being as a community.

The ancient history of VGFN includes the more recent emergence over the past 70 years of private companies seeking to exploit the oil and gas resources and build oil and gas infrastructure in areas within or adjacent to the Traditional Territory. As recently described by the Yukon Supreme Court based on a review of the Vuntut Gwitchin historical record, the search for oil in the Traditional Territory "without Vuntut Gwitchin consent or involvement has caused significant harm to the integrity and health of the Vuntut Gwitchin as a collective" and that "Vuntut Gwitchin continue to address and recover from these harms as they implement self-government."[1]

[1] *Cindy Dickson v Vuntut Gwitchin First Nation*, 2020 YKSC 22 at para 13.

The late Justice Thomas Berger described the beginning of this period of immense change and disruption in his 1977 final report of the Mackenzie Valley Pipeline Inquiry following days of listening to public testimony directly from VGFN Citizens in the community of Old Crow:

> "The caribou have been the mainstay of the native people of Old Crow for thousands of years. Today these people are apprehensive, because they fear that the caribou, and thus they themselves, are threatened. They know the power of the white man. They know that elsewhere the great animal herds have died off with the advance of agriculture and industry. They have seen the white man come and dominate them and their land. Exploration crews, bulldozers and the airstrip that crowds their village against the Porcupine River are continuing reminders of this encroachment. These people fear that the white man may destroy their land and the caribou. They and the caribou have made a long journey together across time and the continents. Is this journey to end now?
>
> …
>
> This ecosystem, with its magnificent wildlife and scenic beauty, has always been protected by its inaccessibility. With pipeline construction, the development of supply and service roads, the intensification of the search for oil and gas, the establishment of an energy corridor, and the increasing occupation of the Northern Yukon, it will no longer be inaccessible to man and his machines.
>
> The proposal by Arctic Gas to build a pipeline across the Northern Yukon confronts us with a fundamental choice. It is a choice that depends not simply upon the impact of a pipeline across the Northern Yukon, but upon the impact of the establishment of a corridor across it. Opening up this country to industrial development will have lasting effects on the great wilderness and on the native people who live there."[2]

Throughout this period and still continuing today over 40 years later, VGFN has always navigated these challenges through the guidance of our Elders, community knowledge keepers, and traditional decision-making processes of deliberation and consensus to carry out our highest mandate: to protect and maintain our physical, cultural, spiritual and economic relationships to the lands, waters and animals for the benefit of future generations. As VGG recently submitted to the US Bureau of Land Management in its assessment of proposed oil and gas exploration adjacent to the VGFN Traditional Territory on the coastal plain of Alaska:

> "Vadzhaii, the caribou, are the heart of Vuntut Gwich'in culture and subsistence economy. The Porcupine caribou migrate north each spring

[2] Thomas R. Berger, "Northern Frontier, Northern Homeland: Mackenzie Valley Pipeline Inquiry" (1997) vol 1. See also Transcripts of proceedings of the Mackenzie Valley Pipeline Inquiry in Old Crow, Yukon (July 11, 1975) vol 14; Transcripts of proceedings of the Mackenzie Valley Pipeline Inquiry in Old Crow, Yukon (July 12, 1975) vol 15; and Transcripts of proceedings of the Mackenzie Valley Pipeline Inquiry in Old Crow, Yukon (July 13, 1975) vol 16.

> through the Vuntut Gwitchin First Nation Traditional Territory to critical calving and nursery grounds in Alaska, where most calves are born. In the fall, the Porcupine caribou return to our homeland, fattened and healthy. For tens of thousands of years the Porcupine caribou herd has occupied the Traditional Territory of the Vuntut Gwitchin First Nation, providing sustenance to our people.
>
> The Vuntut Gwich'in fear the proposed oil and gas leasing program in the Coastal Plain will result in environmental pollution, contamination and habitat disturbance that will degrade and permanently alter the intricate wholeness and habitat integrity of the calving and post-calving grounds, migratory movements and long-term stability of the Porcupine caribou herd. A threat to the health of the Porcupine caribou herd is a threat to Vuntut Gwich'in physical, cultural and spiritual survival."[3]

VGFN's 20-year journey to negotiate the reclamation of our inherent self-government authority and the protection of VGFN rights and interests through our Treaty with Canada and Yukon was indeed largely driven by the rush of outsiders to discover oil and gas without the free, prior and informed consent of the community or respect for VGFN's plans and strategies for the use and development of the Traditional Territory.[4] The monumental achievement of the VGFN Final Agreement and Self-Government Agreement in 1995 set forward a pathway for the pursuit of our self-determination with a fundamental objective of Sustainable Development:

> "'Sustainable Development' means beneficial socio-economic change that does not undermine the ecological and social systems upon which communities and societies are dependent."[5]

The objective of Sustainable Development was included in the development and approval of the North Yukon Regional Land Use Plan (NYRLUP).[6] Sustainable Development is the "core principle" of the NYRLUP with the complementary guiding principles of precaution, conservation and adaptive management.[7] Today, VGG continues to seek to uphold the fundamental objective of Sustainable Development in the implementation of the VGFN Final Agreement, Self-Government Agreement, NYRLUP, the United Nations Declaration on the Rights of Indigenous Peoples, and our internal policies, procedures and mechanisms such as those provided for under the Policy. It is within this important context in which VGG considers our relationship with COGL and the Proposal.

[6] See Vuntut Gwitchin First Nation Final Agreement at 11.1.1.6 which provides that an objective of regional land use planning under Chapter 11 of the Final Agreement is "to ensure that social, cultural, economic and environmental policies are applied to the management, protection and use of land, water and resources in an integrated and coordinated manner so as to ensure Sustainable Development."

[7] North Yukon Regional Land Use Plan at 1.4.

Communication and Engagement

As a result of our internal review and consideration, VGG has determined that COGL's conduct to-date in communication and engagement with VGG regarding the Proposal has consistently undermined the purpose of the Policy to establish and maintain a respectful, transparent and meaningful process for communication and engagement and fails to adhere to the human rights standard of free, prior and informed consent.

Despite VGG providing a clear and transparent process to COGL under the Policy for seeking the free, prior and informed consent of VGFN to the Proposal over 5 years ago, COGL's initial commitment to comply with the Policy in the joint Communication and Engagement Plan (Plan), and VGG's support for a 5-year extension of COGL's exploration permits in reliance on COGL's commitments to the Policy, COGL has repeatedly reneged on its commitments to VGG throughout the process and has engaged in conduct inconsistent with the Policy. This includes, but is not limited to, the following:

- COGL directors, officers, employees, consultants, professional advisors and representatives making public and private communications to VGG Council, employees, contractors, and Natural Resources Committee members regarding the Proposal instead of VGG's designated and agreed to point of contact.

- COGL on several occasions has repudiated its agreement to comply with the Policy by taking positions inconsistent with the Policy, and in particular, COGL's position that the VGFN General Assembly should have no role in decision-making and final approval of the Proposal.

- COGL conduct has interfered in VGG internal decision-making procedures and engaged in practices that cause division related to the Proposal, in particular, through improper influence at meetings of the VGFN General Assembly and the creation of an alternative COGL committee that undermines the role, function and mandate of the VGG Natural Resources Committee in ensuring a respectful, transparent and meaningful engagement process for Citizens.

VGG does not condone this type of conduct and takes it very seriously. We cannot and will not participate in an engagement process unless it is built on trust and good faith and not suspicion, accusations, threats; free from intimidation, coercion, manipulation and harassment; and respects our internal decision-making procedures and mechanisms as a self-governing First Nation. Therefore, VGG will not be continuing any direct communication and engagement with COGL related to the Proposal. The joint Plan between us is terminated effective immediately by notice of this letter with copy to the honourable John Streicker, Minister of Energy, Mines and Resources, who is responsible for the administration of the Plan under Ministerial order.

The Proposal

VGG has also taken this time in our internal review of communication and engagement with COGL to consider a number of other policy considerations in relation to the Proposal. VGG has determined that the Proposal is incompatible with the fundamental objective of Sustainable Development enshrined in our constitutionally protected Treaty, NYRLUP and the Policy which only permits "beneficial socio-

economic change that does not undermine the ecological and social systems upon which communities and societies are dependent." This determination is made based upon the potential environmental, social, cultural, economic and climate impacts of the Proposal, including but not limited to, the following:

- The Proposal is likely to cause significant adverse impacts to the special relationship between the Porcupine caribou herd and the Vuntut Gwitchin, including our ability to meaningfully exercise our Treaty rights to access and harvest the Porcupine caribou.

- The Proposal does not consider or address impacts to the Gwich'in Nation as a whole, including downriver Gwich'in communities in Alaska, contrary to the terms of the Agreement Between the Government of Canada and the Government of the United States of America on the Conservation of the Porcupine Caribou Herd.

- The feasibility of oil and gas production in the North is increasingly diminished with a high probability of oil and gas infrastructure becoming stranded assets.

- Any potential economic benefits that may accrue to Vuntut Gwitchin from the Proposal will be limited and short-term and are greatly outweighed by the potential risks to the land, water, animals and Vuntut Gwitchin way of life.

- The Proposal is inconsistent with VGG's climate plans and strategies, Gwich'in knowledge and science which confirms that no new oil and gas exploration activities should occur in a global pathway to reaching net zero emissions by 2050.

- The Proposal is inconsistent with the Yeendoo Diinehdoo Ji'heezrit Nits'oo Ts'o' Nan He'aa Declaration which called to action local, national and international communities, governments, organizations and movements to respect the traditional knowledge of Indigenous peoples and the established science to prevent the rise of global temperatures beyond the 1.5°C threshold.

- This Proposal is inconsistent with the Gwich'in Nation's right to self-determination as expressed by the Biennial Gwich'in Gathering through the Gwich'in Niintsyaa resolutions for protection of our relationships to Vadzaih (caribou) and Łùk Choo (salmon), the Ni'inlii Declaration calls to "support a global just transition from destructive fossil fuels" and the joint objectives and priorities committed to under the Gwich'in Nation Accord – Gwiyiinji ILak Hah T'igweedi'yaa Sriinatr'igwihee'aa ("We Will Act With One Mind To Make Things Right").

- The Proposal is inconsistent with Government of Yukon's climate policies to reduce Yukon's greenhouse gas emissions to 45% lower than 2010 levels by 2030 and which does not contemplate or address the emergence of a local oil and gas industry in the Yukon or any increase in greenhouse gas emissions arising from new oil and gas exploration and production, including associated activities such as transportation.

- The Proposal is inconsistent with Government of Canada's climate policies to phase out public financing for the oil and gas sector and to set a cap on greenhouse gas emissions for the oil and gas sector with reduction targets starting in 2025.

Based on our determination that the Proposal is incompatible with the objective of Sustainable Development, VGG does not support the Proposal or any other proposal for new oil and gas exploration and development in North Yukon. In the event that COGL submits the Proposal to the Yukon Environmental and Socio-economic Assessment Board (YESAB) despite the express lack of VGG consent, VGG will be fully engaged as a government in the process, including in dialogue within the Gwich'in Nation and with our Treaty partners, to ensure the fundamental objective of Sustainable Development is adhered to and our collective rights are respected.

VGG will also continue to ensure that VGFN Citizens are able to be fully and independently informed of the Proposal and its potential environmental, social, cultural, economic and climate impacts so that they may meaningfully and effectively share their personal views and perspectives with YESAB. Given our commitments under the Gwich'in Nation Accord, VGG will also seek to ensure meaningful opportunities for participation of affected Gwich'in communities in Alaska are provided in relation to the Proposal as required under the Agreement Between the Government of Canada and the Government of the United States of America on the Conservation of the Porcupine Caribou Herd.

Moving Forward

As VGG will no longer be in direct communication and engagement with COGL on the Proposal and have terminated the joint Plan, we ask that all COGL directors, officers, employees, consultants, professional advisors and representatives respect the following protocols moving forward:

- COGL shall provide VGG with 2 weeks advance written notice of any planned activities in VGFN Traditional Territory that are in any way related to the Proposal such as consultation meetings and research activities. A copy of the agenda and any presentation materials used for consultation meetings with VGFN Citizens shall be included.

- COGL directors, officers, employees, consultants, professional advisors and representatives shall not attend the VGG offices in Old Crow or Whitehorse without prior appointment.

- All notices shall be sent by COGL directly to Erika Tizya-Tramm, Strategic Lead, Stewardship and Sustainability (erika.tizyatramm@vgfn.net). COGL shall not solicit or seek to communicate with any other VGG employee, contractor, or Natural Resources Committee members regarding the Proposal.

- COGL directors, officers, employees, consultants, professional advisors and representatives shall not participate in deliberations, decisions and votes of the General Assembly related to the Proposal or VGG's relationship to COGL.

Sincerely,

Chief Dana Tizya-Tramm
VUNTUT GWITCHIN FIRST NATION

Cc: Chief Simon Mervyn, First Nation of Na-Cho Nyäk Dun
Chief Roberta Joseph, Tr'ondëk Hwëch'in
Grand Chief Ken Kyikavichik, Gwich'in Tribal Council
Honourable John Streicker, Minister, Government of Yukon, Energy, Mines and Resources
Honourable Dan Vandal, Government of Canada, Minister of Northern Affairs
Annie Blake, Member of Yukon Legislative Assembly (Vuntut Gwitchin)
Brendan Hanley, Member of Parliament (Yukon)

APPENDIX 2-C-49. Communication and Engagement Plans Letter

Chance
OIL AND GAS LIMITED

April 5, 2023

Chief and Council
Vuntut Gwitchin First Nation
P.O. Box 94
Old Crow, Yukon
Y0B 1N0

Dear Chief [redacted] Deputy Chief [redacted], and Councilor [redacted]

Re: Communication and Engagement Plans

I am writing to follow up our meeting in Vancouver on January 26, 2023 with you and your Vuntut Gwitchin Government ("VGG") staff, representatives of the Gwich'in Tribal Council ("GTC"), and representatives of the First Nation of the Na-Cho Nyak Dun ("NND"). We appreciated the time you and your team gave to participate in the meeting.

As discussed in our meeting, Chance Oil and Gas Limited ("Chance") has plans to undertake an exploration project comprising drilling and testing up to 30 exploration wells, obtaining up to 1,500 square kilometers of new 3D seismic data and obtaining up to 2,000 kilometers of new 2D seismic data. Chance expects to submit a project proposal to the Executive Committee ("ExCom") of the Yukon Environmental and Socio-economic Assessment Board for this project later this year.

Chance is planning to share information such as the detailed project description, baseline environmental studies including heritage surveys and permafrost studies, and details about the exploration work shortly. This information will be provided to all the affected First Nation Governments ("FNG's") to review and provide feedback. In addition to providing information, Chance is also planning to meet with FNG's and the communities at large to discuss the project and expand the opportunities for feedback. In the spirit of the Communication and Engagement Plans, Chance is hoping that engagement with each of the affected FNG's will be done in a constructive, cooperative, and collaborative manner.

Since there are many consultants retained by Chance that will be involved in the engagement process with each of the affected FNG's, long lead time planning is required to address the logistics of travel, accommodation, and availability of each party. As such, Chance and its consultants are planning to visit Old Crow on May 15, 2023. We would like to meet with VGG Chief and Council during this visit as well as host a broader community open house. Please let us know if you are available to meet and we can work with you to prepare an agenda and provide information ahead of time.

CHANCE OIL AND GAS LIMITED

☐ **Whitehorse Office:**
Suite 202, 208 Main Street
Whitehorse, YT Y1A 2A9
Telephone (867) 456-7805

☒ **Calgary Office:**
Suite 1000, 340 - 12th Ave S.W.
Calgary, AB T2R 1L5
Telephone (403) 699-0055
Fax (403) 699-0044

In addition, as a required part of the ExCom submission, Chance needs to gather socio-economic data in each of the affected First Nation Communities. Two Worlds Consulting ("TWC"), who provides advice and support to Chance for Communication and Engagement activities, has been retained to undertake socio-economic studies. TWC is looking to initiate socio-economic data collection during Chance's project engagement visit to Old Crow on June 11, 2023. This work will involve conducting interviews with community members, VGFN government representatives, and organizations in order to understand potential project-related effects to socio-economic conditions (e.g., community well-being, employment and economy, community infrastructure and services etc.). Additional socio-economic interviews will be scheduled for later this summer.

Attached to this letter is a two page summary of the Exploration Project and some indicative scheduling for engagement with FNG's and communities.

We look forward to meeting with you, your officials, and citizens of Old Crow in the coming months.

Yours truly,
Chance Oil and Gas Limited

[redacted]

President

Exploration Project
Update
April 2023

Chance
OIL AND GAS LIMITED

Project Location

Who is Chance? What Do We Plan to Do?

- Exploration company focused on assessing Yukon's oil and natural gas potential
- Hoping for government and community support to explore in the Eagle Plains area
- If approved, investigation would include drilling more wells and carrying out seismic surveys for up to 10 years
- Small scale, to provide steadier long-term jobs and contracts to local residents and businesses
- Once investigations are complete, we would know how much oil vs. how much gas, and whether it's economical to proceed to development
- No fracking anticipated, now or later

What We've Been Working On in 2022/2023

- Refining our plans for how to address concerns related to sensitive environmental factors including caribou
- Preparing to start the regulatory process
- Understanding what information regulators and communities want and need
- Collecting scientific data to understand effects and create options for how to manage effects
- Preparing to show communities our plans before entering the regulatory process in 2023

Where and How We Hope to Engage

- Old Crow, Dawson, Mayo, Inuvik, and Whitehorse
- Respect community preferences on timing, approach
- Share our draft plans, get feedback, adjust/amend plans

What Do Our Plans Look Like for Restarting the Regulatory Process?

Relationship-building, Information-sharing

Engagement 1:
What is the Project?

When: May 15 – 18, 2023

Where: Old Crow, Mayo, Dawson, Inuvik, Whitehorse

With whom: Vuntut Gwitchin First Nation (VGFN), First Nation Na-cho Nyak Dun (FN NND), Tr'ondëk Hwëch'in (TH), Gwich'in Tribal Council, and members of the communities of Old Crow, Mayo, Dawson, Inuvik

What we hope to discuss:

- Who is Chance, what do we stand for?
- What is exploration?
- What is Chance's plan?
- How do communities wish to engage with Chance?

Methods of engagement:

- Meetings with leadership
- Community open houses

Engagement 2
What are Project effects, and how could we manage them?

When: June 12 – 15, 2023

Where: Old Crow, Mayo, Dawson, Inuvik, Whitehorse

With whom: Vuntut Gwitchin First Nation (VGFN), First Nation Na-cho Nyak Dun (FN NND), Tr'ondëk Hwëch'in (TH), Gwich'in Tribal Council, and members and businesses of the communities of Old Crow, Mayo, Dawson, Inuvik

What we hope to discuss:

- What are the potential positive and negative effects of exploration?
- What are community concerns?
- How could Chance address these concerns?

Methods of engagement:

- Meetings with leadership
- Community open houses
- Socio-economic interviews

Regulatory process begins

Yukon Environmental and Socioeconomic Assessment Board (YESAB) begins

- The project will be assessed under YESAB's Executive Committee process
- YESAB will see how Chance has reflected the results of Engagement 1 and Engagement 2 in its submission documents
- Under Yukon Environmental and Socioeconomic Assessment Act (YESAA 2003), YESAB may engage First Nations and communities as needed. Typically, YESAB hosts multiple public comment periods
- Chance will work with YESAB to support their efforts to engage First Nations and communities on the Project
- Chance will be available to share information, listen and learn

APPENDIX 2-C-50. January 24, 2018 Meeting Summary - document not available at time of submission.

APPENDIX 2-C-51. February 22, 2018, Meeting Summary

Vuntut Gwitchin Government and Chance Oil and Gas Limited Meeting

Date: February 22, 2018

Location: Community Hall, Old Crow YT

Attendees:
No sign-in sheet was used.

Vuntut Gwitchin Government:

[redacted], Executive Director, VGG
[redacted] Lands Manager, VGG
Elder [redacted]
Elder [redacted]

Chance Oil and Gas Limited:

[redacted], Board Chair and CEO
[redacted], Board member and Chair of Community Relations Committee
[redacted], President
[redacted], Vice President of Community and Government Relations
[redacted], Regulatory, Environmental and Community Relations Coordinator

Hemmera:
[redacted]

Introduction: Purpose and Objectives

The purpose of this meeting is reset the relationship between Chance Oil and Gas and VGG.

Meeting Objectives:

- Allow opportunities for participants to share their feelings on past relationship building;
- Introduce team members and discuss roles and responsibilities; and
- Chart a new path forward for Chance and VGG.

Key Outcomes for Chance:

- Agreement to work together on an engagement and communication plan (plan);
- Identification of team members to lead on developing the plan; and
- Get some direction/information on engagement with other First Nations and Government.

DRAFT

Discussion of Key Topics:

Opening Remarks:

Vuntut Gwitchin Government (VGG[redacted]) reviews the agenda and asks if any attendees have changes to the agenda. [redacted] requests time to review the January 29th letter with Chance Oil and Gas Limited (Chance)'s feedback on VGG's Oil and Gas Engagement Policy. All agree to add this to the agenda. [redacted] proceeds with opening remarks:

- VGG appreciates Chance's efforts and thanks Chance for coming to Old Crow for the meeting;
- VGG is here to move forward with Chance and is looking forward to learning more about Chance's plans;
- Chance is welcome to return to Old Crow any time.

[redacted] discusses his personal motivations behind joining the Chance team as a Vuntut Gwitchin citizen, noting the evolution of VGG over the years, VGG's Final Agreement, and settlement lands selected for oil and gas exploration. [redacted] notes that neighbouring First Nations such as Tr'ondëk Hwëch'in and Na-cho Nyäk Dun are busy being engaged on mining development in their traditional territories and are moving forward with these projects. [redacted] and [redacted], who work for Chance and are also Vuntut Gwitchin citizens want to facilitate feedback from Vuntut Gwitchin citizens to Chance and make sure the Vuntut Gwitchin voices are heard. [redacted] highlights the importance of their Whitehorse office and the value that the Chance representatives who are Vuntut Gwitchin citizens bring to the Chance team.

Chief [redacted] highlights that this is a learning opportunity for both Chance and VGG, and that Yukon Government has an opportunity to be part of the learning. VGG recognizes that there is an opportunity with Chance to take advantage of; however, the Vuntut Gwitchin do not have 100 years of experience with oil and gas like other First Nations have with mining. Because of this, VGG is taking careful steps and the process is slower with VGG and Chance than it may be elsewhere. As VGG learns more about Chance and oil and gas, the process may move more quickly. [redacted] notes that it is important to provide information to the younger generation as well to include them in this process.

[redacted] thanks VGG for being willing to re-set the relationship with Chance and describes the history of Northern Cross Yukon and past applications to the Yukon Environmental and Socio-economic Assessment Board (YESAB). Northern Cross Yukon was previously owned by the China National Offshore Oil Corporation and came under new ownership by [redacted] in late 2016. With this new ownership comes a desire to renew relationships with VGG and to re-build the internal team in the company. Also, with the new ownership, Northern Cross Yukon decided to undergo a name change as part of this overall company renewal. The name is now Chance Oil and Gas, as the original oil and gas discoveries were called "Chance" and there is a creek nearby called Chance Creek. The new logo for the company incorporates the colours of the aurora borealis and Yukon's bird, the raven. These Yukon-centric elements are being incorporated into the company as Chance's only interests are in the Yukon, and the goal is to bring opportunities to VGG and Yukoners. Chance is looking to rebuild relationships and reputation in Yukon and looks forward to building the relationship with VGG.

Chief [redacted] appreciates Chance's comment and notes that VGG is ready to move forward with Chance.

DRAFT

Community Relations Committee:

[redacted] describes Chance's Community Relations Committee of the Board:

- Developed by the Board of Directors;
- Focused on identifying initiatives that Chance can pursue to promote collaborative community engagement;
- [redacted] is the Chair of the Committee;
- Chance is seeking input from VGG on the Committee and wants someone from the Vuntut Gwitchin community on the Committee;
- The mandate of the Committee is to achieve collaboration whichever way both VGG and Chance want that to occur; and
- The Committee is to find ways to engage and work together in a meaningful way.

[redacted] asks for VGG representation on that committee. Chance agreed.

[redacted] notes that the VGG Oil and Gas Engagement Policy (Policy) is VGG's guiding document for engagement and has agreed internally that the Police will be adaptive and VGG will review the Policy after 1 year. [redacted] notes that the Engagement and Communications Plan that VGG and Chance will develop together can be adaptive as well.

[redacted] and [redacted] introduce themselves and their role as Hemmera in facilitating engagement between VGG and Chance. Hemmera's role is open and can support both VGG and Chance in engagement. Chance and Hemmera will work directly with VGG. While Hemmera is hired by Chance, Hemmera is a neutral party and is not hired for project advocacy.

[redacted] and [redacted] both describe some of their relevant project experience and various options for how Hemmera can support and provide capacity to VGG and Chance.

[redacted] explains VGG's recent work on developing an access management plan and a regional management plan. VGG is looking for opportunities to collaborate with Chance on things like this and is looking forward to working together in the future. Right now, VGG is looking to work on the vision of oil and gas with Chance. Further to this VGG agrees that the Community Relations Committee should have a Vuntut Gwitchin citizen on it, as Vuntut Gwitchin citizens have opinions and can inform many aspects of engagement, including engagement with other communities.

Q: Is the Community Relations Committee is open for other communities to have a role in it?

A: [redacted] explains that this depends on what the other communities want, noting that Chance's permits are 100% within Vuntut Gwitchin territory with some overlap with Tr'ondëk Hwëch'in and Na-cho Nyäk Dun, as well as with the Gwich'in Tribal Council primary use area.

[redacted] describes previous engagement with other First Nations, and that other Nations look to VGG to lead engagement with Chance. [redacted] notes that Chance also seeks advice from VGG on engaging other First Nations, [redacted] thinks that VGG should play a lead role in engagement and how the community is involved in developing management plans and mitigations.

[redacted] notes that VGG wants to be part of the Community Relations Committee and thinks that it is a good initiative, but also wants to ensure that the Vuntut Gwitchin voice on this Committee is given space to be heard and has a greater weight than voices from other communities. VGG suggests a Terms of Reference for the Committee that incorporates this.

Hemmera proposes that they draft a suggested Terms of Reference for Chance and VGG to review.

Engagement and Communications Plan Development:

[redacted] notes that VGG needs to have some internal conversations about who the leads will be on the VGG side for developing the Engagement and Communications Plan; [redacted] will email G. Charlie to let the Chance team know the people who will be involved from the VGG side. VGG has many things on the go and wants to make sure that the Engagement and Communications Plan moves and is done in a robust way where there are alternate representatives from VGG who can fill in and move things forward when other representatives are unavailable.

VGG Oil and Gas Engagement Policy – Chance's Feedback Letter:

[redacted] reviews the letter from Chance to VGG at a high level and asks VGG if there are any specific questions about Chance's feedback.

[redacted] replies that the third bullet requires some clarification.

(note: the statement is copied below for reference.)

- *In 'Citizen Consultation' s.20 the Policy describes the contents of a written notice to be provided by the proponent regarding the description of the purpose of the consultation and associated materials. Chance is happy to comply with this request for future engagement efforts however we do hope that agendas, description of the purpose of consultation and appropriate materials can be collaboratively built between Chance and VGG such that the citizens have the opportunity to specifically direct the topics that are important to them and provide advice to Chance on the appropriate level of detail that materials are to be prepared in.*

[redacted] and [redacted] explain that the citizen consultation described in the VGG Oil and Gas Engagement Policy was interpreted by Chance to be more of a hand-off of documents such as agendas and meeting materials, rather than a collaborative process to develop these materials together. Chance's feedback suggests more of a back-and-forth collaborative development of agenda items and determining presentation materials.

[redacted] thanks Chance for clarifying and notes that VGG is looking to establish a front-heavy approach to engagement for a proponent to gain a social license; this would then help with the YESAB process.

[redacted] notes that collaboration early on with VGG is important to Chance.

[redacted] moves on to Chance's feedback regarding stage 2, asking for clarification on the first bullet.

(note: the statement is copied below for reference)

- *Stages II and III of the Policy describe a requirement for a proponent and VGG to enter into a Benefits and Stewardship agreement, which is outlined in detail in section 28 of the Policy. Several of the items in section 28 of the Policy are identical to the requirements under section 68 of the Yukon Oil and Gas Act for a proponent to enter into a Benefits agreement, which is a tri-partite agreement between an affected First Nation government, Yukon Territory Government, and a proponent. It could be unproductive for all parties to be negotiating similar yet distinct agreements simultaneously and as such the VGG may*

wish to consider revising the wording to more clearly identify how those two agreements could co-exist without being redundant and/or contradictory.

[redacted] and [redacted] explain that the feedback was about making sure that VGG and Chance are clear in understanding the specific items covered off in each agreement to ensure as little confusion as possible.

[redacted] explains that VGG wants to make sure that the community is commenting on what a proponent is proposing, noting that if there is acceptance by VGG then a project would move quickly through the permitting processes. VGG wants to clarify and make sure that the YESAB processes and the processes in VGG's Oil and Gas Engagement Policy align, so VGG will look at the policy and make sure that they are maintaining control of the process.

[redacted] notes that the YESAB process includes comments from the public at large, and there were many comments from the public on the last submission. Collaboration between Chance and VGG on any documents going in to the YESAB process will be ideal moving forward, as it is important to be submitting documents that are workable.

Role of Policy vs Plan:

[redacted] notes that the VGG leads for developing the Engagement and Communications Plan will be identified. VGG has not signed off on the Oil and Gas Engagement Policy yet as VGG needs to have some more internal discussions and work some more on the policy, which is close to complete. The Oil and Gas Engagement Policy will guide VGG and Chance as they work to develop an Engagement and Communication Plan and will act to create an anchor of corporate knowledge moving forward. Outside of the Oil and Gas Engagement Policy, there are specifics about moving forward with engagement that VGG might consider creating a strategic plan for. For example, there are timelines for engagement that need to be shared in advance.

[redacted] describes how there are two types of policy, one that is written down and one that is not. There is public policy, like environmental protection and economic interests, that is not written down, and then there is written policy that is more of an implementation plan for engagement and communications. [redacted] notes that a plan is not an agreement, it can change over time. There is a long way for VGG to go on policy. Vuntut Gwitchin is developing lands legislation, which will need policy as well. [redacted] notes that the Oil and Gas Engagement Policy has a benefits agreement aspect which can help foster the development of policies moving forward.

[redacted] describes how the Vuntut Gwitchin community will want to be part of engagement with Chance and will want to help set priorities for engagement. There are community members with oil and gas experience. [redacted] explains that VGG would like to see a working group for the Engagement and Communications Plan development that involves multiple levels of decision making, which includes principles at the top, senior officials, and directors. Those working at the ground level should be empowered to make decisions and move things ahead, where the more senior levels of representation from both sides will only be involved as necessary and updated periodically.

[redacted] notes the representatives from Chance and Hemmera that will be involved in developing the Engagement and Communications Plan: [redacted], [redacted], [redacted], and [redacted]. [redacted] describes the timeline for developing the Engagement and Communications Plan to meet the August 30th deadline as set out in the Order In Council. The Chance team would like to get the Plan established prior to summer, as many people go away, so June is the soft deadline for VGG and Chance to have the Plan complete. [redacted] describes

attempts made to engage Na-cho Nyäk Dun (NND), Tr'ondëk Hwëch'in, Gwich'in Tribal Council (GTC), and Tetlit Gwich'in on developing Engagement and Communication Plans, with some response from GTC and NND and no response from the other First Nations. Chance would like to look to VGG for guidance on this and to take the lead, if this is acceptable.

[redacted] notes that Hemmera can take the lead on developing a timeline and plan for developing the Engagement and Communication plan, which includes identifying moving parts and how they work together. [redacted] also sees VGG taking the lead on engagement with other First Nations as required. [redacted] notes that once the timeline for VGG and Chance developing the Engagement and Communication Plan is finalized, it could be shared with the other First Nations so that they can determine where and when they fit in. [redacted] explains that there will be long term engagement and impacts for Chance and VGG, so VGG is taking careful steps.

Closing Remarks:

Chief [redacted] identifies for Chance to contact [redacted] for now, as he holds the portfolio at this time. [redacted] notes that VGG will produce VGG milestones for the Oil and Gas Engagement Policy and can move forward from there, VGG may share the Policy one more time. [redacted] will provide the formal point of contact and an alternate by March 2nd.

End of meeting at 5:00 pm.

APPENDIX 2-C-56. September 11 & 12, 2018, Meeting Summary

Vuntut Gwitchin Government and Chance Oil and Gas Limited Meeting

Date: September 11 – 12, 2018

Location: River Vista Boardroom, Hemmera's Whitehorse Office

Attendees:

Vuntut Gwitchin Government:

Councillor [redacted] (Day 1 only)
[redacted], Lands Manager, Vuntut Gwitchin
[redacted], Heritage Manager and Acting Director of Natural Resources
[redacted], Intergovernmental Coordinator

Chance Oil and Gas Limited:

[redacted], Chairman/ CEO
[redacted], President
[redacted], VP Government and Community Relations (Day 1 only)
[redacted] Regulatory, Environmental and Community Relations Coordinator
[redacted], Board member and Chair of Community Relations Committee (Day 1 only)

Hemmera:

[redacted], VP Community Engagement and Social Sciences (Day 2 only)
[redacted], Senior Project Manager
[redacted] Community Engagement and Consultation Specialist

Purpose and Objectives

The purpose of this meeting was to set the stage for Vuntut Gwitchin Government (VGG) and Chance Oil and Gas Limited (Chance) to develop a Cooperation Agreement to work together on matters related to Chance's Oil and Gas exploration.

Meeting Objectives:

- Review the results of the Engagement Plan process and discuss next steps for implementation;
- Identify options for project development scenarios;
- Establish key objectives and common goals for a Cooperation Agreement;

DRAFT | CONFIDENTIAL

- Determine the required content for the proposed Cooperation Agreement;
- Establish roles and responsibilities between the Parties;
- Determine key items for negotiation and establish priorities; and
- Decide on a process and a schedule for completing a Cooperation Agreement.

Day One Discussion:

Introduction

[redacted] opened the meeting by conducting a roundtable of introductions and providing an overview of the agenda. [redacted] gave an introductory statement on behalf of VGG. [redacted] said that he is happy Chance and VGG are meeting and this is a good signal of things to come. VGG looks forward to working closely with Chance on the Cooperation Agreement and creating something mutually beneficial that VGG can take back to the community. [redacted] then gave an introductory statement on behalf of Chance. [redacted] said that Chance is pleased to be meeting with VGG and also hopes to develop a mutually beneficial partnership. Chance hopes for significant opportunities but is still in the exploration phase. Chance and VGG will learn what the realistic project opportunities will be through exploration and Chance hopes to develop a project that will bear fruit for everyone. [redacted] followed up by saying that Chance and VGG can work through a more defined process now that they have the Communications and Engagement Plan (Plan) and have better communication on each side. Chance is still working on project details and wants everyone to be comfortable with the project and understand that the project is adaptive.

[redacted] then added that he wants to keep this meeting confidential and specified that the information shared during the meeting was to be passed along on a need-to-know basis only. VGG agreed and [redacted] said that this followed the process that was outlined in the Plan.

Communications and Engagement Plan Context

[redacted] provided a background about the making of the Communications and Engagement Plans saying that they were required by a Ministerial Order issued in August of 2017 and Hemmera was hired to help Chance develop the plans in fall of 2017. Chance and VGG first met about the Plans in February of 2018 and completed the Plan in May of 2018. Chance completed Plans with all five First Nations listed in the Ministerial Order by August of 2018. Moving forward, Chance and VGG have begun to discuss next steps and share information with the community. Chance received a five-year renewal on its tenure of key permits in August of 2018 and Chance and VGG are now looking to discuss a Cooperation Agreement and collaborate on planning the scope and scale of the project. In addition, Chance will be implementing the Plans with each First Nation and creating reports for Yukon Government on progress made in implementation. See the Appendix for the slides used in this portion of the meeting.

[redacted] asked, looking at near-future Community Engagement and Consultation Planning, on what would VGG like to focus? [redacted] listed topics that included:

- Oil and Gas Activity
- Vuntut Gwitchin Culture and Landscape

DRAFT | CONFIDENTIAL

- Employment and Capacity Building
- Traditional Knowledge and Traditional Land Use
- Legislation and Land Use Plan

[redacted] responded that Chance and VGG are currently between Phase I and Phase II of the VGG Oil and Gas Engagement Policy (the Policy). VGG is looking to learn about the scope and scale of Chance's potential project and would therefore like to prioritize learning about Oil and Gas Activity so they can engage the community in exploration project discussions. [redacted] said that Chance is considering a few different scenarios for exploration and project design that would be worth sharing. As well, they will need engagement on environmental issues such as caribou and ground water. [redacted] replied to [redacted] and said that the North Yukon Land Use Plan was formed to address problems with caribou. She emphasized that Engagement on legislation and plans such as the North Yukon Land Use Plan was very important.

[redacted] raised the Oil and Gas 101 session that had been previously discussed saying that planning this would require some lead time and it may be beneficial to get Yukon Government involved. [redacted] agreed the Oil and Gas 101 session would be beneficial in creating foundational knowledge while also engaging the community in the Cooperation Agreement. He suggested that the Oil and Gas 101 type of engagement could be presented in conjunction with the finalized Cooperation Plan in the community.

[redacted] suggested that asking the communities what Sustainable Development means to them would be useful in creating a common understanding. [redacted] agreed with [redacted] emphasized that they need to build a cohesive relationship, she is worried that they may end up with two concurrent processes and would prefer to focus on the Cooperation Agreement.

[redacted] raised a point about the uncertainty of Oil and Gas activity in relation to Community Engagement and the fact that information that is shared may be subject to change. R. Wyman explained that Chance can have a plan to drill a specific number of wells for exploration, but once Chance starts testing the wells, the plans may change based on results. Chance may start knowing where three wells are and then move around as they gain more information. Chance would prefer to not get too rigid early on and structure a program in a way the ensures operational momentum. It is expensive to start and stop and this does not allow for efficiency or stability in employment. There are five First Nations with interests in Eagle Plain basin and with varying degrees of exposure, however, all of Chance's plans involve working in Vuntut Gwitchin Territory. Chance is wondering if VGG might take a leadership role when dealing with all First Nations.

Now that Chance has their tenure extended for five-years in the south permits, they are reviewing seismic data again to decide where to drill. They must do exploration to define a significant resource, so they can attract investment to build capital to go into development. Once a significant discovery is found, Chance would do production testing for two years to see how the well performs and to inform what the development plan would look like. Chance has to do more testing in Eagle Plain relative to a more southern location due to remoteness and the fact that not much is known about the location in general.

DRAFT | CONFIDENTIAL

Project Next Steps

[redacted] explained that Chance has two approaches to exploration projects. (**NTD**: [redacted] forthcoming memo outlining these in scenarios in more detail will serve as a more robust description of the scenarios than these meeting notes)

The first scenario is that, in accordance with the North Yukon Land Use Plan Zone 4, designated for the highest level of economic development, Chance could do a 'regional impact assessment' for wells in a certain area. they could do the maximum number of wells that the North Yukon Land Use Plan would tolerate. This is complicated by having five First Nations with varying degrees of exposure.

The second scenario involves Chance looking at a smaller area and drilling a smaller number of wells to do appraisal drilling to better understand the region. This would involve multiple YESAB applications. [redacted] asked if the second scenario would also involve two years of production testing and [redacted] responded that it would. [redacted] added that things are iterative in exploration testing. Work would allow Chance and VGG time to build working dynamics and demonstrate that everyone can work together.

[redacted] then raised that Chance's exploration plans are contingent on the results of Chance's lawsuit against Yukon Government. [redacted] emphasized that this information was confidential. Chance has proposed a settlement in which a large central area of the southern dispositions is transferred into long-term leases with more lenient tenure terms. Chance would give up the outside border area of the Southern permits as well as the three northern permits. If this settlement offer is accepted Chance would no longer have a border with TH.

[redacted] then asked [redacted] to explain why the Northern permits are not as good for development. [redacted] explained that there is a data gap in the Northern Permits. The North geological potential is in hydraulic fracturing. Many of the areas that have been evaluated were done using old technology and new technology can provide more information. Chance does not intend to use Hydraulic Fracturing on any permits now. Referring to past work, [redacted] asked if Chance had drilled wells in permits 10 and 11 in winter of 2012 or 2013. [redacted] responded that they could not complete the drilling because of bad weather.

[redacted] said that of the two exploration project scenarios, one large and one small, he has an opinion on which way to go. The larger program would allow Chance to start a continuous program. [redacted] fears that going with a smaller program makes it more expensive because they have to go to YESAB in the middle of drilling and pay for the time delay. Chance is not sure what YESAB will allow, but the large program would decrease costs.

[redacted] said that a stable long-running program is preferable for VGG, however VGG would struggle if there was not an ongoing role for them and if sharing information protocols were not well determined or executed. They need to establish on-going momentum, sharing of data and adaptive management as a true partner. [redacted] said that in either scenario, plans need flexibility, so they can adapt to changes. They must make sure the structure of an agreement does this. [redacted] followed and said that R. Brown addressed this well, through partnerships and sharing of documents they can keep operational momentum and also quell any uncertainties in the community. [redacted] said that is it hard to know what YESAB would think of their proposed projects as they look at input from the broader public. In addition, people with experience in Oil and Gas from YESAB are no longer there and therefore YESAB, as an

DRAFT CONFIDENTIAL

organization, has a steep learning curve. [redacted] followed that, in the past, Chance's multi-well program had delays and political interference. Chance may have to meet with YESAB to figure out their application. [redacted] said that attempting to predict YESABs direction is an unproductive discussion, and that the best approach to the assessment process is for VGG and Chance to work together on an ideal scenario and present it to YESAB jointly for discussion purposes. [redacted] said that they would slide through YESAB with First Nations collaboration on an application as could be demonstrated by joint letterhead.

[redacted] said he would prefer the first scenario where Chance proposes the maximum number of wells. Chance would propose this, but they would probably not reach this. Each well as a small surface footprint, but a deep reach. [redacted] said there are challenges with regional assessments and gaps in legislative tools. Access into the area is a primary concern as there isn't a legislative tool to restrict public access, and this is a concern because this is a caribou migration corridor. *Yukon Oil and Gas Act* gives authority to shut down access to public roads, but you cannot build an all-season road until resources are proven. [redacted] stated that he would hope that the area would never have public access. [redacted] suggested that they could have a radio-controlled road. [redacted] agreed that this was a good thing to consider, and to determine when you move from a winter road to a permanent road. R. Wyman concluded that there are a lot of different ways to manage this to allow for dialogue. [redacted] added that Chance and VGG are going into YESAB together, there is no question about that. Including people is a learning process for everyone and develops local capacity.

[redacted] prompted a further discussion on the scale of the project. [redacted] said that Chance and VGG will need to have further discussion if they are going to try and negotiate the Cooperation Agreement before the election is called. They will need regular meetings. [redacted] added that they will need to figure out the level of capacity funding support required given the scale of the exploration project. [redacted] agreed that VGG needs to think about how to develop capacities. [redacted] then emphasized that the Cooperation Agreement needs to acknowledge a high degree of uncertainty. [redacted] said that he understands and appreciates Chance's need for flexibility in the agreements. VGG is not looking for a rigid description but is looking for a starting point to understand potential activity and make everyone feel comfortable about moving ahead. [redacted] reiterated that making everyone comfortable with the is what is important to VGG and they understand the give and take on available information because of uncertainties.

[redacted] added that any contract work would try to include local employees as much as possible. [redacted] added that a challenge for Chance is how to attract equipment and get participation.

[redacted] recapped that Chance is to provide VGG with a description of the wells. [redacted] added that a one-pager on each scenario described to the best of Chance's knowledge would be appreciated. [redacted] asked if Chance would consider an Executive Committee assessment, and that perhaps this information could be included in the one-pager. [redacted] said Chance would, but the five-year tenure creates a tight timeline. R. Brown asked if Chance would consider scoping out a project for district-level review? [redacted] noted that because Chance got bumped to an Executive Committee level assessment in the past, if the project looks similar, they will get bumped to Executive Committee again. [redacted] suggested that the application could be staggered. [redacted] responded that YESAB would be scrutinizing that sort of scenario for any suggestion of 'project splitting' and noted that YESAB was hard to predict but any project Chance

DRAFT | CONFIDENTIAL

submits will be looked at closely. VGG and Chance working together can create a compelling argument for YESAB.

[redacted] stated that it is good to learn about where Chance is on their exploration activity planning, VGG had not internally thought about the larger exploration project option. [redacted] added that it makes sense to go big from an industry perspective, however would Chance consider changing to a smaller project if perhaps this was what VGG preferred? [redacted] said that Chance has the tenure clock to keep in mind, the does not want to get into a situation where they have just gained a reasonable prediction about affairs and then they run out of time to evaluate. [redacted] suggested they can enter into a Cooperation Agreement in the early stages of the project then VGG can evaluate the project as it is developed. R. Wyman raised the significance of the pace of the project as a slow pace would cause for the project to seem small because this would involve spreading a large project out over a longer timeframe and only a few wells would be drilled at a time. [redacted] said that for Chance it makes operational sense to move slowly, they can build certainty in the project and then build capital. [redacted] said that even with a slow the pace, VGG must review a large project up front.

[redacted] asked if VGG would be bringing in someone from education because there is the potential to create opportunities for community members to participate through high school and college courses that prepare students for the industry. [redacted] said that the Oil and Gas Committee has room to incorporate education. Education is a critical discussion, but the project is not quite there yet.

[redacted] asked what is needed to ratify the Cooperation Agreement, presentations to the community or a Chief and Council decision? [redacted] responded that they get direction from the community and the Oil and Gas Committee and then Chief and Council make a decision.

[redacted] said that VGG needs to have more discussion about the project and the North Yukon Land Use Plan. [redacted] added that Management Plans can address shortcomings in legislations and regulations. [redacted] said that they need to do a gap analysis to figure out the scale of operation for a number of years and determine what the application is going to look like. [redacted] said that the current camp at Chance's site can only hold 75 people and that this is full when they are running a seismic program. They would need two rigs running, if they think about a slow pace the current camp could be workable. [redacted] suggested that community preparedness for a large amount of activity is a concern. [redacted] said that they have experience in working with people from communities. In past activity 15 people were hired from Old Crow and there is room to add more people. They do not want to make people afraid to have these conversations. [redacted] added that a small-scale project for a long time helps to reach sustainability.

[redacted] asked to whom Chance should send future correspondence regarding the Cooperation Agreement and VGG responded that it should go to [redacted] and [redacted] and [redacted] could be CC'd.

[redacted] asked what happens if Yukon Government does not accept Chance's confidential settlement proposa[redacted] [redacted] responded that this is an area of interest and everything is in play until the lawsuit is settled. [redacted] asked if Chance needs a resolution on their lawsuit before they move forward with a project and [redacted] responded that they do.

DRAFT CONFIDENTIAL

Cooperation Agreement Objectives

[redacted] asked VGG if they had any specific objectives for the Cooperation Agreement. [redacted] referred to the draft Cooperation Agreement provided by VGG and acknowledged that a few clauses were no longer relevant such as the one that addressed tenure renewal. Section 4 was important to VGG in that they collaboratively define scale and scope of the project, Chance agrees not to go to YESAB without VGG, and they have a commitment on capacity funding. VGG would also require in the Cooperation Agreement that Chance not acquire new dispositions and focus on the area that they have. [redacted] responded and said that the only reason they would consider another area is to compete with other businesses. [redacted] suggested that maybe the could agree on alternate wording where Chance makes decisions on acquiring new dispositions with VGG.

[redacted] raised that the most Northern permit (number 5) is now against a park. [redacted] confirmed that yes, that permit abuts a protected area. M. Chernoff said that Chance could give up the three most northern permits.

[redacted] concluded the meeting and asked if there were any more objectives to share and [redacted] responded that this depends on the exploration scenario and he looks forward to reading more about Chance's exploration scenarios. [redacted] followed that this had been a great discussion and that he looks forward to follow-up.

Day Two Discussion:

Review of Shared Objectives

[redacted] began Day 2 of the meetings with a recap of the first day's discussion. [redacted] then went over each party's objectives as they were discussed throughout the Day 1 discussion and also expressed in the draft Cooperation Agreement.

[redacted] expressed VGG's objectives as the following:

- Clear commitment from Chance to not go into an assessment process before discussing plans with VGG;
- No Hydraulic Fracturing;
- Avoid activity in the Northern dispositions;
- Clearly outlined goals for stewardship measures;
- Understanding of scale, scope and pace of the project;
- Capacity Funding;
- Adhere to process in the policy; and
- VGG has time internally to review information that is provided.

[redacted] expressed Chance's objectives as the following:

- Cooperation Agreement accepts inherent uncertainties;
- Flexible in nature;
- Operational Momentum; and
- Chance wants the Cooperation Agreement to retain local capacity for employment.

DRAFT | CONFIDENTIAL

[redacted] asked Chance if these objectives were for now or for later, and [redacted] specified that they were for the whole time. [redacted] asked when, in the process outlined by the VGG Oil and Gas Engagement Policy, the Cooperation Agreement ended and [redacted] answered that it ended when it was entered and then Chance and VGG would start a Benefits and Stewardship Agreement.

[redacted] commented on VGG's objective that Chance not acquire new dispositions. [redacted] said that he understands Chance's position and did not hear from Chance about their interests before. [redacted] said that Oil and Gas is competitive, and he does not want to be handcuffed before their knowledge matures. [redacted] clarified that VGG's sentiment behind the clause is that VGG be involved in the process and know Chance's long-term objectives. [redacted] expressed that VGG does not want to be caught off guard when a bid comes up.

[redacted] then explained that their overarching theme is to be as sustainable as possible in their actions, but they do not know if something may come up in seismic testing that would trigger Chance or other companies to want to acquire more land. [redacted] asked for an example scenario. [redacted] responded that Chance may discover hydrocarbons in a currently unknown area because of unknown geologic events. You cannot see what you are working with until you get the hole in the ground. Exploration will mean exploring ideas of where they think significant oil deposits may be. [redacted] clarified that in terms of operation this would shift focus and sequencing? [redacted] responded that that was correct and explained that there are broad characterizations that you are looking for in exploration, but you cannot know until you dig a well. [redacted] further explained that you need seismic to help, you cannot identify a deposit based on geography alone.

[redacted] suggested that it would be useful to VGG to have access to data to form their own opinions. The more information VGG has, the better. [redacted] explained that most of Chance's data is an interpretation and there are commonly disagreements on how to interpret data. [redacted] suggested that it might be better to have the disclosure VGG is looking for after exploration. [redacted] explained that VGG can still make us of information and [redacted] further explained that VGG tries to find areas where all research may be useful and beneficial to VGG. [redacted] explained that Chance has not spent that much time exploring on settlement blocks and [redacted] followed and said that if information is known, VGG would want to know so they could make the decisions together. [redacted] explained that some information would need to be protected as propriety information, however, once they are into development there is a degree of exposure that is required. Chance is not currently trying to be evasive.

[redacted] sought to clarify if the distinction in data that Chance could share was in whether it was raw data vs. interpreted data? [redacted] explained that some raw data is proprietary, some data that has to be disclosed to Yukon Government is private. [redacted] concluded that the information sharing is something that needs to be discussed further.

[redacted] asked if Yukon Government had disclosed anything about the lawsuit? [redacted] answered that only Chance's claim was public information.

Cooperation Agreement Contents and Items for Negotiation

[redacted] then shifted the discussion to the next agenda item saying that for the rest of the morning Chance was going to frame out the agreement and discuss process. [redacted] asked the group, what should the agreement contain, what are bucket items?

DRAFT | CONFIDENTIAL

[redacted] responded that Chance would like to see each party's objectives laid out, have some description of information sharing, and Terms of Reference for how the parties act in executing the exploration. [redacted] said that Chance should provide feedback on the draft that was prepared as this contains VGG's objectives.

[redacted] interjected and recapped VGG's objectives. [redacted] expressed that both parties should start from a place that is as simple as possible. Moving forward, it is probably most productive to work within the current draft and include all points of view such as flexibility for future project decisions that are not currently predictable and that each party should keep the other party fully informed. The Agreement should specify what information should be shared at which stage of the project and address needs for confidentiality. Chance should come up with a revised draft that includes these items in short order because October is not far away. [redacted] added that the Plan and Policy need to be reviewed when considering what needs to be included in this agreement and future agreements. The agreement that is being developed now does not need to define long-term project information but create a building block for those discussions. [redacted] suggested Chance have a look at the document and figure out what more they need and what they do not need.

[redacted] expressed that Chance does not mean to say that they have not carefully looked at the documents, because they have spent some serious time looking at them. [redacted] asked if the Benefits and Stewardship agreement would follow the Cooperation Agreement. [redacted] responded that it would. [redacted] clarified that the Benefits and Stewardship Agreement is not triggered by an operational phase, but that it would apply to multiple phases. [redacted] said yes, and its purpose would be to put measures in place if there was a significant discovery.

[redacted] stated that Chance would like clarity on the types of information that VGG is looking for and would like to know what VGG would do with this information. [redacted] said that often VGG would contract staff to help them work with data that they do not have internal expertise to analyze. North Yukon is heavily researched, and it benefits VGG to have access to this data. For example, many research permits require that data is given to the Polar Knowledge Data Catalogue, so they are aware of what research has been done. They often receive metadata. [redacted] added that geological information can be helpful. [redacted] gave an example of a winter road becoming an all-season road and Chance and VGG might as well be using the same information to make a decision. [redacted] said that Chance would have no problem sharing environmental, geophysical and geological data. They would need a disclosure/ disclaimer about the interpretation. They cannot provide all their raw data as they purchased this from someone else and Chance is the only one with a license to use it. Anything that is licensed they cannot pass along. [redacted] asked if VGG could have access to future seismic data and [redacted] replied that there could be a condition attached for VGG sole use, but the information could not be disclosed.

[redacted] recapped next steps for the draft wherein Chance would take Kris's version and [redacted] Wyman and [redacted] would provide feedback. [redacted] then asked what the process should be moving forward to continue discussion on topics of the agreement that require more time to resolve. [redacted] asked if further discussions would be topical or address changes to the who[redacted] document as they come. [redacted] said that VGG would need time to address the feedback and then decide how to proceed. He then asked how they were going to meet the election target deadline. [redacted] recommended moving backwards from that deadline to build a timeline and [redacted] recommended including the approval

DRAFT / CONFIDENTIAL

process of both parties.

raised that hiring joint technical consultants could be of interest to both parties and responded that VGG would like independent advice until they have a Benefits and Stewardship Agreement. expressed that they would gather data together to avoid duplication and said that it does not make sense if everyone hires their own consultant. said that VGG would like to develop plans based on what they know. said that they could do a joint management plan but clarified that both parties might want the ability throughout creating the plan to seek independent advice. clarified that VGG was trying to avoid the situation where they leave issues to be resolved in a YESAB assessment because then the process for issue resolution is much more difficult. VGG understands that they and Chance have different objectives, they need an adaptive management loop where they have access to information and management reports to strengthen information and resolve issues upfront. clarified that they would go to YESAB with the detailed work done in a way that both parties are confident in.

asked if VGG would expect independent advice to be in the field and replied that Chance and VGG could discuss the specifics later. said that this situation may actually be coming up quickly as Chance may take advantage of a having a helicopter to do geological studies and also do some fish studies. said that it would be nice for VGG to have their own experts. added the importance of getting local advice and oversight as well. agreed and said that VGG has a lot of knowledge in house, however, VGG would require additional knowledge to be confident.

suggested that there could be joint development of a baseline program where feedback is incorporated that meets the needs of both parties. Generally, they would try to make sure everyone feels that they are jointly conducting the program and that duplication of research is in no one's interest. agreed that Chance and VGG have the same views.

summarized the Cooperation Agreement topics that require further discussion. These include:

- Capacity funding;
- Information Sharing;
- Flexibility on project information;
- Future acquisition of dispositions;
- Schedule for completion; and
- Ratification processes of both parties.

Cooperation Agreement Process

said that VGG would have to plan to share the Cooperation Agreement with the community in Old Crow and in Whitehorse. The Cooperation Agreement itself is something Chief and Council would sign off on, but community feedback might require further discussion and edits. S. Shaw suggested that Chance schedule a board meeting to make sure they have enough lead-up time.

DRAFT CONFIDENTIAL

[redacted] clarified what happens after October 19 if they have the Cooperation Agreement complete, or if perhaps it is not completely done. [redacted] said that technical work can continue there will just be no large decisions made. [redacted] clarified that if they have 90% of the agreement complete and it is not signed by the 19th of October, is there the functional ability to overlap the developments of the agreements and [redacted] replied that there was.

The group then discussed a schedule for meetings over the next few weeks and [redacted] committed to sending out schedulers for meetings and placeholder meetings.

[redacted] asked for definition of meta data, as expressed earlier by VGG. [redacted] responded that it is a description of data, mainly dates and methodology.

[redacted] said that they will try to address capacity funding requests as best they can before October 19th given the time constraints and figure out mechanics of who is working on what. [redacted] said that VGG will better understand by the Chance summary what they are considering and be better positioned to plan out the Cooperation Agreement moving forward. [redacted] asked if VGG had prepared a project description for Designated Office before and [redacted] said that they had.

[redacted] concluded the meeting by reviewing action items listed in the table below.

Attachments:

No attachments.

Action Items/Next Steps:

Action Item	Responsible Party	Date Required
Prepare a brief write-up of exploration project scenarios including the scale, scope and pace of planned activity.	Chance	Friday, September 16, 2018
Review Draft Cooperation Agreement and provide feedback for VGG.	Chance/ Hemmera	Friday, September 16, 2018
Next Cooperation Agreement meeting	All	Friday, September 28, 2018 9am to 12pm PST

Key Meeting Outcomes

Outcome	Responsible Party	Notes
Chance and VGG expressed their objectives for the Cooperation Agreement and short-term activity in the Eagle Plain Basin.	VGG	

DRAFT | CONFIDENTIAL

Outcome	Responsible Party	Notes
Chance and VGG decided on a process for completing the Cooperation Agreement with the aim to have the agreement completed by October 19, 2018 when the VGG election is called.	All	
Future correspondence regarding the Cooperation Agreement should go to D. Tizya-Tramm and R. Brown.	All

Negotiation Planning Meeting

Vuntut Gwitchin Government and Chance Oil and Gas Limited

September 11, 2018

Hemmera
An Ausenco Company

Context - Background

- **August 2017** – MO 2017/37 required Chance to create Communications and Engagement Plans (Plans) with five First Nations
- **Fall 2017** – Hemmera was hired to help complete the Plans
- **February 2018** – Chance and VGG met to re-set their relationship and agree to work together on a Plan
- **May 2018** – Chance and VGG's Plan was completed and the VGG Oil and Gas Engagement Policy was appended
- **August 2018** – Chance completed Plans with all five First Nations

Context - Next Steps

- **Summer 2018** – Discussions of Next steps and community celebration
- **August 2018** – Chance's tenure for key permits was extended by five years
- **Fall 2018** – Planning and discussion on next steps
  - Cooperation Agreement Negotiation
  - Chance will begin to scope out the project
  - Engagement Plan implementation with other four First Nations
- **2019** – Continue Engagement Plan Implementation and Annual Reports to Yukon Government

Implementation

What are short-term objectives for Community Engagement and Consultation?

Possible Topics:

- Oil and Gas Activity
- Vuntut Gwitchin Culture and Landscape
- Employment and Capacity Building
- Traditional Knowledge and Traditional Land Use
- Legislation and Land Use Plan

APPENDIX 2-C-57. October 4, 2018, Meeting Summary

Vuntut Gwitchin Government and Chance Oil and Gas Limited Meeting

Date: October 4, 2018

Location: Teleconference

Attendees:

Vuntut Gwitchin Government:

[redacted]
[redacted] Lands Manager
[redacted] Intergovernmental Coordinator

Chance Oil and Gas Limited:

[redacted] President
[redacted] VP Government and Community Relations
[redacted] Regulatory, Environmental and Community Relations Coordinator

Hemmera:

[redacted] VP Community Engagement and Social Sciences
[redacted] Senior Project Manager

Purpose and Objectives

The purpose of this meeting was to review the latest draft of the Cooperation Agreement (Agreement) containing changes made since meeting last on September 11 and 12, 2018; as well as to further discuss Chance's Exploration Project Description as it was presented in the word document sent via email on September 20, 2018.

Meeting Objectives:

- Review VGG's and Chance's changes to the Draft Cooperation Agreement
- Discuss next steps for finalizing the Cooperation Agreement
- Discuss Chance's Exploration Project Plan in more detail and provide clarity on any items if needed

DRAFT | CONFIDENTIAL

Meeting Discussion:

[redacted] opened the meeting by discussing the timeline for finalizing the Agreement. Originally, Chance and VGG were striving for a timeline that would allow for the Agreement to be completed before October 19, when it is expected the VGG election will be called. However, this timeline would not afford time for community engagement. There are benefits to waiting for the incoming council in that they will be the ones to sign off on the agreement and then be responsible for implementing the agreement. [redacted] suggested moving forward with the discussion of the Agreement keeping a new longer timeline in mind. Chance and VGG are likely looking at February 2019 as the earliest date on which an Agreement could be signed off.

[redacted] followed and spoke to the benefits of having a longer timeline for finalizing the Agreement. The community vetting process takes time to be done properly. [redacted] does not see extending the timeline as increasing uncertainty in the Agreement or slipping backwards. Extending the timeline provides more opportunity for engaging members of the community, they will get direction throughout the process, and secure a stronger transition from one council to the next. [redacted] does not see this as problematic.

[redacted] asked how VGG sees the interim between now and February in terms of moving forward. For example, does VGG see any value in having Chance participate in community engagement? [redacted] responded that Chance and VGG can continue the work, they want to bring something non-divisive and clear to Council. Out of the Agreement meetings they will plan the community engagement. [redacted] asked for clarity on what [redacted] meant by non-divisive. [redacted] clarified that they do not want to see scenarios where the community is divided due to uncertainty of process. [redacted] added that VGG wants Chance to provide clarity to the community on the Policy and what the Agreement is and what it is not.

[redacted] asked VGG if they could explain their engagement process. [redacted] said that the Oil and Gas Committee (Committee) membership will have the responsibility of doing community engagement. [redacted] asked if the Committee was formed yet? [redacted] said that the Committee was quite close to being formed and will hopefully be formed before October 19th when the election is called. They are looking at more community membership, including youth and Elders, and membership of a couple different departments. [redacted] said that the community will be tasked with a few initiatives, so it is in everyone's interest to get it set-up as soon as possible.

[redacted] reiterated his question regarding Chance's timelines moving forward. [redacted] replied that Chance has sent a letter to Chief [redacted] relinquishing permit 5. Exploration permits 6-11 are set to expire August 2019, so time pressure exists on these permits as well as permit 19. These permits are part of the legal claim against Yukon Government. [redacted] asked if any advancement with the project required settlement with Yukon Government? [redacted] replied that advancement could be dependent on the settlement, they would want some clarity from Yukon Government moving forward. [redacted] asked if Chance had any problems with the new timeline VGG was proposing. [redacted] responded that Chance does not have problems with this timeline as long as February 2019 remained the target end date for finalizing the Agreement, as this seems to be the realistic deadline.

DRAFT | CONFIDENTIAL

The conversation then moved onto reviewing the latest version of the Agreement that was emailed on September 20, 2018. [redacted] started the conversation by saying that VGG has issues with Chance's amendments and comments to Section 4.3, specifically Chance's reluctance to attach the Policy, and wish to have the freedom to submit a YESAB proposal prior to the end of this Agreement and therefore prior to signing a Benefits Agreement. [redacted] asked if Chance and VGG could potentially complete some aspects of the Policy at the same time rather than sequentially? Due to the facts that YESAB has public components and Chance cannot do anything without permits, it may be time inefficient to advance things sequentially. [redacted] asked for an example of items that Chance would want to develop in paralleled sequences. [redacted] elaborated that Chance and VGG could develop at YESAA application at the same time as a Benefits Agreement. [redacted] reminded the group that a fundamental aspect of the policy is to have a front-end process. [redacted] suggested going over the policy together. [redacted] said that this process is not meant to be onerous.

[redacted] said they would go through the Policy in tandem with the scenarios document and provide written feedback within a week. [redacted] specified that when it comes to engaging with YESAB, they will not be duplicating any work necessarily. Regarding the pace of the project, smaller projects are easier for VG and larger projects are easier for Chance. [redacted] said that Chance and VGG need to drill down in more detail and discuss the North Yukon Regional Land Use Plan (NYRLUP) and what they mean by conformity with the recommendations in the Plan. [redacted] acknowledged that some technology, for example seismic, is different now. [redacted] raised other recommendations in NYRLUP, such as a preference for winter roads and determining safe operating distances from caribou that will require some work to find solutions to comply with recommendations. [redacted] suggested that Chance support the gaps to help conform with the recommendations that are throughout NYRLUP.

Chance and VGG agreed to spend some time at the next meeting on discussing the Policy and NYRLUP in more detail. With a new timeline in mind, Chance and VGG concluded this meeting deciding to meet again during the week of October 15th.

APPENDIX 2-C-58. December 12, 2018, Meeting Summary

Vuntut Gwitchin Government and Chance Oil and Gas Limited Meeting

Date: December 12, 2018

Location: Hemmera's Whitehorse Office and Teleconference

Attendees:

Vuntut Gwitchin Government:

Councillor [redacted]
[redacted] Lands Manager
[redacted] Intergovernmental Coordinator
[redacted] Fish and Wildlife Manager

Chance Oil and Gas Limited:

[redacted] President
[redacted] VP Government and Community Relations
[redacted] Regulatory, Environmental and Community Relations Coordinator

Hemmera:

[redacted] Vice President, Human Environment
[redacted] Business Leader, Human Environment
[redacted] Human Environment Specialist
[redacted] Human Environment Specialist

Purpose and Objectives

The purpose of this meeting was to have an in-depth discussion on the Vuntut Gwitchin Government (VGG) Oil and Gas Engagement Policy (Policy). This meeting sought to increase understanding of the stages of the Policy and the action required by each party to comply with each stage. This included pinpointing which stage of the Policy Chance and VGG are at currently and understanding how the stages of the Policy align with project design and environmental assessment in practice.

Meeting Objectives:

- Provide a forum in which discussion can be held around the Policy before beginning to move forward again with the Cooperation Agreement and other Policy action items
- Increase understanding of the Policy, the reasons behind the Policy, and each stage of the Policy

- Increase understanding of how the Policy will be executed in practice

Meeting Discussion:

[redacted] started the meeting by providing time for attendees to introduce themselves and provided an overview of the agenda. An additional agenda item was added to touch base on the February 1, 2019 All-Party Meeting and discuss logistics.

[redacted] provided opening remarks for VGG. [redacted] thanked Chance for having this meeting and said that he looks forward to establishing where Chance and VGG are within the process and Policy. It is important that Chance and VGG collectively understand where they are so that they can move forward with the Policy. [redacted] wants to bring something back to the Vuntut Gwitchin people and champion a successful project. R. Wyman followed with opening remarks for Chance. [redacted] agreed with [redacted] and stated that Chance wants to build a good partnership.

[redacted] then began his presentation. The presentation was meant to provide background to the Policy, explain the need for the Policy and its contents. Referring to Slide 3, [redacted] explained that the development of the Policy was informed by the VGG Final Agreement and the North Yukon Regional Land Use Plan (NYRLUP). VGG will look to these documents to inform engagement at all stages of the Policy. VGG is aiming for sustainable development and they are not anti-development. The NYRLUP provides a broad overview of sustainable development, and this overview guided how sustainable development was viewed in the making of the Policy. [redacted] explained that the Policy was also guided by past engagement with Northern Cross which provided learning experiences of what worked, what did not work, and how to get through the YESAB process. VGG expects any engagement on potential oil and gas activity in the VGFN Traditional Territory to be a robust process given the significance of Caribou to VGFN and the potential impacts from development in the region. The community should also be involved in this process.

On Slide 4, [redacted] referenced Chance's last multi-well program as an example of a proposal failing where details around the project were not sufficiently defined at the outset with community support. On Slide 5, [redacted] explained that there are existing gaps in the regulatory regime and there are areas that could be improved upon, especially section 68, the Benefits Agreement section of the *Yukon Oil and Gas Act,* and regulations around the development of access roads. VGG is trying to ensure that the Policy addresses these issues. [redacted] said that Yukon Government was working on the roads issue and asked if Chance could follow up on this. [redacted] also suggested that [redacted] Director of Oil, Gas and Mineral Resources with Yukon Government's Department of Energy, Mines and Resources, could provide a summary and provide input on the roads issue at the All-Party Meeting. [redacted] added that VGG is trying to push Yukon Government to work with VGG and all First Nations on resource roads. [redacted] said that Chance will follow what is in the regulations and [redacted] added that in some instances the regulations do not provide enough guidance to follow through with a project, and more research must be done to fully implement the recommendations of the North Yukon Regional Land Use Plan.

[redacted] asked where to find the NYRLUP annual reports. [redacted] replied that they are on the Yukon Government website and every year the Vuntut Gwitchin and Yukon governments agree on implementation priorities for the year ahead.. The NYRLUP is a good reflection of what the people envisioned for the area. The challenge is in the implementation of the plan, and the tendency to overlook

detailed recommendations of the plan by focussing on cumulative effects thresholds instead. The recommendations need to be enacted, and in some cases this is not through government regulation, meaning project proponents need to take action on their own. [redacted] suggested that Chance and VGG go back and look at how VGG referenced the NYRLUP in the YESAB assessment of the Northern Cross Multi-Well project. [redacted] said that Stage III of the Policy reflects this need to fill gaps within the NYRLUP. Referring to Slide 6, [redacted] said that the VGFN GA Resolution No. 2017-02 also ties into this.

Referring to Slide 7, [redacted] explained the United Nations Declaration for the Rights of Indigenous Peoples (UNDRIP) describes the rights of Indigenous people internationally. [redacted] said, that the Council for Yukon First Nations (CYFN) has a process for implementing the Free, Prior and Informed Consent (FPIC) aspect of UNDRIP. However, what does the FPIC process mean for Chance, can there be information sessions? [redacted] said that they could do a presentation and that FPIC is a process for any stage of the project. [redacted] asked if [redacted] only looked at were the United Nations (UN), or if there were examples at the country-level to ground truth FPIC processes. [redacted] explained that Article 43 of UNDRIP sets out minimum standards for Indigenous Rights that should apply to Indigenous people world-wide. [redacted] stated that FPIC is the benchmark that the Policy is based upon.

On Slide 8, [redacted] explained a Gwich'in Council International report in which FPIC principals were applied to Impact Assessment. This is not exactly what you see in the Policy, but this report informed the development of the Policy. [redacted] added that the report referenced on Slide 8 will be circumpolar and when it is published, they will get a copy. [redacted] asked if YESAB would adopt or amend sections to meet the Gwich'in Council International report. [redacted] said that is unknown, however, the Policy fills the gap where YESAB does not address FPIC.

[redacted] said that given the relative lack of development in the VGFN Traditional Territory, and the significance of caribou, VGG wants to gain as much information as possible to figure out what information is absent and what is needed to address Vuntut Gwitchin interests before going to YESAB. VGG worked on the Policy process for eight months and it was finalized in March of 2018. [redacted] contributed. It went to Council, and before it was finalized, it was published on the website and announced at community meetings. A draft was provided to Chance, and Chance provided comments before it was finalized.

Referring to Slide 9, [redacted] explained that many of definitions in the Policy were incorporated from Yukon legislation. It was important that the Policy facilitate discussion with Vuntut Gwitchin Citizens and have community members involved to provide feedback. The Natural Resources Committee (Committee) is mandated with this task. [redacted] asked how the Committee and the proponent will be involved. [redacted] said that the Committee makes their own rules and they can invite anyone to their meetings. There is nothing stopping the proponent from approaching citizens, the proponent just must inform the Committee to arrange logistics and to avoid scheduling conflicts. [redacted] said that the Committee will add to the capacity of the Natural Resources Department by improving direct communication between the department and VGFN citizens. The community and VGG do not have the capacity to support multiple committees under the Natural Resources Department; therefore one committee will handle oil and gas in addition to other files of the department.

DRAFT

[redacted] said that some citizens are saying that it is difficult to get on boards and committees and she suggested that vacancies for boards and committees be posted on the website. [redacted] replied that vacancies for the board had been advertised.

[redacted] asked if VGG could reveal the names of the three board members. [redacted] said that VGG should be able to reveal the names as they are trying to be transparent. The three citizen members of the Committee are [redacted]. The other two members of the Committee are the Standing Chair and the Director of the Natural Resources Department. The Committee will meet for the first time in the New Year after the new Government is sworn [redacted] said that Chance and Hemmera would be available to provide any briefing material to the Committee.

[redacted] went on to explain Slide 10, saying that when trying to coordinate and facilitate engagement with citizens, Chance should provide reasonable notice. [redacted] said that Chance will send VGG a scheduled workplan and that VGG will have lots of notice as to when Chance needs to speak to the community. [redacted] asked about educational sessions in addition to Consultation. [redacted] explained that the Committee would come up with its Terms of Reference to guide operation, and there is the possibility to hold educational sessions. Any additional sessions outside of Consultation would depend on the needs of the community. Consultation is not tied to a specific stage of the Policy.

[redacted] said that Chance is obliged to follow a legislated timeline when designing the Consultation timeline, what if Chance's Consultation timeline and the Committee's timelines do not align? Chance needs time to coordinate with and educate VGG, the Committee, and the community, and is concerned about duplicating Consultation and education efforts prior to and during the YESAB process. [redacted] said that a lot of the coordinating and communicating should be done at the front end before YESAB. [redacted] that nothing should be a surprise during YESAB, the Policy process is supposed to alleviate pressure during the YESAB process. [redacted] suggested that if issues have been addressed then few new items should be raised during the YESAB process. [redacted] clarified that this would mean developing the proposal together with VGG and [redacted] agreed that this summarized the Policy process.

Referring to Slide 10, [redacted] explained section 24 of the Policy and the details of what the proponent's notice should contain. VGG understands that many projects details may not be available when beginning the Policy process, however, Chance should give VGG enough information to understand what upcoming project discussions will contain. When notice is received by the Director of Natural Resources, it is sent to the Committee to review and the Committee decides if they have enough information. They may request more information. [redacted] asked if there were timelines for these stages? [redacted] explained that they initially had strict timelines for each stage, but this was thought to be too restrictive. The wording was designed to suggest some immediacy, and VGG would generally like to know information as early as possible.

[redacted] asked if, when Chance informed VGG about their tenure extension application in the summer of 2018, that was the first time Chance had reached out to VGG separate from Yukon Government. [redacted] thought that is was. [redacted] wondered how much time VGG would generally require to review notification documents and also require with each stage of the Policy.

[redacted] then raised the issue that, when Yukon Government calls for proponents to bid on new opportunities, it is confidential, and the name of the proponent would only be revealed after there is an

award. Some things are hidden by government practices to protect competitive processes. [redacted] added a follow-up question, how does VGG see the Policy meshing with Yukon Government Policies? [redacted] replied to [redacted] question; the wording of the Policy is at the "earliest possible opportunity" and therefore if something is confidential, the earliest time it could be shared is when it is not confidential anymore. The Policy is not meant to intervene in the competitive bidding process.

On Slide 12, [redacted] explained that, for the Cooperation Agreement in Stage II of the Policy, the Proponent and the VGG Chief and Council would enter into the Cooperation Agreement and the Committee's role would be fulfilling its mandate to inform the community. Stage II is meant to be a step where parties are committing to the process.

For slide 13, [redacted] explained that the items in Stage III, that comprise the negotiation for a Benefits and Stewardship Agreement, contain the mechanisms for enacting FPIC. This is the same process as the Cooperation Agreement but is more extensive because there are more items to address. The Committee is tasked with deciding if they are going to recommend the Benefits and Stewardship Agreement to Council. The Committee will be responsible for determining a sufficient ratification process for any Benefits and Stewardship Agreement which could include a community vote or General Assembly Resolution, for example. This Stage is meant to maximize benefits and minimize risks.

[redacted] addressed [redacted] earlier question and said that the timelines are however long it takes to discuss the matters of each Stage. VGG has had issues with Section 68, the Benefits Agreements section of the *Yukon Oil and gas Act*. The First Nation can waive the agreement if the Benefits and Stewardship Agreement for Stage III of the Policy satisfies the First Nation, and then the proponent could satisfy Yukon Government requirements separately. G. Charlie said that he likes this possibility and asked what would happen if the community was not supportive? K. Statnyk replied that this is a possibility, however, if people are informed and included as partners throughout this process and the development of plans and Agreements, then there is a greater likelihood of community support. [redacted] added that it is beneficial to have the Chair of the Committee be an individual that is part of VGG as well as the Committee to help share information. The goal is to provide objective information and have the Committee fulfil their mandate.

[redacted] raised that the YESAB process collects feedback from the general public whereas the VGG Policy is focused on the community. [redacted] said that the Committee can choose to meet with other groups and other groups can meet with members of the community. [redacted] raised concerns around fear mongering or sensationalizing the project during the YESAB process. [redacted] said that there would be public consultation prior to the YESAB process, as is typically done when submitting a proposal to the YESAB Executive Committee.

[redacted] asked how the community and Committee are meant to help in establishing economic benefits and opportunities. [redacted] replied that the Committee is the conduit and that VGG does not expect the Committee to come up with specifics. The Committee can help to make sure that the benefits and opportunities are fair and meet the needs of the community. In January, [redacted] said he would like to have a community event to accelerate and stimulate thinking on Chance's project. [redacted] added that they need someone with experience to help figure out what the benefits and opportunities are. [redacted] said that he is excited to go back to the community and share information about the

project. The Committee may not have membership that is representative of all of VGG's interests as this would require too many people to make a functional committee, however, the Committee will have to reach out to other departments and experts to make decisions. [redacted] said it would be good to provide a historical overview to the Committee, so they could understand what has led Chance and VGG to this point. [redacted] agreed.

[redacted] asked what if YESAB causes amendments to the Benefits and Stewardship Agreement, would Chance and VGG have to go through the ratification process again? [redacted] replied that this is possible, it would depend how the agreement is drafted. Chance and VGG will have to take this into account when drafting the document. [redacted] raised that there is often a debate over stewardship measures and management plans, for example, there could be issues over what YESAB would consider adequate in a conceptual management plan. [redacted] asked if VGG had thought about what adequate means within the Policy. [redacted] said that adequacy would be determined by the community and there will be a lot of things that the community wants to understand.

[redacted] asked, for Item (n) in Stage III of the Policy regarding dispute resolution, what are scenarios that would require dispute resolution and when would this be enacted? Dispute resolution may be required prior to completing the agreement? [redacted] said that disputes will be evaluated on a case by case basis, and parties will figure out mechanisms by which they can get to an agreement. [redacted] said that they will create a process where both parties understand that certain circumstances need to be resolved or negotiated and parties will commit to this. [redacted] suggested that a dispute resolution committee could have members from VGG, Yukon Government, and Chance.

[redacted] began to describe the process of executing the Policy. Once Chance and VGG get through Stage I, he does not see Stage II as being onerous because the parties have already started the Cooperation Agreement, discussed objectives, and provided feedback between each other. [redacted] added to the process that Chance will have to meet with YESAB to discuss the project and get an official decision on whether they are submitting a Designated Office or Executive Committee level proposal. In addition, [redacted] asked if Chance could share the Policy with YESAB and Yukon Government. [redacted] replied that Chance could share the Policy as it is public.

[redacted] informed VGG that Chance is in various stages of engagement with each First Nation. Chance originally thought that they could collaboratively develop the project description. However, they need to be mindful of all the parties when doing so. Chance would like to discuss how to collaborate at the February 1st All-Party Meeting. [redacted] agreed that is was important to keep the other First Nations informed and he thinks that they agree that VGG is the most impacted. [redacted] said that he thinks that VGG can educate the other First Nations about what VGG is doing, but VGG does not think that they need to be involved in the benefits discussions of the other First Nations. [redacted] said that he does not think it is the proponent's responsibility to figure out the division of benefits either, he thinks that is Yukon Government's role. There may be issues with Gwich'in Partners because they are not included in Yukon Legislation.

[redacted] asked that VGG suggest agenda items for the February 1st meeting if they have any additions. [redacted] added that [redacted] from Yukon Government would let Chance know early in the New Year

about the Minister and Deputy Minister's attendance. [redacted] said that an agenda will be sent out a couple of weeks before the meeting.

For the next meeting, it was suggested that VGG and Chance meet in Old Crow. [redacted] reminded the group of the pending law suit with Yukon Government and how Chance was waiting to hear about a settlement. [redacted] wondered if meeting in January may be too soon. [redacted] said that it would be good to talk to the community, provide an update, and introduce the project to new Council members and the Committee. [redacted] said that this would be an introduction before officially starting Stage I of the Policy. January 17th was proposed as the date for the meeting, and Chance was meant to send something in writing to [redacted] the Acting Director of Natural Resources, to connect with the Committee.

[redacted] closed the meeting by saying that the Policy was built on VGG's existing agreements and enacting the Policy will make them Champions of the North. VGG looks forward to next steps and gaining traction in the process. The Policy provides guidance for the project and collaboration between VGG and Chance.

Appended:

- Appendix 1: Vuntut Gwitchin Government Oil and Gas Engagement Policy Background and Overview Presentation

Key Meeting Outcomes

Outcome	Responsible Party	Notes
A thorough presentation of the background of the Policy and its stages. Leading to a discussion on how to implement the Policy with Chance.	VGG	The presentation is appended to the notes for reference.

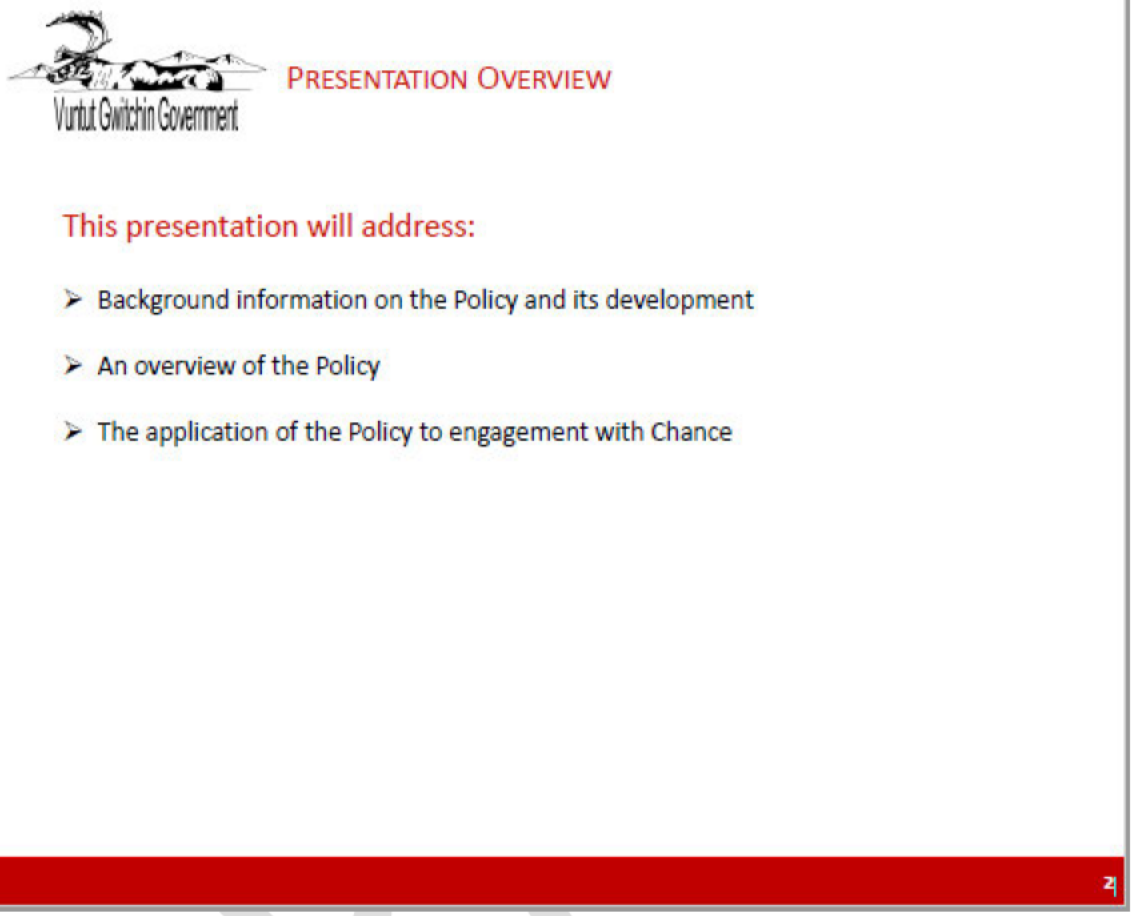
Action Item	Responsible Party	Date Required
Contact [redacted] to schedule a meeting with the Natural Resources Committee on January 17, 2019 and send a scheduler to the group for the meeting.	Hemmera	ASAP

DRAFT

Appendix 1: Vuntut Gwitchin Government Oil and Gas Engagement Policy Background and Overview Presentation



Vuntut Gwitchin Government
PRESENTATION OVERVIEW
This presentation will address:
Background information on the Policy and its development
An overview of the Policy
The application of the Policy to engagement with Chance
2

DRAFT

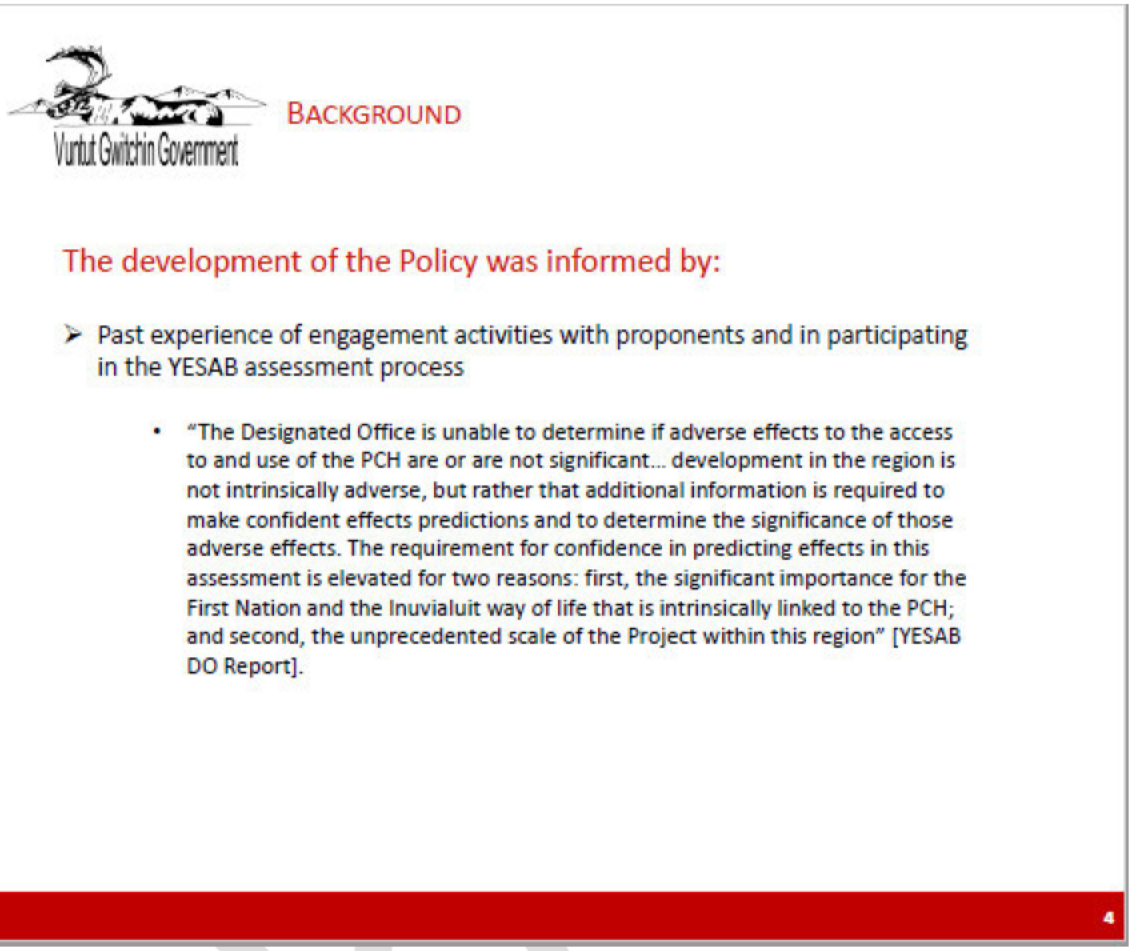
BACKGROUND

The development of the Policy was informed by:

- The principle of sustainable development as enshrined in the VGFN Final Agreement and North Yukon Regional Land Use Plan
  - "'Sustainable Development' means beneficial socio-economic change that does not undermine the ecological and social systems upon which communities and societies are dependent" [VGFN Final Agreement, Chapter 1].
  - "The core principle that guides the Plan is sustainable development, as defined in the VGFNFA... Sustainable development requires consideration of the economic, social and ecological consequences of land use decisions, and management of lands and resources in an integrated and coordinated manner" [NYRLUP]
- The principles, goals, recommendation and best management practices provided for in the North Yukon Regional Land Use Plan

3

DRAFT



Vuntut Gwitchin Government
BACKGROUND
The development of the Policy was informed by:
Past experience of engagement activities with proponents and in participating in the YESAB assessment process
"The Designated Office is unable to determine if adverse effects to the access to and use of the PCH are or are not significant... development in the region is not intrinsically adverse, but rather that additional information is required to make confident effects predictions and to determine the significance of those adverse effects. The requirement for confidence in predicting effects in this assessment is elevated for two reasons: first, the significant importance for the First Nation and the Inuvialuit way of life that is intrinsically linked to the PCH; and second, the unprecedented scale of the Project within this region" [YESAB DO Report].
4

DRAFT

BACKGROUND

The development of the Policy was informed by:

- Shortcomings in the existing territorial regulatory regime
  - "VGG would like to address our concerns with provisions of the Yukon Oil and Gas Act, R.S.Y. 2002, c. 216 and its associated regulations as it relates to benefits agreements and permit extensions. Additionally, VGG would like to resume the development of resource access roads regulations under the Territorial Lands (Yukon) Act, S.Y. 2003, c. 17" [VGG Letter to Premier Silver, May 10, 2017].
  - "The most recent annual report for the NYRLUP stresses the need for baseline data collection and development of best management practices in order to better understand and predict effects. Industrial development in the region is predicated upon fulfillment of goals for information collection as set out in the NYRLUP and associated annual reports" [YESAB DO Report].

5

DRAFT

Vuntut Gwitchin Government

BACKGROUND

The development of the Policy was informed by:

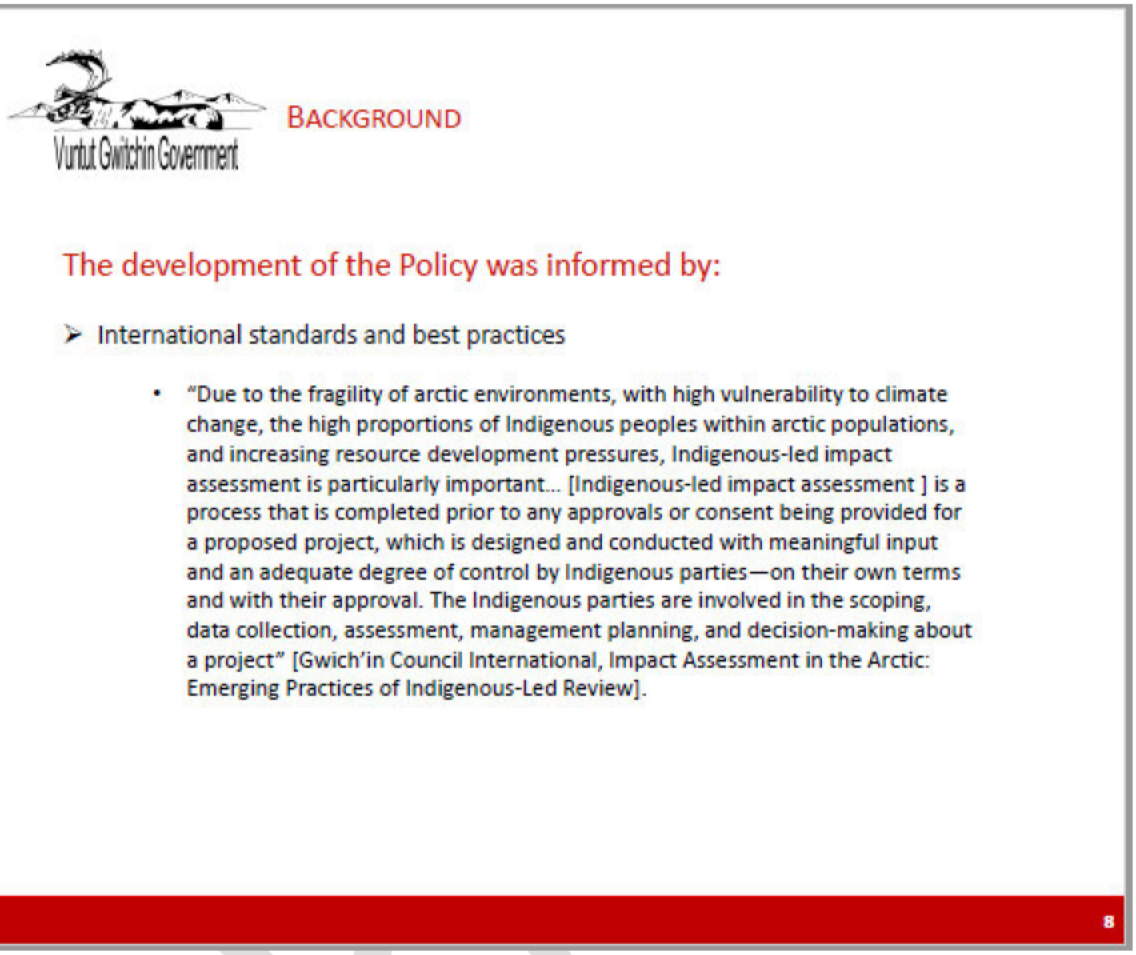
- An identified need for public policy that establishes a framework for respectful, meaningful and transparent engagement
  - "It is a condition of this Order that Chance Oil and Gas Limited must, in consultation with each affected First Nation, revise the first nations communications and engagement plan filed under O.I.C. 2016/169 to the satisfaction of the Minister on or before August 1, 2018" [Ministerial Order 2017/37].
  - "[THEREFORE BE IT RESOLVED] That VGG proceed with efforts that lead to constructive engagement with oil and gas industry proponents and government agencies including partnerships in the areas of employment and training, environmental stewardship and business development" [VGFN GA Resolution No. 2017-02].

6

DRAFT

Vuntut Gwitchin Government
BACKGROUND
The development of the Policy was informed by:
International standards and best practices
"Indigenous peoples have the right to determine and develop priorities and strategies for the development or use of their lands or territories and other resources… [and to] free and informed consent prior to the approval of any project affecting their lands or territories and other resources, particularly in connection with the development, utilization or exploitation of mineral, water or other resources" [UNDRIP, Article 32].
"FPIC is relevant… in relation to development projects encompassing the full project cycle, including but not limited to assessment, planning, implementation, monitoring, evaluation and closure" [UN Permanent Forum on Indigenous Issues, Report of the International Workshop on Methodologies regarding Free, Prior and Informed Consent and Indigenous Peoples].
7

DRAFT



Vuntut Gwitchin Government
BACKGROUND
The development of the Policy was informed by:
International standards and best practices
"Due to the fragility of arctic environments, with high vulnerability to climate change, the high proportions of Indigenous peoples within arctic populations, and increasing resource development pressures, Indigenous-led impact assessment is particularly important... [Indigenous-led impact assessment] is a process that is completed prior to any approvals or consent being provided for a proposed project, which is designed and conducted with meaningful input and an adequate degree of control by Indigenous parties—on their own terms and with their approval. The Indigenous parties are involved in the scoping, data collection, assessment, management planning, and decision-making about a project" [Gwich'in Council International, Impact Assessment in the Arctic: Emerging Practices of Indigenous-Led Review].
8

DRAFT

Overview of the Policy

The main components of the Policy include:

- A clearly defined purpose section
  - "The purpose of this policy is to establish a respectful, transparent and meaningful framework to guide the engagements of the Vuntut Gwitchin Government in relation to Oil and Gas Activities and Oil and Gas Dispositions in a manner that supports and upholds the objective of Sustainable Development" [section 3].
- The establishment and mandating of a committee to facilitate the participation of Citizens in the engagement and decision-making process
  - Membership consists of Standing Committee Chair on Natural Resources, Director of Natural Resources, Elders Representative, Youth Representative and Citizen Representative [section 12].
  - Mandate includes informing and seeking views from Citizens, and assisting and providing recommendations to the Council throughout the Engagement Process [section 11].

9

DRAFT

Overview of the Policy

The main components of the Policy include:

- A process to guide the organizing and carrying out consultations with Citizens regarding Oil and Gas Activities and Oil and Gas Dispositions

  - Director of Natural Resources has primary responsibility for organizing and carrying out any consultation between the Vuntut Gwitchin Government and Citizens regarding Oil and Gas Activities and Oil and Gas Dispositions with the assistance of the Committee as necessary [section 20].

  - Proponents are to coordinate any of its consultation with Citizens by submitting written notice to the Director of Natural Resources that sets out proposed date, location, agenda, description of the purpose of the meeting and any materials to be shared with Citizens [section 21].

10

DRAFT

Overview of the Policy

The main components of the Policy include:

- A three stage process for engagement with Proponents in relation to any Oil and Gas Activity to be completed prior to the Proponent submitting any Proposal to the Board
- Stage 1: Notice Period
  - Sufficient notice of a proposed Oil and Gas Activity must be provided to the Director of Natural Resources at the earliest opportunity [section 24].
  - Director of Natural Resources will refer the notice it receives from the Proponent to the Committee who will review it for sufficiency. The Committee will notify the Proponent in writing of its determination. If notice is not sufficient then more information will be requested. If notice is sufficient then engagement on the Oil and Gas Activity can proceed to Stage 2 [section 25].

11

DRAFT

Overview of the Policy

The main components of the Policy include:

- Stage 2: Cooperation
  - A Cooperation Agreement must be negotiated and entered into following Stage 1 and before proceeding to Stage 3 [section 26].
  - Prior to entering into a Cooperation Agreement, Council must refer the Cooperation Agreement to the Committee. The Council can enter into the Cooperation Agreement if the Committee determines that the Cooperation Agreement adequately addresses items related to compliance with the policy, communications, information sharing and capacity funding [section 27].
  - If a Cooperation Agreement is entered into in relation to an Oil and Gas Activity then the engagement process proceeds to Stage 3. A Cooperation Agreement does not provide free, prior and informed consent to any Oil and Gas Activity.

12

DRAFT

Overview of the Policy

The main components of the Policy include:

- Stage 3: Benefits and Stewardship

  - A Benefits and Stewardship Agreement must be negotiated and entered into following Stage 2 and before proceeding to the Board with a Proposal. It is the mechanism in which the free, prior and informed consent of the Vuntut Gwitchin First Nation is effectively to be provided in relation to any Oil and Gas Activity [section 28].

  - Prior to entering into a Benefits and Stewardship Agreement, Council must refer the Benefits and Stewardship Agreement to the Committee. The Council can enter into the Benefits and Stewardship Agreement if the Committee determines that the Benefits and Stewardship Agreement adequately addresses various items related to economic benefits and environmental stewardship [section 29].

  - Benefits and Stewardship Agreement will be subject to an approval and ratification process deemed adequate by the Committee.

DRAFT

Vuntut Gwitchin Government
APPLICATION OF THE POLICY TO ENGAGEMENT WITH CHANCE
The Policy applies to engagement with Chance:
Chance review of the draft Policy
Chance acceptance of the final Policy
"Chance will comply with the Policy and any other applicable VGG policies. To the extent that there may be any inconsistency between this Plan and the Policy, the Policy will prevail" [Joint Communication and Engagement Plan]
"The Plan, which incorporates the Vuntut Gwitchin Government Oil and Gas Engagement Policy (the "Policy"), sets the framework for all communication and engagement between Chance Oil and Gas Limited ("Chance") and the Vuntut Gwitchin Government ("VGG") moving forward. Chance's commitment to the Plan and Policy is a significant achievement and provides an example for the outside world on how industry ought to approach oil and gas exploration and development in the North within a framework premised on free, prior and informed consent" [VGG June 11, 2018 Letter to Chance]
15

DRAFT

Application of the Policy to Engagement with Chance

The Policy applies to engagement with Chance:

- VGG and Chance engagement is currently in Stage 1 (Notice)
- Chance has shared scenarios for various Oil and Gas Activities at different scales but has not submitted notice of an Oil and Gas Activity it wishes to advance for further consideration under the Policy
- VGG has shared a draft Cooperation Agreement for discussion purposes prior to the completion of Stage 1 (Notice) and in advance of Stage 2 (Cooperation)
- Next steps: Chance to provide written notice of any proposed Oil and Gas Activity to the Director of Natural Resources at the earliest possible opportunity as provided under section 24 of the Policy

APPENDIX 2-C-59. January 29, 2019, Meeting Summary

Vuntut Gwitchin Government and Chance Oil and Gas Limited Meeting

Date: January 29, 2019

Location: Old Crow, Yukon

Attendees:

Vuntut Gwitchin Government:

Councillor [redacted]
[redacted], Lands Manager
[redacted], Intergovernmental Coordinator
[redacted], Standing Committee H&S
[redacted] Standing Chair, Natural Resources Committee
[redacted] Natural Resources Committee
[redacted], Natural Resources Committee
[redacted], Director of Health and Social, Seven Generations Energy

Chance Oil and Gas Limited:

[redacted], Chairman/ CEO
[redacted], President
[redacted], VP Government and Community Relations
[redacted], Regulatory, Environmental and Community Relations Coordinator
[redacted], Board member and Chair of Community Relations Committee

Hemmera:

[redacted], Business Leader, Human Environment

Purpose and Objectives

The purpose of this meeting was to introduce Chance Oil and Gas Limited (Chance) to Vuntut Gwitchin Government's (VGG) new Chief and Council and Natural Resources Committee (Committee). The meeting was an unstructured conversation in which Chance explained their permits and exploration intentions and provided the opportunity for Council and the Committee to share their thoughts on the project and ask questions.

DRAFT

Meeting Objectives:

- Create a common understanding of Chance's permits in Eagle Plains and their exploration project plans
- Meet and greet with the New Chief and Council, the Committee, Chance, and Hemmera

Meeting Discussion:

[redacted] opened the meeting saying that there has been a lot of progress to date between VGG and Chance. The Committee is up to date and has been briefed on the Policy. [redacted] thanked VGG for the invitation to come to Old Crow and introduce Chance to the new Council members and the Committee. [redacted] discussed the process to re-set the relationship between the First Nations and Chance, as well as the company's rebranding from Northern Cross Yukon to Chance Oil and Gas Limited. Chance is entirely Canadian owned and is a small company. In late fall 2017, Chance began the process of creating the Engagement and Communications Plan (Plan) with VGG and completed the Plan in May 2018. Chance went through the same process of creating Engagement and Communications Plans with the other First Nations listed in MO 2017/37 (Gwich'in Tribal Council (GTC), Tetlit Gwich'in Council (TGC), First Nation of Na-cho Nyak Dun (FNNND), and Tr'ondëk Hwëch'in (TH)).

[redacted] described the overlap of Traditional Territories on which Chance's permits are located. [redacted] In meetings with VGG previously, Chance has emphasized that they are still in the exploration phase as the resources Chance has found to date are not sufficient enough for them to go into operation.

[redacted] explained Chance's disposition map (see Appendix 1). Chance released their northern-most permit, 0005, to support the creation of the Ch'Ihilii Chik Habitat Protection Area in the Whitefish Lakes Area. Looking at Chance's permitted area, the green dispositions and the yellow permit, 0019, have upcoming expiry dates in August 2019. The rest of the yellow permits, except permit 0020, were extended in August 2018 for five years and expire in August 2023. Permit 0020 expires in August 2020. Chance has purchased the Significant Discovery Licenses (red blocks on the map) and Chevron has a minor interest in them. The Significant Discovery Licenses have indefinite tenure. Chance's main area of interest is on the west side of the Dempster Highway, with some interest on the east side. Chance is planning to apply to extend their tenure on the green permits sometime this spring.

Next, [redacted] explained how Chance has no plans to do hydraulic fracturing. Previously, Northern Cross Yukon had planned to do this. The testing Northern Cross Yukon did in 2012-2014 was to evaluate shale resources and they spent a lot of money doing so before hydraulic fracturing was disallowed in the Eagle Plain Basin. Chance has legal proceedings underway with Yukon Government and has no plans to pursue non-conventional resources. [redacted] explained that in the green dispositions there is the opportunity for shale, but Chance has not explored this area. Chance found good results for shale in the yellow dispositions and prepared a report saying there was eight billion barrels of recoverable resources if hydraulic fracturing was used for extraction. Without hydraulic fracturing, there is an estimated 10 million barrels available.

DRAFT

[redacted] asked for Chance to expand on their plans for extraction and use of resources. [redacted] answered that they need to understand if there are large enough resources to extract and also evaluate the resources to determine what products they could produce. Though more exploration is needed, what they have found in the significant discovery areas is reasonable for diesel. [redacted] asked about refining to make gas and if the crude oil would have to be shipped out. [redacted] said that Chance would try to do as much treating and processing as possible on site and possibly have a few distillation towers for separating different products.

[redacted] explained that Chance is focused on community relations and they want to make sure that no projects go ahead without community approval. [redacted] highlighted that hydraulic fracturing is a serious undertaking in areas with a mature oil and gas industry and lots of resources and it also requires a lot of water. Because of the remote location of the Chance project, it would be difficult to service the area to do hydraulic fracturing regardless of regulatory or legislative impediments, such as the current ban in Eagle Plain Basin.

[redacted] explained Chance's possible next steps in terms of the oil industry. Upstream industry is exploration and production. Midstream industry is storing, marketing and transporting products such as crude oil and natural gas liquids. Chance is not interested in midstream options and [redacted] proposed that that midstream options in the Yukon be sold to Yukoners. There is less risk in developing the midstream products and Chance would love to see midstream industry options available to Yukoners.

[redacted] said that Chance plans to displace a portion of the local import of fuel which currently totals 300 million liters per year. There are opportunities for Vuntut Gwitchin in environmental stewardship and with s. 68 of the Yukon Oil and Gas Act which outlines Benefits Agreements. The doors are open to explore all the opportunities of the Final Agreement including the purchase of midstream operations by a First Nation. [redacted] added that the end game is very speculative. [redacted] raised that the Vuntut Gwitchin Final Agreement Chapter 22, Economic Development Measures, was applicable to this project. They also must keep in mind the North Yukon Forum with TH and FNNND. C. Charlie recognized that it is important that the proponent have the length of tenure required to get through the YESAB process and acknowledged the work that went into creating the Plans.

[redacted] asked when Chance would start their exploration project. [redacted] responded that Chance needs lead time. They have a 70 to 80-person camp that somewhat limits the size of their operation, however, they also have the Eagle Plain Hotel. All the specialty equipment must come from Northern BC or Alberta and they must wait for the ground to freeze to install infrastructure off the Dempster. Chance's current time constraints are seasonal issues and the required lead times to get going.

[redacted] said that, in the past, the Vuntut Development Corporation (VDC) had received more opportunity, however this time, she envisions more economic opportunity going to the citizens and Vuntut Gwitchin First Nation. G. Charlie said that, at this point, the VDC has a mandate from Chief and Council and they understand that citizens want more opportunities. [redacted] explained that the Community Relations Committee will be focused on understand what the community wants. [redacted] will be providing high-level input as chair of the Community Relations Committee. [redacted] said that it would be important to educate people on opportunities and processes. [redacted] added that the VGG would need lead time to educate and prepare people for opportunities and that the OCDC can

DRAFT

provide training. [redacted] explained that they are also part of the community education process as members of the Committee.

[redacted] then explained that this project is difficult because of the mix of opinions in the community regarding the oil and gas industry. The community has a negative perception of Oil and Gas companies due to drilling in Crow Flats, the most important wetland for the Vuntut Gwitchin. Community members would also recall the Berger Inquiry that halted the development of the Mackenzie Valley Pipeline. In addition, the issues surrounding the Arctic National Wildlife Refuge (ANWR) are on the minds of community members making Chance an important decision for people in Old Crow. The land use planning process is important as is carrying out its recommendations. The Vuntut Gwitchin Elders were not against the development of the R-Block in Eagle Plain Basin. However, the resource should be developed in the safest and most sustainable way with measures taken to mitigate impact to caribou and tundra. [redacted] responded by saying that everyone needs to have input into the management and mitigations. There are never zero impacts and Chance will seek to minimize negative impacts and enhance benefits.

[redacted] explained that it is not the Committee's role to explain Oil and Gas to the Community, instead, the Committee should be viewed as an executive council of the Community. [redacted] acknowledged that there is no way to get rid of hydro-carbons in the local market, however, Vuntut Gwitchin needs to set standards in the world that are not what you find in the 1002 Lands. [redacted] followed and said that the area around the Camp has not been visited by caribou in recent years. There have been a lot of forest fires in the area, which could have something to do with it. [redacted] said that there have been a lot of caribou discussions and they would like to see some support from YG on this topic.

After a short break [redacted] explained more about the project. This is a small-scale exploration over a long period of time. Chance will drill sequentially with only one rig at any one time. Staging exploration over a long period of time is beneficial as Chance will aim to be operating as steadily as possible and can therefore offer more steady employment. They will need to be flexible in case any changes arise. B. Kyikavichik said that another beneficial thing about this project is that the First Nation has control compared to ANWR where they have no control.

[redacted] followed and said that the Elders are always concerned about the environmental impacts of any development because the land could be changed and damaged. It is important that processes are followed to ensure that the lands are not damaged. It is also very important to the community to see people working. There should be an effort made to make sure everyone understands the environmental impacts of the project as well as benefits to the community. For example, the community benefitted from the Airport design and construction because they understood the environmental impacts and were able to shape the project. The Elders are happy because they have young leaders now. The community has specific concerns which are water and the inclusion of Traditional Knowledge in the project design. [redacted] said that Chance is there to listen, and Traditional Knowledge will be featured in the project.

[redacted] explained that First Nations develop relationships in a different way and this is a slow process. As a Committee member, [redacted] will help bring information to the community to educate them so that they will then make decisions. For example, the Committee can educate people that pipelines are low-

DRAFT

risk, or that in Grand Cache, Alberta, lichen doesn't grow there anymore as a result of environmental damage. They will take the time to inform people and make a good decision.

[redacted] further explained that two-thirds of the Yukon's gas come from the United States as far south as South Dakota. One-third of the gas is from Alberta which is either fracked or from oil sands. Displacing imported gas in the Yukon reduces greenhouse gases. B. Kyikavichik added that there would be a reduced carbon footprint.

[redacted] explained that VGG and Chance can form a strong partnership by following the VGG Oil and Gas Engagement Policy. Through this project, VGG can develop capacity internally and funnel money into renewable energy. VGG currently has a young government, and they are motivated to do as much as they can. They have a clear mandate to build a bridge for both industry and citizens.

[redacted] asked about upstream operations. When Chance sells off, will Vuntut Gwitchin still have mechanisms of control? G. Charlie responded that now was the time to start having those conversations. [redacted] followed and said that when the project gets to midstream, Vuntut Gwitchin would still be part of the process and maybe even owners. [redacted] said that there are options for midstream industry and they could identify who is in the midstream business and then approach them. [redacted] asked Chance if they see themselves in this process. [redacted] responded that he is 82 years-old and that he wants to see something happen. If Chance and VGG say "yes" to the project, they can go to YESAB and be drilling in maybe three-years. Chance is the only company interested in Yukon oil.

[redacted] discussed what the project proposal would look like. An Executive Committee assessment would be better for Chance; however, a smaller project is better for Vuntut Gwitchin. Through the front-heavy approach with the Policy, Chance and VGG can circumvent S.68, Benefits Agreement, of the Yukon Oil and Gas Act. It was also suggested that Chance and VGG could do a double track approach such that one proposal can go in and then they could start another. [redacted] emphasized that being flexible is important.

[redacted] explained how they met with YESAB to introduce Chance and provide some information as to what Chance has been doing since it was Northern Cross Yukon. [redacted] said that Chance and VGG are working collaboratively and potentially scoping a project in the fall. [redacted] asked if Chance had a Cooperation Agreement, would that give comfort to the process. [redacted] said that for him a big win would be continued access. Three to four wells would not create an oil industry.

[redacted] asked what other First Nations were thinking. [redacted] responded and said that they are looking to VGG and understand everything that has been discussed thus far. In terms of First Nations relationships, [redacted] that Northern Yukon First Nations, VGG, TH, and FNNND have an agreement and the Gwich'in also have an agreement.

[redacted] said that this project could present more opportunities than VGG can bite off. There should be room enough to do everything and VGG and Chance have the template to forge the path. VGG would like to create a full-time position in Oil and Gas. [redacted] emphasized that relationships with First Nations are so important and that Chance still must establish relationships with the other First Nations. [redacted] agreed. [redacted] reminded everyone that there is only one chance in the YESAB process and through the Policy they can achieve confidence in the process.

DRAFT

[redacted] explained plans for the upcoming summer. Chance is hoping to do field work and invite someone from the VG committee to the site. [redacted] added that Chance will do their annual inspection of the suspended wells ahead of time. Chance will be doing flow testing and looking at building a permanent road.

[redacted] concluded the meeting by saying that Chance and VGG will follow-up on the items discussed in the meeting. This has been a good exchange of information and Chance and VGG will continue to exchange information and figure out action items and next steps. [redacted] thanked the new Natural Resources Council.

APPENDIX 2-C-60. February 1, 2019, Meeting Summary

Summary

Chance Oil and Gas Limited All-Party Meeting

Date: February 1st, 2019 **Time:** 8:00 am to 4:15 pm

Location: Princess Louisa Room, Fairmont Waterfront Hotel, Vancouver, BC V6C 3L5

Meeting Participants:

Vuntut Gwitchin Government:

- Chief [redacted]
- [redacted] Fish and Wildlife Manager
- [redacted] Lands Manager
- [redacted] Intergovernmental Coordinator

First Nation of Na-cho Nyak Dun:

- [redacted] Deputy Chief
- [redacted] Lands and Resources Manager
- [redacted] Strategic Advisor

Gwich'in Partners (Gwich'in Tribal Council and Tetlit Gwich'in Council):

- Chief [redacted]
- [redacted] Director, Lands and Resources

Yukon Government

- Minister [redacted] Energy, Mines and Resources and Economic Development
- [redacted] Assistant Deputy Minister, Oil, Gas and Mineral Resources, Energy, Mines and Resources
- [redacted] Director, Oil, Gas and Mineral Resources, Energy, Mines and Resources

Chance Oil and Gas Limited:

- [redacted] Chairman/ CEO
- [redacted] President
- [redacted] Vice President of Community and Government Relations
- [redacted] Regulatory, Environmental and Community Relations Coordinator

Hemmera:

- [redacted] VP Human Environment
- [redacted] Business Leader, Human Environment
- [redacted] Human Environment Specialist
- [redacted] Human Environment Specialist

DRAFT

Summary:

Topic	Lead
Introduction to Meeting • Review of Agenda • Meeting purpose and objectives Summary: Hemmera was hired in 2017 to assist with the consultation and engagement activities for Chance's exploration project in Eagle Plains.	[redacted]
Round Table Introductions and Opening Statements by Chiefs Summary: Chief [redacted], Minister [redacted] Chief [redacted], and [redacted] provided opening statements.	All Parties
First Nation Engagement Plans • Overview of how we got here and an update on implementation Summary: Chance's current round of engagement was spurred by the 2016 OIC, followed by the 2017 Ministerial Order. A series of meetings started in 2018 to collaboratively create engagement plans, starting with a template, then building out from there. This resulted in unique documents between Chance and each First Nation. Annual reports are required under the 2018 Ministerial Order. Likely not an onerous task, and along the lines of a communication summary. Level of detail will likely be decided by individual First Nations. ***See Appendix 1 – Chance All-Party Meeting: Engagement Plan Presentation***	[redacted]
Overview of Vuntut Gwitchin Government Oil and Gas Engagement Policy Summary: Vuntut Gwitchin Government (VGG) wanted an opportunity to share with the group the work VGG has done over the past year. Guiding principles of the VGG Oil and Gas Engagement Policy (Policy): sustainable development; the NYRLUP; VGG Final Agreement; past learning experiences with YESAB (e.g., gaps in regulatory regime in the Yukon); international standards. The development of oil and gas is a community decision. The Policy is two pieces/themes: internal engagement within the community and how the community will decide on oil and gas; and, external engagement with industry (i.e., the Policy establishes a committee). The Policy itself has three phases. All phases are meant to occur prior to a YESAB submission. VGG believes the new YESAB process (i.e., Pre-Submission Engagement process) largely aligns with the objectives of the Policy. Currently, we are before stage one – waiting for notification from Chance Question: Regarding the format/structure diagram – in terms of YESAB, once an application is complete and there is feedback, does that go to the Council? VGG: Feedback goes back into the whole loop – the loop including Council, the committee, and citizens. The committee isn't an interface between the VGG and YG. The committee would be tasked, as per its specific role, and then they would	[redacted]

DRAFT

report back to the Chief and Council after having done their work. At a later date VGG could expand on the internal processes for clarity.

See Appendix 2 – Chance All-Party Meeting: VGG Oil and Gas Engagement Policy Presentation

Exploration Project Description and Discussion

- Overview of the exploration project plans, oil and gas disposition plans, and YESAB application
- Answer questions or provide clarity on the Exploration Project Description

[redacted]

Summary: First exploration of oil and gas occurred in the Yukon when it was still being permitted by Ottawa back in the 50s, 60s, 70s. Red polygons on the permit map – legacy of exploration done approximately 1959-1968 when oil was found in the Yukon. These properties by themselves are not adequate to move forward with development – more needs to be discovered.

Question: For the discoveries, are conventional or non-conventional means required?

Chance: Do not need to stimulate the rock to facilitate production. Conventional means of extraction would be used.

Winter 2013/2014 had 3D seismic activity, the first in the Yukon. Chance has a base camp that can house 75 people. A limiting factor is man power (i.e., limited places to stay). Land tenure is the period of time that a permit is valid. On the Permits Map, the colour pertains to how the tenures have been extended.

Exploration activities can entail a number of things. Seismic: now lines carved through the bush are not straight, there is no line of sight, and the line are much narrower than those in the 1950s and 1960s. 3D seismic allows you to collect subsurface information in all directions. Exploration activities will include running a basecamp. Chance has to bring up everything needed in order to undertake an activity. Exploration is the riskiest part of the oil and gas industry, and the hardest part of the industry to get money allocated. A population of wells, in order to drill, learn more, and increase your probability of success is preferred.

Question: If Chance went with a 35 well program – is it 35 well pads on the surface with horizonal drilling under ground, or 35 wells total?

Chance: Not certain if we've thought well enough ahead to know that. Not all 30 wells will be exploratory. If something is found, then may need to drill in the vicinity. Possibly drill from the same well pad or one close to it in order to get a better idea of the resource.

YTG: Each well would be authorized. Not by pad.

Question: Would activities be primarily seismic first?

Chance: We do not necessarily have to shoot seismic in order to drill right now as there is legacy data. Chance does not have to do new seismic in all cases.

Chance's goal is to discover and develop a resource that meets the needs of the North and then expand. Chance wants to build local capacity. Around 80% of what Chance needs to

DRAFT

execute a program they cannot get from the Yukon (i.e., a supply line from the Edmonton area is required). If the supply chain can be shortened, it is building capacity and economy in the Yukon. Additionally, it is cheaper to operate in a continuous fashion as opposed to stopping and starting (more costly).

Question: Would activity be year-round?

Chance: Depends on the production, depends on the nature of the access. All weather access is the Dempster. However, if discoveries are made elsewhere, may need to consider all weather access off the Dempster.

Chance would assess before going out on the land to minimize footprint (e.g., build winter access on existing access routes is preferable)

Chance's drilling plan would have one rig maybe two at any given point. Trying to have a smaller scale over a longer period of time. This gives people/community time to get ready, buy equipment, get training.

Question: The concept around winter road versus summer road. All season road would be required if you need to flow test, correct? A year-round fixture on the land?

Chance: Yes, if you are flow testing then you are taking a product out of the ground, over longer periods of time, and you need to get equipment to test it (e.g., trucking operations in the testing period).

Question: For the purpose of the proposal, would that be addressed?

Chance: Yes, it would be covered off in the proposal.

First Chance would go with winter access. and then explain what would happen in the future with a well (e.g., if a well bears fruit, then this is where permanent access would need to be). This would be in the proposal to YESAB.

A multi-well program in an identified area of interest would ensure flexibility. If something is discovered, there will be a significant green house gas reduction (i.e., supply line will be reduced). The camp location was the location used when the highway was under construction – Chance is trying to reactivate/reuse previously disturbed areas.

Question: What does 300 million litres mean?

Chance: The amount of fuel trucked around the Yukon. Fuel is carried in two truck trailers that carry 50,000L each. Chance is likely not going to take out the full 300 million litres but could reduce it to 200 million litres. 2000-3000 barrels a day would remove the need to get fuel to the Yukon. The source would be local instead of foreign. 2000 barrels is about 11 truck loads.

Question: VGG has about 20 monitoring stations to keep a close eye on what's going on in the watershed – how can Chance participate in that?

DRAFT

Chance: Will need clarification, but Chance will be identifying data gaps. E.g., creeks in the area of interest. There is going to be monitoring place for parties to track what's going on. With respect to the Policy. There are stages to go through, and they align well with YESAB processes. Fairly soon Chance is going to have to work on/refine its project scope. Chance's objective is to build capacity and try to operate as continuously as possible. Sequencing of project activities would need to meet Chance's capacity. In the start limited to winter activities. Steady work gives the basis for local businesses to commit to local training. YESAB takes quite a bit of time, and the tenure clock is always ticking. There is a cost associated with multiple entries into YESAB. Question: 400 km/sq area? What area? Chance: Area of interest is about 40% of the total area under permits (See Appendix 3) Question: Expectation of timing for field work and the YESAB process? Chance: Ideally, field work two years from now, after YESAB. Also, likely an application to the Yukon Water Board. Confirming scale and scope with the hope to enter YESAB later this year. Have to satisfy the Policy and any new changes to YESAB. VGG: Can see the benefits but weigh it with concerns for the land and waters. Parties have different mandates but there is overlap. Cooperation Agreement and the front-end approach could be beneficial. Time pressure yes, but it will facilitate YESAB and YOGA agreement. A balance to be struck with timelines and capacity. There is limited oil and gas experience in the Yukon, and the Yukon is nothing like the rest of the country because there is robust land use planning and the power of the people. Mandates come from the people and this will benefit the people. Both sides have significant investments. Acknowledges that parties have and are seeking different requirements: certainty versus flexibility. Question: Is the NYRLUP up for review? It was completed in 2009, parties to the plan have been talking about what a review looks like. Currently assessing the plan to see where it's doing its job and where it might not be (Note: the plan will have new lines/boundaries). Minister Ranj Pillai departed 11:26 am. ***See Appendix 4 – Chance All-Party Meeting: Chance Oil and Gas Project Description Presentation***	
In-camera First Nations Session	
Review of Afternoon Agenda and Opportunity for Statements/Questions Following In-camera Session and Lunch Summary: No questions or comments.	[redacted] All Parties

DRAFT

Presentations and Discussion • Yukon Environmental Assessment Process • Other regulatory processes such as YOGA and the Water Act Summary: YESAA, YOGA, and the Water Act each have various regulations that could apply to any number of activities. There are other departments involved as well (e.g., workers compensation). No work or activity can occur before a decision document and a water license has been issued. Question: What will be the decision body be for Chance's project? YG: Likely Oil and Gas Branch if YESAB process is District Office (DO), or Major Projects Office if it is an Executive Committee (EC). There are three types of processes. DO, EC (typically a longer process and handled out of the head office in Whitehorse, has timelines, specific requirements for consultation prior to submitting an application to YESAB), and panel process. January 2019 YESAB released information around a new process. Pre-Submission Engagement process (PSE). Currently, proponents are creating the entirety of the project proposal and submitting it all at once. Proponents have not had a facilitated process with YESAB prior to submission (i.e., opportunity to receive feedback on scope and size) and this has downsides. It's possible to have 5-10 years of exploration and baseline data. Then have YESAB require baseline data on a separate matter. Providing guidance and direction around scope and valued components would be beneficial to the process and ensure that a proposal is moving in the right direction during development. There are information sessions in the coming weeks, and the process may come into force fall 2019. It is possible that this could reduce time spent on information requests. The intention being to take time away for the stages/process after submission. Question: How will this mirror or link into VGG Oil and Gas Policy? VGG: VGG is also new to what is being proposed by YESAB. After looking at preliminary materials, it appears to align well with the Policy. Question: If Chance proceeds through the three stages of VGG, is the new YESAB process a requirement? Hemmera: Not a requirement yet, but it will be. If a proposal is submitted to YESAB before the new process is in effect, it would proceed under the old/current process. The new PSE process is consistent with what the Federal Government has done and also what BC has done with their new Environmental Assessment process. Question: If Chance proceeded prior to the implementation of the PSE and followed the Policy, would Chance be doing the same activity? Hemmera: The Policy is only for VGG. The PSE process is for everyone, including VGG. Additionally, YESAB collects the views of all of the Yukon. Question: Should Chance implement the PSE process before it is mandatory?	[redacted] All Parties

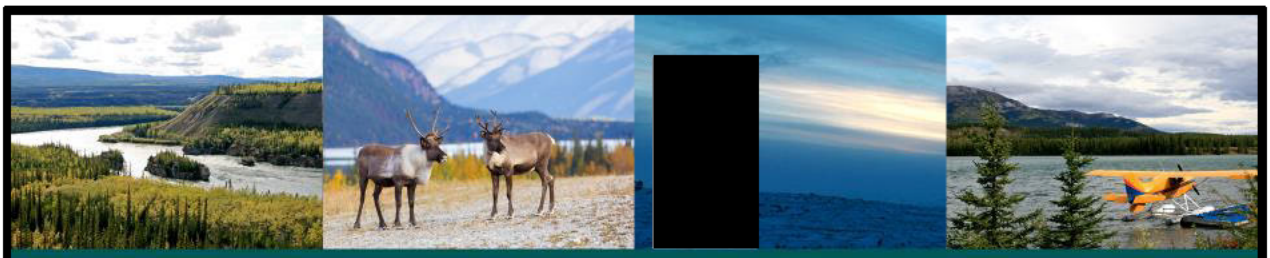
DRAFT

Hemmera: That is for the group to weigh the pros and cons and decide. Nov 2019 is an estimated date and a Federal election may cause more delays. Question: Is this legislation? Is parliamentary time required? Is this a policy, regulatory, or legislative change? Hemmera: This is a question for YESAB. YESAB is independent of the government and they are changing their rules. Maybe gazetting? Because YESAA is a Federal act. YESAA will set out the rules for processes and what consultation is necessary. ***See Appendix 5 – Chance All-Party Meeting: Regulatory Processes Presentation***	
YESAB Application Process • Where are we? • Anticipated timelines and mapping next steps Suggestion (Chance): Moving forward there will need some form of information exchange. Depending on the information, may need to be exchanged in a confidential manner. Finish Confidentiality Agreements. Chance has shared project ideas. Chance is open to feedback. Look into which steps can be done concurrently. Budget estimates and items associated with capacity will assist Chance with internal approval processes. Suggestion (Chance): Future discussion on whether or not there could be agreement or interest in using common consultants – where needed for professional and technical advice. Trying to get common recommendations. Feedback: This may be a good idea on the technical front and a capacity one. However, a biological or cultural assessment, First Nations may want to do that independently. Question: Is YG interested in doing oil and gas 101? YG: YG is amenable to doing oil and gas 101s. Different presentations could be tailored for different audiences Suggestion (VGG): Use previous documents (multi-well project) and analyze the criticism against them, to work on the areas within them, and bring them to a place where the parties support them. E.g., are concerns some that were raised by multiple people, or ones born of miscommunication? Feedback: Hemmera will be conducting a gap analysis to evaluate what is needed to apply to YESAB again (i.e., looking at everything from the DO screening and, if there is an EC, what more is needed). Take those comments from the registry (from the DO process) and evaluate whether there were adequate responses or if since then, different information has arisen, or more adequate best practices have been developed. Suggestion (VGG): Put our minds to the monitoring plan and whether mitigation measures are doing what they should (i.e., applying adaptive management). **Next steps as they were listed on the flipchart** • **Confidentiality Agreements**	[redacted] All Parties

DRAFT

• **Project Scope** • **Processes in Parallel vs. Sequentially** • **Shared consultants – technical disciplines** • **Oil and Gas 101** • **Adaptive Management**	
Wrap Up and Closing Statements Question: Is it useful to have All-Party meetings? Summary: Parties agreed it was valuable. Future All-Party meetings could be timed with key milestones and planned to proceed/follow other key dates/events. VGG: Offered to send a list of key dates/events that could be used. Summary: Chief [redacted], Chief [redacted], and Yukon Government provided closing statements.	S. Shaw

DRAFT



The Engagement Plans:
Development and Next Steps

Hemmera
An Ausenco Company

Creating the Engagement Plans

- Chance's current engagement with First Nations was prompted by M.O. 2017/37
- M.O. 2017/37 requested that Chance file Engagement Plans with each of the affected First Nations listed in the M.O.
- All Engagement Plans were filed in summer 2018

O.I.C. 2016/169
OIL AND GAS ACT

OIL AND GAS ACT

Pursuant to section 10 of the *Oil and Gas Act* and subsection 12(6) of the *Oil and Gas Disposition Regulations*, the Commissioner in Executive Council orders

1 In this Order

"subject permit" means each of the following oil and gas permits held by the subject permittee

(a) oil and gas permit No. 0005,

(b) oil and gas permit No. 0006,

M.O. 2017/37
OIL AND GAS ACT

OIL AND GAS ACT

Pursuant to section 31.01 of the *Oil and Gas Act*, the Minister of Energy, Mines and Resources orders

1 In this Order

"affected First Nation" means each of the Vuntut Gwitchin First Nation, Tr'ondëk Hwëch'in First Nation, First Nation of Na-Cho Nyak Dun, Gwich'in Tribal Council and Tetlit Gwich'in Council; « *Première nation concernée* »

"subject permit" means each of the following oil and

Next Steps

- M.O. 2018/ 42 orders that Chance submit annual reports on the First Nations Engagement Plans (due on July 31 of each year)
- Continue with Plan implementation
- Continue engagement with each First Nation individually, and also as a group

YUKON

CANADA

MINISTERIAL ORDER 2018/ 42

OIL AND GAS ACT

Pursuant to the *Oil and Gas Act*, the Minister of Energy, Mines and Resources orders

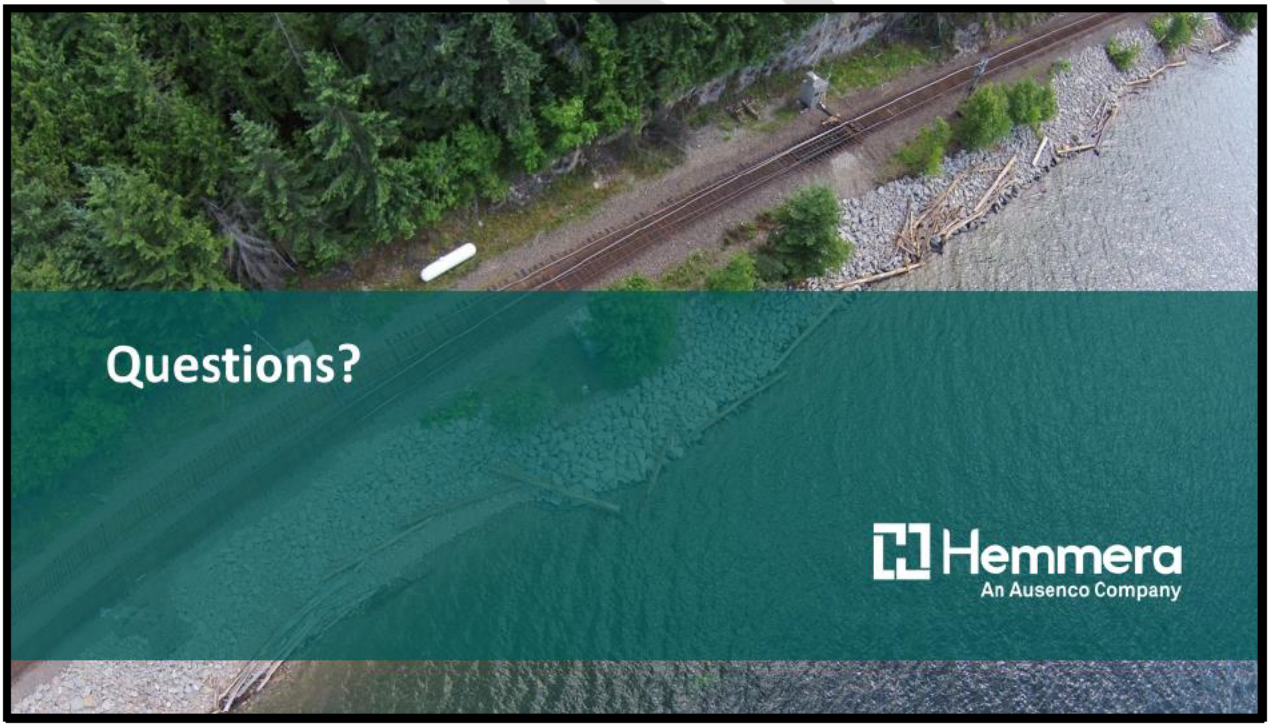
1 In this Order

"subject permit" means each of the following oil and gas permits held by Chance Oil and Gas Limited:

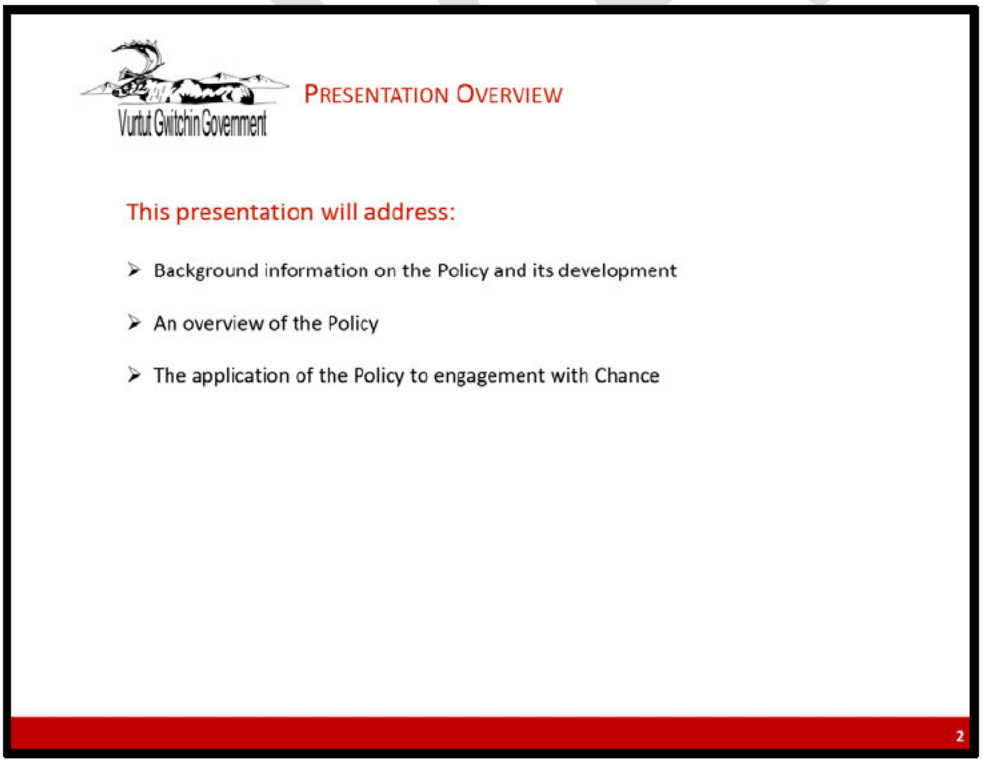
(a) oil and gas permit No. 0012,

(b) oil and gas permit No. 0013,

(c) oil and gas permit No. 0014,



VUNTUT GWITCHIN GOVERNMENT
OIL AND GAS ENGAGEMENT POLICY:
BACKGROUND AND OVERVIEW
Vuntut Gwitchin Government
This presentation was prepared by the Vuntut Gwitchin Government for discussions with Chance Oil and Gas on December 12, 2018 in the traditional territories of the Kwanlin Dün and Ta'an Kwäch'än



Vuntut Gwitchin Government
PRESENTATION OVERVIEW
This presentation will address:
Background information on the Policy and its development
An overview of the Policy
The application of the Policy to engagement with Chance
2

Vuntut Gwitchin Government

BACKGROUND

The development of the Policy was informed by:

- The principle of sustainable development as enshrined in the VGFN Final Agreement and North Yukon Regional Land Use Plan
  - "'Sustainable Development' means beneficial socio-economic change that does not undermine the ecological and social systems upon which communities and societies are dependent" [VGFN Final Agreement, Chapter 1].
  - "The core principle that guides the Plan is sustainable development, as defined in the VGFNFA... Sustainable development requires consideration of the economic, social and ecological consequences of land use decisions, and management of lands and resources in an integrated and coordinated manner" [NYRLUP]
- The principles, goals, recommendation and best management practices provided for in the North Yukon Regional Land Use Plan

3

Vuntut Gwitchin Government

BACKGROUND

The development of the Policy was informed by:

- Past experience of engagement activities with proponents and in participating in the YESAB assessment process
  - "The Designated Office is unable to determine if adverse effects to the access to and use of the PCH are or are not significant... development in the region is not intrinsically adverse, but rather that additional information is required to make confident effects predictions and to determine the significance of those adverse effects. The requirement for confidence in predicting effects in this assessment is elevated for two reasons: first, the significant importance for the First Nation and the Inuvialuit way of life that is intrinsically linked to the PCH; and second, the unprecedented scale of the Project within this region" [YESAB DO Report].

4

BACKGROUND

The development of the Policy was informed by:

- Shortcomings in the existing territorial regulatory regime
  - "VGG would like to address our concerns with provisions of the Yukon Oil and Gas Act, R.S.Y. 2002, c. 216 and its associated regulations as it relates to benefits agreements and permit extensions. Additionally, VGG would like to resume the development of resource access roads regulations under the Territorial Lands (Yukon) Act, S.Y. 2003, c. 17" [VGG Letter to Premier Silver, May 10, 2017].
  - "The most recent annual report for the NYRLUP stresses the need for baseline data collection and development of best management practices in order to better understand and predict effects. Industrial development in the region is predicated upon fulfillment of goals for information collection as set out in the NYRLUP and associated annual reports" [YESAB DO Report].

5

BACKGROUND

The development of the Policy was informed by:

- An identified need for public policy that establishes a framework for respectful, meaningful and transparent engagement
  - "It is a condition of this Order that Chance Oil and Gas Limited must, in consultation with each affected First Nation, revise the first nations communications and engagement plan filed under O.I.C. 2016/169 to the satisfaction of the Minister on or before August 1, 2018" [Ministerial Order 2017/37].
  - "[THEREFORE BE IT RESOLVED] That VGG proceed with efforts that lead to constructive engagement with oil and gas industry proponents and government agencies including partnerships in the areas of employment and training, environmental stewardship and business development" [VGFN GA Resolution No. 2017-02].

6

Vuntut Gwitchin Government

BACKGROUND

The development of the Policy was informed by:

- International standards and best practices
  - "Indigenous peoples have the right to determine and develop priorities and strategies for the development or use of their lands or territories and other resources... [and to] free and informed consent prior to the approval of any project affecting their lands or territories and other resources, particularly in connection with the development, utilization or exploitation of mineral, water or other resources" [UNDRIP, Article 32].
  - "FPIC is relevant... in relation to development projects encompassing the full project cycle, including but not limited to assessment, planning, implementation, monitoring, evaluation and closure" [UN Permanent Forum on Indigenous Issues, Report of the International Workshop on Methodologies regarding Free, Prior and Informed Consent and Indigenous Peoples].

7

Vuntut Gwitchin Government

BACKGROUND

The development of the Policy was informed by:

- International standards and best practices
  - "Due to the fragility of arctic environments, with high vulnerability to climate change, the high proportions of Indigenous peoples within arctic populations, and increasing resource development pressures, Indigenous-led impact assessment is particularly important... [Indigenous-led impact assessment] is a process that is completed prior to any approvals or consent being provided for a proposed project, which is designed and conducted with meaningful input and an adequate degree of control by Indigenous parties—on their own terms and with their approval. The Indigenous parties are involved in the scoping, data collection, assessment, management planning, and decision-making about a project" [Gwich'in Council International, Impact Assessment in the Arctic: Emerging Practices of Indigenous-Led Review].

8

Overview of the Policy

The main components of the Policy include:

- A clearly defined purpose section
  - "The purpose of this policy is to establish a respectful, transparent and meaningful framework to guide the engagements of the Vuntut Gwitchin Government in relation to Oil and Gas Activities and Oil and Gas Dispositions in a manner that supports and upholds the objective of Sustainable Development" [section 3].
- The establishment and mandating of a committee to facilitate the participation of Citizens in the engagement and decision-making process
  - Membership consists of Standing Committee Chair on Natural Resources, Director of Natural Resources, Elders Representative, Youth Representative and Citizen Representative [section 12].
  - Mandate includes informing and seeking views from Citizens, and assisting and providing recommendations to the Council throughout the Engagement Process [section 11].

9

Overview of the Policy

The main components of the Policy include:

- A process to guide the organizing and carrying out consultations with Citizens regarding Oil and Gas Activities and Oil and Gas Dispositions
  - Director of Natural Resources has primary responsibility for organizing and carrying out any consultation between the Vuntut Gwitchin Government and Citizens regarding Oil and Gas Activities and Oil and Gas Dispositions with the assistance of the Committee as necessary [section 20].
  - Proponents are to coordinate any of its consultation with Citizens by submitting written notice to the Director of Natural Resources that sets out proposed date, location, agenda, description of the purpose of the meeting and any materials to be shared with Citizens [section 21].

10

Overview of the Policy

The main components of the Policy include:

- A three stage process for engagement with Proponents in relation to any Oil and Gas Activity to be completed prior to the Proponent submitting any Proposal to the Board
- Stage 1: Notice Period
  - Sufficient notice of a proposed Oil and Gas Activity must be provided to the Director of Natural Resources at the earliest opportunity [section 24].
  - Director of Natural Resources will refer the notice it receives from the Proponent to the Committee who will review it for sufficiency. The Committee will notify the Proponent in writing of its determination. If notice is not sufficient then more information will be requested. If notice is sufficient then engagement on the Oil and Gas Activity can proceed to Stage 2 [section 25].

11

Overview of the Policy

The main components of the Policy include:

- Stage 2: Cooperation
  - A Cooperation Agreement must be negotiated and entered into following Stage 1 and before proceeding to Stage 3 [section 26].
  - Prior to entering into a Cooperation Agreement, Council must refer the Cooperation Agreement to the Committee. The Council can enter into the Cooperation Agreement if the Committee determines that the Cooperation Agreement adequately addresses items related to compliance with the policy, communications, information sharing and capacity funding [section 27].
  - If a Cooperation Agreement is entered into in relation to an Oil and Gas Activity then the engagement process proceeds to Stage 3. A Cooperation Agreement does not provide free, prior and informed consent to any Oil and Gas Activity.

12

Vuntut Gwitchin Government

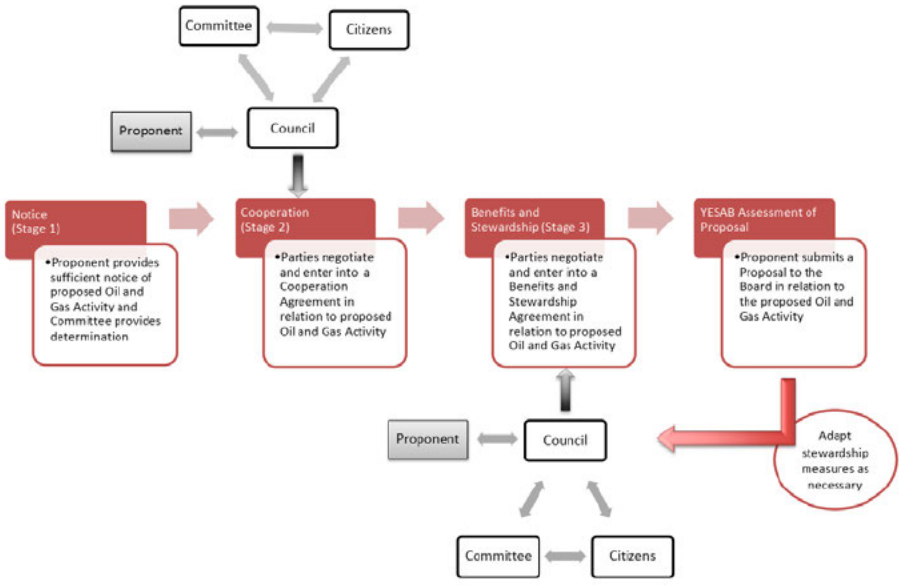
Overview of the Policy

The main components of the Policy include:

- Stage 3: Benefits and Stewardship

  - A Benefits and Stewardship Agreement must be negotiated and entered into following Stage 2 and before proceeding to the Board with a Proposal. It is the mechanism in which the free, prior and informed consent of the Vuntut Gwitchin First Nation is effectively to be provided in relation to any Oil and Gas Activity [section 28].
  - Prior to entering into a Benefits and Stewardship Agreement, Council must refer the Benefits and Stewardship Agreement to the Committee. The Council can enter into the Benefits and Stewardship Agreement if the Committee determines that the Benefits and Stewardship Agreement adequately addresses various items related to economic benefits and environmental stewardship [section 29].
  - Benefits and Stewardship Agreement will be subject to an approval and ratification process deemed adequate by the Committee.

13



14

Application of the Policy to Engagement with Chance

The Policy applies to engagement with Chance:

- Chance review of the draft Policy
- Chance acceptance of the final Policy
  - "Chance will comply with the Policy and any other applicable VGG policies. To the extent that there may be any inconsistency between this Plan and the Policy, the Policy will prevail" [Joint Communication and Engagement Plan]
  - "The Plan, which incorporates the Vuntut Gwitchin Government Oil and Gas Engagement Policy (the "Policy"), sets the framework for all communication and engagement between Chance Oil and Gas Limited ("Chance") and the Vuntut Gwitchin Government ("VGG") moving forward. Chance's commitment to the Plan and Policy is a significant achievement and provides an example for the outside world on how industry ought to approach oil and gas exploration and development in the North within a framework premised on free, prior and informed consent" [VGG June 11, 2018 Letter to Chance]

15

Application of the Policy to Engagement with Chance

The Policy applies to engagement with Chance:

- VGG and Chance engagement is currently in Stage 1 (Notice)
- Chance has shared scenarios for various Oil and Gas Activities at different scales but has not submitted notice of an Oil and Gas Activity it wishes to advance for further consideration under the Policy
- VGG has shared a draft Cooperation Agreement for discussion purposes prior to the completion of Stage 1 (Notice) and in advance of Stage 2 (Cooperation)
- Next steps: Chance to provide written notice of any proposed Oil and Gas Activity to the Director of Natural Resources at the earliest possible opportunity as provided under section 24 of the Policy

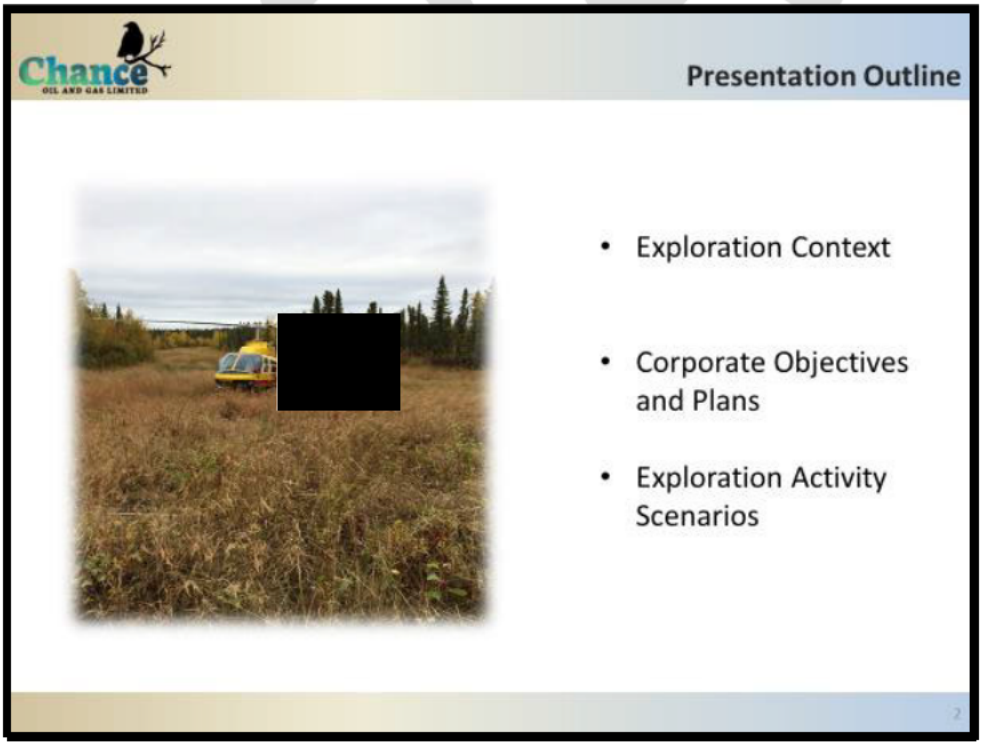
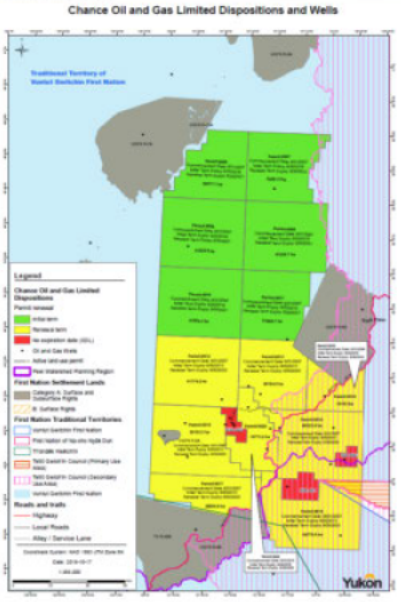
Presentation to the All Parties Meeting
Chance Oil and Gas Limited
February 1st, 2019



Chance
OIL AND GAS LIMITED
Presentation Outline
[redacted]
• Exploration Context
• Corporate Objectives and Plans
• Exploration Activity Scenarios

Land Holdings Eagle Plain, Yukon



- 14 Exploration Permits (0006-0017, 0019-0020 expiring between Aug 30, 2019 and Aug 30, 2023
- 3 Significant Discovery Licenses ("SDL's") with indefinite tenure with discovered oil and natural gas
- Landholdings total about 490,000 hectares
- North Yukon Regional Land Use Plan indicates that this area is suitable for multiuse, including oil and gas industry activities
- Chance surrendered ep. 0005 in 2018 to allow the creation of Ch'ihilii Chik - HPA

3

Infrastructure and Support

- Eagle Plains is an underexplored sedimentary basin
- Discovered resources located at the SDL's is not sufficient to proceed to development
- Oil and gas exploration began in the 1950's and both oil and natural gas have been discovered
- Almost 40 wells have been drilled at Eagle Plains
- Over 10,000 kms. of 2D and about 325 sq. kms. of 3D seismic data has been acquired

4

Land Tenure

- Tenure is the length of time that exploration permits or leases are valid
- Tenure has a large influence on obtaining financing, planning activities and doing the work
- For a remote area like Eagle Plains, longer tenure is better than shorter tenure
- How the legal action against Yukon gets resolved will have an impact on tenure

5

Exploration Activities

- Field work to investigate the geological opportunities
- Acquiring more seismic data (both 2D and 3D)
- Exploration drilling of new wells
- Production testing of any discoveries showing commercial potential
- Construction of seasonal and year-round access trails and roads
- Installing and operating processing facilities connected with production testing

6

Exploration Activities

- Operating the base camp
- Converting wells for injection of water produced with oil and natural gas
- Logistical support for the camp and exploration activities
- Environmental data gathering and monitoring of operations
- No plan to do hydraulic fracturing

Exploration Activities

- Exploration work is the most expensive and most uncertain activity which affects funding commitments
- Exploration activities are unpredictable because results guide the future steps
- Plans are subject to change as priorities change with new information
- Even though Chance has several prospects to evaluate, drilling may find something that could not be predicted before hand that changes the plans
- Flexibility is needed from Assessors, regulators and goods and service providers to accommodate the uncertainties and need to adapt the activity as the work progresses

Objectives and Plans

- Based on current geological understanding, the area of exploration focus includes parts or all of Exploration Permits 0012-0016 and 0019-0020 and the three SDL's
- Acquire more seismic data and drill more wells to evaluate the resource potential
- Discover sufficient oil and natural gas resources to support future development
- Develop discoveries to serve the regional market needs and possibly export markets if the resource base is large enough
- Undertake the exploration program on a small scale over a long period of time to minimize the environmental and social impacts
- Try to operate as continuously as possible to provide steady employment and minimize the high costs of starting up and shutting down

9

Benefits

- Develop local capacity to participate in the projects and displace high cost imported services and equipment
- Diversify the regional economy
- New business, training and employment opportunities
- Reduced GHG's by substituting imported fuel that is shipped thousands of kilometres with Yukon sourced fuel
- Potential to reduce the cost of fuel in the Yukon and surrounding area

10

Project Alternatives

- YESAB assessments are required in order to obtain regulatory approvals to undertake any exploration work
- Depending on the scale and scope of the program, the YESAB assessment could be done by the Designated Office in Dawson or by Executive Committee in Whitehorse
- Two project execution scenarios can be considered: 1) a series of short duration, limited activity projects each with its own YESAB assessment; or 2) one longer duration, but limited scale project over the entire exploration region that undergoes one comprehensive YESAB assessment
- All work is exploration to evaluate the resource potential in order to understand whether the opportunities can eventually be developed commercially

11

Activity Scenarios- Issues to Manage

- YESAB processes are expensive and lengthy
- Lengthy assessment processes grind the tenure clock
- The cost of multiple assessments could hurt the amount of exploration work
- Multiple YESAB assessments of shorter duration, limited scope exploration work means intermittent employment
- Financial and project management are more efficient under a regional YESAB assessment of exploration in a broader area, but still small-scale operation (e.g. a single drilling rig or a single seismic survey)

YESAA Assessment Process

- Assessors look at the potential environmental and socio-economic effects of proposed activities and recommend whether the activities should proceed, proceed with terms and conditions, or not proceed.
- When assessments are complete, recommendations are sent to the relevant Decision Body(s)
  - Designated Office Evaluation
  - Executive Committee Screening
  - Panel of the Board of Review
- Decision Body(s) decide to accept, reject, or vary YESAB's recommendation
- Decision Document issued

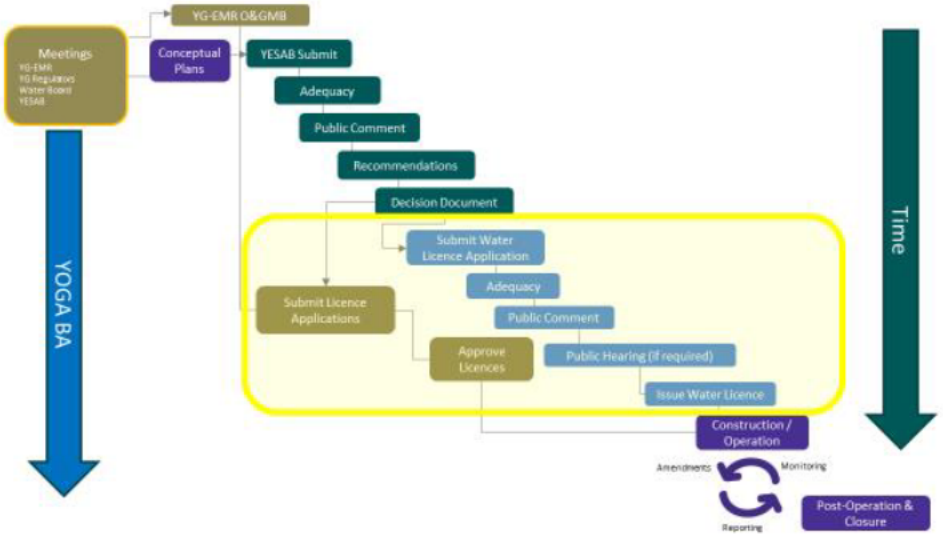
YESAA Assessment Process

New: Pre-Submission Engagement (PSE) process

- YESAB approved the PSE and it will come into effect late Fall 2019 (estimated).
- For Executive Committee screenings only.
- Brings parties together to review project requirements in advance of proposal submission.
- Helps identify gaps and issues of concern, define values and baseline information requirements, and ensure a timely and certain screening process.
- "Terms of Reference" style of process

Licensing Process



Yukon Water Use Licence [1/2]

- Use of water or deposit waste into water
- Petroleum exploration/development are "Industrial Undertakings"
- Interim - Oil and Gas Information Package for Applicants (2013)
- Quasi-judicial board supported by Yukon Water Board Secretariat

Yukon Water Use Licence [2/2]

Choice of Type A vs Type B will drive information requirements, process, and timelines

- Hearing required for Type A
- Both require YESAA decision document prior to issuance

Permitting and Licensing

1. Land Use Permit (YG – EMR, Land Management)
2. Well Licence and Well Operation Approval (YG – EMR, Oil and Gas Resources)
3. Permit for Air Emissions (YG – ENV)
4. Temporary Highway Access Permits (YG – HPW, Transportation Branch)
5. Water Licence/Notification of Water Use (YG, Water Board)
6. Dempster Highway Area Authority Authorization

YOGA Well Licence

- First Nation and community consultation prior to application
- Benefits Agreement for projects >$1M/year
- Requires YESAA decision document prior to issuance

APPENDIX 2-C-61. June 6, 2019, Meeting Summary

Old Crow Community Dinner

Date: June 6, 2019

Location: Old Crow Community Hall

Attendees: 35 Community Members including staff of Vuntut Gwitchin Government (VGG), and members of the Natural Resources Council

Dinner Presentation:

[redacted] opened the meeting and provided welcoming comments. [redacted] then welcomed everyone to the meeting and introduced the members of the Natural Resources Committee (Committee) who attended the dinner.

[redacted] started the Chance presentation by introducing the team and providing an overview of the presentation. As background information, [redacted] explained that Chance was formerly called Northern Cross Yukon and has been in operation for 25 years. Northern Cross Yukon Changed its name to Chance two years ago. An overview of the project area was provided and the 2400 km^2 area of focus was highlighted. [redacted] explained that there will be up to 30 wells drilled with 1500km^2 of 3D seismic and 2000km of 2D seismic. The modern seismic techniques are much lower impact than what was used in the 1950s and 1960s to explore Eagle Plain. The project will be a series of small-scale projects done over ten years, depending on success. They are looking to find sufficient resources to develop; the aim is for crude oil, but Chance is also interested in natural gas. The operation activities Chance is proposing have been tested in the North. This will be a year-round project; access roads and seismic access will be seasonal to year-round. The schedule of operations will alternate between drilling and seismic activity from year to year. Chance's camp can hold approximately 75 people, and this will be the size of the workforce needed for seismic, with some staff able to stay at the Eagle Plains Hotel and some support staff needed outside the camp. [redacted] explained that Chance wishes to build an air strip beside the existing Chance road.

[redacted] presented on the Yukon Environmental and Socio-economic Assessment Board (YESAB) process. Chance is following the VGG Oil and Gas Engagement Policy (the Policy) and within the Policy the Committee has the role of communicating with the community. Chance's project will be evaluated by the Executive Committee in YESAB. This is second tier of evaluation for larger projects. Chance's project is being evaluated by the Executive Committee instead of the Designated Office, meant for smaller projects, because the Designated Office referred the project up to the Executive Committee saying that they need to better understand effects on caribou to resubmit their project.

There was an audience comment on calving ground and winter range of the Porcupine Caribou. This is important for Vuntut Gwitchin as a whole. Caribou research has demonstrated that caribou are sensitive. The people's dependence on caribou is equally as important as the economy and this will challenge anything that could affect the range. Caribou is assumed to be a large topic of conversation surrounding

DRAFT

the project and will be talked about a lot over the summer. The times are changing. Vuntut Gwitchin have had winters with no caribou which is a challenging for the community.

[redacted] explained that the purpose of this meeting is to introduce the project. Future meetings will address concerns with caribou, and management plans will be developed.

Question on if the airstrip Chance is planning could land a hawker airplane and if this could be used to resupply fuel to Old Crow.

[redacted] replied that the airstrip would be approximately 1500m and could land a hawker airplane, however, he is not sure if it could be used for purposes outside of Chance's purposes. This will have to be evaluated at a later date.

Question on road access decimating caribou herds. Will land be protected and how will this be managed?

[redacted] responded that Yukon Government manages roads to resources. The roads that Chance is planning will be managed roads, not public roads. They will have access controls such as gates. This is especially important because there are safety concerns with hydrogen sulfide.

Question about Chance will deal with caribou in the project area. What will be done if caribou are around project activities?

[redacted] responded that he does not know exactly what the plan is, but that Chance and First Nations will develop joint management plans. [redacted] added that Chance has Caribou experts evaluating the project area, and they will be coming up to Old Crow to talk with the Committee and the Community.

Question on the new project. Does the new project look the same as the previously submitted project?

[redacted] responded that they are now pursuing a larger project and well locations have not yet been determined.

Question about whether Chance is ready to develop their new project proposal for YESAB.

[redacted] responded no, they have not started engaging with everyone. [redacted] adds that they will be spending time in Dawson, Mayo, Inuvik, Fort McPherson, Whitehorse and Old Crow to make sure they engage with all affected First Nations and communities.

Question about whether Chance will use Vuntut Gwitchin Government members for environmental monitoring.

[redacted] answered that yes, this can work.

Comment that they should take some people to see an active well or a similar active site. This would be important to Elders and provide proof that the project will be fine and show them what will be left behind.

[redacted] responded that there will opportunities to see the Chance site. They could maybe see similar sites in Northern British Columbia and Alberta.

DRAFT

Question about the phasing of drilling and seismic. There is a concern that the dynamite would affect moose and trappers, for example if pregnant cows are present during dynamite explosions. How do they know the impact it will have on them?

[redacted] responded that they can use existing seismic data, so they do not have to do seismic before drilling when they are starting the first well.

Question about issues with Hydraulic Fracturing.

[redacted] responded that there will be no hydraulic fracturing.

Question about seismic lines. Is there a risk for these becoming a highway for predators such as wolves?

[redacted] responded that seismic lines are narrower and not straight, so they don't get line of sight.

Question asked about the remediation of old sites.

[redacted] answered that wells Chance drilled in the past are suspended for future use.

[redacted] concluded the question period by saying that there will be future community meetings to discuss access and caribou and to talk about what the project might look like.

[redacted] concluded the meeting by saying that he was happy to see this discussion happening. The Vuntut Gwitchin Government has an oil and gas policy; Chance has triggered the first Stage of the Policy. This document is available for the community to see. The Natural Resources Committee operates like the Heritage Committee but there are other regulatory controls on this process such as the Yukon Oil and Gas Act. [redacted] was happy to see that the community is asking questions and hopes that this meaningful conversation continues. Approach [redacted] youth representative [redacted] R[redacted] with any questions.

Key Meeting Outcomes

Outcome	Responsible Party	Notes
Chance presented the Draft Project Description to the Old Crow Community	Chance	
Hemmera provided information on the YESAB project proposal preparation process. Hemmera emphasized that they will be back in the community for future consultation.	Chance and Hemmera	

DRAFT

Action Items/Next Steps:

Action Item	Responsible Party	Date Required
Future community meetings will be held to discuss caribou and access management issues.	Chance	As information is developed and conversations happen with the Committee.

APPENDIX 2-C-62. October 17, 2019, Meeting Summary

DRAFT MINUTES

Meeting between Chance Oil and Gas Limited and Vuntut Gwitchin Government

October 17, 2014, 9:05 AM – 10:027AM

Vuntut Gwitchin Government Board Room

Old Crow, Yukon

Present:

[redacted], President, Chance Oil and Gas Limited

[redacted], VP, Community and Government Relations

[redacted], Regulatory, Environmental and Community Relations Coordinator

[redacted] Chief, Vuntut Gwitchin First Nation (VGFN)

[redacted], Deputy Chief, Vuntut Gwitchin First Nation

[redacted], Councilor, and Standing Committee Chair, Natural Resources, Vuntut Gwitchin First Nation

[redacted], Councilor, Vuntut Gwitchin First Nation

Absent:

[redacted], Jr., Councilor, Vuntut Gwitchin First Nation

Recorder:

[redacted]

TOPIC: Update by Chance Oil and Gas Limited – Cooperation Agreement, Capacity Needs, Moving Forward

Review Agenda:

The agenda was reviewed and accepted by the members present. The agenda items included

1. Update of project activities
2. Discuss each party's desire to work cooperatively and collaboratively to advance the exploration activities
3. Discuss each party's objectives for cooperation and collaboration in respect of the exploration activities
4. Identify capacity funding needs of the VGG to complete and implement the Cooperation Agreement
5. Other business

1. [redacted] welcomed Chance Oil and Gas Limited to the meeting. [redacted] then proceeded with a review of the agenda and asked if there were any additions or deletions. The Agenda was accepted. [redacted] provided an update on the last few months with baseline gathering, LiDAR and photo-imagery. [redacted] mentioned Environmental Dynamics Inc. (EDI) completed a bird survey in late June, two ecosystem mapping surveys in late June and beginning of August, an aquatic survey in late July/early August, and examination of old and new seismic lines. EDI has been waiting for the LiDAR data to complete its interpretation of the data that has been gathered so far. It is intended to share the data and the interpretations as soon as EDI is ready. A VG citizen was hired by EDI to help with the second ecological mapping work and the aquatic survey.
2. [redacted] also mentioned the geological survey that occurred in July that included the hiring of local VGFN citizens from the community to assist. A report will be shared once all the rock samples that were gathered have been evaluated by the laboratory and the data interpreted by our geological staff.
3. Peer Solutions consultants undertook an aerial scouting mission over the entire area of interest to help them develop the programs to acquire new seismic data in the future. Chance retained Peer Solutions because of its experience designing and project managing seismic programs at Eagle Plains with a previous company called GeoTir who worked for Chance in 2013-2014.
4. [redacted] said that in the coming months, we would get back together and host a series of workshops to provide the data from the assessments and obtain input from the VGG and VG citizens. There is a consultation process that Chance Oil and Gas Limited has to follow. He said that as we go through the exercise of consultation, we need to make sure it is wholesome and has community input.
5. On the subject of working together (cooperatively and collaboratively), the VG is very willing to participate in ongoing project development with the ultimate objective of supporting the project. [redacted] Dana Tizya-Tramm said that VGG will send the updated maps.

6. On the subject of resetting the Cooperation Agreement discussion to an earlier stage in order to build the agreement from first principles, the first step is to have each party lists its objectives to be achieved by the Cooperation Agreement. There was acceptance to do so by all parties. [redacted]
7. On the subject of Capacity Funding, it was accepted that there are a number of legal considerations and good corporate governance practices that affect how and the extent that Chance can provide funding. The VG needs to give more thought about the details and timing of its funding needs to satisfy its own needs and comply with the governing laws and practices required of Chance.
8. Other matters related to these broader topics included suggestion that VG would take the leading role in the FN engagement process on behalf of all the affected First Nations to mitigate the potential risks of multiple advisors representing individual FN's providing contradictory advice. As well the lead FN would be responsible for developing the FN relationships so all could benefit in some agreeable manner. In addition, the broader consultation process was discussed with particular attention paid to ensuring that consultation would be sufficiently comprehensive to demonstrate not only VG government engagement, but also broad community engagement. The idea of a part time position be funded by COG under Capacity Funding arrangements to ensure a means of obtaining broad community input and address the concerns of meeting fatigue and shyness.

We concluded by mentioning the National Coalition of Chiefs conference in Calgary on November 4 and 5 and an update on the status the lawsuit Chance has with Yukon.

APPENDIX 2-C-63. November 26 & 27, 2019 Meeting Summary - document not available at submission.

APPENDIX 2-C-64. July 9, 2020, Meeting Summary

VUNTUT GWITCHIN AND CHANCE OIL AND GAS MEETING

PROPOSED WELL MAINTENANCE PROGRAM

Date: July 9, 2020

Location: Conference Call

Attendees:

Vuntut Gwitchin/Firelight:

[redacted], Director of Natural Resources, Vuntut Gwitchin Government
[redacted] Lands Manager, Vuntut Gwitchin Government
[redacted] Senior Researcher, Firelight
[redacted] Researcher, Firelight

Chance Oil and Gas Limited:

[redacted], President
[redacted], VP Government and Community Relations
[redacted], Regulatory, Environmental and Community Relations Coordinator

Vertex/Hemmera:

[redacted] Vertex
[redacted] Human Environment Business Leader, Hemmera
[redacted] Senior Environmental Specialist, Hemmera
[redacted] Human Environment Specialist, Hemmera

Purpose and Objectives

The purpose of this meeting was for Chance to provide an overview of the proposed Eagle Plain Well Maintenance Project and to answer initial questions provided by Vuntut Gwitchin Government (VGG). Additional clarity around the project would allow VGG to provide more official feedback on the project description at a later date.

Meeting Discussion:

Introductions

VGG – Indicated that this meeting/call is not for the purpose of consultation. This is for clarity around the well work in order for VGG to provide feedback at a later date. Quick updates before we get started, we have completed review and comments on the cooperation agreement and should be sending that soon. Hoping there is time to talk about the Old Crow community meeting at the end of the call. We all have the correct PowerPoint and ready to get started.

DRAFT

[redacted] – Chance and Clive will be speaking to the presentation. If during the presentation we discover a technical error in the PowerPoint, we will send out an updated version.

[redacted] – Work proposed is required by YG for Chance to maintain the suspended well status of 4 wells. Chance submitted this application last year. Despite the age of some of these wells, we do annual maintenance checks (i.e., surface infrastructure). The Project will require a YESAB assessment at the Dawson Designated Office. In order to be able to execute this work during the winter of 2020/2021, Chance needs to be in the position to contract suppliers in October, meaning the submission to the DO would need to happen in the next couple weeks. Programs in BC and Saskatchewan for funding orphan and active wells will apply pressure to this project by causing a shortage of equipment and professional services. The main project activities being proposed are well integrity assessment and maintenance work on 8 wells. The work is dictated by regulations. Winter roads will have to be re-activated and some water will be needed for that operation, contingent on the snow-pack. Based on scheduling we have now, it will likely take 2-3 months to do this work. We do have a camp; however it is currently closed/shut down. That camp could be used, or we could use the Eagle Plains Hotel for staff. At this time, for the purpose of the DO screening, we will include both options. Equipment will be needed to open up the winter roads (bulldozers, mulchers, drags to help pack the snow, water trucks) in order to get the winter roads to a state that will allow the equipment to get in. We may run snowmobiles along the winter road routes to start some initial snow packing. Some work at each site will be conducted to ensure equipment can be properly set up at/around each well. The order of which well is addressed first is flexible and can be impacted by presence of wildlife in the area, for example. A pressure test of the casing is the first step, then investigations to confirm if there is casing-vent flow. This is actually checked each year and there have been no issues so far. The temperature check is to figure out the depth of permafrost and to see if there have been any changes in its depth. The tests/procedures will ensure the wells conform to modern regulatory conditions. Their subsurface infrastructure is in-line with the regulations that were in place at the date they were established. The objective is to have all wells be suspended, maybe abandoned, at depth. Suspended is preferable as it allows Chance to possibly use them in the future (for production or disposal). We will have to be prepared for a variety of scenarios. Maps have been provided showing the permits and wells [at this time [redacted]eft the call].

[redacted] – The plan is down hole suspension and to bring wells into compliance with the Oil and Gas Drilling and Production Regulations (OGDPR). We may take some wells to surface abandonment. We plan on inspecting all wells this summer. One of the suspended wells (A-25) is on Permit 25 that is set to expire. We are working on extending that tenure. We are going up to analyze the integrity of the wells and take on the remedial work that we need to. If in the future plans are made to bring them into production or use them as a disposal well that will be a component of a future project.

Firelight – Inquired how Section 91 (5) of OGDPR applies to Chance's suspended wells. Commenting that suspended status is not an indefinite prospect. Section 91 (5) has a condition that suspended wells must be put back into operation or abandoned within a period of three years from the date of suspension or any longer period specified by the Chief Operations Officer.

[redacted] – The Executive Committee Project Proposal may include those wells and activities with those wells and that would hopefully occur within 3 years. We can add that detail to the Executive Committee Project Proposal in order to provide additional clarity. We will also add additional regulatory context and detail.

DRAFT

[redacted] – Effectively we are downhole abandoning these wells. Some of these wells have not been perforated.

Firelight – Downhole abandonment, is that the same as downhole suspension? Is that the same as cement squeezes?

[redacted] – Correct. Cement squeezes ensure that they are isolated. Depending on the assessment during the maintenance activities that we are proposing, we would like to use them as an injection/disposal well or production as a part of the Executive Committee Project Proposal. All work will be in accordance with OGDPR.

Firelight – VG is interested in clarifying some of these terms. Suspension versus abandonment and clarity on what that means. Additionally, there appears to be discrepancy between May 2020 proposal to YG for abandonment and workover. According to that proposal, you planned for abandonment of 6 wells and workover of 2 wells. That is different than the project description that you have shared. They are not the same.

[redacted] – When we originally went to YG, the initial thought on the legacy wells (the four on the Significant Discovery Licensee) was abandonment. After additional examination we wanted to adjust the plan. Once we started understanding the processes and options for the maintenance activities, the proposed project evolved. This application is designed to allow us to do that work, understand what we have at each well, then determine the next steps in the field.

Firelight – Then it seems like YG is providing dated information to VG. We want to make sure that these activities are in accordance with the Act. So YG is aware and apprised of this change?

[redacted] – That is correct. YG is fully aware of the program we are proposing. The Director will be facilitating further discussions with other departments within YG to help implementation.

Firelight – You mentioned that work will be done sequentially, do you have an idea of the sequence?

[redacted] – In terms of operation, the ice road, one of the procedures that we do, is to start with snow cats on the trails. Let snow base sit, then tighten up. Start and continue packing the snow. The sequence is, that the base will be put on the Blackie road and then the Chance road. We will determine the sequence of the wells at a later point, considering factors such as where wildlife is observed. For example, if there are caribou then we will focus/move our work to another well.

Firelight – To confirm, there are no current plans to have these wells become disposal wells. But there is a possibility of that in the future. If that does happen, what does that entail?

[redacted] – From a technical perspective, injection well is the same as a production well. Just the fluid is going in the opposite direction. Tanks, pumps, equipment on site are generally the same.

Firelight - Fluids from other wells, that is not useable, that is what would be disposed?

[redacted] – For the most part. Maybe stimulation fluid.

[redacted] – Any activities along that line would be addressed in a later proposal.

[redacted] – Does VG or Firelight need any other info about Blackie Road?

VGG/Firelight – There are no additional roads being constructed, correct?

[redacted] – That is correct. Not additional road is being constructed, but the Blackie route is overgrown. The vegetation is thicker there. Will be doing some brushing. These winter roads were used decades ago, so there are some spruce trees now. But we will follow the exact route which is also located on the height of land.

VGG – We needed this clarity and information from this meeting in order to finish developing our comments and feedback. We will work with Firelight and hopefully get back to you by the end of the week. Maybe next week.

VGG – As for the open house, we hope to have a response to the questions and input we send you before the community meeting. Accommodation will be a limiting factor. Who would be coming?

[redacted]

[redacted] – Myself or someone on the DO application.

[redacted] – We will be sending the full application shortly. We hope to meet the community after VGG/NRC has had a chance to look at the details. We would like to explore employment opportunities during the open house. Some citizens in Old Crow seem interested in working on this program and future programs. Some opportunities for citizens to operate the equipment or environmental monitors.

VGG – We will get back to you about the availability of VGG/NRC. Full attendance may not be possible.

[redacted] – Can we schedule another brief call to sort out the logistics and the purpose and intent of the open house. Having a DO submission now as well as the ExCom, there could be confusion. How can we make sure we are clear but also not overwhelm people with detail?

VGG – That sounds good. We can arrange that by email later.

Action Items/Next Steps:

Action Item	Responsible Party	Date Required
VGG to provide feedback to Chance on the DO Project Description.	VGG	Sent to Chance/Hemmera July 10, 2020
Chance to provide a response to VGG's feedback in the document/template provided by VGG.	Chance/Hemmera	ASAP Prior to Old Crow Open House
[redacted] and [redacted] to connect via email or phone to discuss logistics and approach to Open House.	[redacted]	No Longer Applicable*
Share Open House communication materials with VGG (e.g., hand outs, project summaries, etc.).	Hemmera	COVID HASP shared July 10th. No Longer Applicable*

*Please Note: The Open House in Old Crow was cancelled the morning of July 20th.

APPENDIX 2-C-65. August 21, 2020, Meeting Summary - document not available at submission.

APPENDIX 2-C-66. September 3, 2020, Meeting Summary

VUNTUT GWITCHIN NATURAL RESOURCE COMMITTEE AND CHANCE OIL AND GAS MEETING

PROPOSED WELL MAINTENANCE AND WINTER ACTIVITIES

Date: September 3, 2020

Location: In-Person Meeting (Old Crow) and Conference Call

Attendees:

Vuntut Gwitchin:

[redacted], Director of Natural Resources, Vuntut Gwitchin Government
[redacted], Lands Manager, Vuntut Gwitchin Government
[redacted], Senior Researcher, Firelight
[redacted], Fish and Wildlife Manager, Vuntut Gwitchin Government
[redacted], Council, Vuntut Gwitchin Government
[redacted] Natural Resource Committee
[redacted], Admin Assistant, Natural Resources, Vuntut Gwitchin Government
[redacted], Natural Resource Committee
[redacted], Youth Representative, Natural Resource Committee
[redacted] Natural Resource Committee

Chance Oil and Gas Limited:

[redacted], President
[redacted], VP Government and Community Relations
[redacted], Regulatory, Environmental and Community Relations Coordinator

Vertex/Hemmera:

[redacted], Vertex
[redacted], Human Environment Business Leader, Hemmera
[redacted], Senior Environmental Specialist, Hemmera
[redacted], Human Environment Specialist, Hemmera

Purpose and Objectives

The purpose of this meeting was for Chance to provide an overview of revisions to the proposed Eagle Plain Well Maintenance and Winter Activities (i.e., amendments from original project description shared) and to answer questions from the Vuntut Gwitchin (VG) Natural Resources Committee (NRC).

Meeting Discussion:

[redacted] – Welcomed everyone and opened the meeting.

DRAFT

[redacted] – Reviewed the agenda.

[redacted] – Everybody has had a chance to review the original draft of the project description. However, it was revised in order to address a few issues. Even within those changes there remains some uncertainty. First, the need to abide by Yukon Government (YG) orders to either abandon or put the wells into service. The previous version of the project description considered having the suspension status continue, but YG has instructed differently. Two wells will be converted to deep well injection. One of those wells is at Chance Camp with rock formations (shale formations) that make it work well for injection (Well E78). Shale and permafrost are well known as fluid migration barriers. Well A25 is located in a dormant borrow pit. The remaining six wells will be abandoned after maintenance activities are completed. We do not want to put those six wells into service because they are further from the Dempster Highway. Second, the item up in the air, is whether or not Chance will open the camp. Mostly this uncertainty is with respect to COVID and addressing COVID management. Eagle Plains Hotel could accommodate us, but they also need to provide essential services to the public. Chance is working on this item. For the purpose of the YESAB submission we have to consider opening the camp and leaving that in as an option. The last item that was changed from the original Project Proposal is access to M59 and using Blackie winter road. When visiting the well sites last month to do inspections, Chance found that the final portion of the Blackie winter road access route was steep and would involve cutting a lot of trees. This portion of the route would be hazardous because it is so steep. Shifting access to the east would be safer and results in less vegetation disturbance.

[redacted] – We have hired Firelight to help with our assessment and evaluation of the project. Justin Page is up in Old Crow. VG has looked at some of the review, and it would be good at this point to use that as a basis for asking questions. Justin, do you want to take the lead?

[redacted] – Might be useful for people to ask high level questions. We've done a detailed review of the proposal. We also have some technical issues with respect to caribou, Vuntut Gwitchin rights, etc. With the conversion to injection, how does that affect timelines? How long would they (injection wells) be permitted for? Is it just to facilitate the abandonment of the other wells or for future activities associated with the Executive Committee Project?

[redacted] – These injection wells would be used to dispose fluids from the maintenance work. They could be useful for the Executive Committee Project also. In the meantime, there is a little water well at the Chance Camp that has some fairly salty water. We might use the disposal wells to dispose of salty water from that water well if we conduct pump tests. This would help us switch from using surface water to that well. But may get some salty water until we get good water.

[redacted] – For clarity, what else will be pumped down there Richard?

[redacted] – Water from drilling operations, sodium chloride or potassium chloride water from the maintenance project, or formation water.

[redacted] – What process are you going to use protect oral history? What about caribou analysis and back and forth with regional biologist? What is the timeline for collecting data on the wildlife, oral history, and interviewing people in the area? Research into the cultural component of the area.
